Again, such a patient might be using sex to get so close to the analyst that he would not be able to see her clearly. "Love" manifested for an analyst of the same sex may also be used for similar purposes and need not be an indication of homosexuality.

The above detailing of some of the factors operating in a male analyst-female patient relationship is also in a sense culturally determined. Our attitude is: "Why, of course such situations would naturally arise in such an intimate relationship!" However, we see the same mental phenomena manifesting themselves in a female analyst-male patient relationship. This fact is being statistically verified by the experience of the increased number of female analysts treating male patients.

In this manner, several other fallacies are being dispelled. Male analysts are not generally superior to their feminine colleagues. Also, male or female patients can work equally well with an analyst of either sex. The success of the therapy depends upon the competence of the analyst and the incentive of the patient to work cooperatively toward mental health regardless of the sex of the patient or analyst.

In the foregoing descriptions of the various sexual activities and cultural attitudes toward sex, an attempt has been made to present a few of the more basic aspects of the modern psychoanalytic viewpoint toward this problem. Modern psychoanalysis emphasizes the importance of the individual and his relationship to himself and to those with whom he lives and works. It believes that individuals, singly, as well as in groups, know what is best for their welfare, have the capacity within themselves to attain a fuller realization of their potentialities as human beings and to create for themselves a society in which cooperative participation for mutual benefit can become a reality. Such a society will respect them because they will have courage and integrity and, above all, because they will believe in the intrinisic value of human life and human dignity.

HERMANN M. BIGGS MEMORIAL LECTURE ON DDT

The Hermann M. Biggs Memorial Lecture, which is held annually in Hosack Hall at the New York Academy of Medicine under the auspices of the Committee on Public Health Relations, will be delivered this year on Thursday, April 5, at 8:30 P.M. by F. C. Bishopp, Ph.D., assistant chief in charge of the Research Bureau of Entomology and Plant Quarantine of the United States Department of Agriculture. The subject of the lecture will be "The Medical and Public Health Importance of the Insecticide DDT." This lecture is open to the general public.

History of Medicine

A BRIEF HISTORY OF DERMATOLOGY IN NEW YORK CITY ITS SHARE IN THE PROGRESS OF THE SPECIALTY IN AMERICA

PAUL E BECHET, M D , Elizabeth, New Jersey

NEW YORK can claim many important contributions to the advance of dermatology and it is the author's intention to substantiate this statement by submitting evidence which can prove this truth beyond peradventure Lest this relation overstimulate the ego of our present generation of New York dermatologists, the author hastens to venture the opinion that such an extraordinary development of a medical specialty in this city is not due to a group of supermen, but rather to the very primitive law of supply and demand New York has always been America's largest city, and naturally, the larger the population, the greater are its dermatologic ills, and the demand for experts to relieve these ills is consequently so great as to stimulate and activate the study of dermatology to an unusual degree, this was evidenced as early as 1869, when as many as twelve men proved sufficiently interested in the specialty to found the New York Dermatological Society, which is the oldest one in the world

Today, American dermatology is so important a field of medicine that it has been given professorships in practically all of the medical colleges, has an independent department, often the largest from the point of view of floor space and attendance, in the leading hospitals, with a number of hospitals devoted entirely to dermatology and completely self-contained in all allied branches, two dermatologic journals, one covering the entire dermatologic field, the other limited to dermatologic research In dermatology alone, there are four national bodies with an enthusiastic and active membership, six sectional societies, eleven state, and twenty local societies The City of New York alone supports seven of these All of this superlative progress is not dependent on the activity of recent years but rather on the enormous amount of groundwork done by a small band of devoted, tireless pioneers in their chosen field of medicine It was they who plodded through the tangled skeins of dermatologic symptomatology and classification, depending entirely on exhaustive clinical notes, trained analytic minds, and unusual acuity of vision—all of this in the face of some condescension and even contempt on the part of specialists in other branches of medicine One of the leading dermatologic pioneers in New York who honored the author with his friendship related, as a humorous incident only, that, in speaking of him, a prominent surgeon of this city stated some fifty years ago that 'while he was hell on a pimple, a boil was too much for him" Sir Erasmus Wilson must have also sensed this same contempt, for he once predicted that the day would come when skin diseases would receive equal recognition from the other specialties

American dermatology began in New York on June 22, 1836, when the Broome Street Infirmary for Diseases of the Skin was opened under the direction of Henry Daggett Bulkley [1] One year later he instituted a series of lectures on cutaneous diseases at the Broome Street Infirmary, and continued these lectures during the next three years at the Broome Street School of Medicine, at the New York Dispensary, and later at the College of Physicians and Surgeons, then located on Crosby Street, delivering nine courses of lectures here during the following ten years Bulkley was therefore not only the first to lecture on dermatology in America but the first to practice the specialty exclusively in America He was born in New Haven, Connecticut, on April 4, 1804 He received an academic degree from Yale College in 1821 He studied medicine at Yale and graduated in 1830 After graduation he went to Paris, in 1831, where he became the first American dermatologic student under Biett and Cazenave, at the old Hôpital Saint-Louis He translated into English the *Manual of Diseases of the Skin* by Cazenave and Schedel in 1845, and in 1851 edited an American edition of Gregory's *Eruptive Fevers* At different times he was president of the New York Academy of Medicine and the New York County and New York State Medical Societies It was at his home at 42 East 22nd Street that the New York Dermatological Society was founded, and he was its first president He died of pneumonia on January 4, 1872, in his sixty-eighth year

In 1870, a year after the founding of the New York Dermatological Society, the first journal on

Read at the Annual Meeting of the Medical Society of the State of New York New York City May 10 1944

dermatology in America made its appearance in New York under the editorship of M. H. Henry. It was entitled *The American Journal of Syphilology and Dermatology*, and under different titles but without interruption it has appeared ever since. In its span of seventy-four years it has proved invaluable to American dermatologists and its appearance caused a tremendous increase in dermatologic activity throughout the country.

In the year 1876 two important dermatologic events occurred. The first was the publication of the second textbook on dermatology in America;[2] its author was Henry Granger Piffard, of New York, and it was published by Macmillan & Co. in New York. The second was the founding of the American Dermatological Association at the University of Pennsylvania on Wednesday, September 6, 1876, at 6 P.M. Of the fourteen men present at the organization meeting, six were New Yorkers, thus illustrating the rapid increase of interest in dermatology in New York.

Henry G. Piffard,[2] the author of the second American textbook on dermatology, graduated in medicine from the College of Physicians and Surgeons in 1864, and studied dermatology abroad, spending most of his time at the University College Hospital in the dermatologic clinic of Tilbury Fox. On his return to New York he rose so rapidly that within a few years he attained such dermatologic eminence that he helped found the New York Dermatological Society, the American Dermatological Association, and received in 1871 the first appointment as visiting dermatologist to the City Hospital, Welfare Island, New York, which was the first institution in the United States to establish dermatologic wards.[4] Piffard was a great teacher, and as early as 1874 became professor of diseases of the skin at New York University, and in 1875 started postgraduate instruction, which he kept up after 1882 at the New York Post-Graduate Medical School and Hospital.[5] Piffard also wrote the first American textbook on dermatotherapy in 1881, but as early as 1868 had published a translation of Hardy's *The Dartrous Diathesis or Eczema and Allied Affections*. Piffard was a dynamo of energy, a genial fighter, avid hobbyist, profound thinker, and forceful teacher. He died of pneumonia on June 8, 1910, at the age of 68. As his life-long friend, George Henry Fox, aptly put it, he was "a blazing meteor in our dermatologic firmament."

In 1879, George Henry Fox marked an epoch in the illustration of skin diseases when he published his *Photographic Illustrations of Skin Diseases*, the first attempt to illustrate dermatoses by means of photography.[6] He also published *Skin Diseases in Children* (1897),[7] and his *Reminiscences* (1926).[8] He was the first to describe a chronic, itching, papular eruption of the axillae and pubes (Fox-Fordyce disease).[9] The clinical observations were done entirely by him. Fordyce did only the histology. Fox was probably the first to report a contact dermatitis, when he described match-box dermatitis as early as 1888. After receiving his medical degree from the University of Pennsylvania in 1869, he served an internship at "old Blockley," where, by a strange coincidence, he succeeded Louis A. Duhring, of Philadelphia, another great American dermatologist.[10] On the completion of his internship at the Philadelphia (Blockley) Hospital, Fox left for Europe, where for three years he studied dermatology, in Berlin under Virchow, in Vienna under Hebra, Neumann, Schroetter, and Stoerck, in Paris with Bazin, Hardy, and Vidal, and in London under Tilbury Fox and Jonathan Hutchinson.

Fox became a great teacher and served at different times as professor of dermatology, from 1875 to 1907, at The Women's Medical College of the New York Infirmary, Starling Medical College, Columbus, Ohio, the New York Post-Graduate Medical School and Hospital, and the College of Physicians and Surgeons in New York. He resigned from the last institution before the age limit in order to enable his chief assistant, Dr. George T. Jackson, to become full professor before also attaining the age limit. Fox served as president of the Medical Society of the County of New York in 1891, and of the Medical Society of the State of New York in 1894. He was president four times of the New York Dermatological Society and a founder (1876), president (1892), and honorary president at its golden anniversary meeting in 1926, of the American Dermatological Association. Most of Fox's clinical work was done at the New York Skin and Cancer Hospital,[11] where he was attending dermatologist from 1883 to 1913. One of the great satisfactions of my life was my close association with Dr. Fox over many years. On the many occasions that we were together, I never heard him speak of his own honors, but he was always ready to speak of those around him who had attained a high degree of proficiency in the specialty he had so greatly loved. Another of Dr. Fox's most lovable traits was the extraordinary friendship and interest which he manifested for the young tyros of his specialty. His willingness to help them in every way possible was expressed without the slightest trace of condescension. As Pusey rightly stated, "He was perhaps the friend of more American dermatologists than any other one of his generation." Fox died on May 3, 1937, at the age of 91.

On January 1, 1883, the doors of a small house at 243 East 34th Street were opened to patients

with skin diseases, and that act marked the beginning of not only the first hospital in the United States devoted to dermatology but also the largest in America, a position it has maintained ever since [11] On the staff of the New York Skin and Cancer Hospital, many of the representative dermatologists of New York have served at different times Even in 1883, its first year, one may find on its consulting staff such famous New York names as William H Draper, Fordyce Barker, T Gaillard Thomas, Edward G Janeway, Alfred L Loomis, and Abraham Jacobi An outstanding member of the group which founded the hospital and the one most responsible for its existence was Dr L Duncan Bulkley, it was he who conceived the original idea He was the son of Henry Daggett Bulkley, who was the first to teach and practice dermatology, not only in New York, but in America as well L Duncan Bulkley graduated in medicine from the College of Physicians and Surgeons in 1869, studied dermatology at the Hôpital Saint-Louis, and on his return to New York, became most active in dermatology His monograph, *Syphilis in the Innocent*,[12] won the Alvarenga prize in 1891 from the College of Physicians of Philadelphia He wrote several hundred articles and six or eight textbooks, mostly devoted to dermatotherapy, in which he had a deep interest He was one of the founders of the American Dermatological Association, and secretary of its first annual meeting, which was held in Niagara Falls, New York, on September 4, 1877 L Duncan Bulkley was also one of the founders of the Section on Dermatology and Syphilology of the American Medical Association and chairman at its first meeting on May 8, 1888 Bulkley died in 1928 at the age of 83

Samuel Sherwell was the first teacher of dermatology at the Long Island Medical College (1877) and first to practice this specialty in Brooklyn, where he remained active for some fifty five years He received his medical degree from University and Bellevue Medical College in 1868 and did postgraduate work in Europe until the outbreak of the Franco-Prussian war in 1879, when he served in the Anglo-American Ambulance Corps with Sir William McCormack and Marion Sims For these services he received from the Bavarian government the military order "Pour le Mérite" He was elected president of the New York Dermatological Society in 1881 and again in 1909 He was also president of the American Dermatological Association in 1894 He wrote a number of dermatologic articles, the most outstanding of which was on his use of acid nitrate of mercury after thorough curettage in the treatment of epithelioma of the skin, a method which proved highly efficacious, giving at the same time excellent cosmetic results Sherwell died in 1928, at the age of 87, after an eventful and interesting life His *Recollections of an Old Boy*[13] makes fascinating reading

Edward L Keyes graduated from New York University Medical College in 1866 On the advice of his preceptor, William H Van Buren, he went abroad to specialize in dermatology In 1871 he was appointed lecturer in dermatology at Bellevue Hospital Medical College, and in 1881, professor of cutaneous and genitourinary diseases at the same school Keyes was deeply interested in genitourinary surgery, but he made a number of valuable contributions to dermatology, among which may be mentioned the invention of the cutaneous punch for biopsies One of his greatest contributions was a paper on the effect of small doses of mercury on syphilitic blood which first appeared in January, 1876 [14] This paper was incorporated in an essay on the same subject which was read by Keyes before the Section on Dermatology and Syphilis at the International Medical Congress at Philadelphia in September, 1876 Keyes was a charter member of both the New York Dermatological Society and the American Dermatological Association Van Buren and Keyes collaborated on a textbook on genitourinary diseases which remained a classic for many years

Andrew Rose Robinson graduated in medicine at Bellevue Hospital Medical College in 1868 and the University of Toronto in 1869 He did postgraduate work in dermatology in London, Paris, and Vienna, where he became especially interested in histopathology, this interest led to his appointment as professor of histology and pathologic anatomy at the New York University Medical College and Women's Medical College of the New York Infirmary for Women and Children, but the institution nearest his heart was the New York Polyclinic Medical School and Hospital, of which he was one of the founders and professor of dermatology for many years He wrote a *Manual of Dermatology*, and was the first to describe hydrocystoma [15] Robinson served as president of the Section of Dermatology and Syphilology at the ninth International Medical Congress in 1887, and of the American Dermatological Association in 1896 He was the first chairman of the Section of Dermatology and Syphilology of the New York Academy of Medicine

Prince A Morrow was born on December 19, 1846, at Mount Vernon, Christian County, Kentucky He received his degree in medicine from New York University in 1873 and after two years of dermatologic work in Europe, he located in New York, where he rapidly rose to

eminence. He became professor of dermatology and genitourinary disease at New York University and Bellevue Hospital Medical College in 1883. He was also an attending physician to the department of cutaneous and venereal disease of the New York Hospital. He was a corresponding or honorary member of most of the foreign dermatologic societies, and he served as secretary of the International Congress of Dermatology and Syphilology in Paris in 1890 and in Vienna in 1893. He edited the *Journal of Cutaneous and Genitourinary Diseases* with Piffard from 1883 to 1888, and with Fordyce from 1888 to 1891. He was the author of *Drug Eruptions* (1887), *An Atlas of Skin and Venereal Diseases* (1888-89), *A System of Genitourinary Diseases, Syphilography and Dermatology*, three volumes (1892-94), *Leprosy* (1880), *Social Diseases and Marriage* (1904). Morrow, through Fournier's *Syphilis and Marriage*, which he translated into English in 1880, received the inspiration to take up the prophylaxis of syphilis, so that later on in life he practically made it his life's work. He founded the Society of Sanitary and Moral Prophylaxis in 1905 and remained its president until his death in 1913. He was the founder and editor of *Social Diseases*, a journal devoted to venereal prophylaxis.

John A. Fordyce graduated in medicine from Northwestern University Medical School in Chicago in 1881, served as intern in the Cook County Hospital until 1883, practiced general medicine at Hot Springs, Arkansas, for three years, studied dermatology abroad for two years, and on his return to the United States in 1888, settled in New York. Fordyce served as professor of dermatology and syphilology at New York University School of Medicine from 1893 to 1912, when he resigned in order to accept a similar position at the College of Physicians and Surgeons. He retained this position until his death. He also served the City Hospital most faithfully as visiting dermatologist from 1893 until his death in 1925. In 1889 he became coeditor with Prince A. Morrow of the *Journal of Cutaneous and Genitourinary Diseases*. From 1892 on he was its sole editor until his resignation in 1897. Fordyce was a prolific writer, and—what is more important—of his more than a hundred monographs, many marked an advance in the specialty to which he devoted a superabundant energy. He became at different times the presiding officer of the more important dermatologic societies in America. Despite a large practice, extensive teaching, much hospital and executive work, he always found time to encourage and help the younger physicians, no matter how obscure. Fordyce was a great histopathologist, a bent in this direction having developed under the inspiration of Kaposi. He was also a pioneer in the modern treatment of neurosyphilis. In 1896 he first described pseudocolloid of the lips (Fordyce's disease) under the following title, "A Peculiar Affection of the Mucous Membrane of the Lips and Oral Cavity."[16] "Infectious Eczematoid Dermatitis. Influences of Anaphylaxis Reactions"[17] appeared in 1911 and probably was the earliest exposition of skin eruptions caused by allergy. Like most great men, Fordyce was modest and extremely diffident. American dermatology suffered an irreparable loss in his death, on June 4, 1925, two weeks after an appendectomy.

Sigmund Pollitzer graduated from the College of Physicians and Surgeons in 1884. After graduation he undertook research work in physiology in Heidelberg, Germany, and in bacteriology in Fresenius' laboratory in Weisbaden, Germany; later he took up special work in Virchow's laboratory and at this time did much original work in physiologic chemistry. It was not until 1889 that he entered on his life's work, first at Unna's clinic and then as an assistant to Sir Malcolm Morris, in which position he edited for some time the *British Journal of Dermatology* under Morris' direction. From London he went to Paris, and there began a lifelong friendship with Darier, whose textbook he translated into English in 1920. Pollitzer was the first to describe the following dermatoses: acanthosis nigricans,[18] hydradenitis destruens suppurativa,[19] and parakeratosis variegata with Unna and Santi.[20] Pollitzer, in 1910, reported the first case of rhinoscleroma cured with x-rays.[21] He did much pioneer work dealing with the modern concept of syphilis. Pollitzer served as vice-president (1913) and president (1914) of the American Dermatological Association, and was one of its most active members for forty-one years. He was professor of dermatology at the New York Post-Graduate Medical School and Hospital from 1885 to 1915. Pollitzer was a strict parliamentarian and was especially critical of long-winded discussions lacking concrete facts. In such instances he could, in a few words of polished English and in well-chosen scientific terms, completely smother the unhappy speaker with unassailable facts, from which there was nothing else to do than to retire in confusion. Pollitzer, in acting thus, did much good service, for he deflated the ego of the usual group of know-it-alls who frequent every dermatologic meeting. In his home and with his friends he exuded kindness, generosity, and simplicity. Pollitzer always evinced much friendship for me; why, I do not know, but it did bring me great happiness. He belongs to that small group of physicians who have placed dermatology on a

sound, dignified, and scientific basis. His death in 1937 was a severe blow to those of us who knew him well enough to appreciate his many qualities of mind and heart.

Robert M. Taylor received his medical degree from the College of Physicians and Surgeons in 1868. He first described idiopathic progressive atrophy in 1876.[22] In 1875 he wrote *Syphilitic Lesions of the Osseous System in Infants and Young Children*,[23] a pioneer and most important contribution to the study of bone syphilis. He published a large folio on venereal and skin diseases in 1889. He was the first to teach dermatology at the University of Vermont and succeeded George Henry Fox as professor of dermatology at the New York Post-Graduate Medical School and Hospital. Taylor was a founder of the American Dermatological Association, and its president in 1882. He was president four times of the New York Dermatological Society. He died in 1908 at the age of 66.

Comment

In the difficult early years of dermatology in America, there is not the slightest doubt that the pioneer dermatologists of New York City played star roles in the development of their specialty in this country. Its present enviable position is substantially due to their tremendous ability, capacity for work, and complete unselfishness; all of these prerequisites were, of course, shared by other American dermatologists; the names of Worcester, White, Hyde, Duhring, Hardaway, Ravogli, Stelwagon, Gilchrist, and Pusey will blaze forever on the marquee of a dermatologic Hall of Fame.

May I conclude with the expression of the hope that this less than complete recital of the deeds of our dermatologic masters of yesterday may refresh your memories, stimulate your interest in medical history, and enhance your appreciation of the labors of these men in a field of medicine which offers an extraordinary fascination to its devotees

HOSPITAL FOR JOINT DISEASES TO MAKE HOUSE STAFF APPOINTMENTS OF INTERNS

The Hospital for Joint Diseases, in New York City, has announced that applications of interns for house staff appointments to fill twelve places on the general rotating service are now being accepted

The appointments will be for nine months; one-half of [illegible] be permitted to continue as junior residents, the number of junior [illegible] for another nine months as senior residents This is in accordance with the allocation plan of the Procurement and Assignment Service. Eight interns are to begin on the [illegible] of the year: July 1 August [illegible] sible within the term of nine months: surgery, [illegible] ophthalmology, [illegible] neurology, [illegible] s, neuropsychiatry, dermatology, pathology, chemistry, [illegible] pediatrics, and [illegible]

[illegible] service, interns and junior [illegible] pointment as residents [illegible] the American Medical Association for general internships and residencies, and by the American College of Surgeons as meeting its standards, provides maintenance, uniforms, and a stipend of $25 a month to interns. About 6,000 patients are treated annually, and one-half of that number are in the surgical, medical, pediatric, and all of the above-mentioned specialties. About 70 per cent are on ward service; all services are active.

The outpatient department treats about 700 pa- [illegible] should be addressed to Joint Diseases, 5, New York.

PREGNANCY AND MULTIPLE SCLEROSIS—CASE REPORT

IGNATIUS M. BIRNER, M.D., Brooklyn, New York

CASES of pregnancy occurring in women with multiple sclerosis are very rare. Among 6,414 cases at the Baudeloque Clinic, there were only 2 cases of multiple sclerosis. On the other hand, multiple sclerosis is one of the most common nervous affections and it occurs usually in young individuals, so that the small number of pregnancies is very remarkable. There are about 45 cases reported in the whole literature, one in the United States by F. J. Atwell and J. M. Mackenzie in the *Clinical Miscellany*, Basset Hospital, 1934.

I thought it worth while to report the following case because of the rarity of this kind of case and because of the peculiar effect pregnancy had on certain symptoms of the pre-existing multiple sclerosis.

Case Report

Case 1.—S. A., 27 years old, a white married woman, was admitted to the hospital on December 30, 1941. On admission her chief complaints were pain in the left upper quadrant, difficulty in walking, and weakness. For the past year and a half she had noticed a gradual weakness and stiffness in her left leg. She began gradually to lose control of her leg, finding difficulty in bending it and in making coordinated movements with it. At the time of admission the patient experienced a sensation on her left side up to the lower rib which was described as a feeling of numbness. Lately she had also complained of some numbness in her left arm.

From her past history the only fact worth while mentioning is that at the age of 6 she had a convulsion, after which she was "ill for six months with both legs in braces." After this period the braces were removed and she was left with no residual paralysis or weakness (patient's explanations about this episode are entirely unsatisfactory). Family history concerning nervous disorders was negative. Neurologic examination on admission revealed the following positive findings: tongue deviation to the left, absent abdominal reflexes, spasticity and weakness of the left extremities, ankle clonus, and Babinski, positive Romberg only with eyes closed, nystagmal jerks on both right and left gaze, zone of hyperesthesia on the left side of the level of the fifth and sixth thoracic vertebrae, paraesthesias over the lower half of the body on the left, and no anesthesias.

Examination of eyegrounds revealed bilateral pallor of disks. Vibration test showed impaired vibratory sense bilaterally and more so on the left side.

There seemed to be some atrophy of the left hypothenar and thenar eminences with definite weakness of the left hand. The left thigh showed considerable atrophy. The entire left lower limb was spastic. Aside from the neurologic findings the physical examination was negative.

Laboratory Data: The urine showed no pathology. Blood examination showed: red blood cells 4,800,000; white blood cells, Leukocytes, 12,000, total polymorphonuclears 68 per cent; hemoglobin 14.5 Gm. The spinal fluid was crystal clear. The pressure was normal and there was no increase in cells. The Wassermann test of the blood and spinal fluid gave a negative result. X-ray examination of the thoracic spinal column showed no evidence of any gross osseous abnormality or dislocation. Despite this last finding, a laminectomy was performed because of suspicion of an osteoma in the region of the fifth and six thoracic vertebrae. At the operating table the right sixth dorsal root was found displaced downward and posteriorly by a bony protuberance appearing as a thickened lamina on the right side and then gradually going over into a growth arising from the body of the sixth dorsal vertebra. This growth was at least half an inch thick at the lateral border of the vertebra. It displaced the cord posteriorly and to the left. Pressure was exerted upon the right and lateral quadrant of the cord.

Postoperative course was uneventful but there was no change in the preoperative symptomatology.

Four months later (the patient was operated upon on January 8, 1942) the patient consulted two specialists and both agreed with the diagnosis of multiple sclerosis.

In May, 1942, the patient came for the first time to my office; she was in her fourth month of pregnancy. Last menstrual period was November 1, 1942. Expected date of confinement was August 8, 1943. My neurologic findings at that time were the following: marked nystagmus in lateral position, positive Romberg without eyes closed, intention tremor, hyperreflexia, especially in the lower extremities, abdominal reflexes absent, positive Babinski, speech scanning and slight dysarthria, increase in muscle tone, especially in lower extremities, paresis in left upper extremity and pronounced weakness in left lower extremity, atrophy of thenar and hypothenar eminences of left hand especially, marked muscular atrophy of left leg, no sensory disturbances, and lability of emotions, tending either to extreme euphoria or extreme depression. The last symptom persisted all through her pregnancy and seemed to increase in intensity with the months of gestation. Toward the eighth month of pregnancy her condition grew worse. Her left leg became very weak and she could walk only with the aid of another person.

Labor started at 4:30 A.M. on August 3, 1943, and she was admitted to the maternity ward of St. Catherine's Hospital at 5 A.M., having fairly strong pains every five minutes. The cervix was fully dilated at 9 A.M., August 4, 1943. The membranes ruptured spontaneously at 7:45 A.M. on August 4, 1943. She delivered a living male child at 9:35 A.M., August 4, 1943. Low forceps were applied and episiotomy was performed because of perineal arrest. The placenta was delivered at 9:43 A.M. The first stage lasted twenty-nine hours, the second lasted thirty-five minutes, and the third, eight minutes. The baby was perfectly normal and weighed 7 pounds, 9 1/2 ounces. The postpartum course was uneventful and the patient left the hospital on the tenth day.

Three months later I examined the patient in my office and could notice the following neurologic changes for the better: nystagmus only slight in lateral position, intention tremor less pronounced, positive Romberg only with eyes closed, speech still scanning but no dysarthria, paresis in left upper extremity less pronounced and increase in strength in left leg, and more stable emotions. The patient was able to attend to her child.

Comment

The publication of this case seemed worth while for two principal reasons; first, because the occurrence of pregnancy at an advanced stage of multiple sclerosis is very rare, and second, because it is one of the very few cases reported in which there was not only an arrest but, moreover, an improvement in some of the neurologic symptoms after delivery.

It would be perhaps too far fetched to express any definite statement about the influence which pregnancy may exert upon the progress of multiple sclerosis, because, as we well know, periods of arrest are very common during the course of this disease. But as long as there is a relationship between nervous disorders and the generative processes, I dare say that pregnancy may even have a beneficial effect on some of the symptoms of multiple sclerosis. Further observation of this case and other cases may give us some more light about this problem in the future.

NEW CANCER ASSOCIATION

A new cancer organization—the Public Health Cancer Association of America—was formed at the Second Wartime Public Health Conference of the American Public Health Association in New York City. Its purposes are to provide for interchange of ideas among persons engaged in cancer control programs, to hold an annual meeting, and to encourage cooperative research in the methods and results of cancer-control measures. It is the representative organization of workers in cancer control.

The new organization reflects the growing activity in cancer control on the part of official health agencies. In addition to members of the American Cancer Society and of the National Cancer Institute, the founders incl[illegible] e state health departmen[illegible] (Illinois, Iowa, Michigan, [illegible], South Carolina, West Virginia); two state cancer commissions (Missouri and Vermont); one city health departm[illegible] health department (N[illegible]; and one district state hea[illegible]ork).

Officers of the Association are: president, Herbert L. Lombard, M.D., director, Division of Adult Hygi[illegible] D[illegible] te[illegible]), d[illegible] n[illegible] treasur[illegible] Divisio[illegible] partme[illegible]

Alth[illegible] is not formally affiliated with the American Public Health Association, its officers were active in arranging for cancer symposia which were held in conjunction with the last two annual meetings of the latter organization.—*Health News, Dec. 25, 1944*

RHEUMATIC FEVER SOUND FILM STRIP

"Jimmy Beats Rheumatic Fever," a fifteen-minute sound film strip, has just been released by the Metropolitan Life Insurance Company. The strip was made under the supervision of George M. Wheatley, M.D., assistant medical director of the company. The script was reviewed by T. Duckett Jones, M.D., of the House of the Good Samaritan, [illegible] scenes on diver[illegible] Alice Burkhardt, [illegible] Nurse Service of [illegible] the annual meeting of the American Academy of Pediatrics, where it was enthusiastically received. Officials of the New York City Department of Health and the Board of Education are recommending it for training courses for nurses and teachers as well as for mothers' clubs.

The strip was produced primarily for parents, teachers, and others who work with children. It is an 8-year-old boy's story about his successful battle with rheumatic fever. Because his mother was [illegible] of [illegible] n. film strip with a 16-inch record.

Other material which will help in presenting a program on rheumatic fever is available from the company. Requests for this and the strip should be addressed to Welfare Division, Metropolitan Life Insurance Company, 1 Madison Avenue, New York 10, New York.

BEAUMONT MEMORIAL FOUNDATION ORGANIZED

Organization of the Dr. William Beaumont Memo[illegible] ochure now The home of Wisconsin, where Dr. Beaumont carried on many of his history-making experiments. It is housed in a restoration of the old Fort Crawford Military Hospital.

The Foundation was organized as a memorial to the pioneer physiologist and as an American medical shrine. It is sponsored by a group of eminent medical men and community-minded Wisconsin citizens. The brochure gives an interesting history of Beaumont, the New England boy whose backwoods research and observations laid the ground work of modern physiologic science. It carries many excerpts from Dr. Beaumont's diaries as well as his famous "51 Inferences."

Medical men may secure a copy of the booklet by writing to the Dr. William Beaumont Memorial Foundation, Prairie Du Chien, Wisconsin.

TRAUMATIC PERFORATION OF THE APPENDIX—CASE REPORT

DAVID LYALL, M.D., and JOHN J. CREEDON, M.D., New York City

(From the Second (Cornell) Surgical Division, Bellevue Hospital)

THIS report presents a case of unusual character, with the role of injury apparently proved. The distinction between "traumatic" appendicitis followed by gangrene with perforation and primary traumatic perforation must be made. As Fowler[1] says, "Appendicitis is a disease and not an accident. It cannot be produced by trauma alone." Discussions of aggravation of pre-existing disease or of the cause of appendicitis following injury remain in the realms of speculation.

As late as 1935[2] the following statement was made: "The exact mechanism of traumatic appendicitis has never been satisfactorily established. It is within the bounds of possibility, though so far as we know no case is on record, that direct violence might bruise the organ, or even cause it to rupture. The demand of some writers for laboratory proof of the trauma is not likely ever to be answered, and their claim stands unchallenged that no case has ever been scientifically proved."

Avulsion from the cecum of the apparently normal appendix has been reported.[3] Other cases[4,5,6] are presented in which the important distinction between traumatic rupture and perforation following appendicitis cannot be made. A case is recorded[5] in a child of 10 in whom the appendix was angulated by adhesions in its middle third and in whom rupture of all coats occurred following a fall from a swing.

Kessler[7] states that "it is highly improbable that trauma can initiate appendicitis." In establishing the validity of a liability or compensation claim he states that, among other things, there must be (1) no previous history suggesting appendicitis; (2) a proved adequately severe injury or overexertion; (3) an injury whose nature and location is suitable to affect the appendix; (4) symptoms directly following trauma.

The case described fulfills these causative conditions and the operative and pathologic findings confirm the role of trauma.

Case 1.—A 57-year-old man (M. L., 48424-43) was admitted to Bellevue Hospital on October 18, 1943, complaining of low abdominal pain. One hour prior to admission he had fallen a distance of six feet from a ladder, landing on his feet with his trunk acutely flexed. He did not lose his balance at any time. Immediately following the accident he experienced severe pain in both lower quadrants of his abdomen, slightly more severe on the right side. Following the fall he was able to walk a distance of 30 feet in a hunched position. He noted at the time that his inguinal hernias, which he had had for many years, were large and painful, particularly that on the right side; however, he was able to reduce both. He was brought to the hospital by ambulance.

On examination his temperature was 100 F., pulse 70, respirations 20, and blood pressure 120/70. He was restless, excited, and in moderate distress, complaining of pain in both lower quadrants. The pertinent physical findings were confined to the slightly distended abdomen. There was direct and rebound tenderness with spasm in both lower quadrants, more marked on the right. There was slight rigidity in the upper abdomen. No masses were palpable. There were large bilateral reducible indirect inguinal hernias. Genitalia were normal. Rectal examination revealed slight tenderness high on the right side. While being examined the patient vomited several times and on one occasion a large, slightly tender, reducible mass was forced into the right hernial sac.

Laboratory Findings: The patient was catheterized and 300 cc. of amber, bloodless urine was obtained. The red cell count was 4,100,000; leukocytes, 8,000—60 per cent polymorphonuclears, 25 per cent transitionals, 12 per cent lymphocytes, 2 per cent monocytes, and 1 per cent eosinophils. A flat plate of the abdomen revealed no free subdiaphragmatic air. The chest plate showed a normal lung field with good diaphragmatic excursions.

Course and Treatment: Parenteral fluids were begun on admission, and oral feedings were withheld. He was watched closely. Twenty-four hours later another flat plate revealed moderate distention of the small bowel with several fluid levels on the right side. The patient continued to complain of moderate low abdominal pain which was somewhat more marked on the right side, but tenderness decreased slightly and became more evident on the left. The temperature hovered around 101 F., pulse 84, and blood pressure 130/70. He was maintained on intravenous fluids for another twenty-four hours. At this time a third flat plate of the abdomen showed moderate distension of the small bowel with numerous fluid levels throughout. The findings remained unchanged except that rectal tenderness appeared to be more acute. The white count rose to 11,500, and the temperature to approximately 102 F.

Operation was performed fifty-four hours after admission through a lower right rectus incision. Upon opening the peritoneum a patchy injection of the large and small bowel was seen. There was cloudy fluid present with an odor suggestive of B. coli. Large indirect inguinal hernia defects were present on both sides. A mass of scarred, fibrosed, edematous omentum 14 × 6 × 6 cm. was found in the abdomen loosely attached to the right hernial sac, which it had evidently occupied prior to the accident. The cecum and its attachments were well down over the brim of the pelvis and appeared to make up the lateral wall of the right hernial sac, thus giving the picture of a "sliding hernia." A greatly thickened appendix was low in the pelvis extending across to the left side where its tip was adherent to the mesosigmoid by a strong fibrous band. The tip lay in an abscess cavity measuring 4 × 4 cm. There was a tiny perforation at the tip of the appendix adjacent to the attachment of the fibrous band. This was seen with difficulty, for it was about one mm. in diameter. The sigmoid forming the lateral wall of the abscess was searched for perforation but none was found. The tip of the appendix was freed and delivered into the wound. The appendix was then removed in the usual manner. The organ was thickened, injected on its sur-

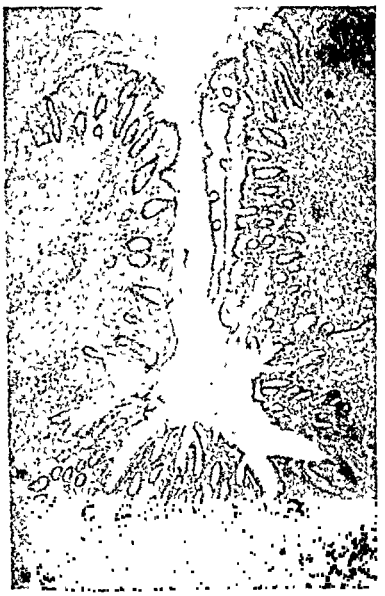

FIG. 1. The mucosa is well preserved and extends outward through opening in muscular and serous coats. The serosa is covered with fibrinopurulent exudate.

face, but not diffusely inflamed. No fecaliths were present. A peritoneal culture was taken and later revealed B. coli. One cigarette drain was placed in the [illegible] a thir[illegible] brough[illegible]. Eight Gm. of sulfanilamide was scattered through the involved areas and the wound was closed in layers with catgut.

Postoperative Course: The patient was placed on Wangensteen drainage and given 500 cc. of citrated blood. For the following eleven days his [illegible]

On the second day he was started on intravenous sodium sulfadiazine. This was maintained for four days, in which period he received a total of 20 Gm. Because of marked abdominal distension he was given nothing by mouth for five days. Clear fluids Regular

The wound drained a serosanguineous material in lessening amounts until the fifteenth day. The drains were removed on the fifteenth day. He was allowed out of bed on the twenty-fourth day and

the appendiceal wall. There is an outpouching of mucosa so that most of this channel is lined by it. An abundant fibrinopurulent exudate is seen on the serosal surface of the appendix. A small amount of similar exudate was seen at the outer margin of the point of perforation. A mild cellular infiltration was found in the tissues at the edges of the rent. There were, however, no gangrenous changes.

coat.

Conclusion

A case of traumatic perforation of the appendix is presented. This resulted from fixation of the appendiceal tip by an adhesion while the cecum was forced in a downward direction. Microscopically the appendix showed no evidence of the degree or type of infection which causes gangrene and perforation.

HEALTH AGENCIES AND MEDICAL CARE

Our health agencies have already hoisted their flags over large fields, some of which (possibly most of which) they occupy so thinly as to be ineffective.

In order to make good our plans for the prevention of disease and the postponement of death, we must keep the preventive aspect clearly in mind. Until we have gotten much farther along toward the complete control of tuberculosis, syphilis, gonorrhea, and other preventable diseases, we cannot, as health authorities, seek or take on the tremendous task of securing good medical care for everybody. That may come unsought, in some degree, in time, probably piecemeal, but we are certainly not ready for it now. To spread out over still wider areas would mean being even less effective than we are now in many of our preventive efforts.—*Homer Folks, Am. J. Pub. Health, Feb. 1941.*

BASILAR IMPRESSION AND ASSOCIATED DEFORMITIES—CASE REPORT

SAMUEL C. LITTLE, (MC), AUS, and LUCIEN M. PASCUCCI, Maj., (MC), AUS

(From the departments of neurology and radiology of the O'Reilly General Hospital, Springfield, Missouri)

ANOMALIES and deformities of the base of the skull and upper cervical spine, though relatively rare, occur with sufficient frequency to be of importance in the differential diagnosis of other organic lesions in this region. These disturbances are not well understood nor widely recognized. Though the majority of investigators feel that they all represent variants of one basic abnormal process, considerable confusion as to their cause still exists. The discussion and case report which follow represent an attempt at clarification of some of the problems concerning the above disturbances.

Arnold-Chiari Deformity

Arnold[1] in 1894 and Chiari[2] in 1895 independently described a group of peculiar deformities of the hindbrain which they classified in the following manner:

1. Elongation of the tonsils and the medial parts of the inferior lobes of the cerebellum as a tongue-like process investing the medulla in the upper portion of the vertebral canal.
2. Displacement of parts of the cerebellum into the upper vertebral canal, and elongation of the fourth ventricle so that it opens into the spinal subarachnoid space below the level of the foramen magnum.
3. Downward herniation of the whole cerebellum into a cervical spina bifida and meningocele.

In the more advanced deformities, the lower cranial nerves may be carried down into the cervical vertebral canal and from there extend cephalad to reach their foramina of exit. The basal ganglia, third ventricle, and thalamus may also be displaced downward. Though these extreme defects are usually incompatible with life, patients with milder degrees of abnormalities frequently reach an advanced age. Ordinary roentgenograms of the head and neck of patients with uncomplicated Arnold-Chiari deformity do not reveal any abnormality, but myelographic studies may show an obstruction of the upper cervical canal and foramen magnum by the herniated cerebellum and medulla. Ogryzlo[3] feels that the operative treatment of this condition resolves itself into a decompression over the deformity and re-establishment of the cerebrospinal fluid circulation. He warns against the dangers of immoderate mobilization of the cerebellar tongue.

Klippel-Feil Syndrome

The Klippel-Feil[4] deformity usually consists of a defect of the atlas, a cervical spina bifida, and fusion of some of the cervical vertebrae. A short neck with limited mobility is the striking clinical feature in most cases. Roentgenograms may reveal fusion of the vertebrae and irregular formation of their bodies and lateral masses; frequently there is a union of all or a part of the atlas with the occipital bone.

Spina Bifida and Spinal Dysraphia

Lichtenstein[5] states, "Spina bifida is primarily an expression of inadequate or improper fusion of the embryonal tissues in the dorsomedian region of the developing embryo, and the resultant pathologic states are manifested therefore in the cutaneous, mesodermal, and/or neural derivatives of these tissues." In the embryo the vertebral column grows faster than the spinal cord, and as the brain is relatively fixed, an upward migration of the cord occurs. In some instances of spina bifida the *meninges, nerve roots, or even the cord are actually* fixed to the cutis; the normal upward migration of the cord is thus prevented, and distant neuroanatomic alterations occur. The list of possible alterations given below is a modification of Lichtenstein's classification:

1. The spinal cord remains in the sacral or lower lumbar region and is liable to injury by lumbar puncture.
2. Degeneration occurs in the spinal cord as a result of stretching.
3. Downward migration of the hindbrain occurs (Arnold-Chiari deformity).
4. The lowermost cranial nerves are elongated and compressed at the foramen magnum by the impacted hindbrain.
5. Stenosis of the aqueduct of Sylvius develops.
6. Internal hydrocephalus results from a stenosis of the aqueduct, from impaction of the hindbrain, or from both.
7. Hydromyelia is seen in the upper cervical cord caused by hydrocephalus.
8. True syringomyelic-like cavities (not due to hydrocephalus) appear in the cervical cord.
9. There is pressure on the anterior spinal arteries and the vertebral system of veins at the foramen magnum.

It must be emphasized that the fixation of the spinal cord is not necessarily associated with a roentgenologically demonstrable bony defect.

Basilar Impression, or Platybasia

Basilar impression, or platybasia, is a deformity of the base of the skull in which the foramen magnum is distorted and seems to have been pushed up into the posterior fossa.[7] The atlas may be assimilated into the occipital bone, the lower part of the odontoid process encroaching on the cervical portion of the vertebral canal and the upper part projecting into the foramen magnum. The cause of basilar impression is not much clearer at present than it was when the condition was first described by Rokitansky in 1884. List[6] suggests that perhaps

FIG. 1. Lateral projection of skull.

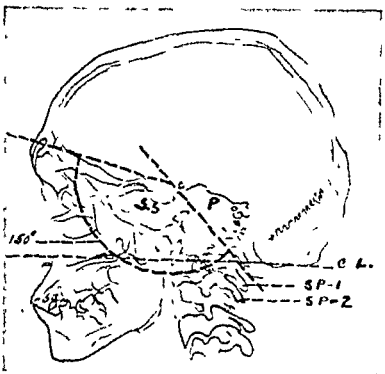

FIG 2 Tracing of Fig. 1 showing basal angle of 150° and elevated petrous ridges.

FIG. 4. Occipital projection.

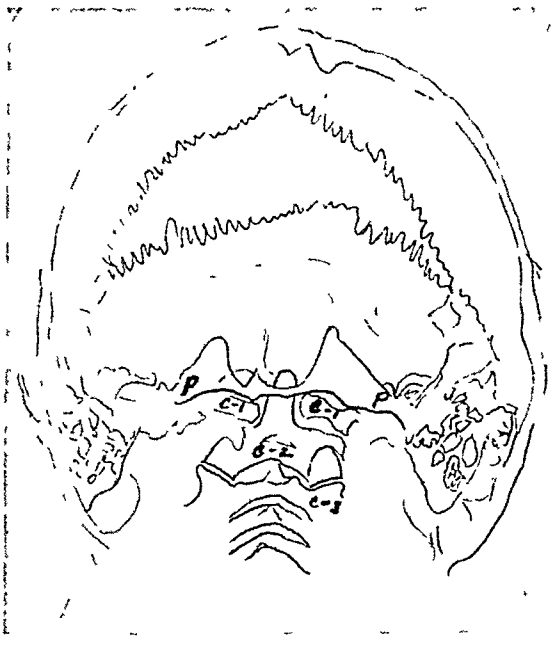

FIG. 5. Tracing of Fig. 4 showing elevated basiocciput and projection of odontoid into foramen magnum.

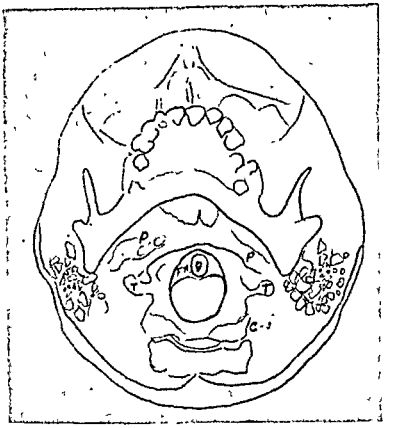

FIG. 6. Basal projection.

the downward pressure of the heavy skull against the unyielding cervical spine invaginates the region of the foramen magnum through an abnormally soft or underdeveloped basiocciput. All investigators are agreed that basilar impression is often associated with the Arnold-Chiari deformity, the Klippel-Feil syndrome, spina bifida, syringomyelia, and other manifestations of spinal dysraphia. It seems the deformity could be produced either by an upward displacement of the bone about the foramen magnum or a downward displacement of the rest of the skull. Lichtenstein's theory of downward displacement of the hindbrain by abnormal fixation of the cord or meninges would explain the Arnold-Chiari malformation which is so often associated with basilar impression, but it is difficult to understand how downward traction by the spinal cord could produce either upward displacement of the bone about the foramen magnum or downward displacement of the skull. It therefore appears that platybasia itself is not a distant complication of spinal dysraphia but is probably a separate manifestation of the same morbid process which produces the dysraphia.

If the condition is at all advanced individuals with platybasia present a characteristic appearance. The head is wide and set close upon the shoulders; the posterior hairline is very low, and the neck movements are restricted. If the head is held tilted to one side, an asymmetric fusion of some of the cervical vertebrae may be suspected.

The neurologic symptoms depend upon associated neurovertebral anomalies present as well as upon the degree of basilar impression. Even when the Arnold-Chiari deformity is not present cerebellar symptoms (such as ataxia, dysdiadokokinesia, and nystagmus) may result from compression of the medulla, pons, and cerebellar peduncles against the rigid tentorium by the deformed basiocciput. Encroachment upon the ventral surface of the pons or medulla by the dorsally displaced odontoid process gives rise to pyramidal tract signs in any or all extremities. Compression and traction on the ninth, tenth, eleventh, and twelfth cranial nerves produce palsies of these nerves unilaterally or bilaterally. Dissociated sensory changes of a syringomyelic type may be caused by pressure on the anterolateral portion of the cord or medulla, by a hydromyelia secondary to hydrocephalus, by a true syringomyelic cavity, or by occlusion of the anterior spinal artery. Hydrocephalus with signs of increased intracranial pressure may result from constriction of the foramen magnum, from the jamming of the cerebellum into the foramen, or from stenosis of the aqueduct of Sylvius. Pain in the occiput and neck may indicate merely irritation of the cervical nerves, but more general headaches and dizziness are usually signs of increased intracranial pressure. When the atlas is dislocated on the axis, pressure on the dorsal part of the cord may give rise to loss of posterior column sensations; thus, posterolateral sclerosis may be simulated. Irritation of the trigeminal roots may cause pain in the face and decrease in the corneal reflexes. The full-blown syndrome is easily mistaken for a posterior fossa tumor

until roentgenograms reveal the characteristic deformity.

Roentgenologically, the platybasic skull may show a basal angle which is greater than 143° (average normal—134°). The plane of the clivus approaches the horizontal. As pointed out by Chamberlain,[8] the tip of the odontoid process frequently projects above a line drawn from the posterior margin of the hard palate to the posterior rim of the foramen magnum. The vault is often widened and the petrous ridges are elevated. The foramen magnum is altered in size and shape; its rim may be greatly thickened. Fusion of the atlas with the occiput, partial anterior dislocation of the atlas on the axis, backward displacement of the odontoid process, and spina bifida may frequently be observed. The lateral view of the skull including the upper cervical spine is the best single projection for demonstrating the findings of diagnostic significance, of which the relation of the odontoid to Chamberlain's line, the increased basal angle, and the elevated petrous portions of the temporal bone are the most important. Anteroposterior, basal, and occipital projections will demonstrate the associated deformities in most cases.

Treatment of basilar impression and its associated Arnold-Chiari deformity is primarily surgical. The greatest operative danger is that of respiratory failure, and operations on anomalies of the hindbrain and occipitoatlantoaxial region should be undertaken with considerable circumspection. Decompression is the principal aim, although immobilization by bone graft is advised by some. Too few cases have been operated upon to establish conclusive figures, but the operative and postoperative mortality in most series seems to be from 25 to 50 per cent. Perhaps perfection of technic and greater experience with this procedure will render operations for relief of the abnormality considerably less formidable.

Case Report

The patient, a 27-year-old private, was admitted to O'Reilly General Hospital on January 11, 1943, complaining of weakness of the left arm and leg. The patient's mother had had a cerebral hemorrhage when she was 44, but otherwise the family history was noncontributory. From the age of eight to the age of seventeen, the patient had had intermittent frontal headaches associated with a feeling of "dizziness." In 1934 he was struck on the head with a bottle and also injured his head while diving; neither of these injuries produced loss of consciousness or any immediate unpleasant after-effects. In this same year the headaches experienced earlier disappeared, although he was unable to state whether this occurred before or [illegible] age of 18, he entered [illegible] he first time, noted [illegible] found himself unable to walk the length of a log without falling, and noted that he stumbled on rough ground and tended to veer to the left in walking. His condition remained about the same for seven years until May, 1941, when he suddenly noticed a stinging sensation in his left hand. Shortly thereafter weakness of the left upper extremity began, and while he was carrying a stove weakness in the left lower extremity suddenly made its appearance. After this he noticed numbness of the left side of the face, shoulder, and chest, the numbness of the face soon disappearing. He was inducted into the army on September 28, 1942, and apparently got along well until he dropped two dummy projectiles because of weakness of the left upper extremity. He was then admitted to a Station Hospital, from which he was eventually transferred to O'Reilly General Hospital. At no time had he had any diplopia or urinary disturbances.

Examination.—The head was brachycephalic with a bulging in the temporal regions. The neck was short, and the hairline extended almost to the base of the neck. Neither passive rotation of the head nor axial percussion produced pain. The optic disks were slightly pale temporally and gross hori- [illegible] lateral gaze. [illegible] iterally hypo- [illegible] involvement of the trigeminal nerves. Hypalgesia and thermhypesthesia were present from the first cervical to the seventh thoracic dermatomes on the left, but superficial and deep sensations were otherwise normal. Mild dysdiadokokinesis was present in all [illegible] e in the left arm. [illegible] duced in the left [illegible] advanced in the left lower extremity. All tendon reflexes were more hyperactive in the left extremities, and the left upper abdominal reflex was reduced. Rossolimo, Babinski, and Chaddock signs were present bilaterally but were most prominent on the left. The gait was suggestive of a spastic paraparesis. There were no other physical or mental abnormalities, and urinalysis, blood count, and blood Kahn test were normal. On roentgen examination the skull showed a symmetric bulging of the temporal bones typical of brachycephaly. The basal angle measured 150°, the petrous portions of the temporal

bones were elevated, and the full length of the odontoid process extended above Chamberlain's line. The cervical spine was apparently shortened and the spinous processes were bifid. The basiocciput was elevated. The foramen magnum was not deformed.

Course.—There was no significant change in his condition during his stay in O'Reilly General Hospital. He was discharged from the Army on March 15, 1943, on a certificate of disability.

Follow-Up.—Through the courtesy of the American Red Cross and the Massachusetts General Hospital, it was possible to follow this patient after discharge. He was admitted to the Massachusetts General Hospital, April 29, 1943, where the findings were essentially the same as those given above. A lumbar puncture revealed no significant abnormality and an electroencephalogram was normal. On about May 20, 1943, a suboccipital decompression was performed under ether anesthesia. The dura was not opened, so it was not possible to determine whether an Arnold-Chiari deformity was present. A day or two after the operation he had several seizures during which "his arms and legs became numb, and he shook all over." After this he improved steadily and was discharged on June 13, 1943 as improved. On July 13, 1943, his neck was a little stiff, but he felt that he was improving steadily and was anxious to go back to work.

Discussion

In this patient it is not possible to precisely delineate the pathoanatomic mechanism producing the neurologic abnormalities, but it seems likely that the processes of stretching, distortion, pressure, etc., mentioned previously were operating in this case just as in other cases. It is unfortunate that the findings of the postoperative neurologic examination are not available, but, since the patient presented himself for the operation because he felt himself totally unable to work, and since the last report showed him to be anxiously looking forward to going back to work, we may assume that considerable improvement had taken place. It does not seem likely that the head traumas this patient received were important in the production of the syndrome.

Summary

1. Basilar impression and certain other craniovertebroneural anomalies are described and reviewed with particular attention to differential diagnosis and cause.

2. It is felt that these conditions may all be manifestations of one basic abnormal developmental process.

3. The clinical features, roentgen findings, and surgical treatment of a case of basilar impression are presented in detail.

ONE OF THE TRENDS OF THE TIMES

Much is being written about the effect of the World War on modern youth, specifically referring to the 'teen age. We shall not essay a discussion of this problem from the standpoint of moral delinquency, confining ourselves to comment on but one phase of the problem. Most of us are familiar with the trend of the times in this connection, among the children of the neighborhood. Formerly wont to play the games of our childhood, Duck-on-the Rock, Three-Corner Cat, etc., our youngsters now engage in wartime exhibitions.

Most any day we note a procession of "soldiers" passing our home, each carrying some sort of gadget representing arms. At other times there is organized "war," with the Allies on one side and the poor Japs on the other—you do not hear much about a war against the Germans.

Later on, through one means or another, some of the group come into possession of airguns, those instruments of the devil himself—such is our personal characterization of the alleged toys. We have seen a few instances in which these airguns have been used in "combat," wondering the while why there are not more injuries resulting therefrom.

These same airgun addicts, when not engaged in playing war, go about the alleys promiscuously shooting at "marks," or some poor bird that happens into view, not caring about the windows in the neighborhood or the residents thereof.

Then there are other weapons equally dangerous and equally destructive. Only the other day we were walking along one of our parks and noted three boys shooting at birds with home-made slingshots. As a matter of fact, we chased these boys for several blocks, wishing to talk to them about the evils of such practices.

That we are not alone in our condemnation of these things is evidenced by an editorial in the rather staid *New England Journal of Medicine*, "Injuries to the Eyes from Air Rifles," an article prompted by a letter received from the Director of the Massachusetts State Division of the Blind. It seems that in that state there is a law making it compulsory to report all injuries received from air rifles, which would seem to be evidence that such injuries are all too common.

The editorial in question recites the fact that while such injuries do not commonly result in a perforation of the globe, the damage sustained is all too often of a serious nature. Such a blow upon the eye may result in a number of serious, permanent injuries to some of the intra-ocular structures.

We are an ardent advocate of play for our youngsters, but we do believe that some of their activities might well be curbed. Some day, someone is going to compile a list of serious injuries produced by air guns and slingshots, and when that time comes our eyes will be opened—wide, and then we may do something about it.—*J. Indiana State Med. Soc., Dec., 1944*

Postgraduate Medical Education

Programs arranged by the Council Committee on Public Health and Education of the Medical Society of the State of New York are published in this section of the JOURNAL. *The members of the committee are Oliver W. H. Mitchell, M.D., Chairman, (428 Greenwood Place, Syracuse); George Baehr, M.D., and Charles D. Post, M.D.*

Series of Lectures for Tioga County

POSTGRADUATE instruction arranged for the Tioga County Medical Society will be given Wednesday evenings at 6 30 P M and will be held alternately at the Wagner Hotel, Waverley, New York, and the Green Lantern Inn, Owego, New York

The first lecture, held March 14 at the Wagner Hotel, was given by Dr Herman O. Mosenthal, clinical professor of medicine at the College of Physicians and Surgeons, Columbia University, who spoke on "Insulin in the Treatment of Diabetes"

The remaining lectures are as follows: March 21, at the Green Lantern Inn, Owego, "Rheumatic Fever," given by Dr. J G Fred Hiss, professor of clinical medicine, Syracuse University College of Medicine; April 4, at the Wagner Hotel, Waverley, "Asthma," given by Dr Stearns S Bullen, assistant professor of medicine, the University of Rochester School of Medicine and Dentistry, April 11, at the Green Lantern Inn, "General Principles in the Treatment of Syphilis," given by Dr. Girsch Astrachan, associate in dermatology and syphilology, New York Post-Graduate Medical School, Columbia University; and April 25, at the Wagner Hotel, "What Can be Accomplished in the Treatment of Heart Disease," given by Dr. Harold J Stewart, associate professor of medicine, Cornell University Medical College

This instruction is provided by the Medical Society of the State of New York, with the exception of the lectures on rheumatic fever and syphilis, which are presented jointly by the Medical Society of the State of New York and the New York State Department of Health

Relation of Vitamins to Disease

DR. NORMAN JOLLIFFE, associate professor of medicine at New York University College of Medicine, spoke on "The Relation of Vitamins to Disease" before the Broome County Medical So-

Penicillin Therapy Instruction

INSTRUCTION in penicillin therapy was given at a joint meeting of the Greene County Medical Society and the staff of the Memorial Hospital of Greene County on February 22 at the Memorial Hospital of Greene County Dr R C Arnold, Surgeon, USPHS, of the Venereal Disease Research Laboratory at the U S Marine Hospital on Staten Island, gave the lecture, which was entitled "Penicillin"

This instruction was presented as a cooperative endeavor between the Medical Society of the State of New York and the State Department of Health.

Two Lectures in Cortland County

TWO lectures have been planned by the Medical Society of the State of New York and the New York State Department of Health for the Cortland County Medical Society. The lectures will be held

of the

will be

of ob-

stetrics, Syracuse University College of Medicine. Dr. Hughes will speak on "Hemorrhages of the Latter Part of Pregnancy"

"The Diagnosis and Treatment of Meningitis" will be discussed at the second meeting on May 18 by Dr. O. D Chapman, professor of bacteriology and parasitology, Syracuse University College of Medicine.

Cardiovascular Emergencies

D
Co
str

lar Emergencies" to the Jefferson County Medical Society. His lecture will be held on April 12 at 6:00 P M at the Black River Valley Club in Watertown

Amendments to Constitution and By laws

IN ACCORDANCE with Article XIII of the Constitution and Bylaws, the following proposed amendments are published for the information of the House of Delegates and will be considered at its next meeting.

Proposed Amendment to Article XI, Section 1

At the annual meeting of the St. Lawrence County Medical Society held at Potsdam, November 11, 1943, the following motion was carried:

"That the President appoint a committee consisting of two delegates and two other members to proceed with the movement to bring about a transfer from the Fourth to the Fifth District Branch."

Accordingly, we suggest the following amendment to the Constitution of the Medical Society of the State of New York:

"Article XI, Section 1, shall be amended so that there be deleted from the fourth paragraph the name 'St. Lawrence;' and so that there be added to the fifth paragraph the name 'St. Lawrence.' These paragraphs would then read:

'The Fourth District Branch shall comprise the members of the Medical Societies of the Counties of Franklin, Clinton, Essex, Hamilton, Fulton, Montgomery, Schenectady, Saratoga, Warren, and Washington.

'The Fifth District Branch shall comprise the members of the Medical Societies of the Counties of Onondaga, Oneida, Herkimer, Oswego Lewis, Madison, Jefferson, and St. Lawrence.'"

Proposed Amendment to Chapter XVI, Section 2—Action Delayed one Year

"All papers read before the Society at its Annual Meeting by its members shall become the property of the Society, but shall not be accepted necessarily for publication in the NEW YORK STATE JOURNAL OF MEDICINE unless approved by the Editor responsible for this function."

Proposed Amendment to Section 2 of Chapter XV of Bylaws—Action Delayed One Year

This is presented on behalf of the Medical Society of the County of Queens:

"It is proposed to amend the first paragraph of Section 2, Chapter XV, of the Bylaws to read as follows:

'Chapter XV, Section 2. When an active member in good standing in any component county medical society removes to another county in this State, transfer of his name to the roster of the county society to which he removes shall be contingent upon the acceptance of the Board of Censors or Comitia Minora of the latter society. Such transfer shall be made at the member's request and be effected without cost to him and provided that he files a certificate with the secretary signed by the president and secretary of the component society from which he removes as to his good standing in such society. No member, however, shall be an active member of more than one component society, nor shall any component county society accept a physician residing in another county in any other way than in accordance with the law governing transfers.'"

Chapter III, Section 2. "There shall be added at the end of the present section, the following:

When available, a voting machine shall be used instead of printed ballots."

Respectfully submitted,
LOUIS H. BAUER, M.D., *Speaker*
W. P. ANDERTON, M.D., *Secretary*

MORE ABOUT MEDICAL WRITING

Classical standards of sentence and paragraph structure are being disregarded by a good many accepted writers in general literature, but they are hard reading and it is not at all sure that such writing will endure. One may disregard subject-predicate relationships, misused nouns and adverbs, and other words in spoken communication and still remain intelligible; but doing so on a printed page makes it very hard for the average reader, who still remembers the rules taught in school. Joyce, Stein, and in large part Faulkner, Hemingway, Wolfe, and Dos Passos, in their writings, probably do not intend to communicate ideas but merely to note down flights and associations occurring in the mind of the author at the time of writing, and meaning nothing to anyone else—even, one doubts, much of permanent value to himself. But when attempting to tell someone what is in your own mind about endocarditis, the style of D. H. Lawrence is not conducive to clarity.

Wilson Follett laments "The Death of the Sentence" in the *Atlantic* for October, 1937; and if he had been reading medical instead of general literature, he would have seen that many sentences had not yet died, but had simply been mangled and allowed to live, crippled and pitiable. Bernard De Voto comes to the defense of the style of modern writers in the *Saturday Review of Literature;* but he defends only changes in structure from the more verbose earlier styles. There is no defense for structures which are so disjointed as to be meaningless.

Medical Legislation

Bulletin No. 4 issued by the Legislative Bureau of the Medical Society of the State of New York, February 5, 1945

THIS will be the last list of bills sent you before the conference of County Society Legislative Chairmen at the Hotel Ten Eyck, Albany, on Friday, February 16. Any bills in which you may have been interested that were introduced between Febru-

meetings our committee meeting will have to be kept under the number fifty this year; otherwise we would have had difficulties arranging for this meeting and probably would not have been granted permission. It is regretted that we could not extend invitations to all who might be interested in attending this meeting, but we have not been able to do so under the present restrictions governing such meetings.

At the present time we have received no information as to hearings on the chiropractic bill. It is hoped that all of the members of the Society and the legislative committees of the county societies and of the Women's Auxiliaries will keep up their activ-

bill is voted on is the important time for these letters to come in. Every contact and every letter will count a great deal.

Due to the weather conditions and the difficulties of traveling, the fuel shortage, etc., work in Albany has been somewhat handicapped. Even the members of the Legislature have been inconvenienced by these conditions and the number of bills that have been submitted during this last week is not very large.

The budget bills have been submitted. The

Committee but remains on the committee. Senator H. W. Griffith has been appointed chairman of this committee.

New Bills Introduced

Senate Int. 415—Warner; Assembly Int. 415—Reoux, provides that a nonexpert witness may give testimony in the nature of inference or opinion if the facts are based on personal observation and no special knowledge, skill, experience, or training is required to draw such inference or state such opinion. Referred to the Codes Committee in the Senate and the Judiciary Committee in the Assembly.

Comment: This bill was not reported earlier. It has been called to our attention by some who feel that it is of great importance. We have been requested by a member of the legislative committee of the State Dental Society to study this bill as they feel that there are dangers in it both for the physician and the dentist.

Senate Int. 650—Hammond, relative to the vitamin and mineral content of flour and bread. Referred to the Agriculture Committee.

Comment: Same as *Assembly Int. 688—Ward*, reported in Bulletin No. 3.

Senate Int. 657—Paris; Assembly Int. 775—Crews, provides that in the case of temporary total and permanent partial disabilities both resulting from the same injury the claimant shall receive separate workmen's compensation awards for each

Senate Int. 721—W. J. Mahoney, authorizes the State Health Commissioner to establish, equip, and conduct a suitable program to collect and distribute human blood and its derivatives for the treatment of sick and injured persons and the preventing of certain diseases; $375,000 is appropriated. Referred to the Finance Committee.

Senate Int. 725—Coudert, permits waiver of privi-

Codes Committee.

Comment: This bill was recommended by the executive committee of the Surrogates' Associa-

workmen's compensation cases such a physician as the employee c participate in or carrier so re mittee.

Comment: This section of the Workmen's Compensation Law was amended in 1944. This amendment cancels the amendment of 1944 and changes the wording of the law back to that of 1944 before the amendment.

Assembly Int. 842—Travia, provides that the employee, employer, or carrier in a workmen's compensation case may apply for the examination of a claima e commission.

Asse that disciplinary proceedings against persons practicing medicine and other professions may be heard by three persons, one of whom may be a member of

there is nmittee $4,000 and ex-

penses for each member of the committee, spent in conducting hearings. Referred to the Ways and Means Committee.

Comment: Printed copies of this bill have not

of testimony and the number of hearings have be-

come so great as to be a burden on the Regents, who do not feel that they have the time to give to these duties.

Assembly Int. 915—Austin, provides that the Industrial Commissioner shall, instead of may, employ physicians of outstanding qualifications as committees of expert consultants for workmen's compensation purposes. Each physician shall receive pay as prescribed by the Commissioner instead of an annual salary of $7,500. Referred to the Labor Committee.

Senator Hammer has introduced a bill—*Int. 663*—that strikes out the provision that dogs, during a rabies epidemic, may be at large if muzzled. It also permits the dog warden or peace officer to kill any dog found at large during an epidemic. The same bill has been introduced in the Assembly by Mr. Stuart, *Int. 767*. Both bills have been referred to the Health Committees.

Action on Bills

Senate Int. 367—Hammer—Health Law, local officers, powers, reported.

Senate 368—Hammer—Health Law, milk supply, embargo, reported.

Senate Int. 369—Hammer—Health Law, venereal diseases, reported.

Senate 370—Hammer—Health Law, laboratories, inspection, reported.

Senate 371—Hammer—State Hospital Superintendents, Directors, reported.

Assembly Int. 254—Stuart—Health Law, milk supply, embargo, third reading.

Assembly Int. 255—Stuart—Health Law, laboratories, inspection, third reading.

Assembly Int. 283—Stuart—Health Law, local officers, powers, third reading.

Assembly Int. 284—Stuart—Health Law, venereal diseases, third reading.

Assembly Int. 286—Stuart—State Hospital Superintendents, Directors, third reading.

Assembly 372—Ferril—Lien Law, hospital liens, third reading.

Assembly Int. 555—Mailler—Education Law, medical practice, third reading.

Assembly Int. 560—Pillion—Professions, license renewal, veterinarians, third reading.

NEW APPROACH TO CANCER

By an act of Congress, April has been designated as "Cancer Control Month." The American Cancer Society seizes the opportunity to press its educational work on a new scale and with new energy. A campaign to raise $5,000,000 is to be directed by a board of which Eric Johnston is the chairman, and which numbers among its members representatives of labor, business, the press, and Congress.

With such an organization the Society's state units of 300,000 women volunteers and thousands of men should be able to reach the multitude. It is especially important that labor should play a conspicuous part in bringing home the facts about the recognition of early cancer and the cures that can be effected by the prompt eradication of a malignant growth.

With the labor unions enlisted through their leaders, the fight against cancer can be waged more effectively than by the devoted band of welfare workers who have to rely on their own eloquence and ingenuity.

There is no nobler cause than this. Cancer is the country's second largest killer. Only heart disease claims more victims. With 600,000 Americans now suffering from cancer, there is work to do—work which can reduce the death rate from cancer by one-third to one-half.—*Editorial, New York Times, Dec 13, 1944*

CLINICAL ORAL PATHOLOGY CONFERENCE IN APRIL

The New York Institute of Clinical Oral Pathology will hold its one hundredth monthly conference at the New York Academy of Medicine on Monday evening, April 30, 1945.

The subject of the meeting will be "A Survey of the Antibiotic Problem." This will be discussed by members of the medical and dental professions from both the theoretic and the clinical standpoints.

Members of the medical, dental, public health, and other professional groups are cordially invited. For further information address all communications to the Executive Secretary, 101 East 79th Street, New York 21.

With Infron Pediatric—

the prophylaxis and treatment of rickets is available in once-a-month dosage

Infron Pediatric is proven... { SAFE / RATIONAL / EFFECTIVE

—as shown in the published work of Wolf, Rambar, Hardy and Fishbein.

Infron Pediatric is readily miscible with the feeding formula, fruit juice, water or milk—can also be mixed with cereal.

Infron *Pediatric*

(Trade Mark)

Infron Pediatric is available for your prescription in the pharmacies—in packages of six capsules (two hermetically sealed vials of 3 capsules each). One package is sufficient dosage for six months.

National Foundation Reports Grants of $1,828,859

THE National Foundation for Infantile Paralysis authorized grants and appropriations totaling $1,828,859 in the eight-month period between September 30, 1943, and May 31, 1944, for research, education, and the training of physical therapists, according to the 1944 annual report of the Foundation made public on February 23 by Basil O'Connor, president.

In addition, a special fund of $2,000,000 for epidemic aid and other emergencies was established by the trustees as of May 31, the report said. Last summer's epidemic—the second worst outbreak in the history of the United States—drew upon this newly created fund to the extent of $739,860, to supplement chapter funds in local communities hard hit by the 1944 outbreak.

During the period covered by the report the national headquarters received $5,191,148 as its share of the 1944 March of Dimes appeal, an additional $5,293,232 remaining with the Foundation's county chapters. Receipts from other sources, including $240,000 donated by the producer of the motion picture "Forever and a Day," increased the total income of the Foundation for the fiscal eight-month period to $5,452,593.

Much was learned from the 1943 epidemic, in which 12,429 cases were reported, exceeded only by those reported in 1944, 1931, and in the great outbreak of 1916, the report said. The "method of the spread of the disease is better understood. Some of the mystery of infantile paralysis is being dispelled. But enough has not yet been learned to set into operation practical control measures. More epidemics must be studied, and laboratory methods must be greatly improved before the final answer can be given."

"Much new knowledge has been gained," the report added, "concerning the distribution of the virus of infantile paralysis in nature and its behavior in the affected individual. But how it spreads from person to person is yet undetermined.

"It is, however, known that the virus is exceedingly widespread and that there are many infected persons who show no paralysis—that paralysis, in fact, may almost be considered as a complication of a common infection which ordinarily produces few, if any, important or characteristic symptoms.

"Grants are in operation, therefore, to study in minute detail factors that may operate to influence the susceptibility of patients to the virus, such as diet, state of nutrition, heredity, and body chemistry. With aid from the National Foundation, grantees seek to find the answers in epidemic areas and in their laboratories.

"Other grantees, employing the increasing fund of knowledge and skills that have improved greatly during the past few years, are studying different strains of virus and the production of experimental immunity. Others are searching for curative drugs."

Public Health Service Sends Four to Liberia

FOUR more members of the Public Health Service mission to Liberia left the United States in February for Monrovia, capital of the West African republic, the Public Health Service announced on February 13.

The mission, which will conduct a five-year health and sanitation program directed primarily to the control of communicable diseases, is headed by Dr. John Baldwin West, senior surgeon (R), who flew to Liberia with two associates in November. A fourth member joined the mission in December.

Dr. West has since returned to the United States but will return to Liberia with the group leaving this week, the Public Health Service said. The four new members of the mission are Dr. Charles I. West, Jr., surgeon (R); Alma Jackson, assistant sanitarian (R); Virginia Ford, assistant nurse officer (R); and Theresa Colwell, assistant nurse officer (R). Dr. Louis R. Middleton, dental surgeon (R), will join the mission at a later date. Two additional members of the mission remain to be named.

Forum on Allergy Awards Annual Prizes

Dr. Jonathan Forman, Executive Director of the Seventh Annual Forum on Allergy, announced that the Marcelle Award has been won by Dr. Mary Loveless, New York City, for her attempt to correlate thermostabile antibodies with clinical results and the consequent use of booster doses which may well shorten and simplify our treatment of hay fever.

The second prize in the Marcelle Award went to Dr. Charles F. Code, of the Section on Clinical Physiology of the Mayo Foundation at Rochester, Minnesota. This prize was awarded for his studies of the role of histamine in the production of anaphylactic and allergic reactions. Dr. A. R. Rich, of Johns Hopkins University, and his associates received honorable mention for their work on serum sickness and periarteritis, as did Dr. Frank Simon, of Louisville, Kentucky, for his studies of the allergens in human dander.

For several years now the Annual Forums on Allergy have given a gold medal in recognition of a life's work in the field. This year the Gold Medal went to Milton J. Rosenau, Chapel Hill, North Carolina, Charles Wilder, Professor of Preventive Medicine and Hygiene, Emeritus, Harvard University, and Professor of Epidemiology, School of Medicine, University of North Carolina.

The selection of the recipients of these awards was made by a distinguished group of allergists. They were: Dr. Sam Feinberg, of Northwestern University, Chicago; Dr. Harry Alexander, editor of the *Journal of Allergy*, St. Louis; Dr. Marion Sulzberger, editor of the *Journal of Investigative Dermatology*, New York City; Dr. French K. Hansel, president of the American College of Allergists and editor of the *Annals of Allergy*, St. Louis; Dr. Ethan Allan Brown, editor of the Review and Abstract Section of the *Annals of Allergy*, Boston;

County News

Albany County

Dr. B. L. Vosburgh, medical director of the General Electric Company, spoke at a meeting of the Capital District Society of Safety Engineers on February 20 at the Van Curler Hotel, Schenectady. He discussed "The Role of the Industrial Physician in the Safety Department."

Dr. Vosburgh was graduated from Albany Medical College in 1922. After interning at the Ellis Hospital, Schenectady, he entered the industrial medical field and has had his present position since 1928.*

• • •

Leaders of the Albany medical and dental profession, hospital authorities, and pharmaceutical association met on February 9 at 1:15 P.M. at the DeWitt Clinton Hotel to discuss possible facilities for the care of service-connected veterans returning to the Albany area.

Dr. Arthur J. Wallingford, president of the county society, represented the physicians; Dr. Henry Schwartz, president of the Albany Dental Society, spoke for the dentists; Dr. H. Benard Milstein was heard on behalf of the podiatrists; Jacob Cheris, president of the Albany Pharmaceutical Society, represented the druggists, together with Francis J. O'Brien, dean of the Albany College of Pharmacy.

All heads of hospitals in Albany were present: Dr. Thomas Hale, Jr., of Albany Hospital, Sister Mary Esther, of St. Peter's Hospital, and Miss Ellen T. Young, of Memorial Hospital.*

Bronx County

The following have been elected to office in the Bronx Pediatric Society for the year of 1945: president, Dr. Jacob H. Turner; vice-president, Dr. Walter Levy; secretary-treasurer, Dr. Harry S. Pizer.

The Society meets on the second Wednesday of each month, except June, July, August, and September, at the Concourse Plaza Hotel.

Chautauqua County

The Jamestown Medical Society held its first dinner meeting of the year in the Hotel Jamestown on January 25 at 6:30 P.M.

Three local physicians spoke on "Toxemias of Pregnancy," discussing various phases, causes, and treatment of the ailment. They were: Dr. D. C. Perkins, Dr. E. J. Kelley, Jr., and Dr. M. L. Bowman.

Dr. George F. Caccamise, president of the society, presided at the session. A floor discussion followed the lectures.*

Chenango County

Coming to Norwich at the suggestion and recommendation of the army and navy procurement and assignment service for the relocation of physicians, Dr. Emil G. Piana has opened an office there for the practice of general medicine.

Dr. Piana is a graduate of the Sorbonne University of Paris, France. Upon the declaration of the war in 1939, Dr. Piana was in private practice in France and at that time joined the French army. After the armistice of 1940 he came to this country. For the last three years he has been a resident physician in various hospitals of the New York City area.*

Columbia County

Dr. Harry A. Pattison, medical director of Potts Memorial Institute, discussed tuberculosis on January 24 in Hudson. This program was sponsored by the Tuberculosis Eradication Association of Columbia County.

Dr. Pattison is well known in Columbia County as an authority on tuberculosis. For the past seventeen years he has devoted all his time to the rehabilitation of the tuberculous. He has visited nearly all the various rehabilitation centers in the United States, England, and continental Europe, and has done much to make Potts Memorial one of the most outstanding rehabilitation centers in this country.

Dr. Pattison explained tuberculosis through the use of x-ray films, microscopic slides, and germ cultures.*

Erie County

The strength and influence of the Medical Society of Erie County were pledged to the all-out war on tuberculosis on January 23.

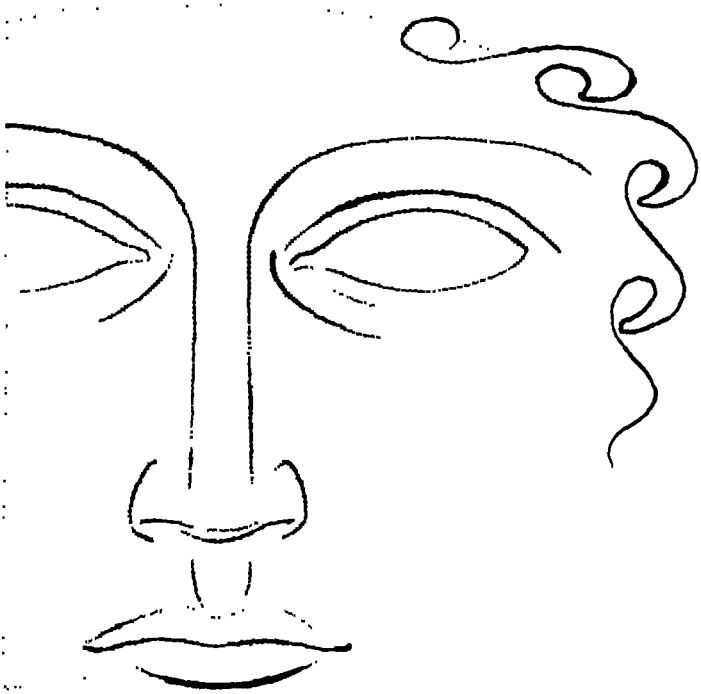
Dr. A. H. Aaron, in his inaugural address as president of the society at its meeting in Hotel Statler, outlined a comprehensive program of medical protection and medical education, designating as one of his most salient points full support of the anti-tuberculosis drive.

He lauded the recent announcement that the Buffalo Tuberculosis Association will purchase a mobile x-ray unit, if the Health Department does not do so, and suggested that the work of the mobile unit be supplemented by the establishment of diagnostic chest clinics in hospital outpatient departments to which people with positive findings can be referred.*

Kings County

Developments in the treatment of syphilis were discussed on February 1 by Dr. Arthur W. Grace in the third of a series of four lectures at the Hoagland Laboratory of the Long Island College of Medicine.

Dr. Grace, professor of clinical dermatology and syphilology at the college, outlined advances made in treatments from 1493, when blood letting was practiced, until the present use of penicillin. He told of the discovery and use of mercury to treat syphilis in 1500, and said it was considered the only treatment until potassium iodide was introduced about three hundred years later.



In 1909, he said, Erhlich proved the efficacy of salvarsan, an arsenic compound, which continued to be the main drug used as a therapeutic measure until neopharsan and mapharsen were introduced in 1934.

He discussed fever therapy and heat treatments

Fewer Coryza Complications

When you prescribe Sulmefrin, the danger of sinusitis and other complications is lessened.

A few drops make breathing easier—make for a more comfortable patient.

Sulmefrin relieves congestion through the vasoconstrictor action of *dl*-desoxyephedrine hydrochloride (0.125%)—and combines the antibacterial properties of sodium sulfathiazole (2.5%). Mildly alkaline, Sulmefrin is non-irritating, helps to dissolve mucous and mucopurulent secretions, and does not impede ciliary action. Administered by spray, drops or tamponage.

Sulmefrin TRADEMARK

SQUIBB

MANUFACTURING CHEMISTS TO THE MEDICAL PROFESSION SINCE 1858

[Continued from page 650]

combined with the administration of mapharsen, which were first used extensively four or five years ago.

Dr. Grace outlined the discovery and production methods of penicillin and cited advantages and disadvantages of the new penicillin treatments as well as of all previous methods of therapy.*

• • •

Dr. William Dock discussed heart disease on January 25 at the Long Island College of Medicine.

Dr. Dock's lecture, the second in a series sponsored by the Friends of Long Island College of Medicine, was illustrated with a color film which showed the functions of a human heart when normal and under diseased conditions.*

Monroe County

Dr. Roland L. Maier, instructor of surgery in the medical school of the University of New York, was the guest speaker at the February meeting of the Rochester Academy of Medicine on February 6. His topic was "The Present Status of the Subject of Treatment of Hernia."

Dr. John J. Finigan, president of the Academy, presided at the business session which opened the meeting.*

• • •

On February 20, Dr. Albert D. Kaiser spoke on "Health Insurance" at a luncheon meeting at the Rochester Club, analyzing the medical insurance plan being proposed by the county society.*

• • •

Dr. Arthur M. Johnson, Rochester health officer since 1932, will retire March 31, Public Safety Commissioner Thomas C. Woods announced on February 3.

Dr. Johnson was educated in Binghamton public schools and at Albany Medical College. He served a two-year internship at Ellis Hospital, Schenectady, and in 1897 entered private practice in Rochester. He became coroner's physician in 1902 under Dr. Henry Kleindienst and remained in that position two years.

From 1905 to 1921 Dr. Johnson was a Health Bureau physician but over the period of World War I, he was on leave of absence with American forces. On March 3, 1921, Dr. Johnson was named second deputy health officer, a position which he held on a part-time basis until January 31, 1925. From February 1, 1925, to August 1, 1932, Dr. Johnson gave full-time service as second deputy health officer. He succeeded Health Officer Dr. George W. Goler.*

New York County

Compulsory health insurance's merits and defects were debated on February 3 by Dr. Louis H. Bauer, member of the board of trustees, American Medical Association, and Dr. Sidney M. Greenberg, instructor in medicine, Cornell University Medical College, who defended the original Wagner-Murray-Dingell bill.

The speakers presented their views before guests of the regular Saturday "nonpartisan discussions" sponsored by the National Republican Club at its headquarters, 54 West 40th Street. Both talks were heard over Station WOR.

• • •

At the social hygiene program of the New York Tuberculosis and Health Association on February 7, at 11:00 A.M., Dr. George W. Kosmak, Editor, *American Journal of Obstetrics and Gynecology*, presided over a discussion of "Venereal Diseases in the Postwar Period" by Col. Thomas B. Turner, MC, USA, Dr. Isador Rosen, clinical professor of dermatology and syphilology, New York Post-Graduate Medical School and Hospital, and Mr. Herbert H. Marks, of the Statistical Bureau, Metropolitan Life Insurance Company. This session was sponsored by the Committee on Public Health Relations of the New York Academy of Medicine.

At 3:00 P.M. Dr. David J. Kaliski, syphilologist at Beth Israel Hospital, presided over a session consisting of two lectures: "Recent Advances in Syphilis Therapy," by Dr. Joseph Earle Moore, director of the syphilis division, department of medicine, Johns Hopkins Hospital, and "Significance of Serologic Tests in the Treatment of Syphilis," by Dr. Evan W. Thomas, associate professor of medicine and assistant professor of dermatology and syphilology, New York University College of Medicine.

• • •

The regular monthly meeting of the Association for the Advancement of Psychotherapy was held at the Academy of Medicine on February 23 at 8:30 P.M. Dr. William Wolf spoke on "Relation of the Endocrine Glands to Emotion and Crime"; the discussion was opened by Dr. Max Gelfand.

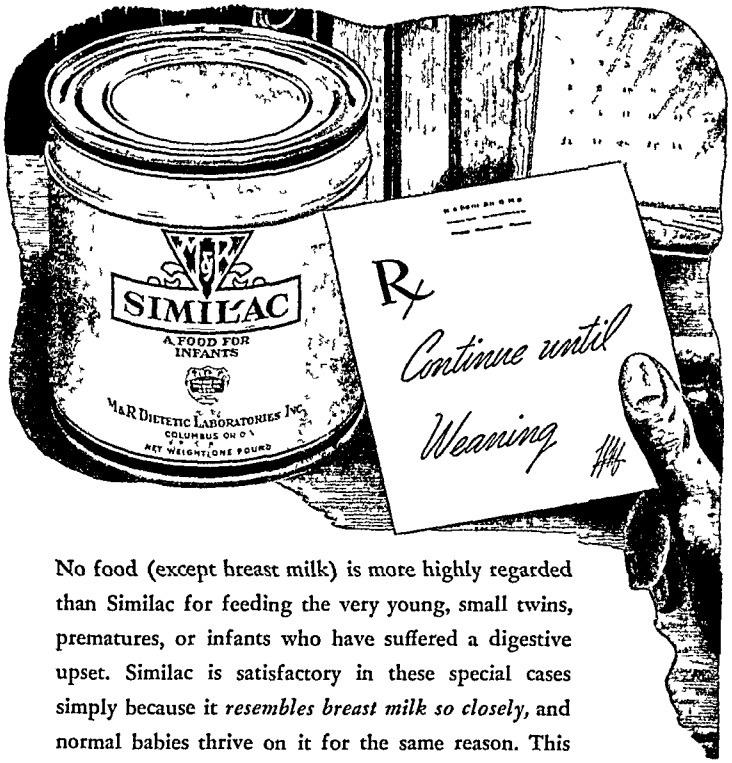
• • •

The regular meeting of the Association for the Advancement of Psychoanalysis was held at the Academy of Medicine on February 28 at 8:30 P.M. The program consisted of a lecture entitled "Psychoneurosis and the Psychology of Action," by Dr. Charles R. Hulbeck, with discussion opened by Dr. Valer Barbu.

• • •

Recognition of the close parallel between training requirements of the dental profession and general medicine has led to the incorporation of Columbia University's faculty of dentistry into the faculty of medicine, it was announced on February 6 by Dr. Nicholas Murray Butler, president of the university.

Dr. Butler reported that the action was taken with a view toward developing an educational policy aimed at strengthening dental education, practice, and research.



It was explained that many ward and clinic patients suffer from a combination of dental and medical conditions, and that closer coordination of dental and medical care could be accomplished more easily through unified action and direction.

The staff in dentistry will retain its identity as a professional group within the faculty of medicine, according to Dr. Butler, and will have departmental autonomy in carrying out the university's educational program in dentistry, which will be continued by the School of Dental and Oral Surgery.

Oneida County

Dr. Fred G. Jones was elected to the presidency

[Continued on page 654]

No food (except breast milk) is more highly regarded than Similac for feeding the very young, small twins, prematures, or infants who have suffered a digestive upset. Similac is satisfactory in these special cases simply because it *resembles breast milk so closely,* and normal babies thrive on it for the same reason. This similarity to breast milk is definitely desirable — *from birth until weaning.*

ACCEPTED AMERICAN MEDICAL ASSN.

A powdered modified milk product especially prepared for infant feeding, made from tuberculin tested cow's milk (casein modified) from which part of the butterfat is removed and to which has been added lactose, olive oil, coconut oil, corn oil, and cod liver oil concentrate

One level tablespoon of Similac powder added to *two* ounces of water makes *two* fluid ounces of Similac. This is the normal mixture and the caloric value is approximately 20 calories per fluid ounce.

SIMILAC } SIMILAR TO BREAST MILK

M & R DIETETIC LABORATORIES, INC • COLUMBUS 16, OHIO

[Continued from page 652]

of the Utica Academy of Medicine at the dinner meeting at the Utica Hotel on January 18. He succeeded Dr. Robert C. Hall, who has been president for the last year. Other officers are: Dr. Milton D. Graham, vice-president; Dr. H. M. Mitchell, secretary; and Dr. H. D. Parkhurst, treasurer.

A symposium on "The Exserviceman and the Private Physician" was presented by a group of speakers including Lt. Col. Fred C. Locke, Batavia; Majs. Lloyd Clarke and Solomon Haimes, Rhoads General Hospital; and Warren C. Tucker, Utica, lawyer.

• • •

Dr. J. J. Wineburgh, of Utica, who enlisted in the Army Medical Corps as a captain in 1942, has been honorably discharged at Walter Reed General Hospital in Washington because of a medical disability.

He resumed his active practice of internal medicine on February 2 in Utica, specializing in electrocardiology, cardiology, and endocrinology.

Doctor Wineburgh served for eighteen months in the China-Burma-India theater under General Stilwell as medical, sanitary, and malaria control officer, giving medical care to British, Chinese, Australian, and native Indian troops, as well as Americans, and obtaining valuable experience in internal medicine, malaria, and other rare and common tropical diseases. Since his return to this country he has served in several of the larger Army general hospitals.*

• • •

Dr. Ursula K. Arnsdorff, who was resident physician at the General Hospital from April, 1944, until she resigned her post in January, has opened an office in Utica for the general practice of medicine.

She continues to serve at the hospital in a part-time capacity and is on duty there alternate nights and in emergencies.*

Ontario County

Dr. Frederick C. McClellan was elected president of the Canandaigua Medical Society on January 8 at the annual session held in the Canandaigua Hotel, with Dr. J. W. Howard, East Bloomfield, as host. Dr. McClellan succeeds Dr: E. C. Merrill, now in service with the Army Medical Corps.

Dr. A. W. Armstrong was named vice-president and Dr. Harry M. Smith was re-elected secretary and treasurer.

A paper on "Phosphatase" was read by the new president.*

• • •

Dr. C. Harvey Jewett, of Canandaigua, was host to the Canandaigua Medical Society on February 2. Dinner was served at 6:15 P.M. Dr. James F. Maltman presented a paper.*

Orange County

Dr. William J. Carr, of Newburgh, is being congratulated by friends on his having completed fifty years of practice of his profession.

Dr. Carr graduated from Bellevue Hospital Medical School on March 29, 1894, and was licensed to practice in New York State on December 4, the same year. In January, 1895, he went to Kingston to practice, but in March moved to Newburgh and has continuously practiced in Newburgh since then. For forty-one years he was on the medical and surgical staffs of St. Luke's Hospital. From 1897 to 1904 he was Health Officer of Newburgh.*

Orleans County

Dr. John G. Ellis, of Albion, formerly of Holley, has been appointed an Orleans County Coroner.

He will fill the vacancy caused by the death of Dr. Paul H. Mahaney, of Albion. Dr. Ellis was graduated from the University of Buffalo School of Medicine.

Dr. Ellis practiced his profession successfully in Holley for several years before being called into government service, when he was located in Brunswick, Georgia.

Commissioned a lieutenant, senior grade, in the Navy on June 5, 1944, Dr. Ellis served until December 29, last year, when he received a medical discharge.*

Putnam County

One hundred residents of Putnam County attended a dinner meeting at the Gipsy Trail Club on February 7, sponsored jointly by the county society and the Lake Mahopac-Carmel Rotary Club.

Following the dinner there was a debate on "Socialized Medicine" as outlined in the Wagner-Murray-Dingell Social Security Bill. Dr. Ernest Boas spoke in favor of the plan and Dr. Louis Bauer in opposition. Winslow Carlton was the mediator.*

Queens County

Two Queens doctors who left private practice to become Army surgeons have been decorated with the Bronze Star Medal, one for heroic achievement in Anguar Island in the Pacific and the other for meritorious service in France.

The doctors are Lt. Robert W. Conrad of Jamaica, and Lt. Col. Frank Huber, Garden City.

Lieutenant Conrad, serving as battalion surgeon with the 81st (Wildcat) Division, was decorated for heroism on Anguar.

Colonel Huber who was attending radiologist at Lenox Hill Hospital, Manhattan, before he went into the Army Medical Corps twenty-eight months ago, is serving as executive officer and chief of x-ray at the 12th Evacuation Hospital somewhere in France.

• • •

The stated meeting of the county society was held on January 30 at 9:00 P.M. Maj. Karl F. Mech, MC, chief of penicillin section, Halloran General Hospital, spoke on "Wound Healing with Special Reference to Penicillin." A panel exhibit on meningitis control was presented by the Scientific Exhibit Committee, through the courtesy of the Department of Health.

• • •

On February 2, at 4:30 P.M. Dr. Asher Winkelstein, associate in medicine and chief of the gastroenterology clinic, Mt. Sinai Hospital, spoke before the county society on "Psychosomatic Disturbances of the Gastrointestinal Tract." On February 9, at 4:30 P.M., Dr. Maurice Bruger, assistant clinical professor of medicine and chief of the division of pathologic chemistry at the New York Post-Graduate Medical School and Hospital, spoke on "Newer Laboratory Tests." These lectures were sponsored by the committee on graduate medical education of the county society.

On February 16 at 4:30 P.M. Dr. Milton J. Raisbeck, associate professor of medicine, New York Medical College, and cardiologist, Fifth Avenue Hospital, New York City, spoke before the county society on "Cardiovascular Emergency."

Richmond County

Plans for the establishment of a permanent office of the county society were discussed at the first meeting of 1945 on January 10 in the Richmond Health Center, St. George.

Power was voted the executive committee to select the headquarters. Announcement of the address and telephone number was made at the meeting on February 14 in the center.

The society has endorsed and will give its full cooperation to Mayor LaGuardia and medical bodies in their endeavors to work out a plan for health insurance, it was announced.

Dr. Milton S. Lloyd, newly elected president, presided, and outlined plans for the coming year.*

Rockland County

At the Nanuet P. T. A. meeting on January 8 Dr. Robert L. Yeager, Jr., Superintendent of Summit Park Sanitarium, gave a talk and showed x-rays on tuberculosis.*

Schenectady County

The regular monthly meeting of the county society was held on February 6 in the Ellis Hospital Library. Dr. S. A. Cosgrove, medical director and superintendent of Margaret Hague Maternity Hospital, Jersey City, and clinical professor of obstetrics at Columbia University's College of Physicians and Surgeons, spoke on "Cesarian Sections, Indications and Types." The paper was discussed by Drs. W. M. Mallia and C. E. Wiedenman.

Westchester County

Psychosomatic problems constituted the subject for discussion at the regular meeting of the county society, held at the New York Hospital, Westchester Division, White Plains, on January 16 at 8:30 P.M. It is estimated that 30 per cent of a doctor's practice deals with these problems.

Dr. James Flexner, of White Plains, presented a paper on "The Medical Approach to Psychosomatic Problems," and Dr. James H. Wall, assistant medical director of New York Hospital, Westchester Division, discussed "The Psychiatric Approach to Psychosomatic Problems."

• • •

More than forty physicians and guests attended the meeting of Mount Vernon Medical Society on January 11 at The Knolls when Dr. Sidney Bassin, director of the chest clinic of the Mount Vernon Department of Health, presented a talk on the treatment of pulmonary tuberculosis. Mrs. Frank Sandberg, chairman of the Mount Vernon branch of the American Red Cross Canteen Corps, also was a guest speaker.

Stressing the importance of early diagnosis for the successful treatment of a tubercular condition, Dr. Bassin presented various methods of collapse therapy and various forms of chemotherapy. He supplemented his remarks with a sound motion picture.

The subject was further discussed by Dr. Theodore Jost, City Commissioner of Health, and Dr. Erich Restin, of the Mount Vernon Hospital.

Mrs. Sandberg discussed "services to our armed forces," relating personal experiences during her canteen work.

Visting and public health nurses were guests of the society.*

Necrology

Fred H. Albee, M.D., F.A.C.S., of New York City, orthopedic surgeon, died February 15 at the age of 68 after a brief illness. Born in Maine, he was graduated from Harvard Medical School (1903). He was formerly professor of orthopedic surgery at New York Post-Graduate Medical School and was president of the International College of Surgeons from 1939 to 1943. Dr. Albee achieved international fame through the invention of the Albee bone mill, which enabled surgeons to perform bone operations formerly impossible, and through his method of grafting healthy bone into diseased bone. He had written extensively on his specialty and lectured throughout the world. In 1937 he described a new treatment for osteomyelitis, and his operation for tuberculosis of the spine, demonstrated in London in 1913, also was one of his major contributions to orthopedic surgery. Dr. Albee's life work is described in his autobiography, *A Surgeon's Fight to Rebuild Men.*

Ellice M. Alger, M.D., F.A.C.S., of New York City, ophthalmologist and founder of the National Society for the Prevention of Blindness, died February 18 at the age of 74 after a long illness. For more than twenty-five years professor of ophthalmology in the New York Post-Graduate Medical School, he was also a surgeon at Post-Graduate Hospital. In 1938 he was awarded the Leslie Dana gold medal for outstanding achievements in the prevention of blindness and the conservation of vision. He was former president of the New York Ophthalmological Society, and a chairman of the section of ophthalmology of the New York Academy of Medicine. Born in Burlington, Vermont, he was graduated from the University of Vermont Medical School in 1883.

Gustav A. Fensterer, M.D., of Garden City, Long Island, died February 8 at the age of 78. He was the first president of the Nassau County Medical Society, and had returned to practice because of the shortage of doctors, after retiring in 1934.

Edward Milton Foote, M.D., F.A.C.S., of New York City, died February 14 at the age of 79, after a brief illness. Born in Syracuse, Dr. Foote received his medical degree from Harvard Medical School in 1890. Former chief of surgery at the Vanderbilt Clinic, he had served as visiting surgeon at the New

York Hospital, the New York Skin and Cancer Hospital, consulting surgeon at Randall Island Hospital and School, instructor in surgery at the College of Physicians and Surgeons, Columbia University, and clinical professor of surgery at New York Polyclinic Medical School and Hospital. He was the author of a textbook, *Minor Surgery*. Dr. Foote had been a practicing physician in New York City from 1891 until his retirement in 1935.

Frank Grauer, M.D., of New York City, died on February 16 at the age of 80, after a brief illness. Born in New York, a graduate of Bellevue Medical School in 1884, he spent several years in postgraduate study abroad as well as at Harvard and Johns Hopkins.

He became associated with Drs. E. G. Janeway and H. W. Biggs, and devoted himself to pathologic research, serving as pathologist to the Harlem City and Lutheran Hospitals. Private practice engaged his attention for fifty years.

William Latzko, M.D., obstetrician and gynecologist, died February 11 at Beth Israel Hospital. Born in Vienna, he received his medical degree at the University of Vienna in 1886 and for a number of years was a member of the faculty there. He became head of the gynecologic department of the Kaiserin Elisabeth Hospital in 1910 and developed methods of treatment for various diseases which came into general use. He developed a method for performing cesarean section by the extraperitoneal route, to which his name was given. Leaving Vienna in 1938, he went to Buenos Aires, where he was a member of the National Academy of Medicine and Obstetrical and Gynecological Society, and later came to New York. In this city he was consulting gynecologist at Beth Israel Hospital. He was the author of more than two hundred scientific papers.

Leon L. Kelley, M.D., former medical adviser of Herkimer County, died at his home in Middleville February 17 at the age of 52.

Franz F. Lyon, M.D. of Patchogue, died February 16. Dr. Lyon came to this country ten years ago from Germany. He had studied medicine in the Universities of Berlin, Munich, and Freiburg. He was born fifty-seven years ago in Saarbrücken, Germany.

Thomas F. McDermott, M.D., orthopedic surgeon on the staff of St. Vincent's Hospital, New York City, died February 11. He was born in Brooklyn, and was graduated from the Medical College of Virginia (1924).

T. Richard Paganelli, ophthalmologist and former professor of eye surgery at New York College of Medicine and Flower-Fifth Avenue, died February 19 at his home in New York City. He was graduated from the College of Physicians and Surgeons of the University of Maryland in 1903. He was founder of the New Jersey Academy of Medicine and a fellow of the American Medical Association and the American College of Surgeons. He was consulting surgeon at St. Clare's Hospital and at Downtown Hospital in New York, and the author of several medical and surgical textbooks.

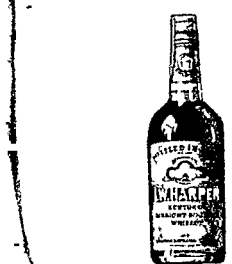
Daniel E. Pugh, M.D., of Utica, died January 11, at the age of 58, as a result of traumatic cerebral hemorrhage due to brain injuries received in a motor accident. Widely known in Central New York, he had been active in both the Utica Academy of Medicine and the Oneida County Medical Society, having at one time been secretary of the latter. He was a member of the staff of St. Luke's Hospital, official examiner for the Veterans Bureau, medical examiner of the Utica area for the New York Life Insurance Company, and deputy health officer of the City of Utica. He was graduated from the Medical Department of the University of Michigan, and was in general practice in Utica until 1917 when he was commissioned in the Medical Corps of the Army, serving overseas until 1919.

Julius Raab, M.D., of New York City, dermatologist and medical director of the Home and Hospital of the Daughters of Israel, died February 7 in the Hospital for Joint Diseases. He was born in New York but was graduated from the University of Vienna Medical School and practiced in Vienna until returning to this country nineteen years ago. He was attending dermatologist at Beekman Hospital and associate dermatologist at the Hospital for Joint Disease.

Mark J. Schoenberg, M.D., of New York City, prominent ophthalmologist, died February 15, 1945, at the age of 70. Born in Romania, he was graduated from the University of Bucharest in 1898 and came to the United States in 1900. He served as an attending physician at the Manhattan Eye, Ear, Nose and Throat Hospital, and the Herman Knapp Memorial Hospital, and as consulting ophthalmologist at the Presbyterian and Bronx Hospitals. He founded the New York Society for Clinical Ophthalmology and was chairman of the Committee on Glaucoma of the National Society for the Prevention of Blindness. Numerous contributions to the literature emanated from his pen, particularly on glaucoma, and he received the Lucien Howe Medal from the State Society for his essay on optic atrophy.

WARTIME BY-PRODUCT

It is obvious that industry is going to have tuberculosis as a by-product. The Army has and will have tuberculosis as a by-product, and the civilian population is going to continue to feel the impact of both. This may severely tax bed facilities, for there is no bed surplus anywhere if we really use the beds the way they should be used.—*Harry S. Mustard, M.D., 1943 Transactions, Nat. Tuber. Assn.*



FIGHT AGAINST TUBERCULOSIS

Less than a generation ago tuberculosis held uncontested leadership among the causes of death; today, its virtual eradication is in sight. It is no longer a fantastic dream for those of us who have been active since the initial stages of the campaign against tuberculosis in America to expect to witness the final stages as well.—*Louis I. Dublin, in Tuberculosis Clip Sheet, Dec., 1944*

Hospital News

Improvements

THE Oneida National Bank & Trust Company established complete banking facilities at Rhoads General Hospital on January 22, continuing for the duration.

The plan was announced on January 20 by Charles W. Hall, president.

He said the bank had been asked by the Treasury Department to provide the service and the request had been accepted. With the cooperation of Col. A. J. Canning, commanding officer, suitable quarters next to the post office, in the heart of the federal layout, have been provided.

Francis R. Ealy, teller at the main office of the bank, who has been associated for twenty-three years there, will be in general charge and will be assisted by another bank employee.*

At the Helm

Directors of the Chenango Memorial Hospital, Inc., at their annual meeting at the hospital, re-elected Cyrus M. Higley president, it was announced. Directors named for three-year terms include: Leroy B. Copley, D. M. Copley, Fred H. O'Hara, William H. Dunne, Judge Hubert L. Brown, John N. Benedict, Jesse L. Millspaugh, and J. L. Miller.

In their organization, officers named by the directors in addition to President Higley are: Gilbert R. Lyon, first vice-president; Carl E. Fribley, second vice-president; L. Forrest Hotchkin, treasurer; and William A. Seely, secretary.

• • • •

Walter N. Brand has been elected president of the board of trustees of Tompkins County Memorial Hospital to succeed Joseph S. Barr.

Re-elected were Fred A. Rogalsky, vice-president, Marion R. Hulse, secretary, and Paul Bradford, treasurer.

The new president is vice-president and works manager of Allen-Wales Adding Machine Corp.

• • •

At the annual meeting of the members of the Hudson City Hospital on January 23 Mrs. Margaret Ferris and William H. Graves, of Hudson, and Albert Bristol, of Copake, were elected trustees. The former two were chosen to succeed themselves on the Board.*

• • •

Capt. John T. Bennett, MC, USN, assumed his new duties as medical officer in command of the U.S. Naval Hospital at Sampson on January 27, succeeding Capt. Claude W. Carr, MC, USN, who was detached this week to become medical officer for the Ninth Naval District.

Capt. Carr, who came to this center in July, 1942, took charge of a hospital which then was scarcely beyond the blueprint stage. The facility was commissioned February 27, 1943, and during the captain's tenure was developed into a plant valued at more than $6,000,000, with 474 acres of ground. During the last year alone, more than 13,000 patients were admitted.*

• • •

Mayor Antonio G. Waldo, of Canastota, has announced the resignation of Dr. H. G. Germer as a member of the municipal hospital board and the appointment by the mayor of Angelo Patane as successor.

Dr. Germer, who has served on the hospital board several years, has been confined to his home this winter by illness and resigns the post in his inability to actively serve. In accepting his resignation Mayor Waldo by letter conveyed to Dr. Germer congratulations in the service he has rendered the community on the hospital board.*

• • •

Dr. Charles A. Brind, Jr., was elected president of the Associated Hospital Service of the Capital District at the annual board of directors meeting early in February.

The following officers and members of the executive committee were elected for a one-year term: James A. Glavin, Ray Palmer Baker, Miss Mary G. McPherson, and William N. Bissell, vice-presidents; Edward S. Poole, secretary; Andrew B. Davison, treasurer; and Dr. R. S. Cunningham, Rev. John G. Hart, and Clifford C. Shore.

Re-elected to the board of directors for three-year terms were Henry B. Barnet, Mr. Bissell, Arthur J. Burch, Lorne A. Davidson, Lewis R. Parker, Mr. Poole, James C. Ryan, Alfred Renshaw, and Harold S. Turner. Mr. Shore, president of the Association of State Civil Service Employes of the State, was elected a three-year board member.*

• • •

At the annual meeting of the Fox Memorial Hospital directors at Oneonta the following officers were elected for the year 1945: president, Edward Crippen; vice-presidents, Dr. M. L. Ford, O. B. Rowe, and Lewis F. Rose; secretary and treasurer, Robert Hall; and superintendent, Mrs. Genevieve N. Lechevet.

Directors elected for a term of three years were: Orlando B. Rowe, Mr. Crippen, Owen C. Becker, Morris L. Pincus, and Robert Hall. Damon L. Getman was elected a director a few months ago to fill the unexpired term of his brother, the late Herbert C. Getman.*

• • •

At the annual meeting of the Board of Directors of Potsdam Hospital the yearly reports were given and the purchase of new equipment discussed, when it can be purchased. Morton Bennett, superintendent of the hospital, also discussed subjects relative to the operation of the hospital.

Members of the board include: Clarence E.

• • •

The annual meeting of the Stephen B. VanDuzee Hospital Association and of the board of directors of the institution was held at the Municipal Building on February 5.

At the Association meeting Vice-President A. E. Boughner presided in the absence of President J. O. Sheldon. Five new directors to serve five-year terms through 1950 were chosen: Miss Kate Leahy, Mrs. Berta Sprague, Miss Adelaide Johnson, and A. K. Laidlaw and John J. Wallace.

Upon adjournment of the Association meeting the board of directors convened at 8:45 P.M. with sixteen in attendance.

Officers were re-elected as follows: J. O. Sheldon, president; A. E. Boughner, first vice-president; B. O. Kinney, second vice-president; A. K. Laidlaw, treasurer; W. B. Simons, secretary.

These officials, by virtue of their offices, are automatically members of the hospital executive committee. To the list three others were added to complete the membership of the committee: Mrs. Berta Sprague, Mrs. B. G. Parker, and Mrs. M. E. Loveland.*

• • •

Harrison B. Wright is starting his third term as president of the South Nassau Communities Hospital, following his re-election at the annual meeting held in Hempstead on January 22.

Elected vice-presidents were Dr. Arthur B. Jacques, East Rockaway; Charles DeLap, Roosevelt; W. Sargeant Nixon, Freeport; John H. Carey, Valley Stream; John M. Fraser, Rockville Centre; George H. Jackson, Lynbrook; Mrs. May V. Walsh, Baldwin; and Frank W. Donnelly, East Rockaway.

Elected directors for three-year terms were Mrs. Earl D. Bennett, John H. Glass, Louis A. Abrams, and Irene M. Gaskell of Rockville Centre; Hugo Platte, Malverne; Miss Hattie Miller and Kathryn H. Carey, Valley Stream; Charles DeLap, Roosevelt; Lyman W. Davison and Dr. Jaques, East Rockaway; William A. Kielman, Lynbrook; Mrs. Henry Sutter and Agnes Earon, Freeport; and two new directors, George Morton Levy and Judge Hilbert R. Johnson, of Freeport.*

Newsy Notes

A fitting tribute was paid to Dr. Walter Lindsay, who practiced in Huntington from 1866 to 1926 in a reminiscent talk by Dr. Burdge P. MacLean. The occasion was the regular monthly medical meeting of the Huntington Hospital Medical Staff.

Dr. Lindsay was one of that vanished type—the horse and buggy doctor. He was also the first doctor in Huntington to own a high-wheeled buggy-type Duryea auto.

A dinner was tendered him in 1916 on the anniversary of his fiftieth year in the active practice of medicine. This was attended by fourteen physicians, among whom were Dr. H. G. Carter, Dr. L. P. G. Gouley, Dr. L. T. Jackman, Dr. B. P. MacLean, and Dr. W. C. Travis.

The program of this dinner together with a picture and biographical epitome of Dr. Lindsay was framed and presented by Dr. M. R. Keen to Huntington Hospital before this meeting.*

• • •

Asserting that there is no hospital within forty miles of Buffalo to take care of returning Erie County veterans, Rep. Edward J. Elsaesser, Buffalo Republican, has launched a drive for the construction of a veterans hospital in Buffalo as soon as possible.

At least 70,000 men and women of Erie County are serving the nation, Elsaesser asserted in a letter to Brig. Gen. Frank T. Hines, administrator of veteran affairs. Not a single hospital in Erie County has been established to care for the county's veterans, the congressman added, and the nearest one at Batavia may "soon be inadequate to care for current needs."*

• • •

According to the latest plans for the proposed enlargement of the hospital at Castle Point, one large main building rising six stories above the ground floor is called for, instead of two three-story wings east and west of the present central administration building and its Wards D and E Wings. The proposed new structure will be a conspicuous landmark as seen from the Hudson. It will be one of the largest and most imposing buildings to be found along the course of the river.

The building will provide four hundred additional beds in four large wards, making Castle Point at least a one thousand, two hundred bed hospital.

• • •

Dr. John E. White, of Malone, who was recently discharged from the Army Medical Corps after serving as a major in the United States, Australia, and New Guinea, in an informal chat with women of the Hospital Club at their meeting on January 9 talked of "How We Run an Army Hospital."*

• • •

Plans for a modern hospital to service lower Manhattan are being formulated by the board of directors of Beekman Hospital, it was revealed by Hospital President Howard S. Cullman. Mr. Cullman made his announcement following the twenty-third annual meeting of the board on January 9.

Recommendations that Beekman Hospital be more centrally located and with more modern facilities were made early last year by the hospital council, which reviewed the hospitalization needs of lower Manhattan, Mr. Cullman said in his annual report. Present plans call for a 150-bed hospital, which would cover the needs of the district.*

Woman's Auxiliary

To the Medical Society of the State of New York

Winter Board Meeting

A VERY well-attended meeting of the Executive Board of the Woman's Auxiliary to the Medical Society of the State of New York was held in the Hotel Pennsylvania in New York City, January 24 and 25.

Two inspiring and very constructive talks were given by Dr. Nathan B. Van Etten and Mr. Dwight Anderson. Miss Yolande Lyon explained posters and literature to be used at lectures on medical indemnity insurance.

County News

Albany County. Two monthly luncheon meetings were held. The December meeting was held in the Crystal Room of the De Witt Clinton Hotel with Mrs. James Bucci presiding. Mrs. Betty Wertz, the state president, was to have addressed the meeting, but was snow-bound and unable to be present. Mrs. Thomas Bullard, president of the Saratoga Auxiliary and a member of the state board of directors, was present and gave a very interesting talk on "Fifty Years a Country Doctor's Wife."

The meeting was attended by the following state legislative chairmen: Mrs. A. Madden; organization, Mrs. Hugh Henry; printing and supplies, Mrs. J. Rainey; public relations, Mrs. B. Shults. Two county presidents also present were Mrs. A. Congdon, of Schenectady, and Mrs. J. Rensselaer. Among the honored guests were Dr. John B. Horner, president of the Albany County Medical Society, and Dr. A. W. Wallingford, vice-president. These persons formed the receiving line. The beautifully appointed tables, gay in their Christmas colors and candles, were arranged by Mrs. Hugh Leahy and her committee. Mrs. Raymond Kircher, assisted by Mrs. Francis A. Stephens and Mrs. A. J. Sullivan, was in charge of the luncheon.

The January luncheon was held at the University Club and Mrs. Bucci, the president, presided. The speaker of the day was the National Director of the Woman's Auxiliary to the American Medical Society, Mrs. Luther Kice, of Garden City, Long Island. She spoke on pending federal legislation and gave a brief summary of Senator Pepper's first report on "Health and Education." She advised the women present to be on the look-out for Senator Pepper's second report in the near future. She also told of the new bill on socialization of medicine introduced by Senator Dingell. A lively discussion followed the talk and was followed by the business meeting under the leadership of the vice-president, because Mrs. Kice, Mrs. Bucci, and Mrs. Madden, state legislative chairman, had to leave to attend the State Board Meeting in New York that evening.

Erie County. A very interesting meeting of the Legislative Committee of the Woman's Auxiliary to the Medical Society of the County of Erie was held at the home of the chairman, Mrs. Benjamin Smallen, Tuesday, February 6. At this meeting it was learned that over two hundred wires had been sent the day before to Albany opposing the Chiropractic Bill.

The Red Cross knitting group was entertained at luncheon Thursday, February 15, at the home of Mrs. Jesse G. Levy. Her cochairman was Mrs. Fred St. John Hoffman. Another afghan has been presented to the American Red Cross which was knitted by this group.

The next Auxiliary meeting was held Tuesday, February 27, when the American Women's Voluntary Service, Inc., gave a "Remake Clothes Revue" and Clothing Conservation Program. The usual round-table luncheon was served and there was a valuable door prize.

Nassau County. The regular meeting of the Woman's Auxiliary to the Nassau County Medical Society was held on Tuesday evening, February 27, at 8:30 P.M. at the Nassau Hospital Auditorium in Mineola.

The speaker was Mr. Stanley B. Pinks, who gave a demonstration of his "Seeing Eye" guide dog. Friends of members were cordially invited.

Refreshments were served by Mrs. John L. Neubert and her committee.

Oneida County. The Woman's Auxiliary to the Medical Society of the County of Oneida had a dinner meeting at 6:30 P.M., Tuesday, January 9, in the Seneca Room of the Hotel Utica with Mrs. Bradford Golly, of Rome, presiding. Thirty members braved a severe snowstorm to attend. After a brief business meeting Miss Augusta Mueller, R.N., of Rome, told of her interesting experiences during her four years' sojourn in Alaska, and displayed many pieces of native clothing. It was voted to buy a War Bond.

The next meeting will be held in April in Rome.

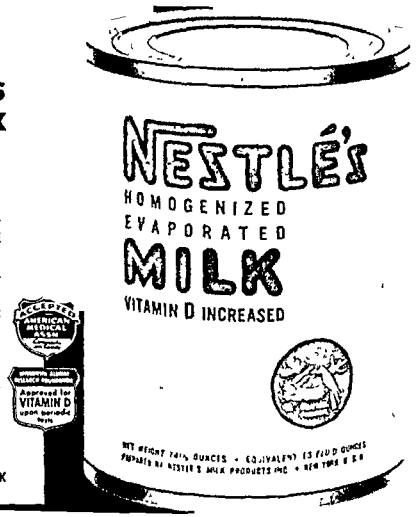
Saratoga County. Mrs. Frederick G. Eaton was elected president of the county auxiliary at the meeting held in the Nurses' Lounge of the Saratoga Hospital. Mrs. Walter McClellan is vice-president; Mrs. Mark Duby, secretary; and Mrs. H. D. Hunt, treasurer.

A program featuring South America was presented. Mrs. H. D. Hunt sang several native songs, and Miss Alice F. Warren, of the Skidmore College faculty, gave a stirring address on the need of a good neighborly policy toward South America.

The retiring president, Mrs. Thomas Bullard, presided and announced the purchase of one of the health certificates of the Saratoga County Tuberculosis Committee. The hostesses for the meeting were Mrs. W. S. McClellan, Mrs. R. Bullard, Mrs. R. G. Loop, and Mrs. J. M. Lebowich.

THE NEW NESTLÉ'S EVAPORATED MILK

supplies 400 units Vitamin D_3 per pint*



*25 USP units of Vitamin D_3 (irradiated 7-dehydrocholesterol) are added to each fluid ounce—so every reconstituted quart of the new NESTLÉ'S Milk supplies 400 units of Vitamin D_3.

Fortification with Vitamin D_3 does not alter the milk's flavor or destroy any of its natural vitamins

This improved milk—under the new label shown here—replaces former Nestlé's brands at no increase in price

No feeding instructions furnished to the laity.

Cataract and Anomalies of the Lens. By John G. Bellows, M.D. Octavo of 624 pages, illustrated, including four color plates. St. Louis, C. V. Mosby Co., 1944. Cloth, $12.

The author is one of Sanford Gifford's corps of instructors at the Northwestern University Medical School. He has given us the first modern work on the lens including the anomalies and embryology. The literature is catalogued and complete.

We predict that this will be the first of many editions. It is highly recommended.

RALPH I. LLOYD

Tropical Nursing. A Handbook for Nurses and Others Going Abroad. By A. L. Gregg, M.D. Second edition. Sextodecimo of 185 pages, illustrated. New York, Philosophical Library, Inc., 1944. Cloth, $3.00.

The subtitle is an excellent index to the nature and the scope of this book. The exotic diseases common to the tropics are briefly described with respect to cause, transmission, effect upon the patient, diagnosis, and treatment. The principles of nursing management for each disease entity are set forth. In addition to items of practical importance which constantly appear in the running text, there are twenty-two pages devoted to technic and procedure, and there is also a brief section on personal hygiene in the tropics. There is a short

glossary of terms for the benefit of those without medical vocabulary. There are few illustrations.

E. J. TIFFANY

The 1943 Year Book of Industrial and Orthopedic Surgery. Edited by Charles F. Painter, M.D. Duodecimo of 440 pages, illustrated. Chicago, Year Book Publishers, Inc., 1943. Cloth, $3.00.

The 1943 Year Book of Industrial and Orthopedic Surgery is an excellent addition to the previous published volumes on the subject. The important recent advances in orthopedic surgery for the year are carefully selected from the extensive literature and clearly described, edited, and amply illustrated. There is an excellent chapter on fractures and traumatic dislocations, with clear descriptions of the newer methods of treatment of various traumatic bone lesions. The chapter on operative technic brings the various new operative procedures up to date in concise form. That part of the book devoted to industrial medicine and surgery should be of interest to the industrial physician.

The book is a real asset to the orthopedist who has not sufficient time to delve into the voluminous current literature of the specialty.

L. G. PAPAE

Lippincott's Quick Reference Book for Medicine and Surgery. A Clinical, Diagnostic and Therapeutic Digest of General Medicine, Surgery, and the Specialties, Compiled Systematically from Modern Literature. By George E. Rehberger, M.D. Twelfth edition. Octavo of 1,460 pages, illustrated. Philadelphia, J. B. Lippincott Co., 1944. Cloth, $15.

The publication of a twelfth edition (since the first in 1920) of this large reference book is testimony to its popularity. The present edition has been revised according to the latest U.S.P. and National Formulary and has been extensively rewritten.

The chief value of a book of this type is that it provides access to information in many specialties. The articles are sketchy, but here a dermatologist may look up a point in orthopedics or otology. The information he will find will not be encyclopedic but may save him a trip to the library.

The illustrations are good. The printing is excellent. There is a good index and most of the material is up-to-date and conforms to the best modern practice.

M. PLOTZ

Vascular Responses in the Extremities of Man in Health and Disease. By David I. Abramson, M.D. Octavo of 412 pages, illustrated. Chicago, University of Chicago Press, 1944. Cloth, $5.00.

This volume is essentially a summary of plethysmographic investigations which the author has conducted on the peripheral circulation.

The book opens with an excellent review of the anatomy, histology, and nervous control of the blood vessels. Then follows a summary and evaluation of all known methods for studying peripheral circulation. After revealing that practicallyall methods possess certain defects and disadvantages for obtaining an accurate estimate of peripheral blood flow, the author describes the plethysmograph and shows it to be the best quantitative method for measuring the rate of the peripheral circulation. Although this method, too, possesses many pitfalls and lends itself to the creation of artefacts which can be easily misinterpreted, the author nevertheless devotes the remainder of the book to a discussion of the responses of the peripheral circulation to such variables as heat, anoxia, drugs, hormones, and mechanical influences.

At best, plethysmography is only an indirect physiologic method for studying blood flow. To draw blood conclusions on both physiologic and clinical laws concerned with the circulation in the limbs from a single method which in itself is certainly not absolute, appears to be too hazardous. The book is well written and should prove stimulating to anyone interested in the subject.

WILLIAM S. COLLENS

in **HYPERTENSION**

Answer it with **HEPVISC**

High blood pressure brought down to safer levels by gradual, prolonged action of HEPVISC. Also relieves headaches and dizziness.

DOSE: 1-2 tablets t.i.d., after meals.
Sample and formula on request.

ANGLO-FRENCH LABORATORIES, Inc. • 75 VARICK STREET, NEW YORK 13, N. Y.

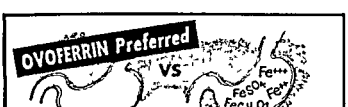
WHEN THE CONVALESCENT NEEDS A "LIFT"

. . . because of lowered hemoglobin

Avoiding gastro-intestinal symptoms and upsets is a major consideration when hematinic therapy is indicated for the convalescent patient.

In simple hemoglobin deficiency due to lack of dietary iron, or in hypochromic anemia from other causes, Ovoferrin is an effective hematinic. For Ovoferrin is colloidal iron . . . iron that is in easily assimilable form, readily absorbed without disturbing side-effects. *No irritation, no constipating action, no dehydration in the intestine.* Ovoferrin stimulates the appetite and raises hemoglobin values of the patient.

HOW OVOFERRIN ACTS IN THE BODY

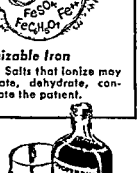


in the mouth... Pleasant and palatable, Ovoferrin is almost tasteless. Doesn't stain teeth or destroy tooth enamel.

in the stomach... Ovoferrin is stable, non-irritating. Non-ionizable, its colloidal structure remains practically unchanged by gastric juices, passes on ready for further assimilation.

in the intestine... Entering here in colloidal form, Ovoferrin iron is readily absorbed, utilized. A stable hydrous oxide that has neither dehydrating nor astringent action. No distressing side-effects, no constipation.

In hypochromic anemia that often accompanies pregnancy and lactation, adolescence and puberty, old age and debility states, Ovoferrin is a hematinic of value prescribed by physicians for many years. Pleasant to take, almost tasteless.

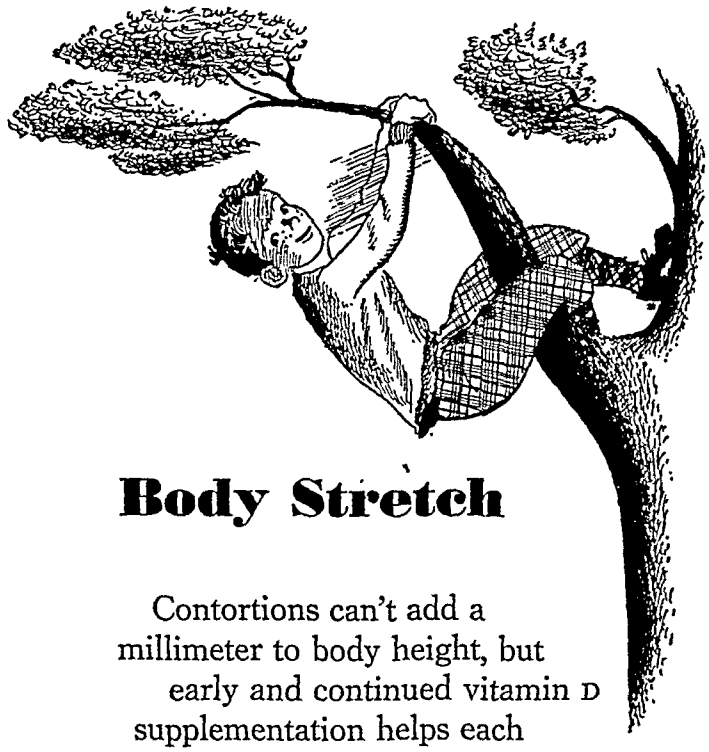


Available in drugstores in 11 oz. bottles. Dosage: one tablespoonful in milk or water at mealtime and bedtime.

Colloidal Iron vs. Ionizable Iron

Ovoferrin Is colloidal iron protein. Non-ionizing, non-irritating. Easily assimilable

Iron Salts that ionize may irritate, dehydrate, constipate the patient.



OVOFERRIN

COLLOIDAL ASSIMILABLE IRON

MADE BY A. C. BARNES CO., NEW BRUNSWICK, N. J.

"Ovoferrin" is a registered trademark, the property of A. C. Barnes Co.

Body Stretch

Contortions can't add a millimeter to body height, but early and continued vitamin D supplementation helps each child better fulfill his height potential, for "rate of growth is increased above the average when the intake of vitamin D is fully adequate."[1]

There is no better way to assure this than with **Super D* Concentrate** which, as always, provides natural fish liver vitamins A and D –with vitamin D exclusively from cod livers.

Different in form

Maltine with Vitamin Concentrates has long been appreciated by physicians for the unusual prescription and dosage control afforded by its liquid form and its solely professional publicity. Potent, palatable and economical, it finds equally high favor with patients. A balanced multiple vitamin preparation for use as a rational dietary supplement, it is compounded with the precision typical of all Maltine products. Each fluid ounce contains:

Vitamin A	*10,000 U.S.P. Units*
Vitamin D	*1000 U.S.P. Units*
Vitamin B_1	*3 Milligrams Thiamine Hydrochloride*
Vitamin B_2	*4 Milligrams Riboflavin*
Nicotinamide	*40 Milligrams*
Pantothenic Acid	*350 Micrograms*
Dicalcium Phosphate	*17 grains*
Maltine	*q.s.*

Available only through prescription pharmacies in bottles of 12 fluid ounces. *The Maltine Company*, New York. Established 1875.

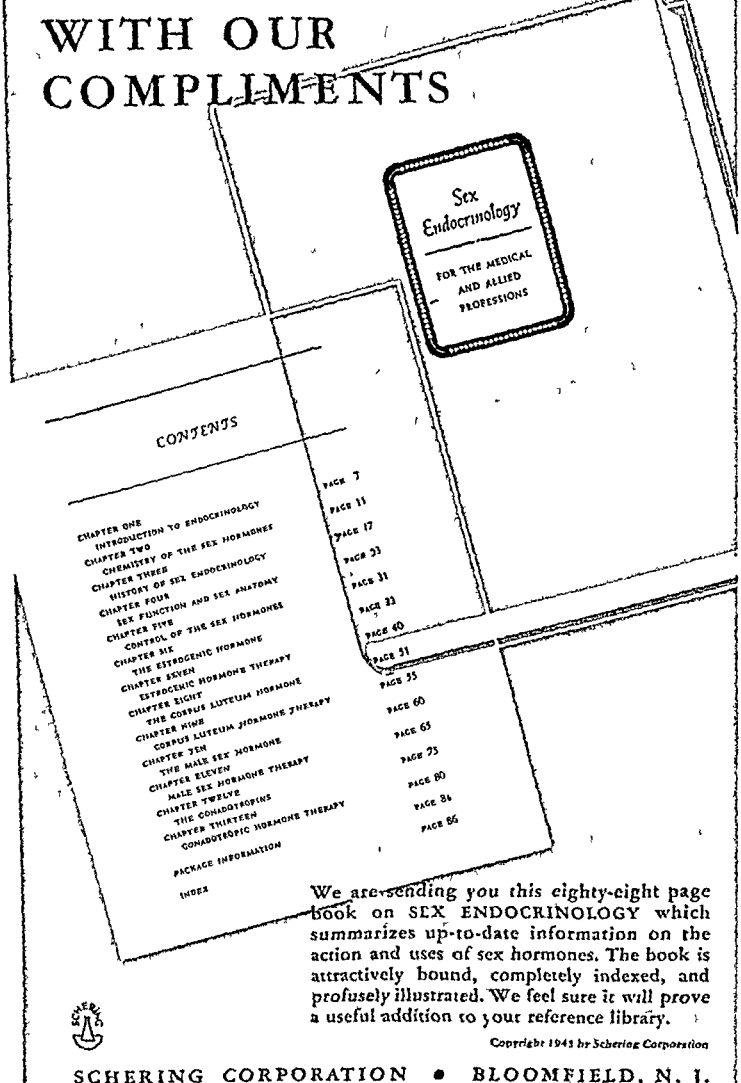
IN DISORDERS OF GASTRIC FUNCTION

Gastron

REG. U.S. PAT. OFF.

GASTRON is an original extract of the organic and inorganic constituents of the entire mucosa of the hog-stomach, including the pylorus. The acidified and aromatized extract is incorporated in an aqueous-glycerin menstruum which preserves the enzymatic activity. The preparation contains no alcohol. It is accurately standardized by assay.



GASTRON is indicated as replacement therapy in atrophic gastritis, and as an aid in the treatment of chronic gastritis. It is of value as adjunctive treatment in the anemias, and in certain gastric deficiencies associated with convalescence and old age. It is worthy of trial in the nausea and vomiting of pregnancy.

GASTRON WITH IRON also is available for prescription use

FAIRCHILD BROTHERS AND FOSTER

70-76 LAIGHT ST., NEW YORK 13, N. Y.

WITH OUR COMPLIMENTS

We are sending you this eighty-eight page book on SEX ENDOCRINOLOGY which summarizes up-to-date information on the action and uses of sex hormones. The book is attractively bound, completely indexed, and profusely illustrated. We feel sure it will prove a useful addition to your reference library.

Clinical Evidence

INDICATES THAT...

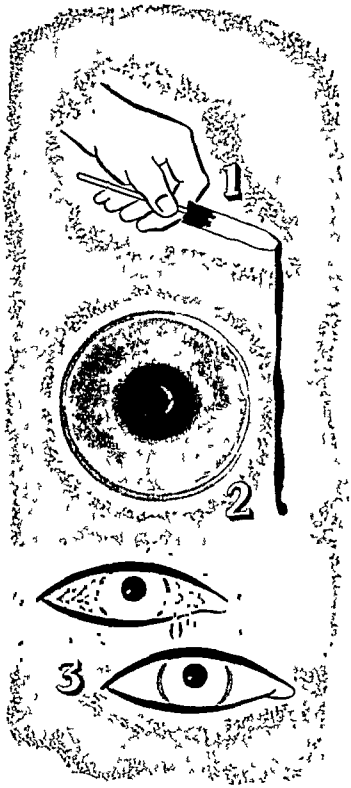
"Marked or complete relief of symptoms" occurred in 73 menopausal patients treated with Benzestrol.

JAEGER, A. S.
Jl. Indiana State Med. Soc. 37; 117, 1944

"The very low incidence of side reactions, particularly of nausea, is of clinical importance." These patients were given Benzestrol by mouth.

ROBERTS, H. K. et al.
J.A.M.A. 123:261: 1943

Schieffelin
BENZESTROL
(2, 4 di (p-hydroxyphenyl)-3 ethyl hexane)
Formerly called by the trade name OCTOFOLLIN



...merits confidence as a synthetic estrogenic agent of high potency and low toxicity. Schieffelin Benzestrol is recommended in all conditions in which natural estrogenic hormones are ordinarily indicated.

Schieffelin Benzestrol is available in tablets of 0.5, 1.0, 2.0 and 5.0 mg.; in solution in 10cc. vials 5 mg. per cc.; and vaginal tablets of 0.5 mg. strength.

3 TREATMENTS IN ONE . . . ARGYROL

in mucous membrane infection

In treating mucous membrane infection today the physician can achieve by use of this one medication ARGYROL *three important results*

For, in addition to being contra infective and contracongestive, ARGYROL is stimulating to the membrane's own inherent and natural defense function

DECONGESTIVE—ARGYROL s decongestive effect in the membrane is the result of its demulcent, osmotic action The withdrawal of ARGYROL tampons from the post nasal cavities frequently brings forth a long ropy mucous discharge measuring as much as two feet or more

BACTERIOSTATIC—Although proved to be definitely bacteriostatic, ARGYROL is non toxic to tissue In nearly a half century of wide medical use of ARGYROL, no case of toxicity, irritation, injury to cilia or pulmonary complication in human beings has ever been reported

STIMULATING—Soothing to nerve ends in the membrane and stimulating to glands, ARGYROL s action is more than surface action For it acts synergetically with the membrane s own deep seated, defense mechanism

NEVER DUPLICATED CHEMICALLY OR IN CLINICAL ACCEPTANCE

Solutions of mild silver protein similar in appearance to ARGYROL are chemically different Different in degree of colloidal dispersion, in size of particles and in Brownian movement viewed under the ultra microscope In ARGYROL unlike other mild silver proteins, and regardless of the concentration of the solution employed, the pH remains

centrations from 1 per cent to 50 per cent To insure the results which you expect from genuine ARGYROL it is important that you insist on ORIGINAL PACKAGE ARGYROL

ARGYROL

THE PHYSIOLOGIC ANTISEPTIC WITH SYNERGETIC ACTION . . .

SAFE, SIMPLE, EFFECTIVE *ORGANOTHERAPY*

Lipolysin
MALE FEMALE
in
OBESITY

Lipolysin increases fat oxidation through stimulation of metabolic processes . . . for safe, gentle and gradual reduction of excess poundage. A dependable pluriglandular preparation of high purity. ***No dinitrophenol.*** Contains thyroid, anterior pituitary, thymus; plus orchitic substance (male), ovarian (female).

AMPULS: boxes of 12 and 100.
Tablets and Capsules: bottles of 100.
Send for literature. Address Dept. N.

CAVENDISH PHARMACEUTICAL CORP. • 25 West Broadway • New York

WHEN NUTRITION MUST BE MAINTAINED

Few are the diseases in which maintenance of the nutritional state is less important than specific therapy. Unless the metabolic demands are adequately satisfied, maximal response to drug administration hardly can be expected.

In a host of febrile, infectious, and neoplastic diseases Ovaltine can be of considerable benefit in supplying the extra nutrients required during periods of greater need. This nutritious food drink, made with milk, supplies the dietary elements required: adequate protein, readily assimilated carbohydrate, B complex and other vitamins, as well as important minerals. Ovaltine leaves the stomach rapidly because of its low curd tension, hence may be taken as frequently as deemed necessary. And its delicious taste encourages adequate consumption, an important factor in combating the anorexia of many diseases.

THE WANDER COMPANY, 360 N. MICHIGAN AVE., CHICAGO 1, ILL.

Ovaltine

Three daily servings of Ovaltine, each made of ½ oz. Ovaltine and 8 oz. of whole milk,* provide:

PROTEIN	31.2 Gm.	VITAMIN A	2953 I.U.
CARBOHYDRATE	62.43 Gm.	VITAMIN D	480 I.U.
FAT	29.34 Gm.	THIAMINE	1.295 mg.
CALCIUM	1.104 Gm.	RIBOFLAVIN	1.278 mg
PHOSPHORUS	.903 Gm.	NIACIN	7.0 mg.
IRON	11.94 mg.	COPPER	.5 mg.

*Based on average reported values for milk.

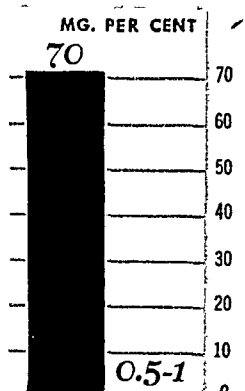
In Congestive Heart Failure

Phyllicin
theophylline-calcium salicylate

A well tolerated,
quickly acting diuretic and myocardial stimulant

DOSE: 1 tablet (4 grains) two to four times a day.

BILHUBER-KNOLL CORP. ORANGE NEW JERSEY



MORE EFFECTIVE LOCAL CHEMOTHERAPY IN OROPHARYNGEAL INFECTIONS

HIGH SALIVARY SULFATHIAZOLE LEVEL

Chewing one tablet of White's Sulfathiazole Gum for ½ to 1 hour promptly provides a HIGH SALIVARY CONCENTRATION of therapeutically active sulfathiazole, averaging 70 mg per cent throughout the chewing period

LOW (NEGLIGIBLE) SYSTEMIC ABSORPTION

Even with maximal dosage, resulting blood levels only occasionally reach 0.5-1 mg per cent—so low that systemic toxic reactions are virtually obviated

White's SULFATHIAZOLE GUM*

provides an efficient and practical method of effecting *immediate* and *prolonged* topical chemotherapy in oropharyngeal areas not similarly reached with gargles, sprays or irrigations.

SUPPLIED IN PACKAGES OF 24 TABLETS, SANITAPED IN SLIP SLEEVE PRESCRIPTION BOXES

INDICATIONS: Local treatment of sulfonamide-susceptible infections of oropharyngeal areas; acute tonsillitis and pharyngitis; septic sore throat; infectious gingivitis and stomatitis, including Vincent's disease. Also indicated in the prevention of local infection secondary to oral and pharyngeal surgery.

IMPORTANT: Please note that your patient requires your prescription to obtain this product from the pharmacist.

A PRODUCT OF **WHITE LABORATORIES, INC.** PHARMACEUTICAL MANUFACTURERS, NEWARK 7, N. J.

Indicated therapy in Sequelae of

Epidemic Encephalitis

Pills Stramonium (*Davies, Rose*)

2½ grains

Physicians in private practice as well as in neurological clinics have widely prescribed these pills since 1929, and their continued interest in and use of them points to the serviceability of this therapy.

Stramonium Pills (*Davies, Rose*) exhibit in each pill 2½ grains of alkaloidally standardized Stramonium (powdered dried leaf and flowering top of Datura Stramonium, U.S.P.), equivalent to 25 minims (1.54 cc.) of Tincture U.S.P.

As a reassurance of the activity of the finished pills, they, too, are alkaloidally assayed, thus establishing as far as possible uniformity and dependability.

A package for clinical trial and literature mailed free of charge upon request.

Views of the left hand of a female, aged 64 years; *illustrating an atrophic arthritis* involving an unusual age group; duration of disease, 8 years; occupation, housewife.

This shows the so-called *fusiform or spindle-shaped* fingers due to and best illustrated by swollen soft tissues about the fourth and fifth as well as the second proximal interphalangeal joints. The skin appears dry, shiny and illustrates trophic disturbances characterized by brownish to red yellow mottling. The distal phalanges are pale yellow to gray in color with spotty red discolorations and are poorly functional. General involvement: cervical and lumbar spine, right hip and symmetrical changes in the wrists, knees and feet.

Born of Research...

ERTRON *in Arthritis*

Ertron*, differing from any previous agent employed in the treatment of arthritis, has been singularly effective against this common affliction

Now, after a decade of intensive investigation in hospital, laboratory, clinic, and private practice, the vast number of articles in foremost medical journals testify to the value of Ertron

SPECIFY ERTRON—In the large list of bibliographic references, the importance of both safety and effectiveness is stressed Quite consistently is it mentioned that the Whittier Process product—Ertron—has the essential features of non-toxicity and successful therapeutic response

ERTRONIZE THE ARTHRITIC—*To Ertronize* the arthritic patient, employ Ertron in adequate dosage over a sufficiently long period to produce beneficial results Gradually increase the dosage to the toleration level—maintain this dosage until maximum improvement occurs

Ertron alone—and no other product—contains electrically activated vaporized ergosterol (Whittier Process) It is the product which numerous investigators have repeatedly shown to be effective and non-toxic in recommended dosages

ERTRON PARENTERAL—For the physician who wishes to reinforce the routine oral administration of ERTRON by intramuscular injections ERTRON Parenteral is available in packages of six 1cc. ampules Each ampule contains 500 000 U S P units of electrically activated vaporized ergosterol (Whittier Process)

Supplied in bottles of 50, 100 and 500 capsules

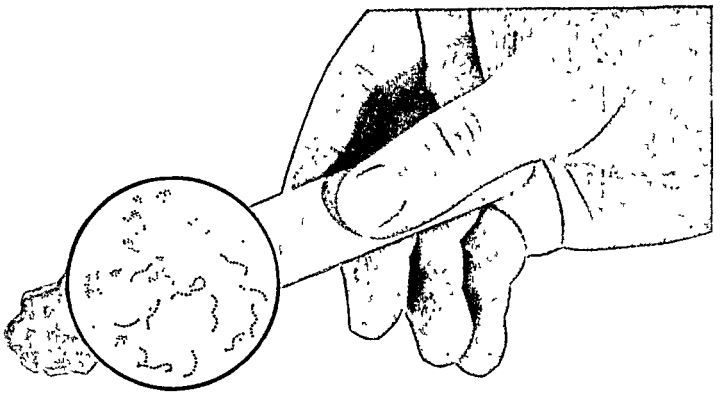
BELBARB



AN *Excellent* SEDATIVE *and* HYPNOTIC

The potentiation of the central action of phenobarbital by the belladonna alkaloids (Friedberg, Arch. f. exp. P. & P. CLX, 276) renders possible attainment of desired effects with relatively small doses, thus avoiding "hang over" and other unpleasant side-actions. In contrast to galenical preparations of belladonna, such as the tincture, Belbarb *has always the same proportion of the alkaloids.*

Indications: Neuroses, migraine, functional digestive and circulatory disturbances, vomiting of pregnancy, menopausal disturbances, hypertension, etc.

Formula: Each tablet contains ¼ grain phenobarbital and the three chief alkaloids, equivalent approximately to 8 minims of tincture of belladonna.

Belbarb No. 2 has the same alkaloidal content but ½ grain phenobarbital per tablet.

Don't apply bacteria to a wound...

Topical application of a contaminated sulfonamide may inadvertently introduce infection, for sulfonamides are not self-sterilizing, being bacteriostatic rather than bactericidal.

There is no such danger with 'SULFATHIADOX'* Self-Sterilizing Sulfathiazole Ointment, a new, unique, sterile *and self-sterilizing* sulfonamide ointment for use in impetigo and other cutaneous infections, traumatic skin lesions and potentially infected burns.

'SULFATHIADOX' Self-Sterilizing Sulfathiazole Ointment provides 5% microcrystalline sulfathiazole; bactericidal, oxygen-liberating urea peroxide, 1%; and the antifungal preservative chlorobutanol, 0.5%, in a special water-soluble, oil-in-water base for greater miscibility with body exudates.

*Trademark Reg U S Pat. Off.

Thantis Season

Winter time is the season of throat affections. Crowded transportation facilities, due to wartime conditions, cause exposure of more people to infection.

Many physicians have found Thantis Lozenges to be effective in relieving throat soreness and irritation, because they are antiseptic and anesthetic for the mucous membranes of the throat and mouth.

Thantis Lozenges contain Merodicein (H. W. & D. Brand of Diiodooxymercuriresorcinsulfonphthalein-sodium), 1/8 grain, and Saligenin (Orthohydroxybenzylalcohol, H. W. & D.), 1 grain. They are effective and convenient; they dissolve slowly, permitting prolonged medication.

Thantis Lozenges are supplied in vials of twelve lozenges each.

In the Management of Subacute Bacterial Endocarditis

BARELY a year ago the reports regarding the use of penicillin in subacute bacterial endocarditis were hardly optimistic. Outstanding clinicians doubted if more than temporary sterilization of the blood stream could be expected. When the wider availability of penicillin permitted more intensive and prolonged therapy, endocarditis in many instances yielded. As recent publications show,* this serious infection, heretofore practically hopeless, no longer need be considered so.

Since very large amounts of penicillin over long periods are required in the treatment of bacterial endocarditis, the purity of the drug administered (number of Oxford Units per milligram of substance) appears of importance. The high degree of purity accomplished in Penicillin-C.S.C. merits the physician's preference for Penicillin-C.S.C. in bacterial endocarditis as well as in other indications.

Physicians are invited to send for this comprehensive brochure. • The Penicillin-C.S.C. Reporter, presenting abstracts of the world literature, is periodically mailed to all physicians. Notify us, if it has not been received.

to ease the strain on the Hypertensive Heart . . .

GRADUAL, PROLONGED VASODILATION WITH —

NITRANITOL

BRAND OF MANNITOL HEXANITRATE

By inducing smooth, gradual reduction of pressure over an extended period, Nitranitol eases the burden on the hypertensive heart, thus preventing arterial damage that results from continued, unrelieved hypertension—or which is likely to follow sharp fluctuations in pressure.

Nitranitol has a slow-developing, steady, prolonged vasorelaxing power—its effect lasts—

1½ times as long as erythrityl tetranitrate
4 times as long as sodium nitrite
12 times as long as glyceryl nitrate

Nitranitol is nontoxic and safe for clinical use over long periods of time.

Supplied in the form of scored tablets containing ½ gr. mannitol hexanitrate. Available at prescription pharmacies in bottles of 100 and 1000.

Sedation Combined with Hypotensive Action

NITRANITOL
Brand of Mannitol Hexanitrate
with PHENOBARBITAL
Each scored tablet contains ½ gr. mannitol hexanitrate and ¼ gr. phenobarbital.

PENICILLIN SCHENLEY

—the drug that gives new meaning to the word "control"

The penicillin which first attracted the attention of Alexander Fleming was an "occurrence of nature", with no control exercised over the conditions of its production Production of pyrogen-free penicillin for the medical profession, however, is accomplished only by the most elaborate methods of control for insuring highest attainable productivity, potency, and purity.

Shown here is one of the many rigid controls exercised at the Schenley Laboratories In this step, PENICILLIN Schenley is being tested to insure standard potency. As supplies of penicillin increase, the elaborate system of control will continue to safeguard its production at Schenley Laboratories

SCHENLEY LABORATORIES, INC.

"AN AMPUL OF PREVENTION...

—is worth a pound of cure" . . . Postoperative abdominal distention and urinary retention—and the troublesome procedures that follow—are often entirely prevented by the routine use of Prostigmin Methylsulfate 1:4000. Convalescence may be hastened—"gas pains" and the discomforts of catheterization can be eliminated by this simple, effective treatment. Inject 1cc of Prostigmin Methylsulfate 'Roche' 1:4000 at the time of operation and continue with five similar injections at 2-hour intervals after the operation . . . . HOFFMANN-LA ROCHE, INC., ROCHE PARK, NUTLEY 10, NEW JERSEY.

PROSTIGMIN METHYLSULFATE 'ROCHE' 1:4000

An *Amazing* NEW ADVANCE *in* EKG DESIGN

Instantaneous STANDARD RECORDINGS *with Portable* **Cardiotron**

You probably know all about electrocardiographs, doctor, but you haven't seen anything like CARDIOTRON. This direct-recording instrument sets new standards of speed, accuracy and simplicity of operation. It saves your time and enables immediate diagnosis by providing permanently recorded standard cardiograms as soon as you connect it to the patient.

With CARDIOTRON there is no time lapse —you can make your diagnosis at once, because developing and other photographic procedures are completely eliminated. CARDIOTRON is sensitive to the minutest variation in cardiac activity—yet it is rugged enough to withstand the roughest treatment. Rigorous tests guarantee its accuracy. And, since no ink or other fluid is used, there is no possibility of clogging. CARDIOTRON'S light weight is another factor which makes it ideal for office or bedside use.

DAWN OF A NEW DAY IN MEDICINE

PENICILLIN

The ever-increasing mass production of *Penicillin* is bringing Medicine closer and closer to the day when this *potent antibiotic will be freely* available for the treatment of many diseases which in the past have defied therapeutic measures.

To make that day an early tomorrow, CHEPLIN LABORATORIES is devoting its peak production efforts.

SYRACUSE 1, NEW YORK

Does Tampax eliminate the problem of menstrual odor?

"THE ANSWER IS *Yes*"

Clinical investigators have shown that internal protection (as afforded by TAMPAX) serves to abolish objectionable odor . . . by absorption of the flow *before* it becomes exposed to air and can suffer consequent decomposition.[1,2] For "menstrual blood taken directly from the interior of the uterus has no odor."[4]

Primarily, TAMPAX meets *all* the requirements of modern menstrual hygiene — since (as one specialist summarizes) "the evidence is conclusive that the tampon method of menstrual hygiene is safe, comfortable and not prejudicial to health . . ."[3]

Indeed, so comfortable is "flat expansion", provided only by TAMPAX, that many women are hardly aware of its presence in situ.[1] Welcome freedom from external bulkiness, vulval irritation or chafing from perineal pads, allows the patient a wider range of activity during the period. An individual applicator permits easy insertion, and a moisture-resistant cord facilitates dainty removal.

TAMPAX is available in three sizes: "Super", "Regular" and "Junior", with absorptive capacities of 45-cc., 30.3-cc. and 20-cc. respectively. Use coupon below for professional samples.

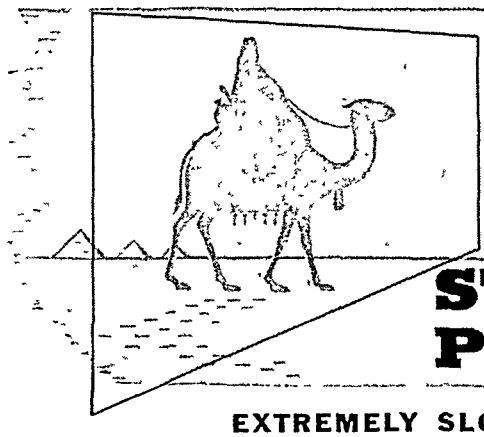
PENICILLIN

IS

NOW AVAILABLE

IN

Yes . . . and in Paterson, Portland, Pittsburgh and Pocatello . . . for this new antibiotic is now being distributed through the same channels which make other Parke-Davis prescription products available to the physicians and pharmacists of the country. In the short space of five years Penicillin has developed from a mold on a petri dish in a London laboratory to a package on the shelves of the prescription rooms of fifty odd thousand retail pharmacies throughout the United States.



To the triumphs of Fleming and Florey must be added the genius of American pharmaceutical production which rapidly developed the means and methods of mass manufacture in sufficient quantity to meet first, the needs of the armed forces; next, the demands of critical civilian cases, then, to supply limited quantities to selected hospitals throughout the country, and finally to release Penicillin for general distribution.

Physicians may now prescribe . . . and pharmacists dispense . . .

STAYING POWER

EXTREMELY SLOW ABSORPTION AFFORDS PROLONGED LOCAL ANALGESIA

A vasoconstrictor is added to most local anesthetics, first — to prevent rapid absorption, and second — to intensify their action.

With Eucupin, however, no such supportive adjunct is required, for Eucupin remains fixed for hours and even days at the site of application; it combines with the protoplasm of the terminal nerve filaments, breaking down slowly enough to afford the otherwise painful area a prolonged period of intense anesthesia and gratifying analgesia.

Thus, when certain procedures and conditions are known to incur long periods of pain, it is obviously futile to attempt to provide enduring control of pain with the common anesthetics. For enduring control, Eucupin is formulated, ready for use, as follows:

EUCUPIN WITH PROCAINE SOLUTION — for surgical anesthesia by infiltration — 30 cc. vials

EUCUPIN SOLUTION IN OIL — octologic ap[illegible] by infiltration and conservative treatment [illegible] pain — [illegible]les, boxes of 6.

EUCUPIN OINTMENT — for topical applicati[illegible] skin and mucocutaneous junctions — 1 oz. tubes and 1 lb. ja:

EUCUPIN SUPPOSITORIES — for analgesia in anorectal disorders — boxes of 12 (2 x 6).

MULTIPLE SHADOWS

Because deficiency states have frequently failed to respond completely to treatment with a single vitamin, clinicians have adopted a policy of mixed vitamin therapy.

White's Neo Multi-Vi Capsules provide a potent, rationally balanced, 8-vitamin formula—including all vitamins known to be essential, in amounts substantially greater than adult basic daily requirements, yet not wastefully in excess of the average patient's needs.

White's NEO MULTI-VI CAPSULES

FORMULA:

VITAMIN A	5000 U.S.P. Units
VITAMIN D	800 U.S.P. Units
THIAMINE HYDROCHLORIDE, U.S.P.	2 mg
RIBOFLAVIN	3 mg
PYRIDOXINE HYDROCHLORIDE	0.5 mg
CALCIUM PANTOTHENATE	5 mg
NICOTINAMIDE	20 mg.
ASCORBIC ACID, U.S.P.	75 mg.

IN IRON-DEFICIENCY ANEMIA

The blood in iron-deficiency anemia is markedly benefited by Copperin administration: hemoglobin percentages quickly rise; red blood cells increase in quantity and improve in quality.

Due to the action of the catalyst, copper sulphate, the amount of iron ammonium citrate per capsule is reduced to only 32 Mgm. But as ALL the iron is made available, maximum therapeutic effect is obtained. Copperin does not stain teeth or irritate the gastrointestinal tract and is water soluble. Prescribe Copperin "A" for adults, Copperin "B" for children.

COPPERIN

POWER.....

● The analgesic power of DEMEROL hydrochloride ranks between morphine and codeine, but carries with it considerably less risk of addiction. The majority of patients do not acquire tolerance. The incidence of euphoria produced by DEMEROL hydrochloride, in the presence of pain, is only 10 per cent. Furthermore, respiratory depression from DEMEROL hydrochloride is very uncommon, and the drug has no constipating effect.

Spasmolytic and sedative action

In addition to its marked analgesic potency, DEMEROL hydrochloride possesses spasmolytic action similar to that of atropine and papaverine, as well as mild sedative effects.

℞ Pediforme
FOOTWEAR

SHOES AS THERAPEUTIC AGENTS

No doctor can ignore that shoe therapy is a major factor in the treatment of many foot disorders. In some cases, however, when further medical or surgical treatment is required, the shoes must be adjusted to conform to any changes such treatments make in the shape or size of the feet.

Pediforme shoes are prepared through experienced craftsmen to make the necessary adjustments as prescribed by the orthopedic surgeon or physician in these cases.

With purchases restricted it is readily apparent that substantial shoes, capable of reconstruction or easy adjustment, should be prescribed. For all practical purposes, Pediforme footwear may well be considered in shoe therapy.

"...if the individual is depressed..."

"... if the individual is depressed or anhedonic ... you can change his attitude ... by physical means just as surely as you can change his digestion by distressing thought ... *In other words, drugs and physical therapeutics are just as much psychic agents as good advice and analysis* and must be used together with these latter agents of cure."

Myerson, A.—*Anhedonia*—
Am. J. Psychiat., July, 1922.

When this was written—in 1922—the only stimulant drugs employed in the treatment of simple depression were of limited effectiveness.

Only in the last decade has there been available—in Benzedrine Sulfate—a therapeutic weapon capable of alleviating depression, overcoming "chronic fatigue" and breaking the vicious circle of anhedonia.

ALLENTOWN • PENNSYLVANIA

A NEW TYPE OF TABLET FORMATION

Assuring Better Absorption

Each PANOVEM contains

Vitamin A	5000 U S P Units
Vitamin D	1000 U S P Units
Thiamine Hydrochloride	5 mg
Riboflavin	3 mg
Pyridoxine Hydrochloride	1 mg
Calcium Pantothenate	1 mg
Niacinamide	25 mg
Ascorbic Acid	75 mg
Natural Mixed Tocopherols	15 mg

PANOVEMS present adequate potencies of nine important vitamins in an advantageous new type of tablet. The fat-soluble vitamins are contained in an enteric-coated inner core, over which the water-soluble vitamins are arranged in gelatin-coated layers. The water-soluble vitamins are released in the stomach—the fat-soluble vitamins are not released until they reach the small intestine, thus effectively eliminating their tendency to cause regurgitation.

PANOVEMS are fully protected against potency-loss from oxidation, are easily swallowed, and do not give rise to "after-taste." One PANOVEM daily is adequate for prophylaxis or for correction of subclinical deficiencies. In frank deficiency states, dosage may be increased in proportion to severity of symptoms. Available in bottles of 100 tablets.

OPTIMAL SUPPLEMENTATION WITH NINE VITAMINS

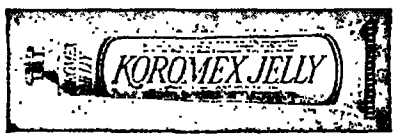
recent extensive investigation confirms contraceptive effectiveness of the active ingredient in Koromex Jelly

A *most illuminating report* based on extensive clinical and experimental data has recently been published by Eastman and Scott (Human Fertility, 9:33, (June) 1944.) These authors studied the safety and efficacy of phenylmercuric acetate which is the active constituent of Koromex Jelly.

1 Clinical evidence showed that in actual use, *phenylmercuric acetate jelly had* a remarkable record for contraceptive efficiency.

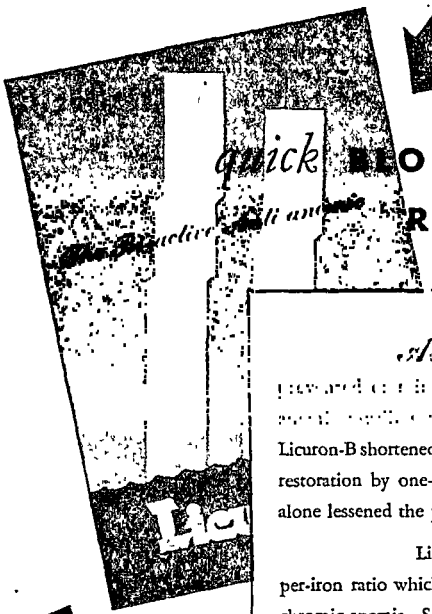
2 The earlier work of Baker, Ranson and Tynen (Lancet, 2:882, (October 15), 1938), showing a very high spermicidal potency, was confirmed.

3 Toxicity was found low.



4 No evidence of irritability on the part of either the husband or wife.

In addition to the above qualities, Koromex Jelly, which also contains oxyquinoline benzoate and boric acid in a well buffered glycerine gum base, has the properties of adhering firmly to the vaginal lining and mixing readily with the vaginal secretions. It has optimum spreading qualities. Its pH of 4.6 is constantly maintained even in the presence of the buffering action of the protein seminal fluid.



Koromex Jelly does not stain. It is not excessively lubricating, and is well tolerated. Because of these qualities you can assuredly — prescribe Koromex *with confidence.*

Write for Literature.

Editorial

Virus Diseases, I

We do not know what a virus is or where it belongs in the classification of living things. The story has just begun, but the opening chapters prove that the discovery of viruses equals in importance the discovery of bacteria as the cause of disease. Already several hundred viruses have been identified and they are known to be capable of infesting almost every living thing from plants to insects, amphibians, birds, mammals, and even bacteria. They are the cause of some of the most important diseases of man, including smallpox, yellow fever, rabies, encephalitis, poliomyelitis, virus pneumonia, measles, and influenza. Is it any wonder that they are being studied in every laboratory dealing with microbiology?

Early investigators in the field of bacteriology discovered that by passing suspensions of bacteria through a porcelain filter a filtrate was obtained which contained no visible or culturable organisms. The first discovery that such a bacteria-free filtrate could cause disease came in 1892 when Iwanosky, using an apparently sterile filtrate of the mosaic disease of tobacco plants, reproduced the disease. The first disease of animals to be transmitted by a filtrate was foot and mouth disease in 1898. At that time the obvious explanation was to be found in the conception of ultramicroscopic bacteria small enough to pass through the pores of the filter. The discovery of bacteriophages in 1920 and studies of their effects led to a radical change of opinion and stimulated research into the nature of other filterable viruses.

This research was made exceedingly difficult by the fact that all attempts to grow viruses on bacterial culture media were unsuccessful. We now know that this was due to a fundamental difference between bacteria and viruses. The latter are obligate intracellular parasites. They can grow only on living tissues, and they die when their host ceases to live. Also, their invisibility prevented any determination of their size by direct measurement.

As early as 1920, viruses were successfully grown in tissue cultures of embryonal

This is the first of two editorials on the virus diseases. The second will appear in a subsequent issue.—*Editor*

cells. In 1931, Woodruff and Goodpasture reported the successful use of fertilized hens' eggs in growing the virus of fowl-pox. When they later reported that the virus used in making smallpox vaccine could be grown in the same way, the importance of the discovery became evident. A single egg could produce enough vaccine to immunize a thousand people. Furthermore, viruses were for the first time made available in quantities necessary for further investigation.

Scientists engaged in research on yellow fever had been growing minute amounts of virus on the brains of mice, a costly and laborious process. By using hens' eggs they were able to grow the virus on a mass-production basis. It was this that has made it possible to vaccinate our soldiers against one of the deadliest of tropical diseases. Many thousands of them have been sent to the worst yellow-fever regions in Africa without contracting the disease. The bite of an infected mosquito is no longer necessarily a deadly menace.

In like manner the development and compulsory use of preventive inoculations have completely protected our soldiers against typhus fever. In every previous war in Europe this disease has occurred in widespread epidemics and has taken a heavy toll in sickness and death. Encouraging reports come from laboratories where the virus of influenza is being studied. A vaccine has been developed in Australia which may prove to be a godsend if we have another world-wide epidemic as we did in 1918. Without undue optimism we may hope for the early conquest of poliomyelitis by immunologic therapy.

It is a strange fact that while more and more bacterial diseases are being cured by antitoxins, chemotherapy, and antibiotics, no specific cure has ever been found for any virus disease, and only recently has a small group of viruses been found that is sensitive to the sulfonamides. It is significant that the members of this group most nearly approach the bacteria in size and probably in other characteristics. They are large enough to be seen with an ordinary microscope; they are the cause of trachoma, lymphogranuloma, and swimming-pool conjunctivitis.

It seems probable that the viruses are protected against the curative action of antitoxins and immune serums by reason of their intracellular habitat. Substances which confer immunity can destroy them before they reach sanctuary inside the cells of the host, but cannot cure the disease after the viruses have escaped from the serum to the cells.

The difficult problem of how to measure invisible bodies was overcome by the use of collodion filters with pores of known and varying sizes. The results corresponded with those of an entirely different method, high-speed centrifugation. More recently the results of both methods have been checked by direct observation with the electron microscope. They show a tremendous difference in the size of the virus bodies in different diseases although the particles of each species are fairly uniform in size. Biochemical research reveals a simplification of structure in inverse ratio to size, ranging from a complexity approaching that of bacteria in the larger bodies to the simplicity of a single molecule in the smallest. It seems likely that as we learn more about them their differences will be found greater than their similarities. In fact, the reclassification of virus bodies into groups has already begun.

What About It?

Recently the J.A.M.A. forecast the probability of a reduction of 15,000 civilian physicians by 1948. We wonder how many already overworked practitioners have considered the significance of this forecast.

In cold figures it means that each doctor will have to increase his output by 10 per cent if present standards of medical care are to be maintained. Whether this will be possible for many already overloaded members of the medical profession, especially the older men, is a question.

The question becomes even more important in view of the Army's demand for 16,000 additional trained nurses. The interrelationship between the available supply

of physicians and the available supply of nurses seems to have been somewhat overlooked in the procurement setup. The busy surgeon, who before the war had a trained nurse as an office assistant and now employs a lay person, must do many things himself which could be done by others.

For instance, we are informed by a physician that while he was on "emergency call" at his local hospital he had in the course of one evening served as physician, nurse, orderly, information clerk, telephone operator, and instructor. Had there been an adequate staff of well-trained nurses on hand as well as a sufficient number of operating personnel much of this work would have been done better in less time, and the physician would have been enabled to apply his time entirely to the practice of medicine.

Doubtless this story could be duplicated at the present time in many local hospitals throughout the country. The wastage of physicians' time, if multiplied by the possible instances in which this sort of thing is occurring in local hospitals, is obviously enormous.

Now, if we are to lose 16,000 additional trained nurses, the amount of extraneous work already falling to the lot of the physician will be further increased. In other words, as the trained nurses are withdrawn from civilian hospitals the efficiency of the individual physician and the number of patients the doctor can properly care for is proportionately decreased, and standards of patient care are necessarily lowered.

We do not for one moment advocate any relaxation of nurse procurement for the armed forces to the extent that these are really necessary. We do, however, ask for intelligent evaluation of the situation in civilian hospitals with respect to nursing care. Instead of enacting more class legislation by drafting female nurses, or depending entirely on voluntary nurse enrollment, would it not be intelligent to train male laymen to carry part of the load? Again we call attention to the large number of 4F's. Are they being utilized as fully as they can be? Do not our hospitals furnish an opportunity to make further use of their services?

Medical Officers Needed

The New York State Guard needs medical officers and personnel. At this time the training and preparation of the Guard for the year 1945 with special reference to the medical detachments requires a full complement of medical officers. The field training is becoming each year more rigorous, and the work of the medical detachments during field training more important to the welfare of the officers and enlisted men of the various units.

Owing to the shortage of physicians it has become increasingly difficult to obtain a full quota of medical officers. It is obvious that proper training of medical corpsmen must begin well in advance of the period of field training in order that maximum efficiency of the medical detachment can be attained. In order to accomplish this, we urge those of our membership who can possibly do so to seek commissions in the Guard as medical officers wherever they are needed throughout the State. It is suggested that any physicians interested communicate with the Adjutant of the New York Guard, Maj. Albert Weber, at Guard Headquarters, 80 Centre Street, New York 13, New York. And do not forget that the New York Guard urgently needs six thousand recruits immediately.

A Memorial to Dr. Peter Irving

Dr. Irving, Secretary and General Manager of this Society since 1937, died on December 28, 1944, at Roosevelt Hospital, after a cardiac illness of several months.

His death is a great loss to the Society and a great sorrow to all who have been associated with him in the work of the Society.

It would be impossible to overestimate his value. Not only was he Secretary and General Manager, and as such was conversant with and helpful in everything that was

undertaken by the Society, but also he was Managing Editor of the NEW YORK STATE JOURNAL OF MEDICINE. Under his editorship the Journal steadily improved; and the improvement will continue under new plans already formulated with his help and guidance. He was appointed in 1943 by Governor Dewey as a member of a Commission to investigate the management and affairs of the Department of Mental Hygiene of the State of New York.

Dr. Irving was born in 1878 in Madison, Wisconsin. His preliminary education was in a private preparatory school, St. Austin's, Staten Island. He went to Columbia University and received his A.B. in 1900. In 1903 he graduated from the College of Physicians and Surgeons (Columbia University) and was the winner of the second Harsen Prize.

His internship was in Roosevelt Hospital, where he was graduated as house physician; and he had been on the staff of that hospital continuously, first as clinical assistant, and for many years as chief of the medical dispensary, advancing up through the grades until, finally, before his retirement from active practice, he was attending physician. At the time of his death he was consulting physician to Roosevelt Hospital and also to New York and Seton Hospitals.

He was a member of the Alumni Association of Roosevelt Hospital, a Fellow of the New York Academy of Medicine, a Fellow of the American College of Physicians, and a Diplomate of the American Board of Internal Medicine.

We are inclined to think of Dr. Irving as the full-time Secretary and General Manager of our Society, but before that, for thirty-two years, he practiced medicine in New York County. He had great knowledge and skill in medicine, but he did not call himself an internist or a diagnostician. He was a family physician at its fullest and best. He treated people and not merely diseases. His judgment was sound and very sane. Called in to see one patient for some illness or ailment, he would soon be guiding the whole family in health matters.

Nothing was too much trouble, nothing was too trivial for him to take an interest in. He knew people, and he knew the art of medicine, and he knew that troubles that are of little importance from the doctor's point of view do not seem unimportant to the patient. There are not many family physicians like him left in the larger cities, and medicine and the public are the worse for their lack. His former patients still talk about his wonderful work for them, whether it was a critical illness in which they are convinced that he saved their lives, or a successful regimen of life which has kept them in health. He first took an active part in organized medicine in 1927 when he became a member of the Special Committee on Nursing of the New York County Society. He served on the Economics Committee in 1928 and 1929, was Assistant Secretary from 1930 to 1936. He served on the Board of Censors for one year and then took up his duties with the State Society. We have already spoken of his work with us since 1937, its excellence, his unfailing attention to duty, but it is not so easy to describe what he gave us over and above that.

There was something about his personality, his candor, his friendship, and his keenness of mind that was an inspiration to all who worked with him, that was a solace and a help to all the members of the Society who came to him for help and for advice.

Perhaps his outstanding characteristic was his intense loyalty, loyalty to the Society and loyalty to his friends and associates. We shall never forget him and it will be a long time, if ever, before we see another man like him.

Resolved, by the Council of the Medical Society of the State of New York that this resolution be spread upon its minutes and that a copy be sent to his family.

At the meeting of the Comitia Minora of the Medical Society of the County of Kings and Academy of Medicine of Brooklyn, held January 3, the following resolution was unanimously approved:

> *Resolved*, that the medical profession of the state of New York has lost an invaluable friend and faithful servant in the death of Dr. Peter Irving, late Secretary of the Medical Society of the State of New York. We wish to express to his own family, as well as to the official family of the Medical Society of the State of New York, our deepest sympathy and heartfelt condolence. We mourn our loss.

THE TENDOGENETIC DISEASE AND ITS TREATMENT WITH X-RAYS

J. Borak, M.D., New York City

(From the X-Ray Department of New York University College of Medicine)

THE most frequently occurring example of a tendogenetic disease is the syndrome constituting the so-called "frozen shoulder."

This condition has been considered to be arthritis of the shoulder joint (omarthritis), periarthritis, humeroscapularis, bursitis. However, in the light of the work of Codman[1] it is certain that it is ultimately caused by a process originating in a tendon, most frequently in that of the supraspinate muscle, situated between the acromion, the bursa subacromialis, the deltoid muscle, and the capsule of the shoulder joint. The infraspinate, subscapular, and biceps muscles, too, are often involved. The tendon of the muscle affected is found to be in a state of degeneration and necrosis. Following the modern concept, this is the result of anemia caused not by an occlusion of the blood vessels, but by disproportion of the blood supply and the demand on the blood. Such a condition can easily develop in a tendon because it can readily be overused, while, in strong contrast to the muscles, it has a very poor vascularization. As a consequence, a number of fibers of the tendon become necrotic. The necrotic tissue acts as a foreign body giving rise to a peritendinitis in the surrounding sheath, which in turn may spread to the walls of the bursa subacromialis, to the sheath of the tendon of the deltoid, to the fibrous layers of the capsule of the shoulder joint, and so on. As a consequence of this spreading over a number of structures, the pain irradiates along the arm, simulating neuritis, and is not restricted to a joint as is the case of true arthritis. The shoulder joint itself, as far as the synovial membrane and the cartilage are concerned, is never involved in that condition.

The object of our treatment is, therefore, never an arthritic disease. Nor do we treat the necrotic tendon. What we do treat is the inflammatory process taking place in the sheath of the affected tendon, in the walls of the bursa, and in the neighboring structures. The inflammatory process presumably starts as a simple serous exudation, but owing to the severity of the necrosis there is usually a precipitation of fibrinogen so that fibrin appears in abundance. The threads of fibrin bind together the walls of the bursa and the adjacent structures. It is essential to realize that we are dealing here with loose attachments caused by fibrin, and not with fixed adhesions caused by fibrous tissue. If the latter were the case, any conservative treatment in that condition would be as ineffective as in fibrous ankylosis. A "frozen shoulder" would then never loosen up, but remain ".rozen" forever.

Experiments concerning the healing of wounds under the influence of x-rays show that the amount of fibrin between the edges of the wound is much less in the irradiated wound than in the nonirradiated wound. As a consequence, the resulting scar is thinner and finer in the irradiated area. However, the rays do not dissolve the fibrin directly. Primarily, they dilate the capillaries and increase the permeability of the capillary walls. This is followed by an increased flow of plasma from the blood, carrying along lymphocytes, monocytes, and leukocytes which have the power to phagocytize and to carry away the fibrin and the necrotic tissue débris.

Within the tendogenetic disease a calcified and a noncalcified variety may be distinguished.

The Calcified Variety

It is assumed that when the tendon is subject to a fatty type of degeneration, saponification takes place, followed by precipitation of the calcium carbonate circulating in the blood stream. Eventually, a lime deposit results which can be well visualized on x-ray films. There is no hypercalcemia, and no disturbance whatsoever of the calcium metabolism.

As to the mode of action of x-rays on the lime deposits, it is noteworthy that small doses may cause the disappearance of calcified deposits in acute cases, while large doses are required in chronic cases. In accordance with this is the fact that in acute cases even very large deposits may disappear within a few weeks, while in chronic cases even small deposits disappear only after several months. This applies also to the clinical symptoms associated with the calcified deposits such as restriction of motion and pain, in part in the region of the bursa, and in part irradiating along the arm. These symptoms subside in a few days in acute cases, while they start to subside only after a considerable length of time in chronic cases. As to the relationship between the response of the clinical symptoms and the radiographic signs of calcification, the clinical symptoms always subside first. While in acute cases the calcium deposits, as a rule, subsequently also gradually show decrease in density and size, in chronic cases the clinical symptoms may be subsiding while the calcium deposits still may be found unchanged. In cases with the calcium

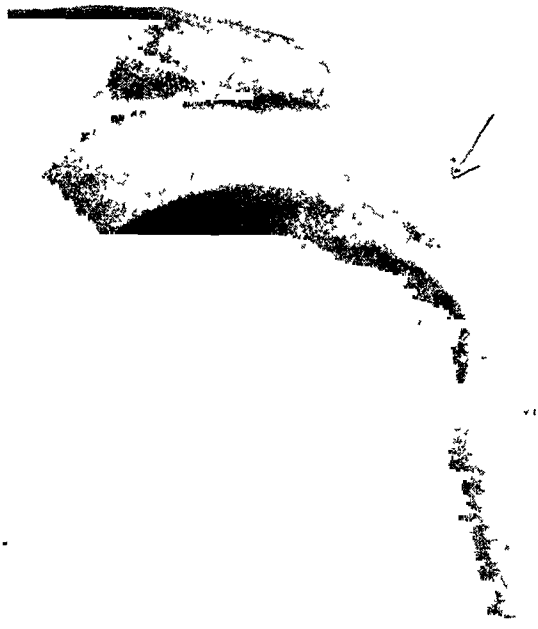

FIG. 1. Large calcification in the region of the subdeltoid bursa.

FIG. 2. Same case as in Fig. 1. Four weeks after a series of x-ray treatments.

deposits but without clinical symptoms, there is no response at all.

All these facts point to the conclusion that x-rays do not have a direct action on the lime deposits, but on the underlying inflammatory process, and that the calcium salts disappear in the course of events incited by rays in the inflamed area. It is the postradiation edema carrying phagocytic cells which causes the dissolution of the calcium deposits. In other words, it is the same radiation effect which causes the disappearance of the fibrin and necrotic tissue that also causes the dissolution of the calcified deposits. In the state of acute inflammation when the capillaries are hyperemic anyway, a small dose is sufficient to increase their permeability, and subsequently the pericapillary edema. However, the more chronic the process the less pronounced is the hyperemia and, consequently, the larger doses are required to bring about the transudation carrying the phagocytic cells in a quantity necessary to absorb the calcified deposits.

Since Renck[2] (Stockholm) suggested x-ray therapy for that condition in 1926, and Sandstrom[3] reported favorable results in a larger number of cases in 1929, a great number of papers have been published on that subject. In this country Lattman,[4] Lorimier,[5] Weinberg,[6] Baird,[7] Pendergrass and Hodes,[8] Klein and Klemes,[9] Brewer and Zink,[10] Harris,[11] and others have published valuable observations on the subject. It appears that when a uniform technic of irradiation is applied in all cases favorable results are obtained only in a certain type of case. In our fifteen years of experience in this field we have found that better results can be achieved if three separate groups are differentiated, and treated in a different manner. The impairment of the range of motion has been found as the most valuable basis for a differentiation. This criterion has proved to be of more decisive importance than the size of the deposit. It is also more dependable than the duration of the symptoms, which in the chronic cases often cannot be recalled exactly. Moreover, acute exacerbations occur in the course of a chronic condition.

The first group is marked by complete, or nearly complete, immobilization of the affected part. The pain sets in suddenly, and is so severe that, as one of the patients has phrased it, "The mere thought of a movement caused pain." The intense pain produces a strong spasm so that the arm is adducted to the body with great force. The region of the subacromial bursa is extremely tender. This acute or hyperacute condition is the pattern of the "frozen shoulder." It is caused by an extension of the calcium deposit from the tendon into the wall of the neighboring bursa, where an acute exudation develops. This condition is one of the most gratifying subjects of

FIG. 3. Calcified deposit in the region of a hip.

FIG. 4. Same case as in Fig. 3; four weeks after a series of x-ray treatments

radiotherapy as far as the smallness of the dose, the promptness of the response, and the degree of the improvement is concerned. Even a dose as small as 100 r, calculated at the bursa, given on two or three successive days, makes the acute symptoms subside overnight, so to speak, so that the disability of the patient disappears within a few days. It appears advisable to add 200 r on two successive days to prolong the duration of the postradiation edema and thus to increase the number of the cells functioning as phagocytes. One portal of entrance is sufficient in these cases. Even very large deposits may then gradually disappear without further treatment (Figs. 1 and 2). About 20 per cent of the patients are treated in this stage

The second group is marked by a restriction of the mobility of the affected arm. The arm is not fixed, as in the first type, but can be only incompletely adducted, e.g., only to 40 or 70 degrees without causing pain. It is obvious that the inflammation and the ensuing spasm are less severe in this type, and for that reason a greater range of motion is possible. This condition is chronic and tends to become progressive, presumably because the inflammatory process becomes more and more rich in fibrin, causing attachments of the bursa and the adjacent structures. To be effective in that stage a dose of 200 r, calculated in the bursa, is given six to eight times at intervals increasing from two to four days. Two portals of entrance, one anterior and one posterior, are required in these cases After a month a new series of treatments is added, if necessary, until the deposit is substantially reduced in size and density, and the pain on moving the arm has considerably subsided. About 65 per cent of the patients are treated in this stage.

The third group is marked by the lack of any restriction when the shoulder is moved actively, but pain is experienced at the extremities of the range of motion when the arm is raised over 80 degrees. This chronically stationary condition develops either as an outcome of one of the previously mentioned types, or as a result of a process insidious from the very beginning. The muscles are not spastic but may become atrophic. It is obviously a mild inflammation which, however, does not come to an end, presumably because of lack of a sufficient number of phagocytic elements in the inflamed area. To help these patients with x-rays a dose of 250 r, calculated at the bursa, is given eight times at intervals of two days. Three portals of entrance, one anterior, one lateral, and one posterior, are required in these cases After about six weeks a new series of treatments is added in accordance with the course of the symptoms. About 15 per cent of the patients are treated in this stage.

The Noncalcified Variety

In the light of the prevailing theories it is to be assumed that if the degeneration is not of the fatty, but of another type, e g , of the hyaline type, an essential precondition for its saponification is lacking, and no calcification will result. The ensuing consequences of the degeneration of the tendon, however, are the same, regardless of the type. Thus peritendinitis, bursitis, or periarthritis may develop.

The clinical pictures are the same as in the

calcified variety. Thus, there is a tenderness in the region of the subacromial bursa, there is a restriction of motion of the affected arm, to a varying degree, and there may be pain irradiating along the arm and toward the neck.

Despite the clinical resemblance, the absence of calcification, far from being an asset, proves a liability, because it deprives the condition of its most valuable diagnostic evidence. If we consider that in the tendogenetic conditions, beside the pain localized in the neighborhood of a joint, there is also pain irradiating in many directions far away from its source, it is natural that "in the absence of calcification, differentiation of this condition from periarticular fibrositis may be impossible" (Steinbrocker)[12]; and that cases "diagnosed as neuritis, rheumatism, and arthritis of the shoulder are really instances of subacromial bursitis" (Codman). There is also often difficulty in deciding whether the pain in the shoulder region originates from peritendinitis, or from a process in the cervical spine. As a consequence of a mistaken diagnosis, the shoulder may be treated with x-rays in a case in which rather the cervical spine should be treated. A failure will naturally result.

On the other hand, due to the lack of conclusive clinical evidence as to the source of the trouble, the result of x-ray therapy acquires to some extent the value of a test. When the diagnosis is wavering, for example, between a tendogenetic condition and a disease emanating from the cervical spine, the disappearance of the pain after the irradiation of the cervical spine with exclusion of the shoulder will obviously favor the diagnosis of a condition irradiating from the cervical spine, and vice versa.

To be of diagnostic value also in cases in which the irradiation of the shoulder was not followed by improvement, x-ray therapy of the noncalcified variety should be performed according to the same principles as that of the calcified variety. Both conditions respond in the same way to x-rays.

This is easily understood when we recall that we do not treat with rays the calcium deposit, but the underlying inflammatory process which is the same in the calcified and noncalcified variety. Accordingly, three groups are to be differentiated, depending on the impairment of the range of motion of the shoulder joint. Each case is treated in the same manner as the corresponding type of the calcified variety. The more pronounced the process of inflammation, and consequently the spasm causing the "freezing" of the shoulder, the smaller the dose effective and the shorter the period of time until an improvement is noticed. Accordingly, it amounts to only a few days in the cases running an acute course, and to a number of weeks in the more chronic processes.

Despite the similarity of response in the corresponding types of the calcified and the noncalcified variety, it appears that the absence of the calcium deposit is a handicap, not only in the field of diagnosis, but also in that of x-ray therapy.

This is so because, deprived of this sign, we do not have a criterion directing the treatment in that condition, while in the case of a calcified tendon the x-ray film showing the calcium deposit may be helpful in determining when the treatment is to be stopped, or when it is to be continued.

Tendogenetic Conditions Outside the Shoulder Region

The tendons of the supraspinate muscle and the neighboring muscles in the region of the shoulder joint, endowed with the function of elevating and rotating the arms, give rise to the development of tendogenetic disturbances more frequently than the tendons of all other muscles taken together.

Occasionally, however, any other tendon may also be affected. In this respect considerable differences exist, probably resulting from differences in function and activity of the muscles. Thus, some of them are decidedly affected more frequently than others, so that sites of predilection may be spoken of.

In the upper extremities, beside the tendons around the shoulder joint, the following tendons are most frequently affected: that of the triceps near the olecranon, that of the muscles below the capitulum radii, giving rise to a complex known as the "tennis elbow," and that of the flexors digitorum longus inserting on the phalangeal joints.

In the lower part of the body, tendogenetic disturbances occur in the region of the hip (Figs. 3 and 4), in the tendons of the gluteus, piriformis, and obturator internus, in the tendon of the adductus magnus and vastus medialis, forming the Pellegrini-Stieda syndrome, and the tendon of Achilles near its insertion on the os calcis. For unknown reasons in some of these the calcified variety prevails, while in others, such as in the "tennis elbow" or subtrochanteric bursa, it occurs very infrequently, if at all.

In all tendogenetic conditions, regardless of their sites, the results of x-ray therapy are in every respect comparable to those in the shoulder region. They can be summarized as follows: x-ray therapy has proved to be a valuable therapeutic agent in tendogenetic conditions, in both the calcified and noncalcified variety. The de-

gree of the impairment of motion should be used as the main criterion of the dose to be applied.

FROM MY POINT OF VIEW

The time was 4:30 P.M. My patience was at a low ebb. The number of my patients was not. My slave driver, officially known as my secretary, ushered in a vivacious, enthusiastic person of some 30 years of age. If there is one thing which makes me cringe it is enthusiasm at 4:30 in the afternoon. The patient laid several books on my desk. I glanced at the titles, and moaned, "Deliver me!" One was a text on allergy, and I knew I was in for a bad half-hour.

Sure enough, as the enthusiastic lady proceeded, despite my attempts to interrupt, she told me not only about the causes of her asthma and hay fever, but all about the factors pertaining to allergy in [illegible] clusively, for fifteen years.

The patient, I gathered, was a school teacher. She was digging a hole, and I proceeded to help her do so, intending to pull the hole in on top of her. Thus, when she paused from sheer exhaustion, I picked up one of her other books. It was a book on calculus. I said, "So you are a mathematician; I doff my hat to you. I never could understand mathematics." Quickly came the reply. "Doctor, that is the fault of your teachers. If you had been taught the basic principles, simple arithmetic, then algebra, and on up, you could then understand calculus."

"Oh, I see your point; and do you think the same procedure is necessary in studying other sciences [illegible] nciple applies

I pulled the pin out of the hand grenade. "If that is true, and I surely agree with you, how then do you expect to understand a book on allergy when you have never been taught the basic sciences of chemistry, physiology, anatomy, and bacteriology?"

"Oh," she replied, "that is different. Everyone knows about his own body." That grenade was a dud.

Of course it isn't "different." Books on surgery, internal medicine, obstetrics, or allergy are the [illegible] the truth, the whole truth, and nothing but the truth, and are usually presented in simple terms, i.e., simple to the man who possesses the basic knowledge necessary to see and understand the truth in its entirety. But we must admit that the lay reader guides his actions, not by the scientific truth contained therein, but by his interpretation of the facts presented and this interpretation is bound by his own narrow horizon of personal observation and experience.

The number of flowering trees and shrubs, rose bushes, and fruit trees which have been destroyed is enormous, even though the article they read said, [illegible] invariably stress the fact that people differ in their sensitivities to different foods, the lay students frequently demand of me my "asthma and hay-fever diet," and intimate that "all that testing" isn't necessary.

I am sure that all M.D.'s have had this experience. I wonder if it is possible to write an article on a medical subject and use words and phrases which cannot be misunderstood by those not educated in basic sciences. My own experience leads me to answer that question in the negative.

People also get the idea that they possess full knowledge about the treatment of a disease from reading or hearing some of the remarkable results radio announcers emit at regular intervals. The formula seems to be that the more enthusiasm shown, and the more convincing the manner in which the facts and the semifacts are presented, the better and higher paid the announcer. The same formula seems to apply to medical articles written for the consumption of the lay reader. So the reader and listener is metamorphosed into a doctor giving advice and remedies, freely, to himself and to everyone else in the community. For this advice he or she charges nothing, which is exactly what it is worth.

The next step, of course, is to attempt to carry that semiknowledge into his physician's office, and use it to interpret the doctor's diagnosis and treatment.

I think it behooves us to stop and take stock of the results of any given procedure after years of following such a line. Personally, I am far from convinced that the good results of the medical educational program which is being followed outweigh the harmful effects. The harmful effects are due mainly to the fact that a knowledge of basic principles *is* a necessity before facts based upon them can be properly understood. This principle applies to almost every branch of science and, notwithstanding the lady's "opinion," the science of the healing art is no exception.—*Frank C. Metzger, M.D., in J. Florida M. A., Jan., 1945*

LESIONS OF THE CERVICAL INTERVERTEBRAL DISC: CLINICO-PATHOLOGIC STUDY OF TWENTY-TWO CASES

JEFFERSON BROWDER, M.D., Brooklyn, New York, and ROBERT WATSON, M.D., Little Rock, Arkansas*

(From the Neurological Unit of the Brooklyn Hospital and the Neurosurgical Service of the Kings County Hospital)

DURING the past decade a phenomenal interest has been manifested in the diagnosis and surgical treatment of patients who present clinical findings considered to be the result of extrusion of an intervertebral structure. The publication of Mixter and Barr[1] in 1934 gave impetus to a clinical enterprise which has disclosed that dorsal displacement of a part of an intervertebral disc is a frequently encountered clinicopathologic entity. Prior to their publication only 56 lesions of this type at all levels of the vertebral column had been described, whereas since this time some 4,000 cases have been added to the literature. Interestingly enough, one third of those recorded before 1934 were in the cervical region; however, since this date less than 2 per cent of all reported instances were in this area. The clinical syndrome resulting from protrusion or herniation of a disc in the lower lumbar area has been well authenticated and effective surgical therapy for relief of the disability produced by such a process has been established. This cannot be said of a cervical lesion of comparable pathogenesis. As estimated by the number of such cases reported, there appears to be a relative infrequency of occurrence of pathologic alterations of the cervical discs; consequently, the syndrome is too often not considered in differential diagnosis when a dysfunction referable to the cervical region is under consideration. From a review of the literature, we have been able to collect only 69 verified cases with protrusion or herniation of a part of the cervical disc. Many of these have merely been enumerated in the reports of large series of extruded discs occurring at various levels of the vertebral column. It seems unlikely that this number represents the true frequency of the lesion. Just as patients with "slipped" discs in the lumbar area were thought to have lumbago, sciatica, sacroiliac strain, etc., before Mixter and Barr designated the causative factor, it is probable that some patients with symptoms and signs resulting from herniation or protrusion of a cervical disc are now considered to have some form of intrinsic disease of the spinal cord. It therefore seems important that all such verified cases of extruded cervical discs be recorded in order that the syndrome produced by this pathologic process be as readily comprehended as that occurring in the lower lumbar area. Toward this end we are presenting our experiences with 22 cases in which this lesion had disturbed the function of the cervical spinal cord and/or nerve roots. Twenty-one were verified at operation and one at autopsy.

Full credit should be accorded Stookey[2] for the delineation of the clinical entity that results from compression of the cervical spinal cord by dorsal protrusion of a part of an intervertebral structure. Although in his initial paper this lesion was designated as ventral extradural chondroma, a second paper[3] by him concerning the same subject was entitled "Compression of the Spinal Cord and Nerve Roots by Herniation of the Nucleus Pulposus in the Cervical Region," indicating that he now considered the so-called chondroma to be a protruded part of a disc. Mixter and Barr[1] in their first publication included four instances of rupture of a cervical disc with protrusion. In 1935 Mixter and Ayer[4] added four more cases, a total of eight from their clinic. In a report of a series of 100 cases of herniated discs at all levels, Walsh and Love[5] found six to be in the cervical region. Additional cases have been recorded, the most recent being that of Semmes and Murphy[6] and a review of 750 cases by Love and Walsh[7] which include 18 in the cervical region.

Pathologic Considerations

Several important investigations have been published relative to the pathologic changes observed in the intervertebral structures. Of particular merit are the contributions by Schmorl,[8] Andrae,[9] Beadle,[10] and, more recently, Saunders and Inman.[11] The excellent review by Saunders and Inman incorporates the essential features of previous studies by others. From the accumulated evidence it appears that the annulus fibrosus is not infrequently encroached upon by the expanding nucleus pulposus, in some instances reducing it to a peripheral ring. Areas of necrosis may occur in the annulus, often serving as a starting point for fissures or tears. Superimposed trauma, even of a mild character, may result in a herniation of a part of the nucleus

Read at the Annual Meeting of the Medical Society of the State of New York City, May 10, 1944.

* By invitation.

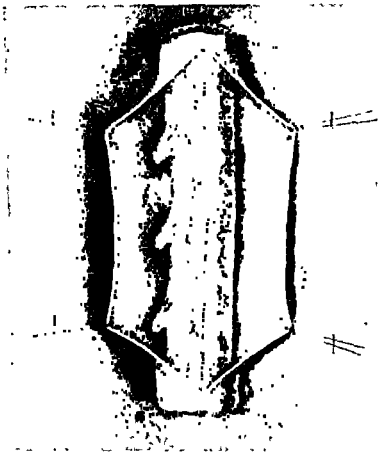

FIG. 1. An artist's conception of the cervical spinal cord compression by a true herniation of the nucleus pulposus producing clinical findings of ventral gray-column disturbance without evidence of fiber tract involvement. Note the herniated protrusion of the disc presented between the nerve roots.

pulposus through the defective part of the annulus. Such a sequence of events seems to be the logical explanation for many of the commonly encountered herniations of the nucleus pulposus in the lower lumbar area. In addition to this, Andrae recognized hyperplasia of the protruding cartilage which was considered by Stookey as chondromatous and later termed by Elsberg[12] "ecchondrosis." From the observations made in the 22 cases of the present series we have concluded that other pathogenic factors must be given consideration to explain the anatomic pathology disclosed in some. We have elected to group the different types of lesions according to their gross anatomic characteristics. These are: Group A—discrete, rounded, or oval-shaped masses consisting of cartilage-like tissue that project from the intervetebral structure into the ventral aspect of the vertebral canal; Group B—herniation of a part of the nucleus pulposus through a rent in the annulus fibrosus; Group C—a protrusion of a dorsal part of the annulus fibrosus surmounting a proliferation of the margins of the adjacent vertebral bodies. Stookey was primarily concerned with the type of lesion included in the first group; those in the second group are the soft protruded parts of the

FIG. 2. A protruding nodule severely damaging the cervical spinal cord.

nucleus pulposus similar to those found in the lower lumbar area, while the lesion in the third group has received but scant attention in the literature.

In the present series, fourteen of the lesions in 13 patients were of the Group A type, one patient having two protruding nodules, each at a different intervertebral level. All of these were 1 to 1.5 cm. in diameter and appeared to be an integral part of the intervertebral disc. At operation the area of the spinal cord impinged upon by the mass usually appeared softened and the undulations imposed on the cord by the movements of the cerebrospinal fluid associated with arterial pulsations and respirations were abruptly altered at the implicated level. In truth, it is this abnormality in the undulatory movements of the spinal cord that frequently attracts the operator's attention to the ventrally located protrusion. The lesions were most frequently found to lie slightly to one side of the midline, forming a glistening rounded elevation as viewed through the thinned-out overlying ventral dura. In a few instances in which a small nodule was laterally placed and compressed a spinal root, the spinal cord was found not to be encroached upon at all. However, a lesion so placed, if of sufficient size, may result in profound degenerative changes in the cord. Upon incising the ventral dura over the projecting mass, a pale, slightly irregular, grayish-white surface presented an appearance not unlike the adjacent part of the annulus. The masses were easily removed with a sharp curette. Microscopically the tissue had the appearance of fibrocartilage.

The second group of lesions was composed of the true herniation of a part of the nucleus pulposus. The masses in general were larger than those in Group A. There were five patients with this lesion in the series under consideration. In two, the spinal cord was grossly compressed by a tumor as large as the distal phalanx of one's index finger. In one case the anterior spinal cord had been compressed, disturbing the function of the ventral gray column unilaterally and without

FIG. 3. Cross section of the spinal cord caudad to the lesion depicted in Fig. 2. Areas of degeneration are quite obvious.

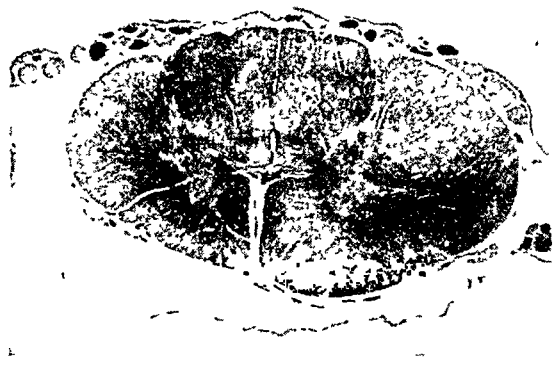

FIG. 4. Cross section of the spinal cord cephalad to the lesion shown in Fig. 2. At this level the degeneration is rather widespread.

clinical evidence of fiber-tract or nerve-root involvement (Fig. 1). The remaining two cases were examples of small herniations compressing a root and without spinal cord implication. Upon opening the ventral dura overlying such a herniation, a rather tough capsule was found to enclose the mass. Incision through this membrane was followed by partial spontaneous extrusion of the contents. The herniated nucleus, when removed, had the characteristic appearance of an extruded portion of the nucleus pulposus as encountered at other levels of the spinal column.

Frequently the mass came away as one piece of pearly-gray, flaky material with frayed, irregularly shaped tentacles. All five examples were located in the anterolateral part of the vertebral canal as obtained in comparable lesions disclosed in the lower lumbar area. In retrospect, after a critical analysis of two of these cases of relatively large dorsal herniation of a part of the nucleus pulposus there were no features of the symptomatology or physical signs that would aid in a preoperative differentiation of this lesion from a neoplasm so situated. A preoperative diagnosis in the remaining three was correctly made. In two of these the symptoms and signs were referable to a single nerve root only and in both, the complaints of pain in the upper chest and upper extremity followed trauma of a character that could be logically considered as a causative factor.

The third group presented a problem that as yet is not fully comprehended. As stated, this pathologic process is a posterior displacement of the dorsal portion of the annulus fibrosus seemingly resulting from proliferation of the adjacent margins of the vertebral bodies. Overgrowth of bone was a prominent feature. Such lesions may be a part of a more extensive so-called hypertrophic spondylitis. There were four cases in this series. Roentgen-ray examination in three cases disclosed a lipping of the vertebral margins associated with narrowing of the intervertebral space at the level of the lesion. A prominent ridge of bone and cartilage was found to extend across the entire ventral aspect of the spinal canal in these, and in one a segment of annulus was dorsally displaced by the overgrowth of bone. That this pathologic process is a protrusion of a part of an intervertebral disc seems incontrovertible; however, it is of different pathogenesis than that commonly designated by this term. Histologically, the projecting tissue was found to be the same as a relatively normal-appearing annulus fibrosus with attached fragments of bone.

Specimens of dorsally displaced discs obtained at operation are frequently somewhat fragmented by the manner of removal; consequently, microscopic study of this material often gives an incomplete picture of the process. The recorded observations on tissues obtained at autopsy have permitted a more detailed study of the involved intervertebral structure. Our investigations of the material obtained at operation in the present series disclosed findings relative to the protruded or herniated part of the disc that are in accord with those reported by others. The single specimen of the cervical spinal cord with the protruded part of the fifth intervertebral disc removed at autopsy without disturbing relationships is deserving of special comment. This specimen showed marked flattening and distortion of the cord (Fig. 2). At the level of the ventral extradural mass there were scattered areas of degeneration in the cord without predilection for any particular fiber tract. The anterior gray columns were distorted and showed a paucity of cells at this level. Sections of the cord extending three spinal segments caudad to the lesion revealed degenerative changes limited for the most part to the fasciculus cuneatus and the dorsolateral spinocerebellar tracts (Fig. 3). Sections extending two spinal

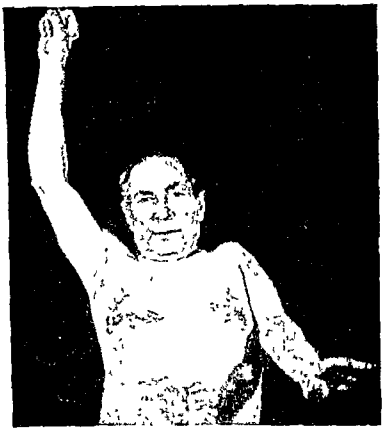

FIG. 5. Photograph of patient demonstrating loss of abduction of the left arm without other abnormal findings. The lesion in this case is that shown in FIG. 1.

segments cephalad to the lesion showed rather widespread degenerative changes (Fig. 4).

Clinical Manifestations

The symptoms and signs arising from compression of the cervical spinal cord by a discrete hyperplasia and dorsal projection of a part of the annulus fibrosus (Stookey's nodes) are fairly constant in pattern. It is noteworthy that in some instances one of these small nodules can produce such profound changes in the spinal cord without there being more than slight partial obstruction of the spinal subarachnoid space. The account of the clinical story and the abnormal physical findings given by Stookey in his original article concerning the ventral extradural chondroma stands as an excellent description of spinal cord disturbances that result from the protrusion of a small nodule into the ventral spinal canal. The findings in most of the patients in our series are in accord with the symptomatology and signs as recorded by him. Relatively early in the course of the disease there is pain and slight clumsiness of an upper extremity with weakness of the homolateral lower extremity. In addition there are changes in appreciation of painful and thermal stimuli on the side contralateral to the lesion. The functions of the dorsal columns are spared for a time. The extent of involvement of the upper extremities depends on the level of the projecting mass. Later in the course of the disease there is implication of the trunk and extremities bilaterally and finally all fiber tracts of the spinal cord become affected. From the evidence derived by clinical examination we have been unable to differentiate with certainty the discrete nodules from a protruding ridge of annulus fibrosus. It may be said, however, that the patients with the rounded, laterally placed lesions frequently manifest signs of unilateral implication of the spinal cord for several months before bilateral involvement is evident, whereas, as would be expected, a protruding ridge of annulus across the ventral vertebral canal often produces bilateral abnormal signs from the outset.

The clinical manifestations produced by true herniation of the nucleus pulposus through a defect in the annulus fibrosus depend on the rapidity with which the nucleus becomes extruded and the size of the mass projecting into the vertebral canal. The genesis of this lesion appears to be clearly understood. Whenever the herniated nucleus presents at the extreme lateral position and is relatively small, only a nerve root is involved. Mild compression of the cord by such a pathologic process may result in dysfunctions limited to the adjacent anterior gray column (Fig. 5). Moderate compression usually implicates the spinothalamic and pyramidal pathways, and, in the instances in which the mass increases to a relatively large size, all fiber tracts will eventually suffer. These herniations may attain considerable size and although advanced physiologic interruption of the cord may accompany the larger masses, the spinal cord seldom undergoes irreparable damage. It is the completeness and promptness of recovery of patients from whom such a lesion has been removed that set it apart from that previously described.

As stated, it has been impossible to clinically differentiate between the projecting discrete nodule and the ridge of annulus fibrosus in many instances. This is particularly true if the effects of either pathologic lesion have been of considerable standing. In our experience, a ridge of annulus produces bilateral signs from the outset. With but one exception, the patients with annulus protrusion presented evidence of advanced spinal cord disturbances when admitted to the hospital. In addition, it is possible that the technical difficulties attending surgical removal of a ridge that extends across the entire ventral canal may necessitate more displacement of the cord than is desirable, thereby adding a mild insult to the cord. In all events, the results following operation for this type of lesion have not been satisfactory.

Facts About the Group as a Whole

From a pathologic point of view it seems certain that the three processes described are not related except for the anatomic structures implicated, yet the symptomatology, physical findings, and therapeutic measures employed tend to draw the three together, thereby making it profitable to consider the entire series as a whole. There are several findings of interest in the 22 cases. Fifteen of the patients were men and 7 were women. The average age was 46 years. The initial complaint was referable to the upper extremities in fifteen instances, ten of these having a radicular type of pain and five having paraesthesias of the involved forearm, hand, and fingers. Those with paraesthesias and two others had pain in the neck and across the shoulders later in the course of their disease. In 5 cases, pain was never a feature of the illness. Of these 17 patients with the complaint of pain in either the neck or upper extremities, 10 had an aggravation of pain upon coughing or sneezing. In 7 cases the onset was characterized by weakness of one or both lower extremities. The duration of symptoms interpreted as being referable to the lesion was from six weeks to six years. Thirteen patients had symptoms less than a year and the remaining 9 gave histories of disturbances varying from one year to six years and two months. The average duration of symptoms for the entire series was twenty-one months. A questionable story of injury was obtained from only 5 patients. One of these fell on a slippery street, striking the occipital region of the head, about nine months before onset of symptoms referable to the cervical spinal cord. Another alleged a slight torsion of the neck while at work, but this accident was recalled only after the patient had been apprised of the type of lesion that was disclosed at operation. The third struck the top of the head on a low ceiling. The fourth sustained minor injuries in an automobile accident. The fifth began to have pains in the neck radiating into the left index finger and thumb while lying on his back repairing a truck. Only 7 patients came under observation prior to the onset of disturbance in gait. Of the remaining 16 patients, 2 were bed-ridden, 5 could walk with assistance, and 8 could walk short distances unassisted, albeit with considerable difficulty. Urinary bladder dysfunction was experienced by 7 patients, 2 having had urinary retention with overflow incontinence and 5 with mild to moderate hesitancy and urgency.

The physical examinations disclosed findings indicative of moderate to severe dysfunctions of the spinal cord with the exception of 7 patients. Four of these were examples of laterally placed nodules and 2 had true herniations of the nucleus, all associated with pain in an upper extremity and only slight, if any, evidence of spinal-cord disturbance. The remaining one showed marked paresis of the muscles of the left shoulder girdle without other demonstrable abnormalities (Fig. 5). In the other 15 patients examination disclosed variable degrees of spinal cord dysfunctions, namely, marked loss of motor power in the hands, interosseous atrophy, variable alterations in activity of the deep reflexes of the upper extremities depending upon the level of the lesion, loss of abdominal reflexes, spasticity, and hyperreflexia of the lower extremities with Babinski's sign bilaterally. Fibrillations were observed in the muscles of the shoulder girdles in 3 patients. A definite level of sensory disturbance could be demonstrated in 15. In 8 of these there was evidence of implication of the dorsal as well as the anterolateral columns; however, in no instance was a complete physiologic interruption of the spinal cord present. Spinal puncture revealed clear cerebrospinal fluid in 21 patients. In one instance there was a complete spinal subarachnoid block and in 13 others varying degrees of partial obstruction were demonstrable. No obstruction was present in 7 patients and spinal puncture was not carried out in the remaining one. The total protein content of the cerebrospinal fluid ranged from 21 to 215 mg. per 100 cc. Excluding a single instance of relatively high total protein (215 mg.) the average was 48 mg. In only one patient were the abnormal physical findings exaggerated by the withdrawal of cerebrospinal fluid. Plain roentgen-ray examination of the cervical vertebrae disclosed narrowing of the intervertebral space at the site of the lesion in six patients. In three of these, hypertrophic lipping of the posterior aspect of the vertebral bodies was shown to project into the spinal canal at the level of the lesion, which was disclosed at operation to be a ridge of annulus. The plain roentgen-ray studies of the cervical spine in all others revealed no abnormalities of significance. A contrast medium was used in 13 cases. Evidence of the presence of a partial obstruction in the cervical subarachnoid space was demonstrated by this method in 6. The procedure was not of diagnostic aid in the other 7 patients.

Surgical Experiences

There were, in all, 25 operations on 21 patients of the series, 2 having been subjected to secondary operations and another to 3 explorations. The pathologic processes were encountered from the third to the sixth cervical interspaces, inclusive. There was one lesion at the third interspace, five

at the fourth, nine at the fifth, and six at the sixth intervertebral space In addition there was one patient with two protrusions, one at the fourth and the other at the fifth interspace Eight of the nodular lesions (chondromas) were on the left side, five on the right side, and one near the middle of the ventral aspect of the vertebral canal All five examples of the true herniation of the nucleus pulposus were on the left side There were three patients with protruding ridges of annulus that extended across the entire ventral spinal canal and one with a ridge across about two thirds of the canal

Hemilaminectomy was not employed in any instance, since it is believed that a wide exposure is advisable to avoid undue manipulation of the spinal cord Then, too, a wide exposure permits cutting of two or more dural attachments of the dentate ligament bilaterally, thereby insuring the greatest possible mobility of the cord As previously stated, after opening the dura, the softened area of the cord frequently directed the operator's attention to the correct location of the lesion No unusual difficulties were experienced in the removal of the true herniation of the nucleus pulposus or the laterally placed cartilaginous nodules Most of the lesions were removed transdurally If a ridge of annulus fibrosus is to be removed, great caution should be exercised, one half of the protrusion being cut away from one side and the remainder from the other side of the spinal cord The procedure advocated by Poppen[13] may be utilized in the instances in which the ridge of annulus involves a single nerve root and is not impinging upon the spinal cord In the present series this procedure was not employed Secondary operations became necessary because of recurrent symptoms and signs in 3 patients Two of these recurrences were caused by incomplete removal of a ridge of annulus The other is of sufficient importance to warrant a brief narration At the first operation a nodule was removed from the middle of the anterior surface of the vertebral canal Improvement in function ensued and the patient became ambulatory by the fifteenth postoperative day During the next ten days the power in the hand was slowly lost and walking became progressively difficult At this time a spinal subarachnoid obstruction was demonstrated and the total protein content of the cerebrospinal fluid was 180 mg per 100 cc The wound was reopened, disclosing a most interesting lesion The nucleus pulposus had become extruded into the canal, forming a tumor mass fully three times the size of the original cartilaginous nodule removed at the first operation As has been suggested by several surgeons, whenever a segment of the annulus fibrosus is removed, an attempt should be made to curette away the entire nucleus pulposus at this level Had such a procedure been carried out in the above-described case, postoperative protrusion of the nucleus might not have occurred Following the second operation there was some improvement, however, not enough for the patient to walk unassisted Six months after the second procedure the wound was opened for the third time There was no evidence of encroachment upon the spinal cord by a mass, but the cord was small, yellow-tinted, and had obviously suffered irreparable damage

Case Reports

Case 1.—The first example in our experience of protrusion of a ridge of annulus fibrosus was that of a woman with signs of advanced cervical spinal cord disease From the subsequent course of events in this instance, it appears that the operator was not sufficiently radical in the removal of the bony ridge After nine months of continued improvement following operation, the patient slowly lost ground during the next year When readmitted to the hospital about two years following the first operation, her disability was even greater than at the time of the first admission The laminectomy wound was reopened, the spinal cord mobilized, and a bony ridge, covered by a thin layer of cartilage, was removed There was considerable improvement in walking, but the impairment of function of the hands remained unaltered In an other of the four cases with the so-called ridge of annulus, the operator was not satisfied that the bone projecting into the ventral vertebral canal had been completely cut away The attachment of the dura to the posterior longitudinal ligament was divided for a distance of 3 cm both cephalad and caudad to the ridge and then the free margins of the open dorsal dura were sutured laterally to the muscles This formed a sling for the spinal cord For about a week following operation the patient complained of pain over both shoulders, no doubt caused by mild distortion of the cervical roots This discomfort disappeared completely and now, two years after operation, there is marked improvement in the gait and function of the hands, although complete recovery has not ensued

Case 2.—The other patient with a ridge of annulus who was subjected to a secondary operation was treated at the first operation by forming a dural hammock as just described Rapid improvement ensued, although complete recovery was not attained In about eight months after operation the lower extremities slowly began to be more spastic and the partial recovery in function of the right hand was lost The wound was reopened A complete new dura had formed over the dorsal aspect of the cord, in fact, no part of the dura that had been sutured to the muscles could be identified as such The dural sling was still effectively holding the spinal cord away from the ridge of annulus At the upper limits of the laminectomy opening the

arachnoid was markedly thickened and had constricted the cord. This was readily divided after the removal of an additional bony arch had given adequate exposure. Four months after the second operation the function of the extremities was as good as, if not better than, at any time following the first operation.

Comment

Three different types of pathologic processes involving the intervertebral discs in the cervical region have been encountered. A wider recognition of the possible existence of such lesions and the correct interpretation of symptoms that may accrue from compression of the cervical spinal cord and/or nerve roots will make for earlier diagnosis. Persistent pain in an upper extremity of a radicular character, or a numbish sensation over a dermatomic zone with intermittent "pin-and-needle" sensations whenever the area is rubbed, associated with a slight limp favoring the same side as the involved upper extremity, is sufficient evidence to warrant surgical intervention. In examples of laterally placed protruding masses, the spinal cord may not be involved. The clinical findings usually suggest implication of a single nerve root and therefore one cannot be certain of the causative factor. The use of a contrast medium and a fluoroscopic tilt-table may not be of diagnostic help, since a lesion so placed produces little if any encroachment upon the dural envelope, nor is there appreciable deformation of the dural sleeve of the adjacent nerve root. Severe pain that persists after conservative treatment is sufficient reason to surgically explore the area under suspicion. Paravertebral neoplasms and low-grade inflammatory lesions of the brachial plexus present the most difficulty in differential diagnosis. The former, if large enough, are frequently palpable along the lateral aspect of the neck or, if situated in the lower cervical spinal region, may be visualized on roentgen-ray examination distorting the pulmonary apex. The inflammatory lesions of the brachial plexus usually implicate the secondary cords and therefore produce symptoms and signs indicative of a more extensive involvement than does a laterally placed protrusion or herniation of a part of an intervertebral disc. Whenever the issue cannot be satisfactorily solved, it is best to institute a conservative palliative regimen and await further developments. Trauma may be, but is not necessarily, an important factor in the production of a protruded or herniated disc. Moreover, in the light of our present knowledge, trauma should not be assumed to be a contributing or aggravating factor unless unequivocal evidence of injury has been obtained. Certainly in the present series, a history of injury was disclosed in only a relatively small percentage of the cases.

The majority of cases of protrusion or herniation of a disc in the cervical area are not correctly diagnosed prior to exposure of the lesion at operation. Furthermore, few come to operation before advanced and sometimes irreparable spinal cord dysfunction is evident. Often this delay has resulted from implicit reliance on the findings derived from the Queckenstedt test. One not uncommonly hears the comment, "the spinal subarachnoid space is patent and the total protein of the spinal fluid is normal," with a finality that inhibits further thought concerning a lesion that could be successfully removed surgically. The failure to demonstrate even a partial spinal subarachnoid obstruction is small evidence against the presence of some type of posterior protrusion of part of a cervical disc, particularly a ridge of annulus fibrosus, provided the clinical findings are in favor of such a process.

Narrowing of the implicated intervertebral space and in some cases lipping of the posterior aspect of the vertebrae has been visualized on the roentgen-ray films. These findings are not infrequently encountered in patients without evidence of spinal-cord involvement. Moreover, narrowing of the fourth or fifth cervical intervertebral space is not an uncommon finding after 45 years of age, the abnormality usually being without clinical significance. Deformation of the vertebral canal as found in large tumors of considerable standing has not been observed in association with the lesion under consideration. It may therefore be said that the information derived from plain roentgen-ray films of the cervical spine is only occasionally an aid in the diagnosis and treatment of lesions of the intervertebral discs.

Further experience will be necessary to substantiate or refute the impression gained from this series, namely, that recovery following the removal of a true herniation of the nucleus pulposus is prompt and functionally complete, that the patients with a ridge of annulus have had the greatest residual disability, while those with a discrete nodule stand in an intermediary position.

It is to be recalled that more than half of the patients presented signs of end-stage disease. No doubt early diagnosis and early operation would give more uniformly gratifying results.

Conclusion

1. A series of 22 cases with cervical spinal cord and/or spinal nerve root compression caused by herniation or protrusion of a part of an intervertebral disc has been reviewed.

2 From the number of cases reported in the literature (69), we judge that these lesions are either relatively rare or are not recognized

3 Three different types of pathologic processes have been encountered (*a*) discrete, oval, or rounded nodules projecting into the ventral vertebral canal, (*b*) true dorsal herniations of the nucleus pulposus, and (*c*) ridges of annulus fibrosus surmounting hypertrophic bone at the margins of the adjacent vertebra

4 A negative Queckenstedt test does not exclude the presence of such a lesion

5 The operative mortality for the series was zero and the case mortality was 4 5 per cent, one patient having died before coming to operation

THE AMERICAN JEWISH JOINT DISTRIBUTION COMMITTEE FORMS HEALTH GROUP

The American Jewish Joint Distribution Committee, aligning itself with governmental intergovernmental, and voluntary agencies in preparing for the postwar health needs of Europe s war victims, announced on December 15 the formation of the Committee on Health, Nutrition, and Medical Service

Dr Jacob J Golub, director of the Hospital for Joint Diseases was named chairman Dr Golub, who has been on the J D C Executive Committee for many years, was a member of a Health Commission with similar objectives, which J D C sent abroad after the last war

In announcing the formation of the Committee, Joseph C Hyman, executive vice-Chairman of the J D C, stated 'The starvation diets of these people, the lack of medical care and medicines, the systematic destruction of Jewish institutions including hospitals clinics, sanatoria research centers, etc —all these factors have combined to create a crucial state of health in Europe which must be relieved by joint action of all the agencies concerned with the problem"

Because of the singling out of the Jews in the German extermination program, Mr Hyman pointed out that their health problems are of extreme seriousness and that the formation of the Committee is the first step in meeting an urgent need

'The special committee, patterned on a similar J D C Health Committee organized in 1921, will concern itself with supplementing postwar public health programs now being maintained or considered by the governmental and intergovernmental agencies engaged in similar activities It is also concerned with the rebuilding of the special health facilities, many of which were constructed with J D C help in the past thirty years, and which the Germans have now destroyed

As one of its preliminary objectives, the Committee will study surveys on European vital and medical statistics, housing, sanitation, and epidemic diseases

Also planned is the addition of a public health expert to J D C's overseas staff, which is headed by Dr Joseph J Schwartz, chairman of the J D C European Council

Emphasizing J.D C 's policy of utilizing local resources in its work, Mr Hyman pointed out that, just as after the last war, the J D C will work with [illegible]

A REPORT ON THE PROGRESS OF THE GLAUCOMA CAMPAIGN DURING THE PAST THREE YEARS*

MARK J. SCHOENBERG, M. D., New York City

(Chairman of the Committee on Glaucoma of the National Society for the Prevention of Blindness, and Chief of the Glaucoma Clinic of the Manhattan Eye, Ear and Throat Hospital)

SEVERAL years ago the National Society for the Prevention of Blindness initiated a campaign for the prevention of blindness from glaucoma.

Considering the fact that there are at least 20,000 individuals totally blind in the United States and an additional 150,000 blind in one eye from this disease, the Society recognized the need for emphasizing a project concerned with its control.

Blindness from glaucoma can be prevented in a large number of cases if discovered early and treated properly. Therefore, our problem is to stimulate the discovery of patients with the disease in its very earliest stages, to provide regular, adequate treatment, and to secure the complete cooperation of the patient.

For the purpose of organizing our campaign the following steps of a program were outlined:

1. The appointment of a committee, consisting of ophthalmologists representing the larger eye clinics in Greater New York and lay persons representing hospital administrations, the United Hospital Fund, the New York State Commission for the Blind, and the National Society for the Prevention of Blindness. This group is known as the Committee on Glaucoma, and is the source through which the rank and file of ophthalmologists, general practitioners, other professional groups, eye institutions, organizations concerned with conservation of vision, and the general public are being reached and invited to further the progress of the campaign.

2. The second step was to survey present methods followed in eye clinics of making a diagnosis, treating, and handling glaucoma patients; and to study the results obtained from treatment over a period of ten or more years.

3. On the basis of the findings in the survey, to suggest and introduce measures that might remedy the weaknesses of the present system prevailing almost universally in eye clinics.

4. To establish a demonstration Glaucoma Clinic and to encourage as many eye institutions as possible to organize special clinics in order to work out details which can be accomplished only by actual experience.

5. To agitate among general practitioners the need for an examination of the eyes not less thorough than that they are doing when making a general health survey of the rest of the body.

6. To induce medical colleges to offer students more thorough training in recognizing or at least suspecting the presence of an impending but preventable blindness.

7. To establish a checking station for tonometers where the instruments now in use by ophthalmologists may be checked to determine their accuracy and reliability.

8. To arrange with manufacturers of tonometers that the newly made ones be submitted to a testing laboratory which should certify them if found accurate.

9. To distribute educational material to the general public about early symptoms of glaucoma and emphasizing the need for periodic eye examinations, particularly for people 40 years of age and over.

10. To promote research in the clinical study of glaucoma, especially of diagnosis in its early stages and nonsurgical treatment.

What Has Been Accomplished So Far?

1. In spite of the fact that the present war emergency has depleted staffs of eye institutions, special services to glaucoma patients have been organized at Mt. Sinai Hospital Eye Clinic under direction of Drs. Robert Lambert and Herbert Katzin, at New York Eye and Ear Infirmary by Dr. Willis Knighton, and at Bellevue Hospital Eye Clinic under direction of Drs. Daniel Kirby and Alfred Kestenbaum. At Post-Graduate Hospital, a medical social worker has been assigned to offer social guidance and follow-up for all glaucoma patients.

2. About one and a half years ago a special glaucoma clinic was organized at the Manhattan Eye, Ear and Throat Hospital. This is a demonstration project, sponsored by the National Society for the Prevention of Blindness. The glaucoma clinic has a number of innovations and interesting features which were illustrated in the "Glaucoma Exhibit" at the annual meeting of the State Medical Society.

A salaried perimetrist (ophthalmologist) is recording fields of vision every one to three months for all patients attending this clinic. During the past year, the perimetrist trained

*Read at the Annual Meeting of the Medical Society of the State of New York, New York City, May 10, 1944.
Dr. Schoenberg died on February 15.

volunteers to chart fields, preparing them to offer their services to other eye clinics in New York.

3. A checking station for the examination of tonometers in use by ophthalmologists as to accuracy of construction and performance has been functioning for the past two years at the headquarters of the National Society for the Prevention of Blindness, first under the direction of Dr. A. Posner, later under that of the author of this paper.

4. Appointment was made in 1942 by the American Academy of Ophthalmology and Otolaryngology of a Committee for the Standardization of Tonometers through which tonometer-checking stations have been established in Chicago and San Francisco. The work of these stations is being closely coordinated with that of the station previously established in New York.

5. Demonstrations and exhibits were prepared for annual meetings of the American Medical Association, the American Academy of Ophthalmology and Otolaryngology, and the American Ophthalmological Society. Publications and exhibit materials have been distributed to a number of agencies concerned with prevention of blindness which have organized special glaucoma campaigns. Many requests for advice concerning organization of glaucoma services have been received from ophthalmologists, medical social workers, nurses, and prevention-of-blindness workers. There is indication that many ophthalmologists have become more interested in our campaign.

6. Papers* on glaucoma were read at medical meetings and published in ophthalmologic journals and the Sight-Saving Review.

A number of radio talks were given during the past year by members of the Committee on Glaucoma.

7. Two modest prizes—one for an original contribution to the earlier diagnosis of glaucoma simplex, and one for the improvement of its nonsurgical treatment, have been offered to the ophthalmologists in North, Central, and South America.

8. A glaucoma exhibit was organized in conjunction with the 1944 meeting of the Medical Society of the State of New York.

What Is Yet to Be Accomplished?

Our task is far from completion.

1. We must continue to urge general practitioners to become more glaucoma-conscious and to suggest special examinations which should be included in a general physical examination of all over 35 years of age.

2. An educational program, including methods of recognizing glaucoma, should be organized for optometrists. This group could help immeasurably in preventing blindness from glaucoma by adding certain examinations to their general routine for their patients 35 years of age and over, keeping in mind the possibility of glaucoma. However, it seems that education of optometrists cannot be started before a majority of the ophthalmologists agree on the advisability of such a step.

3. We must convince a larger number of ophthalmologists of the value of a special glaucoma clinic—both to themselves and to the patients.

4. A course for training professional perimetrists should be started. Ophthalmologists and hospitals are badly in need of the services of such qualified technical assistants.

5. Additional medical social services must be provided by hospitals so that glaucoma patients can be kept under continuous medical care and supervision.

6. Funds must be obtained and made available to qualified ophthalmologists who are eager to study the various unsolved problems related to glaucoma.

7. We must induce the rank and file of ophthalmologists to take an active part in the campaign for prevention of blindness from glaucoma and to stress the importance of this problem in the communities in which they practice.

Prevention of blindness from glaucoma is possible in a large percentage of cases if we follow an organized plan and if we secure the cooperation of the many groups concerned with the glaucoma problem.

Discussion

Dr. Edwin Perry Hall, *Oneonta, New York*— Any preventable condition, and especially blindness, is a challenge. Dr. Schoenberg is to be congratulated on the progress he is making in the campaign against blindness from glaucoma. Unfortunately, it will take a long time to demonstrate results, and that can only be done by the collection of reasonably accurate statistics; perhaps he has them, but I must confess to not having studied this disease from the statistical angle. The whole campaign may be summed up in one word: education, directed toward the earlier diagnosis and treatment of cases. His review of the steps taken in the metropolitan area needs no discussion but commendation, but I am interested in what can be done in the rural areas which I represent. We have no free clinics except the doctors' offices; staff and county society meetings demand programs of more tangible interest to the general practitioner. The

* Schoenberg, Mark J.: Trained Nurse and Hosp. Rev. 109: 233 (Oct.) 1942; Sight-Saving Rev. 12: 252 (Dec.) 1942; (National Society for the Prevention of Blindness Publication #393); New York State J. Med. 41: 2216 (Nov. 15) 1941; Tr. Am. Acad. Ophth. and Otol 61, (Nov.–Dec.) 1941; Am. J. Ophthalmol. 25: 521 (May) 1942; Arch. Ophthalmol. 28: 173(July) 1942.

problem of reaching the public is more difficult, but, after all, they are quite conscious of the seriousness of a "hardened eyeball." I agree with Dr. Schoenberg that the optometrists should be reached in this campaign of education. It impresses me that the social workers of the Blind Commission might well direct more intensive efforts in this educational field as well as in that of rehabilitation of the blind. I hastily went over the records of the last five years and discovered about 30 cases of definitely increased tension, two thirds of those being long-standing cases, and one half of that two thirds blind in one eye. A criticism of my own records suggests that collective statistics would be improved by a uniform system of records in follow-up. It impresses me that a traveling consultation clinic, organized along the lines of the State tuberculosis and orthopedic clinics, seeing cases referred by any legal practitioner, would have an immense educational value for both the public and all types of practitioners; this might well be another "postwar project."

Dr. Frank M. Sulzman, *Troy, New York*—Dr. Schoenberg is to be congratulated on his paper, not only for the subject matter but for his willingness to undertake this instructive research and to stimulate interest in the subject of glaucoma, which is one of the real problems of ophthalmology.

The work of the joint committee and other matters he has suggested will, I know, have our hearty approval. There is no glamour in it but just plain hard work to get at facts that will aid in solving some of the problems that are still far from solution.

My old professor, in either materia medica or general medicine, I just forget which, made the statement one day in his lecture in my medical school days that when you saw a list of drugs used in many of the diseases that the human frame is subject to, you could be reasonably sure that not one was a specific for any disease.

Years have come and gone and, observing the work of my distinguished colleagues here and abroad, the treatment and diagnosis of glaucoma have often come up for discussion. It has been a personal observation that a method of operative procedure seen in many will, after a lapse of time, be superseded by a different method of approach. Discussion with the operator will elicit the information that he was not satisfied with his previous results. This is a general observation, one that I am sure everyone has made in many of the well-known clinics, and just shows how far we are from solving the problems of glaucoma. In these centers for the study of glaucoma, the Manhattan Eye, The Infirmary, and the Ophthalmic Institute, where sufficient material is at hand and competent observers are to be had, combined with a real desire and enthusiasm for the work, some basic facts will be developed which will further aid in solving some of the early diagnostic problems of this important condition. I do not know of any more important work in the field of ophthalmology than this. We all see these cases but, due to the pressure of work, the day is never quite long enough to do many of the things we are called upon to do; we are unable to give the time and detail so necessary to get sufficient data to base a valuable opinion on.

There are two points that I would like to call Dr. Schoenberg's attention to and ask that some thought and study be given to them. One was a remark made to me by Magitot in Paris some years ago. We were discussing the subject of glaucoma and he turned to me and said, "Doctor, if you will take a series of cases and operate on them by any method or methods that you may elect I will take an equal number and treat them by dietetic measures and I will obtain fully as good a result with my series." He was emphasizing a certain line of treatment which, unfortunately, I have been unable to carry out, and, looking over the literature, have been unable to obtain an opinion on this data. I respectfully submit this as a possible thought for future study and research. Professor Magitot is a man of keen intellect and an excellent operator. He would hardly make this statement without basing it on some facts from his own personal experience. Time does not permit detail on the many excellent points of Dr. Schoenberg's paper, but one is worth consideration in the little time that I have left for discussion, namely, perimetry, or taking fields. This work is time-consuming, not spectacular, but yet it is very important. One point in taking fields which I hope the doctor will give further thought and study to was made to a group of students by the late Sanford Gifford, whose most untimely death in Chicago recently we all deeply regret. We were members of a group taking Backsteed's course in perimetry in Vienna some seventeen or eighteen years ago. Backsteed emphasized in his lecture the point that in taking fields we should not attempt to take them in the ordinary white coat but should wear a gray coat with gloves to match if possible, about the same depth of color as the gray on the arc on the Feri-Rand perimeter. The point he developed was that the movements of the bare hand are sometimes detected and misinterpreted by the patient being examined instead of the movements and location of the test object that is being moved along the arc in the course of taking the fields in the usual way. We had a friendly discussion regarding this point afterwards. I practiced it for a time, but due to the limited number of cases and pressure of time, did not carry it out long enough to form a direct evaluation of its importance. I hope, if opportunity presents itself, that further study of this point can be made, as it might be of some value.

The standardization of instruments is, of course, extremely important. I am very much surprised to find so much difference has already been found in these instruments made by different manufacturers or by the same manufacturer. While not to the point, we have many times used the two standard types of instrument in the office and found a close relationship; if the Schiotz showed an increase of tension, the MacLean in its method of reading showed a proportionate increase. It was a check we made for our own personal use.

I am sure I express our deep thanks to Dr. Schoenberg and his group for the work they are doing, and only hope they will continue with this study.

THE USE OF BISMUTH IN THE TREATMENT OF VINCENT'S INFECTION

HUGH M. COX, M.D., New York City, and JOSEPH H. HODAS, LT. CMDR., USNR

(From the Medical Service of Misericordia Hospital)

DURING the last World War one of the most common epidemics among our armed forces and among civilians as well was Vincent's angina, or, as it was more commonly known, trench mouth. Although the disease was infrequently fatal, the cost in manpower and production time was tremendous. There were few or no adequate measures for its control. Treatment was mainly local. It was permitted to run its course, and frequently recurred. The name "trench mouth" was given to this infection because of its particular prevalence among the personnel at the front and in the trenches. This can be readily understood because of inadequate sanitation, close quarters, and the use of common eating and drinking utensils which prevailed in these places during the emergency. Subsequently, the infection spread to the civilian population and has been endemic and at times epidemic throughout the world ever since. No doubt the occurrence of Vincent's infection among the troops and civilian population will have to be dealt with during this war. With this in mind, we believe that it is timely to record our experiences during the past few years in the treatment of this condition with preparations of bismuth. We have found this heavy metal easy to administer, and effective in shortening the duration of the disease and in preventing recurrences This form of therapy is now new and seems to be in more common use than the literature on this subject would indicate. A careful search discloses but few reports since the use of bismuth for this infection was first described by Rigby in 1929.[1] Bismuth has also been used extensively in South America in the treatment of acute anginas of streptococcal origin, as has been reported by Monteiro and his coworkers.[2]

Before detailing our own experiences, it might be worth while to review the pathogenesis of the infection and the clinical picture presented. Vincent's angina, trench mouth, ulceromembranous stomatitis, or fusospirochetal infection of the throat, is believed to be due to two organisms: (*a*) Bacillus fusiformis or fusiformis dentium, and (*b*) Borrelia or spironema vincenti, growing in symbiosis. Some authorities, however, hold that they are the same organism merely in different stages of development.[3] The organisms may sometimes be found in ulcerative conditions of the mouth and throat, but their constant presence in Vincent's infection and their great number points to their specific character. It is now believed that Vincent's organisms are secondary invaders. The initial lesion and point of entry may be caused by a herpetic virus infection of the mouth and gums;[3] ulcerative stomatitis due to avitaminosis;[4] or periodontal infection and poor mouth hygiene. Infection usually results from direct contact with an infected individual, such as by kissing or by contact with contaminated utensils. Children and young adults are most susceptible. The disorder usually begins insidiously with malaise, general pains, and a temperature of 100 to 101 F. The pain in the throat is slight, but the glands on the affected side become enlarged and tender, and the breath is usually offensive. The infection is nearly always unilateral at the onset, but may later spread over the gums and nasopharynx. When the throat is involved, a soft, detachable, yellowish membrane first forms on the affected tonsil and comes away in a day or two, exposing a well-defined ulcer. Another type of this infection, more commonly seen on the gums and tonsillar pillars, is a raised, diffuse, nonulcerative form, which in healing leaves white or yellowish vesicles. Pulmonary complications due to these fusospirochetal organisms are by no means infrequent and have been often mentioned in the literature.[5] It is equally possible, too, that the condition may spread upwards and may be a factor in some of the refractory cases of so-called chronic sinusitis and postnasal drip.

Treatment

In the past, the treatment of Vincent's angina has embraced a great number of compounds and has been mainly topical and local. The great number of medications used attests to their nonspecific nature and inadequate therapeutic value. Soap, methylthionine chloride, picric acid, tartar emetic, acriviolet, hexylresorcinol, chamomile, copper sulfate and glycerin, ultraviolet rays, intramuscular mercuric cyanide, intravenous emetine, short-wave therapy, sodium citrate, and a host of oxygen-liberating drugs, such as sodium peroxide, sodium perborate, and potassium permanganate, have all been used in the past, in addition to many others less commonly used and too numerous to be mentioned. More recent therapy, and perhaps more effective, has been the use

TABLE 1.—Number of Injections Required for Negative Smear

Total Number of Cases	1 Injection	2 Injections	3 Injections	4 Injections	Unimproved

Within 24 Hours	48 Hours	72 Hours and Longer	No Improvement
4 cases	23 cases	6 cases	2 cases

of bismuth pastes applied topically[6] and also the local application of neoarsphenamine in a glucose or glycerin base.

During the period of the first World War, and for some time afterwards, the use of vitamin C was advocated, since it was believed that many lesions were due to a deficiency of this vitamin. Actual therapeutic tests and vitamin determinations did not confirm these findings, and this treatment was later replaced by treatment with nicotinic acid on the basis that the lesions were similar to those found in pellagra.[7] In 1938 Spies reported a series of cases treated with nicotinic acid with encouraging results. Further studies and better evaluation are needed to form a more complete picture as to the value of vitamin therapy in Vincent's angina. True, a debilitating condition of the mouth and gums, such as is caused by a vitamin deficiency, may predispose to Vincent's angina and provide a portal of entry. When this condition is shown to exist, the administration of adequate vitamins will undoubtedly shorten the duration of the disease.

The use of arsphenamine intravenously has also been advocated and is at times quite effective. Both bismuth and the arsenicals are effective antispirochetal agents, but the arsenic compounds are more toxic and the intravenous route of administration more hazardous, and should be used only in extreme cases. In addition, bismuth has the advantage over arsenic, in that following intramuscular injection of the metal, it is carried by the blood stream and deposited in the salivary glands and around the gums where the Vincent's infection is usually located.

The objection to the use of bismuth has been due to the complications of nephritis, hepatitis, and stomatitis. Investigation into these toxic results has shown that they were due to overdosage or to prolonged administration.[8] The former can be avoided by more accurate determination of dosage in accordance with the patient's age and general condition. Since it is seldom necessary to give more than four doses of bismuth, chronic poisoning should not occur.

TABLE 3.—Recurrences (Based on a Follow-up of 20 Patients for a Period of Two Years)

3 Months	9 Months	2 Years
2 cases	None	2 cases

The oral administration* of bismuth has also been used by us in the treatment of Vincent's infection. Although these cases are not numerous enough to enable us to form a definite opinion, it appears that because of gastrointestinal discomfort which occurred in several of our patients, and because the infectious process was not checked as promptly as with the injection treatment, this form of therapy should be reserved for those unable or unwilling to take the intramuscular injection. In this connection, it is interesting to note that the average duration of the disease in orally treated cases was about thirty days, as compared with ten to fourteen days' duration in those treated intramuscularly.

The intramuscular preparations used were the bismuth salicylate in oil, and a water-soluble bismuth.† No recognizable difference was observed in the results from these two products. A combination of bismuth and cevitamic acid‡ was also used on a series of cases in the hope that this combination might prove more effective than the bismuth compounds more commonly used. These results also indicate no definite advantage.

Method of Injection

The usual injection for adults consisted of 2 cc. of bismuth preparation, injected intramuscularly by standard technic into the gluteal region. This was administered as soon as possible after a positive smear was obtained. The throat was rechecked by an additional smear about four or five days later, and if still positive, another injection of bismuth was given on the opposite buttock. One week later another smear was taken and if still positive, the third injection was given. Usually even the most refractory cases responded within this period. If a fourth injection was necessary, this would be given a week after the third. Usually, relief of pain and discomfort was obtained within a period of thirty hours from the first injection and most of the smears became negative within a period of ten days. Recurrences appear much less frequently with this type of therapy than with local therapy. Bronchial symptoms, such as cough and expectoration,

* The preparation used was Sobisminol, a reaction product of sodium bismuthate, triisopropanolamine, and propylene glycol.

† The water-soluble bismuth used was Thio-bismol (sodium-bismuth thioglycollate—Parke-Davis and Co.).

‡ Bismuth cevitamate (Smith and Co.).

when present, also showed improvement. This suggests that the Vincent's infection probably spread to the larynx and bronchi and was the cause of these symptoms.[9] It also seems plausible that a great many cases of so-called chronic bronchitis and perhaps even bronchiectasis and lung abscess may have had their origin from an original Vincent's infection of the mouth. It would be well to search diligently for the Vincent's organisms and, when they are found, to treat these cases early and adequately, thereby preventing these complications which become more difficult to treat later.

Analysis of Results

The results of treatment in our series of 35 cases have been summarized in Tables 1, 2, and 3. Thirty of these cases were ambulant when first seen. Symptomatic improvement was observed in about thirty hours in most of our cases. The majority of patients required between two and three injections in order to obtain a negative smear. Relatively few required four, and only 2 patients failed to respond to this form of therapy, one of whom subsequently responded to two injections of neosalvarsan; the other still shows a positive smear after two years of varied and intensive treatment. This case may be complicated by constant reinfection. The acute cases with fever and systemic symptoms seemed to respond more favorably and quickly than those in whom the infection had persisted for several weeks or longer. Bronchial symptoms, such as cough and expectoration, which were present in about 25 per cent of our patients, also responded favorably to this type of therapy. The average duration of the infection under treatment was about two weeks, in contrast to six weeks or longer with local therapy. Recurrences were relatively infrequent as well, and promptly responded to one or two additional injections when they did occur. No toxic results were observed in any of our cases.

Summary

The treatment of Vincent's angina has been facilitated by the use of bismuth intramuscularly. The duration of the infection has been shortened, recurrences have been less frequent, and relief to the patient more prompt with this form of therapy. Only 2 cases of 35 treated have failed to respond. No toxic results were observed. This form of therapy is advocated as inexpensive, accessible, and safe.

NAVAL MEDICAL OFFICERS NEEDED

The need for Naval Medical officers is great. The fact that the Army has announced the suspension of procurement of physicians should not be interpreted to mean that the Navy is in the same position. We must face the truth; our rate of casualties has been increasing in recent months. Our men

Officer Procurement is making a special appeal to the members of the medical profession to assist them in every way possible. They fully realize the drain which has been imposed upon civilians. In many sections of the country the shortage of doctors is acute. Hard as this shortage is on tens of thousands of people, yet thousands of people must be asked to make sacrifices in medical care for their friends, relatives, and countrymen whose need for

to a only serve their country, but at the same time, an opportunity to learn the most advanced technic of the profession,

path for him to follow is to seek a commission with the U.S. Navy.

Since the start of the war, physical requirements have been somewhat modified. Physicians are now accepted up to the age of 60. Men in the older age groups are assigned to hospitals, dispensaries, and other Naval activities ashore.

Physical defects which are organic constitute a cause for rejection. However, waivers can be granted for defects which were formerly disqualifying, such as variations in height, weight, defective vision, and others.

Interested physicians, without making any definite commitment whatsoever, will be interviewed at their convenience at the Office of Naval Officer Procurement, 33 Pine Street, New York, on any weekday between 8:30 A.M. and 5 P.M.—telephone WHitehall 3-4060.

Therapeutics

CONFERENCES ON THERAPY

THESE are stenographic reports, slightly edited, of conferences by the members of the Departments of Pharmacology and of Medicine of Cornell University Medical College and the New York Hospital, with collaboration of other departments and institutions. The questions and discussions involve participation by members of the staff of the college and hospital, students, and visitors. The next report will appear in the May 1 issue and will concern "Psychologic Aspects of the Treatment of Pain."

Treatment of Poliomyelitis

DR. C. H. WHEELER: Anterior poliomyelitis is a disease which interests us all. There is so much about it we do not know. The way it spreads and how to prevent it are still pretty obscure and there is a good deal of uncertainty about the treatment. You are all aware, I am sure, of the wave of interest which has passed through the country in Sister Kenny's treatment. Dr. Philip M. Stimson, as you know, works also at the Willard Parker Hospital and has had an extensive experience with poliomyelitis. He is going to give us his ideas about treatment this afternoon.

DR. PHILIP M. STIMSON: Anybody who talks on the treatment of poliomyelitis these days must do so with an apology because it isn't easy to prove whether one treatment is better than another. One has to depend pretty much on general impressions.

Poliomyelitis varies enormously from year to year and from case to case. One series may contain no paralytic cases and the next may contain a very large number. The results are not comparable. Also, observers differ greatly in what they see when they look at a poliomyelitis case. The average orthopedist, for instance, looks for deformities and muscle weakness. The person who is trained by Sister Kenny does not look for muscle weakness but looks for spasm. They see entirely different things.

Poliomyelitis is a virus disease, and like most of the virus diseases it is one for which we have no drug, chemical, or serum which is of any benefit after the onset of clinical manifestations, so all we can do in the treatment of poliomyelitis is to minimize the end results, and there are still differences of opinion on how that can best be done.

I shall begin first by taking up minimal cases, the cases that are sometimes called characteristic minor illness, undiagnosable as poliomyelitis, but they occur in great number in the presence of a poliomyelitis epidemic. For instance, we had a child in this hospital with overwhelming bulbar poliomyelitis, whom we took to the Willard Parker Hospital. She died two days later. We talked with the mother and asked if she had any other young children. She said, "Yes, a 9- and a 2-year-old." "How are they?" "Fine, the 9-year-old had a little headache and digestive disturbance three or four days ago but is perfectly well now," she answered. We asked her to bring this 9-year-old child into the hospital the next day so that we could look him over. This we did, and the child had a slightly stiff neck. We did a lumbar puncture and there were 60 cells in the spinal fluid. We hospitalized the child and found that he had developed a little spasm in the hamstring muscles. The child was given hot compresses and watched carefully for two or three weeks and came out of it perfectly well, but the disease would have been entirely overlooked if there had not been this serious case in the family. The treatment of minor cases, we feel, is of considerable importance.

The natural history of the disease as it is now understood predicates the infection by mouth, the virus getting down the alimentary canal, invading the mucosa, multiplying there, being excreted in the bowel, and passed out in the feces. A variable amount of the virus penetrates the mucosa, or some barrier somewhere, to pass along the regional nerves to the central nervous system. The factors which determine this invasion or breaking down of the barrier are very poorly understood. One factor is insult to the mucous membrane, such as tonsillectomy. A common cold or perhaps an attack of indigestion may be that insult. We don't know. We do know that many cases of recognizable poliomyelitis are preceded by a minor illness, sometimes called the first hump of the dromedary type of poliomyelitis. Whether the minor illness is a manifestation of the disease itself, or whether it is the insult to the mucous membrane which breaks down the barrier, is not known. We also have fairly good evidence that chilling and fatigue are contributory factors to breaking down that barrier. Monkeys have been given equal quantities of the virus and half of them have been put in cold baths, made to swim, and allowed to get chilled. These mon-

keys had worse cases of poliomyelitis than those which were kept quiet in their cages We know many instances of people who came down with severe poliomyelitis a day or two after being chilled or exhausted There was a football game reported in the German literature in which the boys got excessively tired and chilled, there were some six recognizable cases of poliomyelitis in that group of boys who were apparently incubating the disease at the time of the game Every now and then we hear of an adult—a nurse, for instance—who had a headache and fever, vomited, but did not report sick because the next day was her day off, and who kept going until the third day, and then developed a severe case of poliomyelitis So it seems desirable in the presence of a poliomyelitis epidemic to treat every minor illness as potential poliomyelitis, to put the patient to bed, and keep him as quiet as possible Paul, of New Haven, in a speech at the Academy of Medicine a few years ago, laid emphasis on the importance of putting patients with poliomyelitis to bed at the very onset of symptoms The worst cases seemed to be in those who fought the disease and kept going for a few days Rest would seem to be of the greatest importance

That brings us to the management of a patient who is seen for the first time There are many details of the management which are important The first thing we do is to observe the patient without handling him We just look him over, and see how sick he is Does he have difficulty in breathing, is there evidence of bulbar involvement, is there evidence of tight muscles as shown by abnormal position?

On November 15, 1944, at the Willard Parker Hospital a group of us examined a 10-year-old girl who had just been admitted By observation and talking with her we found that she had seventh-nerve involvement We call this a cranial case She had bulbar involvement as evidenced by difficulty in swallowing fluids One of the points which was particularly interesting was that as she lay in bed the left leg seemed shorter than the right, and we found that the lumbar muscles on the left side were very much tighter than those on the right Spasm on one side caused shortening of the left leg and narrowing of the space between the left iliac crest and lower ribs in contrast to the right side She was also observed to have a sway-back She had lumbar lordosis In her case we found it was due to spasm of the iliopsoas muscles on both sides As she lay on the bed one shoulder was higher than the other and was rotated inward, due to spasm of both of the trapezius muscles and of one pectoral muscle, which caused the inward rotation We did not try to find out how much weakness she had because this symptom is likely to change in a few days The things that counted on admission were how sick she was, whether she could breathe well, whether she could swallow, and where she had tight muscles She could swallow, so we were able to give her fluid by mouth, but she had some difficulty and occasionally it would come back through her nose The trouble was not with deglutition but with her palate Her breathing was normal But we tested her a little further and found that one deltoid was quite weak and the other one a little weak, and we know from experience that when one deltoid is gone there is apt to be trouble with breathing When both deltoids are gone there is almost certain to be trouble with breathing So the house staff watched this girl very carefully to see if she developed difficulty in breathing

The treatment we instituted was, first, the use of fluids by vein The hydrodynamics of poliomyelitis are not clearly worked out and I hope there will be some discussion about it today There are those who advocate giving hypotonic saline intravenously and inserting a lumbar puncture needle on the theory that they are going to flush out the perivascular infiltration in the cord What good that is supposed to do I don't know More recently they have stopped using the lumbar needle and are using only hypotonic saline, but we don't advocate it What we are doing is using hypertonic 10 per cent glucose Usually the older child or adult receives 500 cc on admission, slowly injected In monkeys, this measure has been shown to reduce the brain bulk, and in poliomyelitis we know there is edema of the cord and of the brain The hypertonic glucose reduces the edema by osmosis, and at the same time supplies fluid and some nourishment After the first 500 cc we usually change to 5 per cent glucose to supply the fluid requirements as long as there is inability to swallow We give it particularly to patients who look sick and have a toxic appearance Whether we are doing the right thing or not we are not sure

In the bulbar cases sometimes there is an enormous secretion of mucus in the nasopharynx One child seemed to excrete as much as a pint in half an hour Whether it would be well to keep such patients a little dry by withholding fluids, we do not know They cannot cough and cannot swallow The material must be removed in other ways

After we have given the patients fluid we handle them as little as possible We let them assume that position in bed in which they are most comfortable A child who has a muscle which is tight will have pain in that muscle if it is stretched For instance, if the hamstrings are tight and the child is laid flat on his back with the

leg perfectly straight, the hamstrings are stretched to a greater extent than if the child is allowed to lie on his side with hips and knees bent.

So we either let them lie on their sides or, if Kenny packs are used, as they are most of the time, we let them lie on their backs, but we then put a pillow under their knees so that they are bent to avoid the extra pull on the hamstrings. Similarly, if the pectoral muscles are tight, we are apt to put a little baby pillow under their shoulders to hold them forward. If the neck is tight, as it is practically invariably, we don't put a pillow under the head. The head is kept flat on a hard mattress. We make the patients as comfortable as we possibly can.

The hot compresses, according to the technic of Kenny, increase comfort very materially. It is the one best remedy we have for relieving the patient's discomfort in the early stages. Whether the hot compresses do more than that is a matter of opinion. Some people think they speed up the release of spasm; others don't. If spasm is left alone it usually will clear up of its own accord, but I am among those who think that hot compresses help to hasten the release of spasm.

The principal points I want to discuss in the treatment of poliomyelitis relate to the two difficult kinds of cases, the bulbar cases and those with respiratory difficulty. But I will first say a word about the ordinary spinal case.

In the acute stage of the usual spinal case there is indeed a question as to whether anything we do accomplishes more than rest in bed would accomplish. Rest in bed and time allow those anterior horn cells which were not killed, but put temporarily out of business, to recover. There is no drug or other treatment which will help those cells. They will recover no matter what you do, if they were not killed. Spasm will almost always clear up if left alone. I think it clears up more quickly with hot compresses.

The treatment of the average so-called spinal case is largely one of physiotherapy. The best physiotherapy technician whom I know in the country at the present time is Sister Kenny. She is amazingly good as a technician and, if she would limit her activities to that, she would get a lot further. If you were to read the pamphlet which was published by the New York City Department of Health in about 1926 on the treatment of poliomyelitis, you would note that it speaks of incoordination, of forgetting how to use muscles, of muscle spasm and of how it should be treated. Sister Kenny has popularized these points and has given much publicity to the importance of treating those three factors in poliomyelitis; that is, muscle spasticity or spasm, incoordination, and what might be called hysterical paralysis, but which she calls alienation.

I want now to discuss the treatment of cases with respiratory distress and the bulbar cases. In many of the bulbar cases there is very little that we can do. We see patients come in and expire right in front of our eyes. Their progress is downhill no matter what we do. A person must be very humble when he undertakes to treat a bulbar case. But then there are patients who come in and look just as sick, who don't die, who hang on, and then get well, and they usually get entirely well. Now what is the difference? I don't know. We obtain the most skillful nursing care that we can get. We give them fluids, of course. They accumulate a large amount of mucus in the nasopharynx, and that must not be allowed to get into the trachea and bronchi, or they drown. It must not be allowed to remain there, because they have difficulty breathing past it. So we raise the foot of the bed and put patients on their chests, face down. This permits gravity to come into play, and we have suction going all the time. We have special nurses on the job until the patients are well enough to apply suction to their own throats. We give them a big catheter which they can use if they do not have arm involvement. We do not allow them to have anything by mouth if there is any difficulty in swallowing. We watch their breathing. We don't use any drugs. We use a great deal of oxygen. Usually we cannot use an oxygen mask as then we cannot watch the patients adequately, and for the same reason we do not use a tent. We cannot use aspiration if they have a mask on, so oxygen has to be given by nasal catheter. Above all, they are kept as quiet as possible. I might add that we keep the parents away; they disturb and excite the patient. If the patients have any stiffness, we put the proper packs on them; that is, while they are prone, hot compresses are laid on the back of the neck and on the back. That can be done without disturbing them.

Then, after the first twenty-four or forty-eight hours, if the patient cannot swallow, we are apt to try to pass a Levine tube down into the stomach through one nostril, and the patient is then fed by tube. Some years ago a patient was fed thirty-three days that way. That is the longest we have had before the patient could swallow again. Usually they have the tube for four, five, or six days, and then are able to swallow.

Many of these bulbar cases are complicated by respiratory difficulties. This brings us to the subject of respiratory troubles occurring in poliomyelitis. There are four general types. Each requires different treatment. In the first type there is involvement of the respiratory center.

The cardiac and respiratory centers are situated in the bulb in the region of the nuclei of the ninth to the twelfth nerves, and are, therefore, very apt to be involved if there is other bulbar involvement A patient with this type of respiratory difficulty retains some control of the intercostal muscles and the diaphragm If you ask him to take a deep breath, he can do so But the control is sufficiently impaired so that when he is not thinking about it, the respirations become irregular, shallow, and ineffective The patient is apt to become cyanotic, and the pulse thready Curiously enough, in these children the blood pressure may rise to 130 or 140 mm Then as the respiratory and cardiac centers fail, the blood pressure begins to fall Oxygen is no longer helpful The patient becomes unconscious and dies To put a patient of that type in the respirator is only a gesture, perhaps, to try to keep the child going by artificial respiration another half hour, perhaps until the parents can come to the hospital, or perhaps to let the parents think that everything possible has been done for the patient But it is without avail

The second type of respiratory difficulty in bulbar cases results from the accumulation of fluid Although there is no trouble with the respiratory center, the child has so much difficulty trying to breathe past that fluid that he grows tired It is unwise to put him into a respirator, which only sucks the fluid down into the chest and, of course, does a great deal of damage

The other two types of respiratory trouble are seen in spinal cases In one, there is loss of innervation, in the other, there is spasm of the respiratory muscles There is, of course, much overlapping If the trouble is due largely to spasm, the patient is treated with hot compresses, as illustrated in the following case A 17-year-old boy came into the hospital with spasm of his neck and chest, and even of the abdominal muscles The only way he could breathe was by using the muscles in front of the neck He was breathing by lifting his thoracic cage with the platysma and sternocleidomastoid muscles A half hour after treatment with hot compresses he was breathing with his chest, and he came along beautifully without having to be put in a respirator As spasm was relieved it was found that he had practically no weakness of any of those muscles His trouble was entirely due to spasm He was examined with the fluoroscope, and it was shown that the diaphragm was not working at all It was not paralyzed but perfectly rigid across his chest, and as he took a breath the diaphragm did not move On the other hand, we have patients who come into the hospital with the intercostal muscles and diaphragm paralyzed, and thus the child has no true respiratory muscles to breathe with He may be trying to breathe with his neck, pectoral, or back muscles, but he gets very little air We try to carry him along with encouragement, oxygen, and hot compresses because we feel that the end results are better if he can fight it out without having to be put in the respirator If, despite these measures, the child shows signs of anoxia, particularly when he begins to develop twitching around the corners of the mouth and then fails to answer questions, we at once give artificial respiration, either manually or with a respirator, until he comes back to consciousness When he has rested a little we stop the respirator and encourage him to maintain spontaneous breathing We have had patients in and out of a respirator eight times in a week, and have then been able to keep them out entirely But, if we once leave a patient in the respirator for two or three days, he is apt to be in the respirator for two or three months, during which time contractures develop in his respiratory muscles despite all efforts at treatment with hot compresses He now has great difficulty in breathing with his chest muscles From having been in the respirator he has learned to breathe with his neck Worst of all, he has become apparently permanently unable to cough He cannot get the mucus up out of his trachea and he has a marked tendency to aspirate mucus and develop atelectasis Many of these patients who have been in respirators a long time live for some months, but then die from what appears to be pneumonia Upon autopsy the cause is found to be atelectasis with pneumonia superimposed It is our belief that these patients are best served by being encouraged to maintain breathing without the respirator as long as they are conscious

I was much amused by an article on the use of the respirator written three years ago by a noted authority in which the following argument was given for the use of the respirator at the first sign of respiratory difficulty "This machine gives the respiratory muscles the nearest possible approach to the rest given by a splint to a biceps" That is just what we don't do nowadays for the biceps when it is in the acute stages of the disease A neurologist does not immobilize the limb in a patient with a severed nerve He keeps it moving and thus keeps the muscle in good condition It would seem logical, then, that when we have a nerve that is more or less out of business, nothing is to be gained by immobilizing the muscle In fact, we know definitely that harm is done because then the effects of immobilization as well as those of the loss of innervation must be overcome So, if that is the reason for the use of the respirator, it strengthens us all the more in the

feeling that respirators ought not to be used unless absolutely necessary.

Sister Kenny has been quoted as saying that there must be no support whatever, that the patients must get along on their own support. I suppose the 100 per cent followers of Sister Kenny would therefore consider splints and braces as anathema, but I think it is common sense that there must be support against gravity and for weight-bearing. As long as the patient is flat in bed there is very little gravity effective, except perhaps a little in a case of footdrop, but that is easily handled with a sandbag under the foot. But when a patient begins to sit up or stand, then there must be support for weight-bearing and for gravity. Splints should never be used when they increase muscle spasm.

Many orthopedists believe that when there is weakness of the anterior tibialis the gastrocnemius contracts and overstretches the anterior tibialis. They therefore recommend that in the acute stage of the disease the foot be pushed up to a right angle and held there so as to prevent stretching of the anterior tibialis. Those of us who are seeing a lot of acute poliomyelitis think that that is just the wrong treatment. To push the foot up at right angles increases the spasm of the gastrocnemius. We believe that the slight possibility that the anterior tibialis may be overstretched is less important than the danger of increasing the spasm of the gastrocnemius.

On the other hand, Sister Kenny believes the primary trouble is in the gastrocnemius, which has gone into spasm, pulling the heel up and stretching the anterior tibialis, which may or may not be weakened. Because of the spasm of the gastrocnemius the anterior tibialis cannot contract to pull the foot up. Her treatment, then, is to relax the spasm of the gastrocnemius, and when that is relaxed the anterior tibialis is re-educated to contract in its usual normal manner.

DR. WHEELER: Dr. Hansson, will you comment on Dr. Stimson's remarks and make any additions which you would like to make from the standpoint of the physical therapist?

DR. K. G. HANSSON: I believe that Dr. Stimson has clarified many points in the treatment of poliomyelitis. The immediate treatment for acute poliomyelitis should be in the hands of pediatricians. The second stage is the province of physical therapy, and the third stage is the province of the orthopedic surgeons. There is fairly general accord in the treatment of the acute phase by the pediatricians and of the paralysis or deformity by the orthopedic surgeon, but in the area of the physical therapist there is a good deal of controversy.

During the last twenty years or so we have had various theories of treatment. In the 1920's we used to put these patients in pools and exercise them freely; that is, active exercises began three weeks after the acute onset. Then in the 1930's we started immobilizing the affected limbs. This immobilization, which is now much criticized, is not as foolish as it seems. In the 1940's there came a return to early mobile treatment; that is, from the time the diagnosis is made. However, statistics since 1920 show very little difference in the actual number of "cures." When the reports come from orthopedic hospitals where they deal mostly with paralytic cases, the "cures" usually range around 60 per cent. In reports from general or contagious disease hospitals, the "cures" usually run up to between 80 and 90 per cent, because nonparalytic types of poliomyelitis are included. My own impression, after using the new (Sister Kenny) treatment for three years is that after its use the patient's general condition is very much better than it used to be with the previous forms of treatment. They learn to get along better without much support and, I think, due to the packing and re-education exercises, the condition of the muscles is much better with the present treatment. It certainly does no harm to start physical therapy early. So far I have not seen the marked deformities and contractures which were formerly seen. We now see very few of the severe paralytic scolioses. We also see very few of the drop foot cases. It is perhaps too early to be certain because many of the deformities occur several years after the acute onset.

We have always used some form of heat for relief of the muscle spasm. The current treatment in the last three or four years places more emphasis on muscle spasm. I believe it has gone a little too far, and I still think that the most important part of the disease is the paralyzed, not the spastic, muscle. Moldaver, of the Neurologic Institute, Schwartz, of Rochester, and Watkins, of Boston, studied the muscles by means of the electromyogram. They found that for the spastic muscle the myographic curve is very similar to normal muscle under tension. They further found that some of the muscles antagonistic to the spastic muscles showed a perfectly normal response, while others showed the reaction of degeneration. Therefore, one cannot assume that spasticity is the important part. There is need for more careful studies by means of electromyographic or other forms of electric recording of muscle function in order to ascertain whether the muscle is really paralyzed, or only inactive for the time being, due to the spasticity of the opposing muscle groups.

DR. WHEELER: Why would it not be sensible to treat the patients in a hot tub as the psychia-

trists do rather than to apply hot packs over a long period of time?

DR. STIMSON: They are doing that at Haverstraw. They have a pool at 104 F., but it is a curious thing that Sister Kenny's technic, with its elaborate ritual and ceremony, in her hands seems to get better results than any deviation from it.

INTERN: I would like to ask Dr. Stimson to what extent the Kenny treatment is applicable to a case which develops in a home. Should the patient be sent at once to the hospital, or can the mild case be treated at home? If treated at home, how much of the Kenny treatment is utilized?

DR. STIMSON: If it is a mild case it can be treated at home, but many mild cases develop very quickly into bad ones. That is the only difficulty. In a mild case treatment can be done at home in several ways. If a wringer is not available for wringing boiling hot compresses according to the Kenny technic, a very good hot compress can be made by wringing a piece of blanket out of hot water from the hot-water faucet and ironing it with a very hot iron at the bedside until it is essentially dry.

INTERN: How often do you reapply the compresses?

DR. STIMSON: It depends entirely on the patient. Miss Kenny would have you begin at 8:00 in the morning and apply them every two hours until 8:00 at night. Many patients do very well, however, on prone packs. They lie on their face, prone-packed for an hour, and the compresses are changed every fifteen minutes. This is repeated four times a day. Prone packs, particularly when you are short of help, are often satisfactory. Haven't you found that to be true, DR. HANSSON?

DR. HANSSON: Yes.

DR. WHEELER: What is the elaborate ritual of which you speak, Dr. Stimson?

DR. STIMSON: Sister Kenny speaks of the way in which the packs are to be put on and in what sequence, where the safety pins are to go, just how the patient is to be held while the packs are applied, and then how often they are to be applied.

DR. WHEELER: From the practical standpoint, is it correct to say that if you apply a hot moist pack continuously to the spastic muscles that you are carrying out the essentials of her treatment?

DR. STIMSON: Partly. Of course, re-education of the muscles is a major part of her treatment.

DR. HANSSON: It is important not to include the use of heat given by means of the hot bath such as employed by the psychiatrist. That is not the type of heat for the treatment in poliomyelitis. The fact that the packs are superior to the pool is, I believe, due to the fact that the packs, when put on, are usually 120 to 122 F. and cool off rapidly. Therefore, you start with maximum heat and go down to a degree or two below body temperature in two or three minutes.

DR. WHEELER: The alteration in temperature is, then, the important factor.

DR. CARL H. SMITH: A very practical point has come up in regard to the Kenny treatment to allay spasm, and that is, how long should it be applied?

DR. HANSSON: As long as there is spasm.

DR. SMITH: I have seen the Kenny treatment used for as long as a month. Is that correct, Dr. Stimson?

DR. STIMSON: Even a year.

DR. SMITH: What is your end point? There is no spasm for a year, is there?

DR. HANSSON: Oh, yes, there may be.

DR. MCKEEN CATTELL: Is there any scientific evidence to show that the presence or absence of spasm affects the end result of the condition? Is its value merely to relieve the discomfort for the time being?

DR. HANSSON: I believe it does more than relieve discomfort.

DR. WHEELER: What do you think, Dr. Stimson?

DR. STIMSON: I think the truth is part way between what was the former conception of the disease in which the loss of innervation was assumed to be the entire trouble, and Sister Kenny's concept which assumes that spasm is the entire cause of trouble. Spasm certainly can cause three kinds of trouble. The first is muscle shortening and its restriction of the normal motion of the muscle. The second is that as a result of this spasticity there is apt to be incoordination in the proper function of muscles with substitution of one muscle for another. The third trouble to which Kenny calls attention is that a person forgets how to use a particular muscle when it is not used for an appreciable length of time. Sometimes it is not used because of pain. Sometimes it is not used because it has been immobilized. Sometimes it is not used because there was temporary loss of innervation.

DR. WHEELER: Dr. Gold, in the pharmacologist's huge armamentarium is there not some drug used to relieve spasm? How about curare? If the object of the treatment is to relieve spasm, why could not that be used?

DR. HARRY GOLD: But we may also have partly paralyzed muscles at the same time, and there is the possibility of weakening those further while relieving the spasm in the others. As for curare, in spastic muscle disorders it has been

used in intramuscular or intravenous doses of about 25 mg., and it has been stated that spasm in muscles may be relieved by doses that do not affect normal muscles appreciably. The potency of the drug is variable and is not well established.

There is a drug which crossed my mind in relation to the troublesome hypersecretions of the bulbar cases. Why don't you try to dry up the secretions by means of atropine?

DR. STIMSON: Some people advocate it. We don't like it at the Willard Parker Hospital. It makes the secretion sticky and the stickiness seems to be worse than the profuseness.

I would like to ask what Dr. Gold has to say about the hydrodynamics of poliomyelitis. What could one use systemically in these patients for the edema of the central nervous system?

DR. GOLD: There are, of course, the mercurial and xanthine diuretics which are effective dehydrating agents. I don't know whether they would do any good here.

DR. STIMSON: In this connection, I might mention another complication in patients with very marked bulbar trouble, namely, the difficulty they have in emptying the bowel and bladder. We have to resort to catheterization and enemata sometimes for several days.

DR. WHEELER: The hypertonic fluids which you suggested for the early treatment would also have the effect of drawing water out of the central nervous system, which would then pass out in the urine.

DR. HANSSON: I would like to ask Dr. Gold another question, if I may. There have been people advocating prostigmine for the relief of spasticity. Is there any scientific evidence for such a thing?

DR. GOLD: Prostigmine has been utilized for both the muscular weakness of myasthenia gravis and for the relief of muscular spasm. I am not sure that the evidence is very good. Dr. Cattell, do you have any notion about that?

DR. CATTELL: I don't think prostigmine could be used. It increases the action of acetylcholine formed in the body, and acetylcholine does block transmission. But that is true only with large doses which are beyond the therapeutic range.

DR. GOLD: When an animal is severely poisoned by a dose of prostigmine, if it is not given so rapidly as to cause central paralysis, very little response follows stimulation of the peripheral nerves. For example, if the phrenic nerve is stimulated, there is almost no response of the diaphragm. This peripheral action of prostigmine blocks conduction only when given in very large doses. Incidentally, quinine in rather small doses has been used to block conduction in certain types of spasticity of muscles. There was a report of its successful use in doses of 0.3 Gm. in patients with myatonia congenita.

Summary

DR. GOLD: We may now tie together the chief points brought out in the conference today. Poliomyelitis is a virus disease apparently acquired chiefly by way of the alimentary canal, the virus being passed out in the stool. The barrier to systemic invasion may be broken down by such factors as tonsillectomy, chilling, or fatigue. In an epidemic there are many mild cases. During such periods, every minor illness should be suspected. A patient with a little headache or digestive disorder, if carefully examined, may show some muscular spasm or increased cells in the spinal fluid. The results of treatment are good, and reports of cures run as high as 90 per cent.

There is no specific remedy. Treatment falls into three categories—care of the acute phase in the hands of the pediatrician or internist, physiotherapy, and orthopedics.

Bed rest and expert nursing seem to be of foremost importance in the acute phase. The disease is likely to be more severe in those who have not had early rest. Hypertonic solutions of glucose are given intravenously in the hope of reducing the edema of the central nervous system.

Other measures are applied in relation to the special needs presented by the particular case. If there is difficulty in swallowing and the patient cannot take fluids by mouth, isotonic glucose solution is given intravenously. Pain in spastic muscles is controlled by suitable position and support by means of pillows so as to prevent stretching of the involved muscles. Spasm in muscles and its attending discomfort is relieved by hot compresses. The technic of applying these packs as employed by Sister Kenny seems to be particularly successful. The profuse mucus secretion in the nasopharynx in some bulbar cases is managed by appropriate drainage and aspiration. Atropine is not satisfactory, because it renders the mucus too sticky.

Respiratory difficulties are managed in various ways, depending on the mechanism. Oxygen is used freely, preferably by the nasal catheter. Drugs seem to be without value in these cases. In some spinal cases the relief of respiratory muscle spasm by hot packs establishes satisfactory respiration. In bulbar cases with profuse mucus, proper suction is sufficient to remove the cyanosis and establish normal ventilation. However, in some bulbar cases with respiratory-center involvement, and in spinal cases with muscular paralysis the respirator becomes necessary. It should be used sparingly, and only after all measures to maintain spontaneous breathing

have failed, since the respirator tends to suppress the establishment of normal mechanisms of breathing.

From the standpoint of the physiotherapy of poliomyelitis practices have differed. Until fairly recently, immobilization was popular. Now movement of the affected parts as early as possible is considered the preferable treatment. The paralyzed muscle was formerly regarded as the essential element of the disease. Sister Kenny has popularized the notion that the primary trouble in the disease is the spastic muscle. It gives rise to inhibition of its antagonist, and the train of muscular difficulties associated with this disease. She is responsible for important recent trends in the therapy of poliomyelitis, namely, the abandonment of early immobilization, the free use of the hot pack for the spastic muscles, and methods of muscle re-education.

The possible value of curare, prostigmine, and quinine for the relief of spasm was considered.

TWENTY YEARS' PROGRESS IN CHILD HEALTH

youngsters 5 to 14 years, insured in the Industrial Department of the Metropolitan Life Insurance Company, the death rate from all causes combined was cut 65 per cent between 1922–1923 and 1942–1943.

There has obviously been a great saving of young lives. For every two children who die under current mortality conditions, more than five would have died if the death rate of only two decades ago had continued to prevail. This marked improvement has benefited each color and sex group, al-

girls at ages 5 to 14 is
point of 0.6 per 1,000.

duction of no less than 93 per cent in the past twenty years for the children of grade school age.

treatment have been available for the entire period. At present, the death rate from diphtheria among the insured children of elementary school age is only 1/28th what it was two decades ago; as a result, the disease has been reduced from one of the principal causes of death at these ages, to one of wholly minor importance. Notable progress has also been achieved with regard to the other three diseases in this group, the decreases in mortality during the period amounting to nearly 90 per cent for scarlet fever and 80 per cent for both whooping cough and measles.

The rapid downward trend in the death rates from tuberculosis and pneumonia has reduced the death rate from these diseases among children by fully three fourths in twenty years. The decline in the toll from pneumonia at ages 5 to 14, as for all other periods of life, was accelerated following 1937, when chemotherapy began to be used on a wide scale. The efforts to curt been greatly aided by t cases complicated with of 70 per cent in the mortality from appendicitis among these young policyholders reflects also advances in surgical technic and the success of the educational campaign, in which the public has been urged to seek medical care without delay and to avoid the use of laxatives in the case of abdominal pain.

Rheumatic fever and organic heart disease, which latter at these ages is very largely due to rheumatic fever, recorded a drop of three-fifths in mortality over the twenty-year period. Nevertheless, rheumatic fever now ranks first among the diseases causing death at ages 5 to 14, and as the aftermath of

decrease of 52 per cent, made an even more favorable record than accidents as a whole. This is the more remarkable, when it is considered that the death rate from automobile accidents in the total population is currently not very different from what it was twenty years ago. Especially noteworthy also are reductions of more than 70 per cent in the death rate from burns and scalds, the leading class of fata per ce Safety share t though the greater attention given to the care of young children have also played a large role.

There can be no doubt that the efforts to make child life healthier and safer have been eminently ges have that the Future ment of measures to prevent or control rheumatic fever, upon wiping out what remains of tuberculosis at these ages, and upon accident prevention.—*Statistical Bulletin, Jan., 1945*

Annual Report

Medical Society of the State of New York

1943—1944

Report of the President

To the House of Delegates; Gentlemen:

In the month of May, 1944, it became my honored privilege to ascend to the high office of your Presidency. On that occasion I was much impressed with the responsibility that was mine. The traditional and treasured loyalty of great constructive personalities in the history of our New York State Medical Society invite into the mind of the new standard-bearer feelings of fearful inadequacy. Yet, withal, there is the command and the challenge to carry on.

Then, as now, the most important task of the day was the winning of the war. We discussed it, hopefully for early victory, and not without great pride in our membership engaged in the military services. From assignment and procurement to postwar rehabilitation—all in all, a vast program—so that we might the more fully instill hope and cheer and merciful preservation of the mind and body into this great sad epoch of modern civilization. The subject is of immeasurable magnitude. We shall touch on it frequently during the many years to come. There is an appalling similarity in the price paid for failure to prevent war and the failure to prevent disease. It begins to dawn on us that there is a price paid in the destruction of the happiness of a people should freedom become just a word. These likewise have a parallel in medicine.

In the emergency of war we have been requested to postpone the important Annual Meeting of the House of Delegates. This action will make it necessary to revise and supplement our usual annual reports for the House, when it shall have the opportunity to meet. There are several items of importance that I shall endeavor to touch upon again in a later report. All of them I mark as portraying definite advancement in our plans for the public service and the enhancement of cordial public relations.

We have suffered much from losses not alone confined to the blighting ravages of the great conflict. Our faithful Peter Irving passed away on December 28, 1944. As Secretary and General Manager he performed a most difficult task incomparably well. As a man of character, as a student and practitioner of the healing art, he was equally marked with singular renown. I knew Dr. Irving well. He did not worry much about himself, but he always hitched our Medical Society to a star to his last day. They didn't come any better than Peter.

Shortly before the death of the Secretary, our Society suffered greatly in the loss by death of the Assistant Secretary, Dr. Edward Podvin. Well versed in the affairs of organized medicine by long years of work in the State Society and his county society, Dr. Podvin became a mainstay to his fellow practitioners. Especially does the metropolitan area feel the loss of such an experienced and able servant.

In the summer of 1944 the Medical Society was signally honored by the selection of its executive officer, Dr. Joseph Lawrence, as Director of the Public Relations Bureau of the American Medical Association. This was a well-merited recognition of exceptional ability and unusual experience, but we had become so dependent on the cheerful and efficient solution Joe Lawrence had for so many of our troubles!

It is not easy—indeed, it is very nearly impossible—to replace such men. Only those who have actively joined in this endeavor can appreciate the difficulties. And yet the Council and Trustees have achieved the most unusual in the selection of Dr. Walter P. Anderton as Secretary, part time, and Dr. Roger B. Hannon as Executive Officer. These two are talented and gifted men of the highest character and professional standing.

In February, 1945, we added Mr. George P. Farrell as Director of the new Bureau of Medical Care Insurance. This is a very important position and I am high in the hope that Mr. Farrell will prove successful in a most difficult undertaking.

The Publication Committee, headed by Thomas M. Brennan, M.D., chairman, wisely managed for the immediate advancement of our NEW YORK STATE JOURNAL OF MEDICINE by inducing Dr. George W. Kosmak to become the managing editor. Dr. Kosmak makes a real sacrifice in putting himself so energetically into this work. He is a person experienced in editorial management, complemented immeasurably by his long and faithful service to the Society as a former treasurer, and now as a member of the Board of Trustees.

Our JOURNAL has much to do with publicity and public relations, but this is only a small part of the achievement in our publicity. In the past year the director of the Public Relations Bureau, Mr. Dwight Anderson, has put forth on a large scale a most constructive publicity program. It reached regularly our individual membership, county societies, and our district branch meetings; and, more important still, it made a wide and intelligent contact with the public itself. Its efforts were so directed that the *man in the street has become more and more familiar* with the high-minded principles of our New York State Medical Society. Mr. Anderson took on considerably more duties and responsibilities during the year and was our mainstay in carrying on during the vacancies occasioned by the loss of our important personnel.

The Workmen's Compensation Committee and the Board of Trustees have secured the full-time service of the director, Dr. David J. Kaliski. The work of the Bureau has progressed satisfactorily and there has been a much better understanding between it and the county compensation commit-

I mention the personnel noted above because of the essential changes of activity indicated. I am very deeply appreciative of the cooperation and support given our Society by its employed personnel in general and by all of the committees of our membership, who have worked so well under the most trying conditions of difficult transportation. The *esprit de corps* is wonderful, and I know of no better working organization anywhere than that which we have in our Medical Society. A special

paid and unpaid, we have now interested in New York State organized medicine is a great tribute to our aims and principles, and it is the best concrete illustration that the public appreciates that we are trying to do the right thing to the entire exclusion of unworthy selfish motives.

this writing it appears that our legislators recognize that official license to practice the healing art must be dependent upon the high-standard requirements of the Medical Practice Act and is not to be confused with claims to cure, or even with public testimonials of cure. There has been much agitation for the relief of legislators and public officials constantly besieged with pressing demands by those already deriving a sizable cash income from the practice of the healing arts under the guise of cultism. Quite
are engaging
o continue to
where a basic
science requirement would give them the training and supervised experience necessary to practice medicine. I believe those who are favoring basic science legislation in this State are, perhaps unwittingly, but nevertheless effectively, placing a desirable weapon in the hands of those favoring cultist trends. No one thinks a first- or second-year student in a recognized college of medicine is qualified to practice the healing art, and I do not think any of our legislators would vote for the preferential treatment of such an untrained group. Medical schools and hospitals must meet the standard requirements of our Board of Regents before their graduates are entitled even to examination for licensure. The standards are set and the successful applicant is required to meet them. Pressure of groups not possess

it goes far beyond the monetary protection afforded. It is a part of our program for good medicine and cordial public relations. I bespeak the participation of every member of our Society in our own group plan. The Public Relations and Economics Committee has spent much time on medical care problems and, with the subcommittee on medical care
new
time
havi
to encroach upon the field of the practice of medicine. It is unfortunate that some of our hospital superintendents have chosen to side with the insurance-plan representatives rather than cooperate fully with the medical staff working in their hospitals. This has directed keen attention to hospital procedures and, I feel, should inspire our medical men again to participate more actively in hospital management. The public—the patients in the hospital—need this personal interest of medicine. Our Public Relations and Economics Committee and the committee from the New York State Hospital Association have met several times, and from these meetings I am sure great good will come, not only to the hospitals and to the medical profession, but to the people of this State. The entire subject of medical care insurance is of nation-wide and even world-wide importance. In a special report I shall endeavor to discuss more fully the problems of providing adequate medical care to the people of this country.

The many activities of the Council and its committees will, of course, be of great interest to the House of Delegates. It has been decided that the Council, the Board of Trustees, and the various important committees of our Society shall make regular reports in suitable brief form to the component county societies. I have long been in favor of such a democratic step, and I am sure our profession will be much more effective for it. I offer no further comment for the present, except to say that one is really amazed that so many important men in medicine will give the time for the amount of work represented in the reports to your House of Delegates.

We are handicapped now because we do not know when the next House of Delegates meeting will take place. In the interim we shall be gaining additional information, and I beg indulgence to report further, even though I have completed my term in office. Most of the present officials of your Society need to continue in their positions until the Annual Meeting, and such vacancies as occur will be filled

Annual Report

Medical Society of the State of New York

1943—1944

Report of the President

To the House of Delegates; Gentlemen:

In the month of May, 1944, it became my honored privilege to ascend to the high office of your Presidency. On that occasion I was much impressed with the responsibility that was mine. The traditional and treasured loyalty of great constructive personalities in the history of our New York State Medical Society invite into the mind of the new standard-bearer feelings of fearful inadequacy. Yet, withal, there is the command and the challenge to carry on.

Then, as now, the most important task of the day was the winning of the war. We discussed it, hopefully for early victory, and not without great pride in our membership engaged in the military services. From assignment and procurement to postwar rehabilitation—all in all, a vast program—so that we might the more fully instill hope and cheer and merciful preservation of the mind and body into this great sad epoch of modern civilization. The subject is of immeasurable magnitude. We shall touch on it frequently during the many years to come. There is an appalling similarity in the price paid for failure to prevent war and the failure to prevent disease. It begins to dawn on us that there is a price paid in the destruction of the happiness of a people should freedom become just a word. These likewise have a parallel in medicine.

In the emergency of war we have been requested to postpone the important Annual Meeting of the House of Delegates. This action will make it necessary to revise and supplement our usual annual reports for the House, when it shall have the opportunity to meet. There are several items of importance that I shall endeavor to touch upon again in a later report. All of them I mark as portraying definite advancement in our plans for the public service and the enhancement of cordial public relations.

We have suffered much from losses not alone confined to the blighting ravages of the great conflict. Our faithful Peter Irving passed away on December 28, 1944. As Secretary and General Manager he performed a most difficult task incomparably well. As a man of character, as a student and practitioner of the healing art, he was equally marked with singular renown. I knew Dr. Irving well. He did not worry much about himself, but he always hitched our Medical Society to a star to his last day. They didn't come any better than Peter.

Shortly before the death of the Secretary, our Society suffered greatly in the loss by death of the Assistant Secretary, Dr. Edward Podvin. Well versed in the affairs of organized medicine by long years of work in the State Society and his county society, Dr. Podvin became a mainstay to his fellow practitioners. Especially does the metropolitan area feel the loss of such an experienced and able servant.

In the summer of 1944 the Medical Society was signally honored by the selection of its executive officer, Dr. Joseph Lawrence, as Director of the Public Relations Bureau of the American Medical Association. This was a well-merited recognition of exceptional ability and unusual experience, but we had become so dependent on the cheerful and efficient solution Joe Lawrence had for so many of our troubles!

It is not easy—indeed, it is very nearly impossible—to replace such men. Only those who have actively joined in this endeavor can appreciate the difficulties. And yet the Council and Trustees have achieved the most unusual in the selection of Dr. Walter P. Anderton as Secretary, part time, and Dr. Roger B. Hannon as Executive Officer. These two are talented and gifted men of the highest character and professional standing.

In February, 1945, we added Mr. George P. Farrell as Director of the new Bureau of Medical Care Insurance. This is a very important position and I am high in the hope that Mr. Farrell will prove successful in a most difficult undertaking.

The Publication Committee, headed by Thomas M. Brennan, M.D., chairman, wisely managed for the immediate advancement of our NEW YORK STATE JOURNAL OF MEDICINE by inducing Dr. George W. Kosmak to become the managing editor. Dr. Kosmak makes a real sacrifice in putting himself so energetically into this work. He is a person experienced in editorial management, complemented immeasurably by his long and faithful service to the Society as a former treasurer, and now as a member of the Board of Trustees.

Our JOURNAL has much to do with publicity and public relations, but this is only a small part of the achievement in our publicity. In the past year the director of the Public Relations Bureau, Mr. Dwight Anderson, has put forth on a large scale a most constructive publicity program. It reached regularly our individual membership, county societies, and our district branch meetings; and, more important still, it made a wide and intelligent contact with the public itself. Its efforts were so directed that the man in the street has become more and more familiar with the high-minded principles of our New York State Medical Society. Mr. Anderson took on considerably more duties and responsibilities during the year and was our mainstay in carrying on during the vacancies occasioned by the loss of our important personnel.

The Workmen's Compensation Committee and the Board of Trustees have secured the full-time service of the director, Dr David J Kalisk The work of the Bureau has progressed satisfactorily and there has been a much better understanding between it and the county compensation committees, the officials of the Division of Labor, and the public at large All of this redounds to the advantage of the working man and woman in the preservation of good health

I mention the personnel noted above because of the essential changes of activity indicated I am very deeply appreciative of the cooperation and support given our Society by its employed personnel in general and by all of the committees of our membership, who have worked so well under the most trying conditions of difficult transportation The *esprit de corps* is wonderful, and I know of no better working organization anywhere than that which we have in our Medical Society A special committee on office management and the revision of

by the Council. However, in the case of the President, his successor, as President-elect, has already been selected by the House of Delegates. Therefore, the present President-elect should assume the office of the presidency on the date that was set for this event at the Annual Meeting, namely, May 1, 1945.

I am deeply appreciative of the opportunity I have had to serve as President of the Medical Society of the State of New York. I have the greatest confidence in our advancement in the public esteem. Firmly and openly we work for the health benefits of our people and as we gain experience in our public relations we shall be the more helpful to serve as practicing physicians.

HERBERT H. BAUCKUS, M.D., *President*
March 19, 1945

Report of the Secretary

To the House of Delegates; Gentlemen:

It is with a mingled individual sense of regret and appreciation that this report is rendered. My regret is deep as I am here only because of the death of an outstanding, true friend who had proved himself an irreplaceable executive of our Society. My appreciation is also deep because of the honor the Council has paid me in allowing me to undertake the duties of your Secretary.

Membership.—The total number of members of the Medical Society of the State of New York on December 31, 1944, was 18,941. We were joined by 663 new members during the past year; also, 5,141 members are in the service of our country. The honor counties (none of whose members failed to pay their dues in 1944) include Broome, Cattaraugus, Chemung, Chenango, Clinton, Columbia, Delaware, Essex, Franklin, Fulton, Lewis, Montgomery, Ontario, Orange, Putnam, Queens, Saratoga, Schoharie, Schuyler, Seneca, Steuben, Tioga, Tompkins, and Wyoming.

Changes in Management.—Owing to deaths and resignation, changes have been necessary in the mechanism and personnel of management. Dr. Robert R. Hannon has become Executive Officer in Albany, replacing Dr. Joseph S. Lawrence, who resigned to accept the position of Director of Council of Medical Service and Public Relations of the American Medical Association in Washington, D.C. After Dr. Edward C. Podvin's death, Dr. George W. Kosmak was elected by the Council as Assistant Secretary. Mr. Dwight Anderson has been given the title of Executive Secretary. With the able assistance of Miss Doris K. Dougherty as Administrative Assistant, he has improved the office management. He has broadened the scope of our Public Relations Bureau as evidenced by activities in regard to the chiropractic bill, and he has continued to improve the quantity and quality of advertisements in the JOURNAL. Your Secretary has taken care of the professional correspondence, has attended meetings of the Council, Trustees, and most committees in an effort to coordinate the workings of the Society. Dr. George W. Kosmak has been appointed Managing Editor, and Dr. Laurance D. Redway, Literary and Assistant Managing Editor, of the JOURNAL, by the Council. Because of the scope of his duties Dr. David J. Kaliski has accepted the full-time post of Director of the Workmen's Compensation Bureau. A new division of work has been established—Bureau of Medical Care Insurance—of which Mr. George P. Farrell, formerly Supervisor of Field Services of the Western New York Hospital Corporation of Buffalo, took charge early in February.

Directory.—We regret to report that because of the national shortage of paper and the difficulty in engaging personnel, it has been necessary again to postpone publication of the directory.

Council.—As detailed elsewhere, the Council has continued executive activities of the Society between meetings of the House of Delegates. In September, in cooperation with the Hospital Association of the State of New York, a joint committee of six members was formed to consider common problems. Our members are Dr. Carlton E. Wertz, *chairman*, and Drs. Walter W. Mott and J. Stanley Kenney. The Hospital Association of New York is represented by Mr. John F. McCormack, *chairman*, Mr. Carl P. Wright, and Mr. Moir P. Tanney.

The Reorganization Committee, Dr. O. W. H. Mitchell, *chairman*, and Drs. Thomas M. Brennan, Thomas A. McGoldrick, Nathan B. Van Etten, Floyd S. Winslow, George W. Kosmak, and Kirby Dwight, was appointed in October. These gentlemen have been studying changes in the Constitution and Bylaws with a view toward improving efficiency and management.

In December your Council decided upon two new subcommittees of the Public Health and Education Committee. The Subcommittee on Laboratory Service and Medical Care consists of Dr. F. Leslie Sullivan, *chairman*, and Drs. Kenneth F. Bott, Stephen Rumble Monteith, Scott Lord Smith, Walter S. Thomas, Ivan N. Peterson, George A. Marsden, Peter J. Di Natale, and Dan Mellen. The Subcommittee on Cancer consists of Dr. Ralph T. B. Todd, *chairman*, and Drs. James M. Flynn, Clyde L. Randall, Victor C. Jacobsen, and Frank E. Adair.

On account of a new Federal law the Subcommittee on Rehabilitation was selected to act under the Public Health and Education Committee. Its members are Dr. Oliver W. H. Mitchell, *chairman*, Drs. Edward R. Cunniffe, Ralph T. B. Todd, Charles M. Allaben, and Conrad Berens. Also in January the Council elected Dr. Scott Lord Smith as next ranking alternate to fill the vacancy caused by Dr. Louis H. Bauer's resignation as delegate to the American Medical Association. Dr. Bauer resigned because he had been elevated to the office of Trustee of the American Medical Association. Dr. Clarence G. Bandler and Dr. Emily D. Barringer, next ranking alternates, were elected in place of Drs. William A. Krieger and Edward C. Podvin, deceased. Upon recommendation of Dr. Walter S. McClellan, chairman of the Session on Physical Therapy, the name of this Session was changed to Session on Physical Medicine, on December 14, 1944.

During the past year, as a result of nominations from your Council, Dr. Alfred Stillman, 2nd, and Dr. Leander H. Shearer have been appointed members of the Medical Grievance Committee, and Dr. Norman S. Moore, Dr. Laurance D. Redway, and Dr. W. P. Anderton were appointed members of the

Nurse Advisory Council of the New York State Education Department, through resolutions of the Board of Regents.

Convention.—At the behest of the United States Government the scientific sessions of our 1945 convention were canceled, and the meeting of the House of Delegates postponed.

Comment.—As a newcomer in your executive household, allow me to state my admiration for the efficiency and scope of the work of your Council, Trustees, and Committees. I appreciate this opportunity to record my thanks for the patience, guidance, and cooperation which I have experienced in my endeavors as your Secretary.

Respectfully submitted,
W. P. ANDERTON, M.D., *Secretary*

February 21, 1945

Report of the Treasurer

To the House of Delegates; Gentlemen:

The financial status of the Society is shown on the following pages by excerpts from the annual report of our Auditors, Messrs. J. K. Lasser and Company, for the year 1944.

During the year there has been an increase of $77,464 in our surplus balance, of which about $19,000 represents appreciation in the market value of our securities.

Remission of dues for our members in the uniformed forces of the United States amounted to $47,240.

There has been an income from our securities and bank balances of about $14,000, and this includes a small gain on the sale of securities.

The remaining $44,000 comes from an excess of income over operating expenses. By far the greatest factor in giving this favorable balance is the operating balance of our JOURNAL.

The net surplus of receipts over expenditures of the JOURNAL is a little more than $30,000. In 1943 this net surplus was $6,000, and that was the first time that there had been a net surplus.

Going back three years to 1941, there was a net cost of $15,000, a difference of about $45,000.

Thus the improvement in the balance sheet of the JOURNAL has almost completely compensated for the loss of revenue from the remission of dues to our members in the Service.

Also, the Medical Expense Insurance Bureau,

There is one point of special interest which is not shown in the auditor's report, but which should be brought to your attention. By direction of the Board of Trustees the net surplus of the JOURNAL, that is, the total surplus minus the one dollar per member subscription price allocated to circulation income, has been placed in a reserve fund for future needs of the JOURNAL. The reason for this action is that the JOURNAL is subject to most of the financial hazards that are inherent in any publishing business. Everything is favorable at the present time, but the times are not normal, and no one can see into the future.

The market is now good for the sale of advertising space, but this is probably a temporary wartime condition. In the near future it may be more difficult to sell this space and the JOURNAL's income may be cut sharply—how sharply we do not know.

Last
and it r
this inc
per cent (which is quite possible), it is readily seen that there would be a net deficit instead of a net surplus. It is for this reason that it has been felt that a special reserve for the JOURNAL should be established so that the surpluses earned in good years might be used to offset the deficits suffered in bad years, without disturbing the rest of the economy of the Society.

Report of the Council

To the House of Delegates; Gentlemen:

Your Council has the honor to report on its executive and administrative management of the affairs of the Society in the period following your last meeting on May 8–11, 1944. The various matters that came before it, actions thereon, and recommendations are here presented in successive "Parts" of this report.

PART I

Postgraduate Education

The Council Committee on Public Health and Education arranges for instruction in a wide variety of subjects. Speakers are provided by the Committee for meetings of county medical societies, hospital staffs, and other medical groups. This program is made available through the combined efforts of the faculties of the medical schools and research institutions, the State Department of Health, the Dental Society of the State of New York, the Division of Industrial Hygiene of the New York State Department of Labor, the Medical Society of the State of New York, and several other organizations and associations.

A considerable part of the activities of the Committee is presented in cooperation with the New York State Department of Health. The Medical Society of the State of New York pays the traveling expenses of the speakers and the honoraria for all speakers are paid by the Medical Society of the State of New York or the New York State Department of Health. Arrangements may be made for courses of lectures and, in addition, many speakers on special subjects are provided for single lectures.

The Committee prepares and distributes the *Course Outline Book*, which lists subjects and speakers available. The *Course Outline Book* is revised annually.

In May, 1944, letters were sent to all physicians who had arranged courses of instruction for inclusion in the *Course Outline Book* requesting them to make any changes in subjects or speakers they desired.

On July 27, 1944, in New York City, the Council Committee on Public Health and Education conferred with the State Commissioner of Health, the Assistant Commissioner for Medical Administration, the Assistant Commissioner for Local Health Administration, and several Directors of various divisions of the New York State Department of Health, and the Director of the Division of Industrial Hygiene of the New York State Department of Labor to review the activities of the Committee in the field of postgraduate medical education for the year and to discuss plans for the coming year. Also present at this session were the chairmen of the Subcommittees of the Council Committee on Public Health and Education and officers of the Medical Society of the State of New York. To acquaint the group present with the accomplishments of the Committee in the field of postgraduate education, data was distributed. This material showed the counties in which instruction was presented, the number of lectures given, and the subjects and percentage of attendance at meetings from May 1, 1943, to May 1, 1944. The Committee expressed the appreciation of the Medical Society of the State of New York to

the New York State Department of Health for not only the cooperation of the Department in developing programs, but also for the financial assistance received.

Following this meeting the material for the 1944–1945 *Course* [illegible] submitted to [illegible]-nine announcements, including courses of lectures, Teaching Day programs, and single lectures on special subjects. In addition to the instruction listed in the *Course Outline Book* last year, the Committee ar-

[illegible]

Health Commissioners, physicians who arranged courses in the *Course Outline Book*, d[illegible]ted States, librarians [illegible] of New York, secr[illegible] in the United States, executive health officers of the various states, members of the New York State Board of Regents, New [illegible] Education and Director

The Committee arranged for postgraduate instruction to be presented in thirty-two counties with a total of one hundred and thirty-six lectures.

Public health matters receiving particular emphasis from the New York State Department of Health and the Medical Society of the State of New York this year have been: cancer, gynecology, home and farm accidents, industrial health, meningitis, nutrition, obstetrics, orthopedics, pediatrics, penicillin therapy, plasma therapy, poliomyelitis, rheumatic fever—rheumatic heart disease, sulfonamide therapy, syphilis, tropical medicine, tuberculosis, virus diseases, and war medicine and surgery.

PART II

Maternal and Child Welfare

Maternal Welfare.—The Emergency Maternity and Infant Care Program received considerable attention at the Annual Meeting of the House of Delegates held in New York City in May, 1944. Among the features of the program, as presented by the Children's Bureau, which the Council Committees had considered was that of recognition of extra services of the qualified specialists and the compensation in keeping with such services. That portion of the Report of the Council Committees as submitted to the House of Delegates reads as follows:

> "4. The plan provides for additional fees where the services of a qualified consultant are required, but makes no provision for recognizing the extra services of a qualified obstetrician or pediatrician where such physician has undertaken the basic maternity or sick-infant care of a patient, under the plan."

The Reference Committee on Report of Council—Part II: Maternal and Child Welfare commented as follows:

> "We recommend the passage of the Council Committees' proposal that some system should be devised for recognition of extra services of the qualified specialist and for compensating him in keeping with the extra services rendered."

In accordance with the recommendation of the Council Committees and the action of the House of Delegates, the New York State Commissioner of Health requested the Children's Bureau to amend their regulations in keeping with this action. Recently the Children's Bureau acceded to this request by allowing an increase in fees up to 50 per cent for qualified specialists. The Council Committee on Public Health and Education and the Subcommittees on Maternal and Child Welfare were notified of this action by the New York State Commissioner of Health. These Committees conferred with representatives of the New York State Department of Health on October 11 and 26, 1944, in New York City to formulate a plan of procedure for establishing a list of qualified specialists in New York State.

The following plan was submitted to the Council of the Medical Society of the State of New York at its meeting on November 9, 1944, by the New York State Department of Health:

In order to apply the provisions of amendment 8, which provides for differential fees for qualified specialists, it will be necessary that the E.M.I.C. Bureau possess a list of physicians in New York State who would be considered specialists in a particular branch of medicine, i.e., obstetrics, pediatrics, surgery, radiology, orthopedic surgery, internal medicine, dermatology, plastic surgery, ophthalmology, otolaryngology, urology, psychiatry, and neurology. Such a roster or panel of qualified specialists would be comprised of physicians meeting the following requirements:

(*a*) Physicians who have been certified by their respective specialty boards;

(*b*) Physicians who are not members of a specialty board; these must present evidence that their training and experience meet the requirements of training and experience for admission to the examinations of such boards or that they have had equivalent training and experience in their specialty which, in the opinion of the State Commissioner of Health, with the advice of an advisory board, would qualify them as specialists.

The following procedures are to be used in connection with the establishment of a list of specialists as defined under (*b*) above:

1. Formal notification of the State Medical Society by the State Health Commissioner of necessity for listing of qualified specialists.
2. Notification of county medical societies regarding proposed plan by officials of State Medical Society.
3. Each county medical society would establish a special committee for consideration of qualifications of physicians to be considered as specialists in the E.M.I.C. Program. (In so far as is practicable the members of this special committee should be diplomates of various specialty boards.)
4. Preparation of suitable application forms by the State Health Departments to be used by interested physicians. (Application forms may be obtained from county medical societies and district health officers.)
5. Suitable publicity regarding the proposed plan in:
    1. The New York State Journal of Medicine
    2. *Health News*
    3. County Medical Society bulletins

Publicity will specifically (*a*) suggest that interested physicians submit their qualifications for consideration by their respective county medical society committees, and (*b*) list standards which will be used

* Traveling expenses and honoraria of speakers and printing of programs provided by the New York State Department of Health.

in evaluating eligibility of applicants for specialist status.

6. The physician will submit the completed application to the chairman of the special committee on qualifications of the county medical society or to the district health officer for transmittal to the

Health for the final decision.

7. The individual physicians will be notified of

issioner of Health,

rred by the State

Commissioner of Health, for recommendation and advice, to the appropriate subcommittee of the State Medical Society.

9.

Department; (*b*) submitted to the respective district health officers;

spective secretaries o

(It was decided that

ferent for New York

of physicians would b

Health Department and representatives of the five counties in the metropolitan area.)

After much discussion of the plan, including the reading of the action taken by the House of Delegates at its 1944 meeting, the following motion was passed by the Council on November 9, 1944:

> "Approval of the whole E.M.I.C. Program and this report of the procedure regarding the differential in fees between the specialists and general practitioners shall apply only for the duration of the emergency and six months thereafter."

The following letter was prepared by the Council Committee on Public Health and Education, the Subcommittees on Maternal Welfare and Child Welfare, representatives of the New York State Department of Health and the City of New York Department of Health, and mailed from the office of the Council Committee on Public Health and Education in December, 1944, to the presidents of county medical societies not including the counties in New York City:

"Dear Doctor:

"At the Annual Meeting of the House of Delegates of the Medical Society of the State of New York held in New York City, Tuesday, May 9, 1944, the Emergency Maternity and Infant Care

65.

mit-

the

the services of a qualified consultant are required, but names no provision for recognizing the extra services of a qualified obstetrician or pediatrician where such physician has undertaken the basic maternity or sick infant care o a patient under the plan."

"The Reference Committee commented as follows

"We recommend the passage of the Counci Committees' proposal that some system shoul be devised for recognition or extra services o the qualified specialist and for compensatin him in keeping with the extra services rendered.'

"This part of the report was adopted along witl the rest of the report of the Reference Committee

"In accordance with the recommendation of the Council Committees and the action of the Hous of Delegates, Commissioner Godfrey, of the New York State Department of Health, requested th Children's Bureau to amend their regulations i keeping with this action. Recently the Children' Bureau acceded to this request by allowing a increase in fees up to 50 per cent for qualifie specialists. The Council Committee on Publi Health and Education of the Medical Society o the State of New York and the Subcommittee on Maternal and Child Welfare were notified b Commissioner Godfrey of this action. Thes Committees have conferred with Commissione Godfrey and other representatives of the Ne York State Department of Health and a plan o procedure was agreed upon. This plan was sub mitted to the Council of the Medical Society of th State of New York and approved at its meetin on Thursday, November 9, 1944.

"It therefore becomes necessary to have eac county medical society assist the State Depart ment of Health (the operating agency of th E.M.I.C. Program) by having a special com mittee list the members of their organization wh are considered specialists. Such a roster of special ists will be comprised of physicians meeting th following requirements:

"(*a*) Physicians who have been certified by thei respective specialty boards;

"(*b*) Physicians who are not members of specialty board; these must present evidence tha their training and experience meet the require ments of training and experience for admission t the examinations of such boards or that they hav had equivalent training and experience in thei specialty which, in the opinion of the State Com missioner of Health, with the advice of an ad visory bo sts.

York.

"The roster of approved specialists will be on record in the New York State Department of Health, the district health offices, and the office of the secretary of each county medical society.

"Your cooperation and assistance are greatly appreciated.

Sincerely yours,

O. W. H. MITCHELL, M.D., *Chairman*"

In February, 1945, the following letter, which was prepared after a conference with the Commissioner of Health of the City of New York Department of Health and officials of the New York State Department of Health, was mailed from the office of the Council Committee on Public Health and Education to the presidents of Kings, Queens, Bronx, New York, and Richmond County Medical Societies:

"Dear Doctor:

"At the Annual Meeting of the House of Delegates of the Medical Society of New York State, held in New York City on May 9, 1944, the Emergency Maternity and Infant Care Program was discussed. The House of Delegates recommended that a system be 'devised for recognition of extra services of the qualified specialist and for compensating him in keeping with the extra services rendered.' This report was adopted. Recently, the Children's Bureau of the U.S. Department of Labor has acceded to this request by allowing a 50 per cent increase in fees for qualified specialists, effective December 15, 1944. A plan of procedure has been devised by the State Health Department, and approved by the Council of the Medical Society of the State of New York at its meeting on November 9, 1944. It is now proposed to institute a similar plan in New York City.

"It therefore becomes necessary to have each of the five county medical societies in New York City assist the New York City Department of Health (the operating agency of the E.M.I.C. program), as follows:

"A joint committee should be set up, composed of qualified representatives in all specialties from the five county medical societies. This committee will have the function of listing the members of their organization who are considered specialists. Such a roster of specialists will be comprised of physicians meeting the following requirements:

"(*a*) Physicians who are diplomates of their respective specialty boards;

"(*b*) Physicians who are not diplomates of a specialty board; these must present evidence that their training and experience meet the requirements of training and experience for admission to the examination of such boards, or that they have had equivalent training and experience in their specialty which, in the opinion of the New York City Commissioner of Health, with the advice of an appropriate advisory committee, is equal to that required for admission to the examinations for board certification.

"(*c*) In the fields of obstetrics and pediatrics only, a physician not falling into group (*a*) or (*b*) may be qualified if he presents credentials satisfactory to the Commissioner of Health, as advised by the Commissioner's present Committees on Obstetrics and Pediatric Consultants composed of qualified obstetricians and pediatricians, respectively, resident in one of the five boroughs of New York City, and approved by their respective county societies.

"This joint committee of the five county medical societies in New York City should be established for this purpose as soon as possible. Physicians should be requested to submit their applications for specialist rating on a form which will be supplied to the county medical societies. The joint committee of the five county medical societies, after review, will forward the application with its recommendations to the New York City Commissioner of Health for final decision.

"The roster of approved specialists will be on record in the New York City Department of Health and the office of the secretary of each county medical society.

"Your cooperation and assistance will be greatly appreciated.

"Sincerely yours,

O. W. H. MITCHELL, M.D., *Chairman*"

In January, 1945, the Director of the E.M.I.C. Bureau, New York State Department of Health, informed the office of the Council Committee on Public Health and Education that a supply of the application forms which are used for the setting-up of a roster of specialists in the E.M.I.C. Program was sent to each of the district health officers and to the secretaries of county medical societies.

There has been splendid cooperation between the official State Agencies and the Medical Society of the State of New York in the working of the E.M.I.C. Program in New York State.

The Subcommittee on Maternal Welfare has the following membership: Charles A. Gordon, M.D., *chairman*, Brooklyn; Edward C. Hughes, M.D., Syracuse; Alexander T. Martin, M.D., New York City; James K. Quigley, M.D., Rochester.

PART III

School Health Program

In September, 1942, the Regents passed a regulation requiring the teaching of health in the high schools of the State. In August, 1944, the new *Health Teaching Syllabus for High Schools* was distributed by the State Education Department to the schools. This bulletin was prepared by a State [illegible] n of the [illegible] is a practical aid to administrators and health teachers for immediate use in establishing local health-teaching programs.
To assist in the preparation of this bulletin, the Council of the Medical Society of the State of New [illegible]

[illegible]

"Your Committee notes that one important phase of the School Health Program apparently has not been given the attention it merits either in this or previous reports of this Council Subcommittee.
"We refer to the matter of instruction of health [illegible] available in the normal school in State Teachers Colleges, are not utilized to their full advantage. If we are to have good health instruction in the schools, we must have a sufficient number of well-qualified teachers.
"We *therefore recommend to the Subcommittee* that they place special emphasis on this phase of the subject during the coming year."

This recommendation was adopted by the House of Delegates. On motion duly seconded and carried, this was referred to the Council Committee on Public Health and Education.
On May 23, 1944, in Syracuse, a conference was held to consider the qualifications of teachers [illegible] teachers in this field. It was also stressed at this meeting the need for specific instruction and guidance from the State Education Department to local school authorities on the training, selection, and

assignment of personnel in this teaching program. Also at this meeting it was suggested that the Commissioner of Education might well include such instruction in his letter transmitting the new syllabus to the schools. Present at this meeting were members of the Council Committee on Public Health and Education, the Subcommittee on Child Welfare, the Advisory Committee of the Medical Society of the State of New York to the State Education Department, and representatives from the Division of Health and Physical Education of the State Education Department, the New York State Association of School Physicians, and the New York State Department of Health.

Also on June 22, 1944, another meeting was held in New York City to discuss the health teaching program in the high schools. Present at this meeting were: State Commissioner of Education, President of the Medical Society of the State of New York, members of the Council Committee on Public Health and Education, the chairman of the Subcommittee on Child Welfare, and the director of the Division of Health and Physical Education of the State Education Department.

The following copy of a letter, which was addressed to superintendents and principals of schools from the State Commissioner of Education, was received by the Chairman of the Council Committee on Public Health and Education on June 28, 1945:

"The University of the State of New York
The State Education Department
Office of the President of the University
and Commissioner of Education
Albany

June 26, 1944

"To Superintendents and Principals:

"The new *Health Teaching Syllabus for Junior and Senior High Schools*, prepared under the direction of the Division of Health and Physical Education, will go forward to you soon. It is the aim of the Department to have this syllabus used experimentally in the schools of the State during the coming year. It will be helpful if teachers will record their reactions concerning its practicability and the ways in which it may be improved in its next edition.

"The Department, through its Divisions of Research and Health and Physical Education, will make an intensive study of the use of this syllabus during the coming year in certain schools of different types.

"It is hoped that the State may achieve a health-teaching program that will become fully effective by September, 1945.

"Some schools have already scheduled this course work. Others are now making plans to be carried out during the coming year. It is important that the competent staff be assigned to the teaching and coordination of the health-teaching program. Wherever possible, certified health teachers should be used. If they are not available, teachers with partial preparation will necessarily serve until trained staff can be secured.

"Courses to assist teachers in preparation for high-school health teaching will be offered during the regular summer sessions at several colleges and universities. Intersession courses based on the new syllabus will be offered. This work is for the immediate training of teachers who will be responsible for health teaching in September. Boards of Education may well encourage teachers to take these courses.

"At the beginning of the new school year, the Division of Health and Physical Education will conduct a series of two-day regional institutes throughout the State for the purpose of discussing problems concerned with the local administration of this program. You will receive a schedule of these institutes.

"A form on which you may requisition copies of the syllabus is enclosed.

"Please direct all requests for information and materials to Dr. Hiram A. Jones, Director of the Division of Health and Physical Education.

"Sincerely yours,
GEORGE D. STODDARD"

Copies of the Syllabus were received by the Council Committee on Public Health and Education for distribution to Subcommittee members and officers of the Medical Society of the State of New York.

There has been very satisfactory cooperation between the State Departments of Education and Health, the New York State Association of School Physicians, the Dental Society of the State of New York, and the Medical Society of the State of New York concerning the School Health Program.

On August 21, 1944, the following letter was received by the Chairmen of the Council Committee on Public Health and Education from Dr. Hiram A. Jones, Director of the Division of Health and Physical Education, State Education Department, expressing the appreciation of the Department for the assistance given by the Medical Society of the State of New York in the preparation of the syllabus for health teaching in the high schools:

"The University of the State of New York
The State Education Department
Albany 1

"Division of Health and Physical Education
Hiram A. Jones, Director

August 19, 1944

"O. W. H. Mitchell, M.D., *Chairman*
Council Committee on Public Health and
Education
Medical Society of the State of New York
428 Greenwood Place
Syracuse, New York

"Dear Doctor Mitchell:

"I write to advise that the new *Health Teaching Syllabus* for the Junior and Senior High Schools of the State will be available for distribution next week.

"This syllabus is a product of which everyone should be proud. The State is greatly indebted to you and members of your Committee of the Medical Society of the State of New York for the exceptionally valuable assistance in its preparation. To my knowledge, it represents the finest contribution that has appeared to date in this field. Both from the State and national points of view it is an outstanding piece of work. You will be interested to know that it is being used by the Medical Division of the Selective Service System as the example for the Nation. So, I am grateful for the devoted attention that this work has received from the Medical Society of the State.

"I also want to express the hope that the assistance of your Committee may continue. There are many problems of vital nature on which we need your advice. Immediately I think of the following:

"1. The question of adequate health records that may be uniformly utilized throughout the State and Nation;
"2. The steps that should be taken to insure adequate medical organization and supervision in carrying forward this program throughout the State;
"3. Specific training of school physicians;
"4. Assistance that may be rendered by members of your Committee and representatives of the county medical societies in the conduct of Health Teaching Institutes to present the syllabus materials and help in the local development of this program.

"Any help that you and your Committee can [illegible]

"With all good wishes.

"Sincerely yours,
HIRAM A. JONES"

The Medical Society of the State of New York was represented at a meeting of the Committee appointed by the State Commissioner of Education to study and report on problems of tuberculosis control among school personnel, held in Albany on Tuesday, December 5, 1944. The following issues were considered at this meeting (it should be kept in mind that the Committee is concerned with medical examinations and such related problems only, with regard to tuberculosis control):

1. Should a program for the control of tuberculosis among school personnel be developed?
2. If emphasis were given to such a program, is *additional legislation necessary?*
3. If changes are considered in legislative con- [illegible] should not [illegible] ion of permissive legislation to cover the problem which exists in tenure areas?
5. If [illegible] were mandatory, [illegible] be administered, i.e. [illegible], the State Education Department, or both?
6 [illegible] by [illegible] cat [illegible] should be designated to each?
7. If legislation were obtained should such legislation be a part of the Education Law, the Public Health Law, or both?
8. If the program were undertaken, what action should be recommended with regard to the following:

(*a*) Who would do the examination?
  (1) Private physician
  (2) School physician
  (3) Private physician's examination, findings to be approved by Health Department
  (4) Public-health official
(*b*) Who would pay for the examination?
  (1) School employee
  (2) Governing body of school district
  (3) State Health Department
(*c*) If the [illegible] agenc [illegible]
  (1) [illegible]
  sioner of the State Health Department or such review agency as appointed by him.
  (2) If the appeal were directed toward action taken with regard to the teacher, such an appeal is within the jurisdiction of the Commissioner of the State Education Department.
(*d*) What would or should be done with employees found to have active cases of pulmonary tuberculosis?
  (1) With regard to jobs
    (*a*) A leave of absence for duration of treatment requiring continuous supervision which has been authorized or recommended (by what medical agency)
    (*b*) A leave of absence for six months to two years at the discretion of the appointing officer
    (*c*) In tenure areas or Civil Service what variation of the above would be feasible (Section 575)?
    (*d*) Removed from duty permanently but continued on the payroll at partial or full rate for duration of contract
    (*e*) Discharged
  (2) With regard to economic situation
    (*a*) Income
      Full or partial payment by a school board for a varying length of time or the duration of required treatment [illegible]
      of and in the course of employment)
    (*b*) Hospitalization and treatment
      Paid by patient
      Hospitalization fund
      Paid by State

9. Whether or not the Committee recommends an extension of permissive or mandatory legislation, should an attempt be made to direct attention of all school authorities and school personnel to the scope of the problem?

The Advisory Committee of the Medical Society of the State of New York to the State Education Department has the following membership:

Paul W. Beaven, M.D., vice-chairman, Subcommittee on Child Welfare, 26 South Goodman Street, Rochester
J. G. Fred Hiss, M.D., chairman, Subcommittee on 4-H Clubs and Youth Health Activities, 505 State Tower Building, Syracuse
A. C. Silverman, M.D., member, Subcommittee on Child Welfare, 608 East Genesee Street, Syracuse

Industrial Health.—The Study Committee on Industrial Health has the following membership:

Leon H. Griggs, M.D., *Chairman*, 1804 State Tower Building, Syracuse 2
[illegible]
Syracuse 10
John H. Garlock, M.D., 50 E. 77 Street, New York 21

Stuart A. Good, M.D., Curtiss-Wright Corporation, Buffalo 5
John S. Lawrence, M.D., 260 Crittenden Boulevard, Rochester 7
Nelson W. Strohm, M.D., 289 Linwood Avenue, Buffalo 9

Ex Officio

Edward S. Godfrey, Jr., M.D., Commissioner of Health, State Department of Health, Albany 1
Leonard Greenburg, M.D., Executive Director, Division of Industrial Hygiene, State Department of Labor, 80 Centre Street, New York 13, New York
David J. Kaliski, M.D., Director, Bureau of Workmen's Compensation, Medical Society of the State of New York, 292 Madison Avenue, New York 17, New York.

The Study Committee on Industrial Health held meetings in New York City on July 26 and August 23, 1944, to discuss the educational program to be offered county medical societies for the coming year. Present at these meetings were members of the Study Committee, the Council Committee on Public Health and Education, officers of the Medical Society of the State of New York, the State Commissioner of Health, and the Director of the Division of Industrial Hygiene of the New York State Department of Labor. At the meeting of the Study Committee on August 23, a representative of the Council on Industrial Health of the American Medical Association was also present.

To stimulate interest in industrial health and instruction in county medical societies, the Director of the Division of Industrial Hygiene of the New York State Department of Labor and the Council Committee on Public Health and Education prepared a series of symposia on industrial health. This announcement appears in the 1944–1945 *Course Outline Book*.

Many of the lectures arranged by the Committee on Public Health and Education for county medical societies could be considered a part of the Industrial Health Program, but only one is so designated. See report on "Postgraduate Medical Education."

PART IV

Public Health Activities

4-H Clubs and Youth Health Activities.—Dr. J. G. Fred Hiss, Syracuse, *chairman*, Subcommittee on 4-H Clubs and Youth Health Activities, attended a meeting of the Health Committee of the 4-H Club held in Syracuse on September 26, 1944. The health program of the 4-H Club was discussed. School examinations are accepted in considering the 4-H health program. The general tendency throughout the State is to improve the quality of these examinations. At this meeting the Chairman of the Subcommittee on 4-H Clubs and Youth Health Activities moved that the 4-H Club engage a health specialist or health educator whose chief duty was to instruct club leaders in the importance of the health program so that a larger number of 4-H Club members would engage in this activity. The motion was passed and the request for such a specialist will be made. This should serve a very useful purpose.

Another meeting of the Health Committee of the 4-H Clubs was scheduled for March 14, 1945, when the results of last year's campaign were discussed and analyzed.

The State officials of the 4-H Clubs at Ithaca have sent out weekly letters on health information and programs to the various club leaders. These are very well made up and serve a very useful purpose.

The chairman of the Subcommittee on 4-H Clubs and Youth Health Activities was asked by the Director of Public Health Nursing, Syracuse University College of Medicine, to speak to the nurses taking the public-health course on the health programs of the 4-H Clubs. The nurses are being trained for state and county positions and it is believed that they may be able to use the 4-H Clubs as an outlet for public-health education programs.

Dr. Hiss is also chairman of the Physician's Committee on Personal Health and Safety in connection with the Home and Farm Safety Program of the Division of Public Health Education of the New York State Department of Health. The chairman of the Council Committee on Public Health and Education is also a member of this Committee.

With the approval of the Council, the Council Committee on Public Health and Education has cooperated with the Division of Public Health Education in developing a program on home and farm accident prevention. The Committee has arranged for a series of postgraduate lectures on the medical and surgical care of home and farm accidents. An announcement appears in the 1944–1945 *Course Outline Book*.

Blood and Plasma Exchange Bank.—As a result of the recommendations of the Subcommittee on Blood and Plasma Exchange Bank submitted to the New York State Department of Health in 1944, the New York State Department of Health has prepared a program to provide blood and blood derivatives for use throughout the State. This program was developed with the cooperation of the Medical Society of the State of New York, the State Hospital Association, and the State Association of Public Laboratories. A very extensive survey was made by the State Department of Health. The Department submitted to the Council Committee on Public Health and Education a proposed bill to be submitted to the Legislature of the State of New York. This bill includes the following statements:

> "The Commissioner of Health is hereby authorized to establish, equip, maintain, and conduct a suitable program to collect, process, store, and distribute human blood and the various human-blood derivatives, including special therapeutic and diagnostic serums, which are deemed of value in the treatment of sick and injured persons, and the prevention of certain diseases; to carry out such educational and research activities as he may deem necessary in connection with said program; and to establish necessary rules and regulations to effect the purposes of this act.
>
> "This act shall be effective throughout the State of New York exclusive of New York City.
>
> "The State Commissioner of Health may conduct such program solely as a State activity, or in cooperation with such institutions, hospitals, or municipal corporations as he may select, on such terms as may be agreed upon."

This statement to appear in the proposed bill was approved at the meeting of the Council of the Medical Society of the State of New York on November 9, 1944.

The Subcommittee on Blood and Plasma Exchange Bank has the following membership:

George M. MacKenzie, M.D., *Chairman*, Mary Imogene Bassett Hospital, Cooperstown
Morris Maslon, M.D., 43 Coolidge Avenue, Glens Falls
Lester J. Unger M.D., 135 East 74 Street, New York

Ex Officio

Edward S. Rogers, M.D., State Department of Health, Albany

Cancer.—At a meeting of the Council of the Medical Society of the State of New York on November 9, 1944,

It was moved, seconded, and carried that the President appoint a subcommittee of five members of the Council Committee on Public Health and Education to deal with the subject of cancer and that the American Society for the Control of Cancer be notified of this action.

The President, with the approval of the Council, appointed the following physicians as members of the Subcommittee on Cancer:

Ralph Ten Broeck Todd, M.D., *Chairman*, Tarrytown
James M. Flynn, M.D., 277 Alexander Street, Rochester
Frank E. Adair, M.D., 75 East 71 Street, New York
Victor C. Jacobsen, M.D., 51 First Street, Troy
Clyde L. Randall, M.D., 89 Bryant Street, Buffalo

A meeting of the Subcommittee on Cancer was held in New York City on January 10, 1945. In addition to the members of the Subcommittee there were also present at this meeting officers of the Medical Society of the State of New York, the [illegible] partment of Health.

The Committee will work with the State Department of Health and other agencies to stimulate interest and expand the cancer educational program. During the year arrangements have been made for seventeen lectures on cancer to be given in five counties, including four Regional Teaching Days. Arrangements are now being made for three Regional Teaching Days to be held in various counties in the near future. See report on "Postgraduate Medical Education."

These lectures, presented by the New York State Department of Health and the Medical Society of the State of New York, have been well attended and received.

Dental Health.—The educational program arranged by this Joint Committee appears in the *Course Outline Book*.

The Joint Committee on Dental Health has the following membership:

Medical Society of the State of New York:

O. W. H. Mitchell, M.D., *Chairman*, 428 Greenwood Place, Syracuse 10
Harry Aranow, M.D., 1882 Grand Concourse, Bronx, 57
Carleton E. Wertz, M.D., 91 Parker Avenue, Buffalo 14

Dental Society of the State of New York:

Charles M. McNeely, D.D.S., 1 Nevins Street, Brooklyn 17
Douglas B. Parker, M.D., D.D.S., 121 East 60 Street, New York
Leuman M. Waugh, D.D.S., 931 Fifth Avenue, New York 19

Hard of Hearing and The Deaf.—Through correspondence with every county medical society within the State, the Subcommittee on Hard of Hearing and the Deaf has assisted in organizing, outside of metropolitan New York, thirty-two local committees that have agreed to cooperate in the form [illegible] arranging [illegible] to the [illegible] reported no otologists within their territories, and nineteen failed to respond to any of our appeals.

At the present time there are in New York State ten active "Hearing Clinics." It is expected that within the next year the number will increase to twenty or more.

These Centers are—and will continue to be—established in existing dispensaries where persons normally classified as clinic patients may receive the following free services: (1) complete otologic [illegible] procedures.

The "Hearing Clinics" are not expected to carry out the actual procedures outlined under point (3), *but rather to counsel the patients concerning them.* Personnel especially trained in dealing with acoustically handicapped individuals, the local chapter of the American Society for the Hard of Hearing, classes in the Conservation of Hearing, and the *Schools for the Deaf will be responsible for the educational phases of the work.*

The Subcommittee on Hard of Hearing and the Deaf has the following membership:

C. Stewart Nash, M.D., *Chairman*, 708 Medical Arts Building, Rochester
Ralph Almour, M.D., 71 East 80 Street, New York
John F. Fairbairn, M.D., 925 Delaware Avenue, Buffalo
Edmund Prince Fowler, M.D., 140 East 54 Street, New York
Marvin F. Jones, M.D., 121 East 60 Street, New York

[illegible] nittee [illegible] year. [illegible] War [illegible]

O. W. H. Mitchell, M.D., *Chairman*, 428 Greenwood Place, Syracuse 10
Gustave Au Fricht, M.D., 103 East 86 Street, New York 28
Louis H. Bauer, M.D., 503 Professional Building, Hempstead
L. Whittington Gorham, M.D., Albany Hospital, Albany 1
Leonard Greenburg, M.D., 80 Centre Street, New York 13
Leo Mayer, M.D., 1150 Fifth Avenue, New York 28
James E. Perkins, M.D., State Department of Health, Albany 1
Byron Stookey, M.D., Neurological Institute, New York 32
Frederick S. Wetherell, M.D., 713 East Genesee Street, Syracuse 2

New York State Commission For The Blind.—The following letter was received by the Chairman of the Council Committee on Public Health and Education from a member of the New York State Commission for the Blind and was read at the meeting of the Council on December 14, 1944:

"December 12, 1944

"O. W. H. Mitchell, M.D.
Roosevelt Hotel
New York City

"Dear Doctor Mitchell:

"The New York State Commission for the Blind would like to have the New York State Medical Society cooperate with it in furthering its prevention program. The Commission is anxious to have its approved literature made available to the physicians of our State through your Society. We suggest a plan similar to that used by several of our Midwestern States. The method of approach can be worked out by a small group appointed for that purpose.

"The Commission further asks the New York State Medical Society to indorse its program asking for the mandatory reporting of the blind. This will enable the Commission to fulfill its obligations as defined in Section 3 of Section 84 of the unconsolidated laws establishing the State Commission for the Blind.

"*Section 84* "Register of Blind;" *Sec. 3* "It shall be the duty of this Commission to cause to be maintained a complete register of the blind in New York State, etc."

"This is a brief résumé of our recent talks. If there is any further information desired, please call Miss Grace S. Harper, the Director of the Commission, who is located at 205 E. 42nd Street, telephone Murray Hill 4-5000.

"Very truly yours,
D. F. GILLETTE, M.D."

The Chairman of the Council Committee on Public Health and Education recommended to the Council that the Medical Society of the State of New York cooperate and distribute as a joint activity this literattre. This recommendation was adopted.

Infantile Paralysis Program.—During the year several conferences were held with representatives of the National Foundation for Infantile Paralysis to discuss educational plans, particularly on a regional basis. Some progress has been made but it is likely that much time will be required to satisfactorily develop the program due to the lack of trained personnel because of the war emergency. In cooperation with the New York State Department of Health, a considerable amount of instruction was presented during the time when poliomyelitis was prevalent. For details see report on "Postgraduate Education."

Rheumatic Fever—Rheumatic Heart Disease Program.—During the year special consideration has been given to this program. Lectures were given in various parts of the State. A Regional Teaching Day was held in Syracuse in November, 1944. This meeting was very well attended and favorable comments regarding the speakers were received. The Teaching Day was given as a part of the four-county plan which is being developed in Onondaga, Cayuga, Cortland, and Oswego counties. For details see report on "Postgraduate Medical Education."

The rheumatic fever—rheumatic heart disease program is a cooperative endeavor of the New York State Department of Health and the Medical Society of the State of New York.

PART V

Laboratory Service and Medical Care

The Report of the Reference Committee on Report of Planning Committee for Medical Policies concerning Regional Centers for Diagnostic Aid which was accepted by the House of Delegates at its meeting in May, 1944 reads as follows:

"The Committee has made a very comprehensive study of the necessity of the location and the supervision of the centers in rural areas. They believe they can be created and operated in carefully selected areas with no damage to a free and unfettered practice of medicine. Since no specific recommendations are made at this time, we will not go into the details of their report. They do, however, recommend that a special committee or subcommittee be appointed by the President to make a survey of New York State to determine the need for such a program and the areas to be cared for. The suggested methods of operations are, of course, tentative, and if the survey indicates the desirability of establishing such diagnostic centers, then the details of management would have to be worked out carefully. Your Reference Committee recommends the appointment of such a committee by the President."

By action of the Council at the meeting held on November 9, 1944, this was referred to the Committee on Public Health and Education and the President authorized to appoint a Subcommittee to study the need for Diagnostic Centers in New York State.

The Subcommittee on Laboratory Service and Medical Care has the following membership:

F. Leslie Sullivan, M.D., *Chairman*, Scotia
First District—Westchester and Putnam Counties
Andrew A. Eggston, M.D., New York
Orange and Rockland Counties
Stephen R. Monteith, M.D., Nyack
Dutchess County
Scott Lord Smith, M.D., Poughkeepsie
Third District—Albany, Columbia, Greene, Rensselaer, Schoharie, Sullivan, Ulster Counties
Kenneth F. Bott, M.D., Greenville
Fourth District—Clinton, Essex, Franklin, Fulton, Hamilton, Montgomery, St. Lawrence, Saratoga, Schenectady, Warren, Washington Counties
Dan Mellen, M.D., Rome
Fifth District—Herkimer, Jefferson, Lewis, Madison, Oneida, Onondaga, Oswego Counties
George A. Marsden, M.D., Oswego
Sixth District—Broome, Chemung, Chenango, Cortland, Delaware, Otsego, Schuyler, Tioga, Tompkins Counties
Ivan N. Peterson, M.D., Owego
Seventh District—Cayuga, Livingston, Monroe, Ontario, Seneca, Steuben, Wayne, Yates Counties
Walter S. Thomas, M.D., Rochester
Eighth District—Allegany, Cattaraugus, Chautauqua, Erie, Genesee, Niagara, Orleans, Wyoming Counties
Peter J. Di Natale, M.D., Batavia

These physicians are now engaged in making surveys [illegible] of their [illegible]

1. M[illegible] lines, giving the nearest exact figure of population in towns, in villages of 3,000 or over, and in cities and counties.

2. Location of the effective and ineffective physicians and the relative ratio of specialists to general practitioners.

3. Location of all legally incorporated hospitals with specification as to the types of hospitals, number of beds, and remarks as to types of service and whether there is sufficient service capacity for the community served; notation of x-ray and metabolic laboratory services, approximate percentage of acute service.

4. The location of all laboratories assisting in diagnosis of any type; specification as to type, approved or unapproved; whether they are associated with or are independent of a hospital; and the variety

tories, Procurement and Assignment Service, the Health Preparedness Commission, the Planning Committee, and the Committee on Public Health and Education of the Medical Society of the State of New York. Further meetings with other committees and commissions making similar studies under governmental direction are anticipated as the work progresses.

PART VI

Rehabilitation

Under date of January 2, 1945, Dr. Edward S. [illegible] Public Health and Education the following letter:

"State of New York
Department of Health
Office of Medical Administration
Albany 7

Bond Street
76 State Street

"Edward S. Godfrey, Jr., M.D.
Commissioner
"Dr. O. W. H. Mitchell, *Chairman*
[illegible]
York

Syracuse 10, New York
"Dear Doctor Mitchell:
"[illegible]
mer
ser
STA
1929, is not adequate at the present time, as it includes certain surgical procedures which no longer are being performed, excludes some procedures which are being used, and, finally, is out of date as far as the actual fees for the various procedures are concerned.

"Some time ago an inquiry was sent to the Regional Consultant Orthopedic Surgeons eliciting their opinions as to what changes should be made in the fee schedule and in accordance with their opinions, Dr. O'Donnell, associate physician (orthopedics), Bureau of Medical Rehabilitation, prepared a tentative fee schedule. This tentative schedule was submitted for revisions and recommendations to the Department's Orthopedic Advisory Committee, consisting of Dr. Alan DeForest Smith, Dr. Philip Wilson, and Dr. R. Plato Schwartz.

"Attached is a copy of the final fee schedule which is to be submitted to the Commissioner for his approval. Thus, this fee schedule represents the opinions of a majority of the practicing orthopedic surgeons throughout the State.

"We would be pleased to receive your advice or comments before sending it to the Commissioner for final approval.

"Sincerely yours,

EDWARD S. ROGERS, M.D
Assistant Commissioner for Medical Administration"

Dr. Rogers was advised by the chairman of the Council Committee on Public Health and Education that it wasn't a matter for the Committee to decide but was something which should be brought before the Council of the Medical Society of the State of New York.

[illegible] di[illegible] Y[illegible] S[illegible] ministration of the New York State Department of Health, conferred with the chairman of the Council Committee on Public Health and Education to discuss the proposed fee schedules covering an almost identical [illegible] cluded in the Y[illegible] During this conf[illegible] Committee on Public Health and Education informed Dr. Rogers and Mr. Bohlin that he would request the Council of the Medical Society of the State of New York to designate a Committee of four or five physicians who work in this field to decide whether the fee schedules were in keeping with reasonable [illegible]

[illegible] approved. The President appointed the following physicians as members of the Subcommittee:

O. W. H [illegible]
Charles [illegible]
Conrad
Edward R. Cunniff, M.D., New York
Ralph T. Todd, M.D., Tarrytown

[illegible]
ha

Su
So
Co

Workmen's Compensation Bureau, and representatives from the New York State Department of Health and the Division of Vocational Rehabilitation of the New York State Education Department.

All of the surgical procedures in the list submitted for the Handicapped Children's Program of the New York State Department of Health and the Vocational Rehabilitation Program of the New York State Education Department were compared with the fee schedules of Workmen's Compensation. After thorough discussion, there was agreement on the fees to be submitted by the State Department of Health for the Handicapped Children's Program and the State Department of Education for the Vocational Rehabilitation Program. They are uniform for identical procedures in the three fee schedules. The Subcommittee realizes that only a beginning has been made. It is likely that in the near future these fields of activities will be broadened and that other government agencies will request conferences.

PART VIII

Medical Service and Public Relations

The Committee on Medical Service and Public Relations respectfully submits the following report.

There was a Regional Conference of the Council on Medical Service and Public Relations of the A.M.A., held at the Mayflower Hotel, Washington, D. C., on December 6, 1944. Our President, Dr. Herbert H. Bauckus, in accordance with the authorization of the Council of the State Medical Society, appointed a committee of five to attend: Dr. Edward R. Cunniffe, President-Elect, Dr. O. W. H. Mitchell, chairman of Public Health and Education, Dr. J. Stanley Kenney, chairman of Policy Planning, Dr. Carlton E. Wertz, chairman of Public Relations and Economics, and Dr. John L. Bauer, chairman of Medical Service and Public Relations. Dr. Walter P. Anderton, Secretary of the State Society; Dr. Herbert H. Bauckus, and Mr. Dwight Anderson, of the Public Relations Bureau, were also present.

Presidents, secretaries, and other representatives from other states of the Eastern region with the members of the Council of the A.M.A., including Dr. Louis H. Bauer, trustee, were included.

Dr. John H. Fitzgibbon, of Oregon, presided. He outlined the purpose of the Conference, reviewed the work that had been accomplished, and announced certain decisions of the last House of Delegates of the A.M.A.

Mr. J. W. Holloway, Jr., gave a description of the creation and program of the Council, followed by free discussion.

Dr. Joseph S. Lawrence initiated us into the problems of the Washington office, and outlined a program for the coming year. He said that he would keep us informed of the bills introduced, and he asked that we would see to it that the Congressmen and Senators from our districts were acquainted with our wishes in regard to these bills. This plan follows the same procedure which Dr. Lawrence has pursued during his many years as Executive Officer, in relation to legislation of the State of New York.

Lt. Col. Harold C. Leuth spoke on the topic of "Assisting Returning Physicians in Securing Locations." Dr. F. H. Arestad talked on "Postgraduate Refresher Courses." Dr. Carl Peterson's subject was "Rehabilitation."

Voluntary health-insurance plans that have developed were freely discussed. The representatives from the State Medical Society found themselves rather well informed on these plans, possibly owing to the extensive education they have been receiving from the President, Dr. Herbert H. Bauckus.

It was emphasized that there was a great need of bringing to the attention of Congressmen the attitude of Medicine and that our program should be constructive and aggressive—not defensive.

We have just received from Dr. Lawrence Bulletin No. 8, which requires the attention of the Medical Service and Public Relations Committee. This committee, as set up by the Medical Society of the State of New York, consists of Dr. Edward R. Cunniffe, Dr. Walter P. Anderton, Dr. Robert R. Hannon, Dr. Walter W. Mott, Dr. Leo F. Simpson, and Dr. John L. Bauer.

A meeting was scheduled for Friday, February 16, in Albany, on the same day that the Conference of the County Society Legislative Chairmen would meet.

PART X

Workmen's Compensation

The Council Committee on Workmen's Compensation—Dr. Harry Aranow, *Chairman*, New York; Dr. Joseph P. Henry, Rochester; Dr. Dan Mellen, Rome—has submitted the following report.

REPORT

The annual report of the Council Committee on Workmen's Compensation to the House of Delegates for the year 1944 was a complete survey of the medical aspects of the Workmen's Compensation Law from the year 1935 to 1944 and took stock of the situation existing last year.

The law was amended in 1935 to provide more adequate medical care for injured workmen and to eliminate abuses and evils which existed. The Workmen's Compensation Law was enacted in 1913 to provide prompt medical care for injuries arising out of and in the course of employment and to compensate for disabilities.

The cost of medical care in compensation is borne directly by the employers of the State and indirectly by the public. Inferior medical care is expensive in that it prolongs disability and may result in greater functional loss, thereby increasing compensation. Frequently it results in disability impairing industrial skill and reduces the earning capacity of the worker. The purpose of the amendments to the law in 1935, vouchsafing free choice of physician to the worker, was to enable him to obtain treatment at the hands of a physician or specialist of his own choice and to select from the most competent and highly skilled practitioners in this State. To date more than twenty thousand physicians have been authorized to treat workmen's compensation patients.

The free-choice principle has gone a long way to eliminate the so-called compensation medical clinics, many of which were owned or controlled by lay persons and operated for profit without due regard to the welfare of the worker. The free-choice principle required the adoption of certain regulatory controls of medical practice. These were effected through the intervention of the sixty-one county medical societies of this State which, under the statute, were given certain disciplinary and regulatory powers. For the first time physicians were required to limit their medical practice to what they were actually qualified to do, thereby safeguarding

the patients. General practitioners and specialists were rated by the county medical societies' compensation boards in accordance with high standards which were set up and followed, to the end that physicians designated as specialists could be safely trusted to render a high quality of medical care. Only licensed and authorized physicians were permitted to make x-ray examinations and to use x-rays for treatment. Thus to all intents and purposes, the specialty of x-ray under the Workmen's Compensation Law actually was regarded as the practice of medicine.

Although we originally recommended that lay-owned and commercial x-ray laboratories should not be permitted to operate, the wording of the statute enacted into law in 1935 permitted the operation of such laboratories provided they were supervised by qualified physicians. We feel that this has permitted the intrusion of [illegible] sation practice, an evil [illegible]

The report gave in [illegible] sponsibilities of the medical societies and indicated with what degree of competency these functions were carried out throughout the State. It might be stressed here that the amendment to Section 13 of the Workmen's Compensation Law was passed in the late Spring of 1935. The amendments affecting the Medical Societies went into effect on July 1, [illegible]

achieved with singular efficiency and success and without any cost to the State. The amendments of last year (1944) took away from the county societies in New York, Kings, Queens, and Bronx direct responsibility for carrying out these functions. More than ten months have elapsed since these amendments went into effect and yet the new body of the Labor Department upon whom these responsibilities were placed has failed to function in a satisfactory manner. Many physicians have been held up for more than six months in their efforts to practice [illegible] others waited [illegible] at the [illegible] he four [illegible] to assist [illegible] or origi- [illegible] menda- [illegible] inctions could be carried out at all. In effect, the four Greater New York county medical societies are again performing certain functions which legally devolve upon the Medical Practice Committee.

As a result of the recent Moreland Act Investigation, a large number of physicians were charged by the Industrial Commissioner with accepting rebates from roentgenologists, x-ray laboratories, and dealers in surgical supplies. The four county medical societies in Greater New York were efficient enough to hold trials or hearings of a majority of those physicians charged with derelictions. On the other hand, hundreds of physicians whom the medical societies were unable to hear or try for many reasons not within their control and who were referred to the Medical Practice Committee for trial have not as yet been brought to justice. We know of no instance where even the most flagrant offenders have been called upon to stand trial as required by law. Furthermore, in no instance has the Industrial Commissioner exercised his rights, in spite of all the clamor made by the Moreland Commissioners, even to temporarily suspend one of these physicians, pending trial. It might be pointed out here that the medical societies fulfilled their obligations to the State at great cost to themselves and the State was saved the expense of carrying out these functions. Compare this with the cost to the State of trying to "administer" the law under present auspices.

In the report of the Pool Committee on Workmen's Compensation appointed by Governor Lehman in 1933, it was recommended that the county medical societies assume the responsibilities of investigating charges filed against physicians for improper medical practice and violations of certain ethical principles which were incorporated in the Workmen's Compensation Law. It was not intended that the medical societies should alone seek out the offenders, make charges, and then act as trial bodies, thus assuming police powers over violators of the Law. While it is urged that the power of the medical societies to recommend discipline of their own members and those whom they have qualified be restored to the local county medical societies in New York, it is felt that the proper functioning of the Workmen's Compensation Law re- [illegible]

tion have the independent power to file charges against any physician violating the law and after a hearing to suspend or revoke his license.

It is clear that the interest of the State from the [illegible] par with the other fifty-seven counties of the State.

The following resolution was passed by the House of Delegates in May, 1944:

"WHEREAS, at the recent session of the Legislature of this State, the Workmen's Compensation Act was amended in such a manner as to divide the State of New York in this matter into two distinct portions, (1) the counties of New York, Kings, Queens, and Bronx, and (2) the remainder [illegible] [illegible] ians for certain [illegible] be it therefore [illegible] *ety of the State* [illegible] *lature and have legislation introduced to return to the four county medical societies those powers that were abrogated by the recent change in the compensation law.*"

We have repeatedly stated in our reports that the proper functioning of the Workmen's Compensation Law is largely dependent upon the efficiency of the Department of Labor. It is high time that the administrative procedures of the Department be so [illegible]

and promptly compensated for lost time and disability.

We believe it is not too much to assert that no other interested parties to the Workmen's Compensation Law, not even the Labor Department, has made a greater contribution to the public welfare than the medical profession through its agencies. Progress in workmen's compensation administration is evolutionary rather than revolutionary. Once laws are enacted, even if widely drawn, they must be properly administered by the agency of government responsible for their enforcement. Unless the statutes are drawn carefully and after due thought, they may defeat the purpose for which they are intended. No little confusion has been created and maladministration fostered by ambiguities and redundancies in the original amendments enacted in 1935. The medical societies were not unaware of this confusion and frequently sought by all means to obtain amendments to the Law to clarify and simplify the statutes so that they could be more effectively administered and so that the medical societies and medical profession could more effectively carry out their responsibilities. Unfortunately, despite the recommendations of the medical societies, few, if any, amendments of the law to improve its administration have been enacted since 1935.

Nothing that has transpired in the Labor Department during the past year indicates much improvement along these lines. A reorganization of the Department is urgently needed. Clamor and furor of the Moreland Act investigation resulted in many amendments to the Workmen's Compensation Law last year. A number of these were hastily drawn and, though well intentioned, failed to achieve the purposes for which they were enacted. This is just another example of trying to improve things by "passing a law" without giving due consideration to the means of achieving the end. It is necessary now to recommend further amendments to clarify and simplify the administration of the Workmen's Compensation Law, particularly as it affects Section 13. In this your Committee has, to the best of its ability, cooperated with the Industrial Commissioner and it is hoped that the present session of the Legislature will give consideration to amendments designed to clear up the situation with respect to many parts of Section 13.

Our Workmen's Compensation Bureau has repeatedly recommended the separation of the claims and medical departments of insurance carriers. This same recommendation has been made by other investigating bodies but has not, up to the present time, been adopted by the insurance carriers. This is in the interest of the injured worker and would achieve a more harmonious relationship between the medical profession and the carriers and employers. The petty irritations which result from contact between the law personnel of insurance carriers and practicing physicians do not make for proper and harmonious relationships, and occasionally redound to the disadvantage of the injured workers. Furthermore, the insurance carriers, self-insurers, and other employers should employ properly qualified physicians and consultants to check up on patients under treatment rather than commit this important function to physicians occasionally not qualified for the important function they serve. It would seem, from the standpoint of self-interest, that the insurance carriers would realize that the highest quality of medical personnel would, in the long run, serve their interests better than the employment of less fully qualified examiners.

The Committee protested a decision of the Industrial Board upheld by the Attorney General in 1936 to the effect that unauthorized physicians under the Workmen's Compensation Law would be permitted to participate in examinations before the Department of Labor or to render testimony. The original opinion held that only physicians who *treated* patients might be authorized by the Industrial Commissioner. The brief submitted was based on the definition of the practice of medicine as contained in Section 1250 of the Education Law (which indicates that all physicians examining or treating patients are engaging in the practice of medicine) and, therefore, should also be authorized and qualified by the Industrial Commissioner, if they are to be permitted not only to treat patients but to examine compensation claimants and to give testimony. Our protest was necessitated by the fact that a certain physician whose license to practice under the Workmen's Compensation Law had been suspended was acting as an examiner of patients at the Department of Labor. No opinion from the Attorney General on this question has been received.

At the last meeting of the House of Delegates held in May, 1944, the following resolutions were passed:

> *"Resolved*, That the Medical Society of the State of New York take such appropriate action as is necessary with the Industrial Commissioner of the State of New York and the representatives of the Compensation Insurance Carriers that an increase be granted to the medical profession for fees in the present Medical Fee Schedule."
>
> *"Resolved*, that the Medical Society of the State of New York be requested to arrange with the Industrial Commissioner of the State of New York that no deduction be made in the payment of bills for Workmen's Compensation cases (5 per cent discount)."

At the June, 1944, meeting of the Council of the State Society, all amendments to Section 13 and 10-a of the Workmen's Compensation Law and Labor Law which were enacted at the 1944 session of the Legislature and signed by the Governor were presented.

Up to that time, the Industrial Commissioner had not announced the names of the Medical Practice Committee to function in the four New York counties. Neither had the Governor announced the names of the three medical members of the Industrial Council who were to constitute the Medical Appeals Unit of such Council.

A request had already been received, however, from Commissioner Edward Corsi by each of the four county medical societies to cooperate with the proposed Medical Practice Committee yet to be appointed, in carrying out the qualifications of physicians in the four counties, although at that time he had not made a formal request in writing as the societies had requested. A question was also raised as to the power of the Commissioner under the law to delegate to the County Medical Societies these functions in the four counties.

Arbitrations.—Under the new law all arbitrations outside of the four New York county societies are carried on as before, with the exception that a fifth arbitrator (physician) in each instance was to be appointed by the Industrial Commissioner. The settlement of disputed bills in the four county medical societies was to be done by the new Medical Practice Committee, but the law does not provide for regular arbitration proceeding. The decision

of the three members of the Medical Practice Committee is final and binding on the parties and there is no provision for an appeal from their decision. These functions in the past were, we are certain, satisfactorily carried out by the county societies and insurance carriers' organization without any cost to the State. No need for a change was demonstrated and these functions, too, should be restored in the four counties.

During the year 1944 (up to June 1) there were twenty-nine arbitration sessions held. This includes the metropolitan area and the upstate area; 212 cases were arbitrated in the metropolitan, and 48 in the upstate area. In a total amount of 260 cases arbitrated, awards were given in all but 15. The amount of money in dispute in the metropolitan area was $20,468.17, and the awards totaled $11,263.92. This included the cases in which no awards were made. The amount in dispute in the upstate area was $4,358.40 and the awards totaled $2,467.20. In 143 cases, bills scheduled for arbitration were settled at the time of arbitration without the necessity of a hearing. Arbitrations will be continued under the joint auspices of the county medical society and the Compensation Insurance Rating Board in fifty-seven counties outside New York City, as heretofore

Examination Facilities.—The Workmen's Compensation Committees of the county medical societies continued studies made at the request of the Industrial Commissioner on the facilities available in various parts of the State for the examination of claimants by physicians of the Department of Labor at the time of hearings before referees. (Communication No. 56 attached.)

On June [illegible] I. [illegible] vited your [illegible] pate in a co[illegible] ried hospital roentgenologists under the provisions of the Workmen's Compensation Law (Section 13-d). Oral arguments were presented and a written brief submitted indicating the stand of the Medical Society in regard to roentgenology as the practice of medicine and the right of the hospital to charge for

[illegible]

Roentgenologists, Pathologists, Anesthesiologists, and Physical Therapy Physicians, was published in the STATE JOURNAL OF MEDICINE, September 1 and 15, 1944. It was urged that the Council of the Medical Society of the State of New York take a strong stand on the right of the hospitals to practice medicine, and it was further urged that steps be taken to have the specialty of roentgenology designated in the Statute as a branch of the practice of medicine.

At this June meeting reports were made by the Director on the trials and hearings held of physicians charged with violations of the Workmen's Compensation Law as a result of the Moreland investigation. This included a report from Westchester County.

The Director was requested by the Council to "hold preliminary conferences with the representatives of insurance carriers (Compensation Insurance Rating Board), self-insurers, and representatives of [illegible] conditions." This has been done and we sincerely hope such an agreement will shortly be reached, preliminary to hearings by the Industrial Commissioner on the fee schedule.

Your Director was authorized to cooperate with [illegible] ture in 1945.

Your Director was requested to sit with the Committee on Industrial Health, of which Dr. Oliver W. H. Mitchell is chairman, and has attended a number of meetings of this committee.

The Bureau undertook a study of compensation fees throughout the United States and addressed a communication to all state medical societies as well as to the Commissioner of Labor or similar officer in every state of the Union to obtain the necessary information. This information is now being tabulated.

Many conferences were held with the Industrial Commissioner and his deputies in regard to the functions of the compensation committees of the four county medical societies in qualifying physicians in the course of the year. On November 29, 1944, the Industrial Commissioner, the Hon. Edward Corsi, after a number of conferences, finally announced the support of the four counties in New York in the qualifying of physicians by writing a letter satisfactory to the Society which in part read:

> "In the interest of attaining proper and harmonious administration of the amendments to Section 13 of the Workmen's Compensation Law, I am requesting, and shall appreciate your kind cooperation and advice in the same friendly spirit as you have so generously given in the past."

The Industrial Commissioner enlisted the support of the Society in obtaining from physicians *throughout the State prompt* reporting of compensation cases, especially the notarization of the C-4 reports. We strongly urge that physicians treating or examining compensation patients send in all necessary reports promptly to facilitate the prompt adjudication of claims, thereby hastening the payment of compensation to the injured worker and prompt consideration of bills for medical care.

Under date of December 21, 1944, we issued a bulletin to all c[illegible] St[illegible] excerpts from [illegible] November 9, [illegible] to standards of qualifying physicians available to all counties in the State and to information necessary for the compiling of information concerning increase in fees warranted under present conditions. It urged all physicians to read the provisions of Section 13 of the Workmen's Compensation Law, which we published in the December 15, 1944, issue of the NEW YORK STATE JOURNAL OF MEDICINE. It also requested each county medical society to make a report to the Bureau of any complaints of alleged violations of the free-choice principle of the Workmen's Compensation Law (Section 13-a 6). It [illegible] medical societies [illegible] Compensation

Bureau For Bill Collection And Adjustment Of Disputes Between Physicians And Employers and Insurance Carriers.—It is proposed that the Bureau serve as a clearing house for the fifty-seven county medical s[illegible] of the n[illegible] physician[illegible] Many of [illegible] ties for protecting the interests of physicians in

workmen's compensation matters and it is proposed that the facilities of this Bureau be made available to all such counties as desire it.

The Bureau will continue to receive all objection forms to doctors' bills and at periodic intervals will send these forms to the chairman of the workmen's compensation committee of the county medical society and to the secretary of same and request the workmen's compensation committee either to take direct action in an attempt to straighten out disputes, or if the facilities for such adjustment are not available in the county, to refer the matter to this Bureau for action. This service has been carried out to a limited extent throughout the State and has been greatly appreciated by many county medical societies and a large number of physicians. If this procedure is approved the Bureau will circularize the entire state to the end that physicians' bills will, in the future, be more promptly paid or, if settlement is impossible, will be promptly arbitrated.

The assistance of the Bureau was enlisted by the Vice-Chairman of the Industrial Board, Miss Mary Donlon, in the discussion of an amendment to Section 15, 8-a of the Workmen's Compensation Law which was enacted in May of 1944. This law was devised to enable injured war veterans to obtain employment and to apportion the degree of disability resulting from a possible second injury between the then insurance carrier and a Special Fund created especially to bear the cost of disability resulting from the first injury or illness. In other words, the insurance carrier or employer would be responsible only for such portion of the disability and medical care as could properly be ascribed to the second injury alone, based upon medical testimony. This law, as enacted, is redundant and ambiguous and covers not only veterans but all employed persons who had sustained injuries or had suffered a disease which was aggravated by a second injury or recurrence of an industrial disease. One hearing was held at our office and another at the office of the Industrial Board, at which time your Director represented the Society. It is hoped that as a result of these meetings a sufficient expression of medical opinion was obtained to enable the Department to write an amendment to the law so as to make this section workable.

Expert Consultants.—The amended law of 1944 provided for the setting up of panels of medical experts in various specialties to assist in the adjudication of claims, and to resolve disputes concerning medical care. Up to the present time nothing has been done to set up these panels.

In January, 1945, the Industrial Commissioner, the Hon. Edward Corsi, requested the cooperation of your Committee in the selection of physicians to serve on panels of specialists to assist the referees and Industrial Board in the determination of questions of causal relationship, degree of disability, and medical questions concerning treatment of claimants under the Workmen's Compensation Law. These panels of specialists were authorized in the Spring of 1944. The Industrial Commissioner was of the belief that, from investigations he had made, a salary of $7,500 per year for part time was not adequate to secure the services of properly qualified specialists. If this were the case, it would be necessary to obtain an amendment to the law to permit the payment of larger fees. A preliminary examination indicated that it would be possible in many parts of the State to secure many thoroughly qualified specialists for the sum of $7,500. A certain number would be available in New York City. A bulletin has been issued to the county societies of the State requesting them to explore this situation and advise this Bureau of the names of properly qualified physicians who would be willing to accept appointments.

Ives Legislative Committee.—The Joint Legislative Committee on Industrial and Labor Conditions, which was headed by the Hon. Irving M. Ives, held a public hearing at the Hotel Roosevelt on December 18, 1944. Through an inadvertence an invitation which had been sent to Dr. Joseph Lawrence, advising the State Society of the meeting, had not been received because Dr. Lawrence had left the employ of the State Society before this date. We were not aware of the Legislative Committee meeting until the morning of the Council meeting held the same day. Nobody represented the State Society at the hearing, although matters of great importance to the medical profession involving Workmen's Compensation and other matters were brought up. A letter was addressed to Mr. Ives shortly thereafter requesting that the State Society be given an opportunity to be heard by his committee in advance of any report to the Legislature for changes in the law. Unfortunately, no reply has ever been received to this letter. On February 8 another letter was addressed to Mr. Ives by Dr. Herbert H. Bauckus, President of the Medical Society of the State of New York, indicating the interest of the medical profession in the work of the Ives Committee and requesting an opportunity to discuss the forthcoming report of the Committee. The Ives Committee has not yet replied and we have not, up to the present time, had an opportunity to discuss matters with Mr. Ives, the chairman of the Committee, or with any other members of the Committee.

Fee For Testimony Of Physicians.—An important question involving the payment of physicians for testimony before the Department of Labor has again arisen. The law provides in Section 13-f (2) that a physician whose presence is required at a hearing before the Department of Labor is entitled to receive a fee from the employer or carrier, the amount of which is to be fixed by the Industrial Commissioner. Usually general practitioners are paid a fee of $10 and specialists $25 for their testimony. In rural areas the physician often has to travel a long distance and spend part of the day, or the whole day, in testifying. The Industrial Board holds that under the law it may not pay more than four and a half cents a mile for travel to the place of the hearing. Recently a physician spent a half day and traveled fifty-six miles. He was reimbursed by a fee of $10 for testimony, and $2.50 for mileage based on four and a half cents per mile. In this particular instance there was no other means of transportation available than the physician's car. In a previous discussion of this matter with the Chairman of the Industrial Board, it was held that in instances such as the above, the referee, while not able to make a larger allowance for mileage, could increase the fee of the physician for testimony to adequately compensate him for the time spent. We have again addressed a communication to the Industrial Board calling these facts to their attention and requesting a ruling by the Board so that physicians may be adequately compensated for the time spent and expense incurred in complying with subpoenas of the Department of Labor requiring their presence at hearings. Referees should be instructed to ad-

just the fee in such a way as to adequately compen-

other government agencies.

Qualifying Standards.—We have now completed a new set of standards to guide the county medical societies in the qualification of physicians. These have been sent to each county society in the state for their guidance. Questions frequently arise concerning the method of qualifying a particular physician and may be referred to this office for opinion.

Medical Care, Treatment, Practice Of Medicine. —Under date of August 18, 1936, the Attorney General ruled that the Industrial Board was correct in the ruling which it made that physicians who *examined* or *participated* in *examinations* or who *testified* at hearings and *did not* treat claimants are not required to be authorized by the Industrial Commissioner, and may accept fees from claimants. A specific difference was made between physicians who treat claimants and those who examine claimants. To this opinion we take objection, as "examination" is obviously a part of the practice of medicine. The Workmen's Compensation Law uses the term "treatment" throughout. In our opinion it is inclusive of "examination" or "diagnosis." A person who examines should be authorized to do so as is any other physician under the Workmen's Compensation Law.

Soon after the Moreland investigation was begun, certain physicians were suspended from the list of physicians authorized to render medical care to injured workmen by the Industrial Commissioner. These physicians promptly appeared in the Department of Labor and acted as medical examiners and gave testimony before the Commissioner. This was a flouting of the law that was encouraged by

ieral sustaining
1936. We be-
th to the letter
and spirit of the Workmen's Compensation Law, and
T
Ind
tention of
Goodman
this day we have not received a reply, nor has the present Deputy Commissioner Goodman rendered an opinion in the matter.

On December 12, 1944, your Director again submitted this question to the Deputy Industrial Commissioner for his attention. It is a matter of the utmost importance which involves the question of what constitutes the practice of medicine. It may require an amendment to the Workmen's Compensation Law.

Prompt Notification Of Intention To Controvert A Claim.—The importance of notifying physicians as promptly as possible of the intention of controverting a case under medical care so as to protect the physician's rights and assure the claimant proper and continued medical care need not be stressed. We believe that the Department of Labor should
- compensation
xperience indicates that physicians are encouraged by insurance carriers to treat claimants when the carrier was possessed of information indicating that the claim would probably be disallowed.

The need for prompt notification of the physician that a claim is to be controverted is absolutely essential to the interest of the doctor and in the long run to the interest of the injured workman. Many physicians are reluctant to participate in the treatment of workmen's compensation cases after a few unpleasant experiences when they attempt to collect bills after weeks or months of treatment, only to be informed that the case was being controverted and subsequently disallowed by the Department. Certain insurance carriers offend more frequently than others in this respect.

Physicians should not be conditioned by bad experiences with carriers to neglect the interest of the claimant by refusing to give necessary treatment promptly or to postpone necessary treatment because of the lack of prompt cooperation on the part of insurance carriers. Most physicians are more than willing to meet the carriers halfway in the interest of providing prompt and efficient medical care to injured workers.

Furthermore, insurance carriers should not permit a situation to arise in which outstanding physicians feel that they are being imposed upon by insurance carriers because of their failure to act promptly when a req
when such
should not
way to correct the situation is to so improve the administrative practices of the insurance carriers as to avoid even the suspicion on the part of the physician that he is being imposed upon because of a technicality in the law.

Objection To Physicians' Bills.—An insurance carrier objected to a bill of a physician who treated a patient for syphilis in connection with a compensation injury because said physician was a general practitioner with a rating to treat industrial injuries and diseases. This raised a fundamental question concerning the scope of the general practitioner
is no warrant for
with uncompli-
in retarding the
be treated by a
specialist and denying the right of a general practitioner to treat him. General practitioners are recog-
of syphilis.

There has been a tendency of late for certain insurance carriers to deny payment of a physician's bill on the ground that the physician was not "qualified" under the Workmen's Compensation Law to treat a particular condition or disease. The Workmen's Compensation Law *does* require a physician to limit his practice to what he is qualified by
the
the
and
a so
explain as to definitely determine or delineate the exact qualifications of a given practitioner. The practitioner, himself, must to a large extent limit his own work in accordance with his training, experience, and conscience. Certain broad general principles have been laid down by the medical societies through this bureau from time to time which have

worked out very well from a practical standpoint and the welfare of patients has been safeguarded by the care with which physicians have been granted authorization to treat compensation claimants, but in the long run much depends upon the physician himself in determining the type of patient he will accept or reject and, in the latter event, refer to another practitioner or specialist. A tendency to limit more and more the field of the general practitioner is not consistent with the welfare of the public and with good medical practice throughout the State. The medical societies, through their compensation committees, should encourage high quality medical care and should, of course, be vigilant in investigating instances of improper medical practice or complaints of the assumption on the part of a physician of responsibility beyond his training and competence. The State Medical Society has provided many opportunities for the general practitioner to familiarize himself with the latest advances in medicine and opportunities for postgraduate work are afforded throughout the State. As a result the level of professional competence is high throughout the State among general practitioners.

New York State Federation of Labor.—A conference was held recently with the President and representatives of the New York State Federation of Labor, with a view of bringing about a closer relationship and mutual understanding between the Society and this group in all matters affecting medical care and especially treatment of injured workers under the Workmen's Compensation Law. It is hoped that it will be possible soon to bring about this relationship.

Radiology.—During the year 1944 there were four radiology examinations held at the New York Academy of Medicine building for the Metropolitan area. Sixteen applicants were examined (Kings 2, Westchester 4, New York 9, and Nassau 1).

It is recommended that all applicants for either XD or SD rating be referred to the advisory State Radiology Committee for examination, unless the applicant can fully meet the standards for x-ray qualification (*q. v.*).

Condon Bill.—As this report is being written, the Legislature has passed a bill to amend the Labor Law and the Workmen's Compensation Law to create in the Department of Labor a new Workmen's Compensation Board. This bill abolishes the old industrial board and transfers its functions, powers, and duties to the new workmen's compensation board.

The new workmen's compensation board will consist of ten members, at least three of whom shall be attorneys and counsellors-at-law duly admitted to practice in this state.

The members of the board shall be appointed by the Governor, by and with the advice and consent of the Senate.

The present appointees of the industrial board constituted the first members of the new workmen's compensation board and shall continue in office for the terms for which they were appointed. Provisions are made for the appointment by the Governor to fill vacancies up to April 1, when the new law goes into effect. As the terms of the present members expire, new members shall be appointed for a period of six years by the Governor. The Governor shall designate one of the members as chairman of the board. The chairman becomes the administrative head of the workmen's compensation board and shall exercise the powers and duties in relation to the administration of the new chapter, heretofore vested in the industrial commissioner by chapter 50 of the laws of 1921 and acts amendatory thereof. The chairman shall preside at all meetings of the board and appoint all committees and panels of the board and shall perform all administrative functions as set forth in the new law. The chairman may make administrative regulations and orders concerning all claims and reports, notices of hearings and decisions, for certifying records; shall fix the time and place of hearing of claims and provide for the conduct of hearings; establishing of calendars, practice, etc. The chairman shall issue and revoke certificates and authorizations of physicians as provided in 13-a of the Workmen's Compensation Law, and license all medical bureaus and x-ray and other laboratories and shall have and exercise all powers not otherwise provided for in relation to the administration of the law, heretofore expressly conferred upon the industrial commissioner by any provisions of chapter 13-c or of the labor law. Under general powers and duties of the workmen's compensation board is the power to hear and determine all claims for rating, compensation, or benefits relating to special funds; to require medical service for injured employees; to approve and fix attorney's fees and claims for medical service in out-of-state cases and in noninsured cases; to excuse failure to give notice; to approve agreements; to modify or rescind awards; to make conclusions of fact and rulings of law; to certify questions to the Appellate Division of the Supreme Court; to enter orders in appealed cases; and to perform such other duties in connection with claims of claimants, penalties, and awards, as were heretofore done by the industrial commissioner; to hear and determine claims under the occupational disease act; to order physical examinations, etc.

The new workmen's compensation board is deemed to be a continuation of the industrial board provided for by the provisions of the labor law, and all proceedings pending before the industrial board are now transferred to the workmen's compensation board. All reviews, hearings, etc., are to be conducted by any panel of the board consisting of not less than three members thereof and the order, decision, or determination of a majority of the members of a panel of three shall be deemed the order of the board, unless the board on its own motion modify or rescind such order or determination. Three panels shall be constituted at all times, the chairman assigning the members to the panels; at least one member of each panel shall be an attorney. The panel shall be so constituted that the members of the Board shall alternate in their periods of service together thereon. When a number of proceedings remains pending before the board for a period in excess of thirty days, members of the board shall hold hearings and otherwise act in the discharge of their duties evenings and at other convenient times on all days of the week except Sundays, in addition to such other times as they would perform such duties in the ordinary conduct of business, in order to expedite the disposal of claims. The chairman may and shall, when directed by the Governor, prescribe the hours and times for such additional performance of duties by the members of the board. A member of the board may be designated by the chairman to act individually in the hearing and determination of any claim or conduct any investigational hearing or inquiry except in reviews which must be heard by the board or a panel thereof. Members of the board and referees are given the

usual power to issue subpoenaes, to hear testimony, and to take depositions of witnesses in the manner prescribed by law. Neither the industrial commissioner nor any board or ment of labor shall in any or reverse any decision shall the industrial commissioner or any board or other agency of the department of labor supervise or control the board or its members in the exercise of any powers or in the performance of any duties under the new law. The chairman of the board is given the power to appoint a secretary and to remove same and fix the salary of the secretary, whose duties and administrative powers are assigned or delegated by the chairman of the board. Vacancies on the board are filled by the Governor, who may remove the chairman or any member of the board for cause after charges and hearing. Members of the board shall devote their entire time to the duties of the office.

The chairman receives an annual salary of $10,000, the other members $8,500.

[illegible] ...s of workinistration the chairnits of the appropriation available therefor, to initiate studies and surveys, to observe operations in other states, to conduct research, and to make investigations in the entire field of workmen's compensation, within and without the State of New York. The chairman is also hereby authorized to accept a gift, grant, or contribution of funds to be used in his discretion to carry out the purposes of this subdivision and shall in the annual report of the board set forth the progress of same.

The chairman of the board may appoint officers and employees, including such investigators, statisticians, examiners, and other assistants as may be necessary for the exercise of the powers and the performance of the duties of the chairman of the board.

In the future, referees shall be appointed by the new board. A referee shall devote his entire time to the duties of his office at a salary to be fixed by the board within the appropriation made therefor. The referees shall carry out duties heretofore assigned to these officers. The chairman of the workmen's compensation board shall designate an employee of the board to act as secretary of the medical appeals unit of the industrial council. These three medical members of the industrial council shall consider all matters connected with the practice of medicine submitted to it by the workmen's compensation board or chairman thereof. The duties of the Medical Appeals Unit of the Industrial Council shall be similar to their duties under the law of 1944 in relation to physicians, compensation medical [illegible] ...ised authorization to do compensation work by the medical practice committee or any medical society or board and make recommendations to the chairman of the workmen's compensation board instead of to the industrial commissioner. It also shall have power to review the revocation of the authorization of any of the above by either the Medical Practice Committee or the medical society workmen's compensation board and make recommendations to the chairman of the new workmen's compensation board. The medical appeals unit may reopen matters and receive further evidence and its decision and recommendation shall be advisory to the chairman of the workmen's compensation board and not binding or conclusive upon him.

The industrial commissioner has the power to make, amend, and appeal regulations necessary for the internal administration necessary for the department of labor not in conflict with the rules adopted by the workmen's compensation board or the board of standards and appeals for the enforcement of the labor law.

Section 24-a is amended to provide for representation before the workmen's compensation board instead of the industrial board and sets up the require- [illegible] ... not to exceed the sum of $100 annually. The fees are paid into the special fund under subdivision 8 of section 15.

The board shall have such tests of character and fitness with respect to applicants for licenses and such rules governing the conduct of those licensed as may be necessary and the board shall maintain a registry or list of persons to whom licenses have been issued. Such licenses may be revoked by the board for cause after a hearing by the board. Licenses are issued for one year. No person, firm, or corporation, other than an attorney and counse[illegible] ...senting or ... fore the bo[illegible] ...g hearings, etc., unless he shall be a citizen of the United States or a corporation organized under the laws of the State, and shall have obtained from the bo[illegible] ... to a reg[illegible] ... nor shall the provisions of the above section apply to a regular employee of an insurance carrier appearing on behalf of his employer, but the board may prohibit the appearance of any such employee for cause.

At the time this report was written, the bill was in the hands of the Governor and it is believed he will sign it.

It is hoped that the new setup will materially enhance the efficiency of the department in relation to claims of injured workers. It is hoped that the relations of the medical societies to the chairman and members of the board will be close and cordial to the end that the medical aspects of the workmen's compensation law will be more effectively carried out in the interest of the injured workers of this State.

Total Physicians Qualified.—To date 20,860 physicians have been qualified and recommended for authorization by the county medical societies' compensation boards. The number qualified in each county follows:

[illegible] ...Seneca, 47; Steuben, 95; Sullivan, 41; Suffolk, 206; Tioga, 41; Tompkins, 72; Ulster, 114; Warren, 62; Washington, 52; Wayne, 69; Westchester, 919; Wyoming, 47; Yates, 27.

Communication No. 56.—

"Dear Doctor:

"We have been requested by the Department of Labor to survey the present facilities available for medical examinations at the various points of hearing throughout the State in order to determine whether the present available space and facilities are adequate.

"I am enclosing a copy of the letter received from the Department which contains the locations of the points of hearing in your County and the minimal facilities that the Department believes should be available.

"It would be appreciated and advisable for you to appoint a committee of physicians within your county to make an inspection of these facilities and review the method of conducting medical examinations, facilities presently available, the nature and the scope of the examinations. After making this survey, the committee is requested to submit a separate report on each point of hearing, commenting on the facilities and incorporating its recommendations.

"I desire to call your particular attention to the request contained in the letter from the Labor Department—that the committee suggest a more appropriate place in the County (including hospitals) that might be available to conduct these hearings and examinations.

"Should you desire any information, particularly the dates on which hearings will be held at the various hearing points designated, I would suggest that you communicate with the Assistant Industrial Commissioner who represents the Industrial Commissioner in your County.

"I would appreciate it if your Society would take an active interest in this matter and submit a report of present conditions, with recommendations, at the earliest possible date.

"Very truly yours,
DAVID J. KALISKI, M.D.
Director"

Howard Fox, M.D.....New York
David A. Haller, M.D.....Rochester

REPORT

This is the third annual report of the Committee of Medical Licensure. Medical licensure statistics for the year 1943 are interesting and gratifying. As a result of the accelerated program in medical education a considerable increase occurred in numbers taking examinations in 1943 as compared with the preceding year. However, fewer licenses were actually issued last year than in 1942 because many graduates examined in December did not receive licenses until early 1944, hence they do not appear in this report. Their licenses will appear in the statistics to be published next year. In addition some physicians entered the Army before becoming licensed and fewer foreign graduates applied.

For a time there were large annual increases in foreign graduates examined, so that in 1940 there were over three times as many tested as in 1936. Since 1940 there have been annual decreases. The number last year was about half that of 1940, although it was still almost double the 1936 figure. Throughout the years failures among foreign graduates have been high. Nearly 50 per cent of foreign graduates examined failed in 1943 as compared with 1.5 per cent failures of graduates of approved schools and 38.4 per cent failures from unapproved schools.

The total number of licenses issued by the medical examining boards of the forty-eight states, the District of Columbia, Alaska, Hawaii, and the Virgin Islands was 8,276; 5,974 were issued after examination and 2,302 by reciprocity and endorsement. This compares favorably with the total of 8,557 for 1942. In the State of New York 912 licenses were issued as against 1,330 for 1942 and 1,173 for 1941; in California, 706 as against 740; Illinois, 506, three less than in 1942. Pennsylvania licensed 520, four more than in 1942. Your committee has used these for comparison each year because they annually license more than 500 candidates.

New York State in 1941 licensed one seventh of the total number licensed in the United States, District of Columbia, and possessions; in 1942, one sixth of the total; the number has now dropped this past year to one ninth of the total. In 1941 this state licensed 439 foreign physicians, in 1942 the Department licensed 698, and in 1943, 361, a decrease of 337.

It does not follow that all physicians certified in a given year after examination were tested in that year. In twenty-three states, the District of Columbia, Alaska, Hawaii, and Puerto Rico the internship is a requisite for practice, but in some a physician is permitted to take an examination before completion of the internship, and, if he is successful, the license is withheld until the completion of the internship. Licenses are also withheld in some states for proof of citizenship and minor technicalities. In others the licenses of those examined in December are dated and issued in the following year. This was particularly true last year, with two graduating classes from the medical schools operating under the accelerated curriculum. Most of the schools granted M.D. degrees in March and December. While many of the December graduates were examined for medical licensure on the M.D., for the most part their examination papers could not be graded in sufficient time for them to receive licenses during the last calendar year.

Twenty-three states, the District of Columbia, and the territories and possessions licensed fewer than 100. The smallest number of licenses (4) was granted in North Dakota. None were licensed by examination in Nevada, Wyoming, or the Virgin Islands, and only one physician was registered by this method in New Mexico and in North Dakota. Eleven boards (notably California, Connecticut, the District of Columbia, and Utah) licensed more physicians by reciprocity or endorsement than by examination. Florida, Idaho, Massachusetts, Rhode Island, and Hawaii have no reciprocal agreements, but with the exception of Florida these states endorse diplomates of the National Board of Medical Examiners.

Increases in the number of physicians registered last year as compared with that reported for the year 1942 were noticeable in Alabama, Louisiana, Maine, and Maryland, while more pronounced decreases in registration were effected in Indiana, Mississippi, Nebraska, New York, Texas, Virginia, and Wisconsin. In Indiana and Texas this may be due

partially to the fact that the medical schools of those states accelerated their curriculum at an earlier date. In New York there was also a large reduction in

Twenty-
possessions
Hawaii, 13;
the Virgin

Islands, 7.

Throughout the year 8,392 were examined, of

[illegible]

porations of other countries, seven medical schools

states who obtained the legal right to special practice by the osteopathic board are excluded from these compilations.

The 8,392 examinees represented 6,427 graduates

who graduated from approved medical schools no longer operating, with 5.0 per cent failures; 1,031 graduates of faculties of medicine located in countries other than the United States and Canada, 49.8 per cent of whom failed; and 757 graduates of unapproved schools with 38.4 per cent failures. In 1943 there were 599 fewer foreign graduates examined, largely accounted for by the reduction by 501 in numbers of such candidates tested in New York.

The most striking change in numbers examined is the increase in candidates from approved medical schools.

There were 4,905 of these in 1942 and 6,427 in 1943, an increase of 23.7 per cent. This may

[illegible]

aminations in 1943 was 8,392 as compared with 7,181 the preceding year, an increase of 14.4 per cent. This increase is not seen in the tabulation showing licenses issued because the licenses of many examined in December, 1943, will be dated 1944. In the calendar year 1943, while no compilation of recent graduates has been made, only 1.5 per cent of the 6,427 graduates of the approved medical schools in the United States failed.

Twenty-nine approved schools in the United States had no failures before medical licensing boards, thirty had less than 5 per cent, and seven between 5 and 10 per cent.

The source of candidates for licensure last year on the basis of examination is further tabulated in Table 1, giving totals for five groups, namely, approved medical schools in the United States, those from Canada, schools and unapproved institutions. The greatest percentage of failures represented two groups—foreign scho[illegible]

Consolidated Examinations.—In the calendar year 1943, 6,427 graduates of approved medical schools in the United States were examined by medi-

TABLE I.—SOURCE OF CANDIDATES EXAMINED, 1943

Medical Schools	No.	No. Examined	No. Passed	No. Failed	Percentage Failed
Approved in United States	67	6,427	6,334	93	1.5
Approved in Canada	8	76	64	12	15.7
Extinct	7	101	96	5	5.0
Foreign	100	1,031	518	513	49.8

Totals	199	8,302	7,478	914	10.9

instances schools having a high percentage of failures before licensing boards had few, if any, failures before the National Board. In these consolidated figures the percentage of failures for approved medical schools in the United States was 1.4 per cent. Of Canadian schools 15.7 per cent of the graduates failed state tests and 14.3 per cent the combined tests. Only thirty-one graduates of foreign faculties of medicine were admitted to the National Board's final examination, while 1,031 were examined by state licensing boards. The National Board does not admit to its examination the graduates of unapproved medical schools in the United States.

Failures.—The United States is divided into two groups—the thirty states in which approved four-year medical schools are located, and those, including Alaska and Hawaii, which have no approved medical school within their boundaries. Presented is the number who failed state board examinations and were graduates of a medical school in which they were examined and for comparison, the number of graduates licensed in a given state who obtained their [illegible]

REPORT

This is the third annual report of the Committee of Medical Licensure. Medical licensure statistics for the year 1943 are interesting and gratifying. As a result of the accelerated program in medical education a considerable increase occurred in numbers taking examinations in 1943 as compared with the preceding year. However, fewer licenses were actually issued last year than in 1942 because many graduates examined in December did not receive licenses until early 1944, hence they do not appear in this report. Their licenses will appear in the statistics to be published next year. In addition some physicians entered the Army before becoming licensed and fewer foreign graduates applied.

For a time there were large annual increases in foreign graduates examined, so that in 1940 there were over three times as many tested as in 1936. Since 1940 there have been annual decreases. The number last year was about half that of 1940, although it was still almost double the 1936 figure. Throughout the years failures among foreign graduates have been high. Nearly 50 per cent of foreign graduates examined failed in 1943 as compared with 1.5 per cent failures of graduates of approved schools and 38.4 per cent failures from unapproved schools.

The total number of licenses issued by the medical examining boards of the forty-eight states, the District of Columbia, Alaska, Hawaii, and the Virgin Islands was 8,276; 5,974 were issued after examination and 2,302 by reciprocity and endorsement. This compares favorably with the total of 8,557 for 1942. In the State of New York 912 licenses were issued as against 1,330 for 1942 and 1,173 for 1941; in California, 706 as against 740; Illinois, 506, three less than in 1942. Pennsylvania licensed 520, four more than in 1942. Your committee has used these for comparison each year because they annually license more than 500 candidates.

New York State in 1941 licensed one seventh of the total number licensed in the United States, District of Columbia, and possessions; in 1942, one sixth of the total; the number has now dropped this past year to one ninth of the total. In 1941 this state licensed 439 foreign physicians, in 1942 the Department licensed 698, and in 1943, 361, a decrease of 337.

It does not follow that all physicians certified in a given year after examination were tested in that year. In twenty-three states, the District of Columbia, Alaska, Hawaii, and Puerto Rico the internship is a requisite for practice, but in some a physician is permitted to take an examination before completion of the internship, and, if he is successful, the license is withheld until the completion of the internship. Licenses are also withheld in some states for proof of citizenship and minor technicalities. In others the licenses of those examined in December are dated and issued in the following year. This was particularly true last year, with two graduating classes from the medical schools operating under the accelerated curriculum. Most of the schools granted M.D. degrees in March and December. While many of the December graduates were examined for medical licensure on the M.D., for the most part their examination papers could not be graded in sufficient time for them to receive licenses during the last calendar year.

Twenty-three states, the District of Columbia, and the territories and possessions licensed fewer than 100. The smallest number of licenses (4) was granted in North Dakota. None were licensed by examination in Nevada, Wyoming, or the Virgin Islands, and only one physician was registered by this method in New Mexico and in North Dakota. Eleven boards (notably California, Connecticut, the District of Columbia, and Utah) licensed more physicians by reciprocity or endorsement than by examination. Florida, Idaho, Massachusetts, Rhode Island, and Hawaii have no reciprocal agreements, but with the exception of Florida these states endorse diplomates of the National Board of Medical Examiners.

Increases in the number of physicians registered last year as compared with that reported for the year 1942 were noticeable in Alabama, Louisiana, Maine, and Maryland, while more pronounced decreases in registration were effected in Indiana, Mississippi, Nebraska, New York, Texas, Virginia, and Wisconsin. In Indiana and Texas this may be due

Twenty-five of these states besides Alaska and Puerto Rico reciprocate with specifically indicated states Twenty-four of them, including five which have specific reciprocity agreements, as well as the District of Columbia, are given discretionary powers under the medical practice acts. New York has no reciprocity agreement with any state. However, the [illegible] discretionary upon the department to issue them licenses. The states in which diplomates of the National Board of Medical Examiners and returned officers of [illegible] licensure o [illegible] indicated. [illegible] sional practice, oral examination, and internship, are recorded, as is also the fee for a license without written examination. Citizenship prerequisites are also indicated in thirty-one states In some states physicians of Canadian birth are exempt from the citizenship requirements. Few states will accept graduates of foreign faculties of medicine on a reciprocal basis Additional requisites of exemptions are mentioned.

The number of [illegible] to practice medic [illegible] examination on p [illegible] tials is given in T [illegible] tered who presen [illegible] the District of Columbia, Canada, and foreign countries, or the certificate of the National Board of Medical Examiners or one of the government services California issued licenses to 355 physicians by this method and New York to 279 Four other states endorsed 100 or more candidates, namely, Illinois, 100, Michigan, 105, Ohio, 110, and New Jersey, 140 The lar- [illegible] same type of credenti [illegible] senting certificates of [illegible] Examiners On the basis of the National Board's certificate 215 were certified by New York and 94 [illegible] without written examination in six states, California, 6; Kentucky, 4, and 1 each in Missouri, North Carolina, Texas, and Wisconsin

On the basis of a license from one of the territories seven physicians were registered in two states—California and New York. Two physicians presented to the California board licenses from Alaska and four, a certificate issued in Hawaii. One physician secured a license in our State presenting for registration by this method a license from Puerto Rico.

Diplomates of the National Board of Medical Examiners secured licenses in forty states and in Hawaii. Six states endorsed the certificate of 25 or more physicians The greatest number accepted by any one state was our State of New York, where 215 diplomates secured licenses to practice medicine.

Fewer than 25 physicians obtained reciprocity licenses in twenty-two states There has been a noticeable decrease in physicians who migrated to other states, as evidenced by a reduction of 170 as compared with the number so registered in 1942. This probably is a condition related to the war.

[illegible] Pr [illegible] me [illegible] by death in the same period was 3,382. It would appear, therefore, that the physician population in the United States last year was increased by 2,570. In view of the accelerated curriculum with two classes graduating from the majority of schools in 1943, one might expect that additions to the profession should be considerably higher. This is in reality the case at the present. However, many physicians who obtained M D degrees in December of 1943 were not able to receive licenses until early in the year 1944, owing to administrative details. An accurate analysis can be made in 1945 when data for the current year are available

The greatest number of physicians in any one state, 683, was added to the profession in the State of New York. Be[illegible] added more than [illegible] more than 300 T [illegible] about 200, but in [illegible] [illegible] Wisconsin. In New York 220 fewer appear in the tabulations as the result of the reduction in the [illegible] in three years in the profession; [illegible] ful written exam [illegible] endorsement. In the same period 80,393 licenses were issued, 56,003 by examination and 24,390 by endorsement or credentials. Thus 26,446 licenses were obtained by physicians who had previously been licensed to practice medicine. Estimated figures indicate that on February 1, 1944, the number of physicians in continental United States, including those licensed in 1943, was 186,496. Excluding physicians who are in military service, engaged in full-time hospital work, retired, not in practice, or in full-time teaching, there remain about 100,000 physicians in private practice, some of whom are part-time teachers.

* Refer to chart of "Reciprocity and Endorsement Policies" for further data.

[1] Certificate of National Board of Medical Examiners and licensure in country in which school of graduation is located.

[2] Internship or one year in medical school in United States.

[3] Certificate of National Board of Medical Examiners.

[4] For graduates of last five years; if more than five years $50.

[5] Residence of one year in Delaware.

[6] If similar privileges are accorded licentiates of District of Columbia by licensing agency of jurisdiction from which applicant comes.

[7] Senior year in class A medical school in United States.

[8] Graduates of European medical colleges after July 1, 1936, Switzerland excepted, shall not be eligible for licensure. Graduates prior to this date may be accepted for the regular written and clinical examination after completing rotating internships in approved hospitals in Illinois.

[9] Enemy aliens not accepted.

[10] Application must be filed six months prior to date of examination.

[11] Licensed to practice medicine and surgery in country in which school of graduation is located, otherwise required to complete senior year in approved medical school in United States.

[12] Diplomates of National Board of Medical Examiners eligible.

[13] License to practice medicine and surgery in the country in which the school of graduation is located.

[14] Matriculants after Jan. 1, 1940, not accepted.

[15] At the discretion of the board.

[16] Internship and graduate work.

[17] Internship completed in foreign countries after July 1, 1934, not acceptable.

[18] Rotating internship in approved hospital in the United States or completion of senior year in class A medical school in the United States.

[19] These requirements apply also to graduates of Canadian schools.

[20] Graduates from foreign medical colleges accepted if they present also a diploma from an approved medical school in the United States.

[21] Provided standard was the same as California on the same date.

[22] Degree from an American medical college acceptable to the Medical Council of Delaware required.

[23] Diplomates of the National Board of Medical Examiners accepted. Citizenship required.

[24] Very limited number contracting to practice in rural districts may be accepted.

[25] Effective July 1, 1943.

[26] Homeopathic board requires one year internship in homeopathic hospital in the United States.

under the accelerated medical program are eligible [illegible] 1942 and 1943.

Acceleration of Premedical Courses.—The mini- [illegible] tion and Hospitals recommended that for the duration of the war premedical education, including satisfactory courses in physics, biology, and chemistry, be included within two calendar years. Such a program was adopted by practically all medical schools of the country. The Army Specialized Training and Navy V-12 premedical programs call for less than two years of college training, but in both of these programs the studies are continuous and provide for the student carrying more than the normal peacetime studies per semester. Both the Army and Navy programs provide for work well in excess of the sixty semester hours constituting the normal two academic years of medical study.

With the exception of California, Connecticut, and Nebraska, the state licensing boards, by statute in the majority of instances, require that an applicant for licensure must present evidence of having completed two years of college training. Most states indicated that their board will accept applicants graduated under the accelerated plan of approved medical schools, thereby recognizing the certification of the premedical training by the dean of the medical school. This State, New York, requires the Medical Student's Qualifying Certificate. It would appear that the accelerated premedical requirements of the Army and Navy premedical programs will probably offer no licensure difficulties.

[illegible] in some industrial and rural sections of the country. [illegible] calendar year are shown in Table 5.

Annual Registration.—Twenty-seven states, the District of Columbia, Alaska, and Hawaii require physicians to register their license annually; New York and Missouri of that number issue licenses biennially (Table 6). Wisconsin was added to this list in 1943 and West Virginia no longer requires annual registration of medical licenses. With one exception, Colorado, the requirement has been waived for physicians in military service. In some instances legislative action was necessary to obtain a waiver.

* Biennial registration.

Candidates Examined 1939-1943.—During this period 38,791 examinations were given for all states and territories; 32,396 were successful, and 6,395—16.5 per cent—failed. New York State leads in the number of examinations given. In this State there were 4,572 successful tests in a five-year period. Other states examining more than 2,000 include Pennsylvania, 2,403; Illinois, 2,351; and California, 2,145. More than 1,000 were examined in seven other states and passed, namely, Maryland, Massachusetts, Minnesota, Missouri, Ohio, and Texas. The greatest percentage of failures occurred in three states—Massachusetts, with 51.2 per cent; New York, with 45.7 per cent; and Connecticut, with 34.1 per cent. The high percentage in Massachusetts is due to the fact that the licensing board has been required by law to admit to its examinations [illegible] of whom [illegible] ntage of [illegible] umber of graduates of foreign faculties of medicine, who likewise fail repeatedly. The percentage of failures in all states has decreased from 20.6 per cent in 1940 to 10.9 in 1943, which is the lowest figure since 1937.

[illegible] nite trend in the numbers annually registered from 1906 to 1933, although in 1918 the number registered dropped to the all-time low record of 4,231. After 1933 there was an upward trend for a time followed by a decline which terminated in 1942. The decrease of more than 1,200 in 1918 was due to the sudden withdrawal of physicians and recent gradu- [illegible] result of the accelerated curriculum and the universal effort on the part of the medical leaders of the country to maintain a steady flow of physicians for both civilian and military practice. In 1943 more [illegible] the migration of physicians to the country beginning in 1936 there was a resultant licensure rise, until, in 1940, they surpassed even the 1904 figure. This rise is also attributable to the inability of graduates

of unapproved schools to obtain licensure successfully. In the last two years the number of foreign graduates applying for licensure has decreased considerably.

Physicians Examined on the Basis of Credentials Obtained in Countries Other Than the United States and Canada.—The council of Medical Education and Hospitals does not grade or classify medical schools outside the United States and Canada. It does not attempt to evaluate institutions which it is not in a position to visit to determine if they meet the minimum essentials of an acceptable medical school as outlined by the Council. This was true even before the war.

In New York State no matriculates of foreign schools after 1940 would be permitted to qualify for examination unless, in addition to other requirements, the Department of Education or its agent had had an opportunity to inspect and approve the school from which the candidate was graduated. The requirements of candidates for medical licensure in New York State on the basis of credentials obtained in countries other than the United States and Canada are given in Table 7.

Eighteen states reported that the holders of such credentials are not eligible for licensure. Eighteen states, Alaska, Hawaii, and Puerto Rico require full citizenship and two states naturalization papers as a condition precedent to taking the examination. California, Indiana, and the District of Columbia make no reference to citizenship. In some states the recognition or nonrecognition of such individuals is by rule of the board, in others the provision is by statute. Ten states require a certificate from the state board of examiners in the basic sciences. Eighteen states, Alaska, Hawaii, and Puerto Rico require an internship in this country at the discretion of the board. In five states there is a requirement of a senior year's work in an approved medical school in the United States relative to physicians with foreign credentials who are to be examined for medical licensure. In 1943 in New York State 178 candidates from Germany's medical schools tried and passed the examinations while 184 failed. As in the past, Italy was runner-up with 48 who passed our examination and 73 who failed. France registered 26 successful examinees and 27 failures. Scotland had 20 successful examinees and 3 failures. Switzerland had 42 who successfully tried our state examination and 46 who failed. The greatest number of foreign graduates examined by any one state was 762 in New York, of whom 361 passed and 401, or 52.6 per cent, failed. No other state tested more than 54 of the physicians. Fewer than five were tested by 12 states and Hawaii. The percentage of failures in 59 schools was 50 per cent or higher.

TABLE 8

Year	No. Examined	Passed	Percentage Failed
1930	167	92	44.9
1931	158	91	42.4
1932	182	96	47.3
1933	200	129	35.5
1934	285	170	40.2
1935	437	303	30.7
1936	588	382	35.0
1937	920	637	30.8
1938	1,164	716	38.5
1939	1,691	839	50.4
1940	2,088	948	54.7
1941	1,717	698	59.2
1942	1,630	800	45.4
1943	1,031	518	49.8
Totals	12,258	6,509	46.9

The total for the fourteen years, 1930–1943, is presented in Table 8.

In this period 12,258 were examined, of whom 6,509 passed and 46.9 per cent failed. In 1943 there were 599 fewer examined than in the year previous, yet the percentage of failures was higher, and in 1940 the greatest number, 2,088, were examined. In that year 948 secured licenses. The highest percentage of failures occurred in 1941, when 59.2 per cent failed. At no time in this fourteen-year period did fewer than 30.7 per cent fail.

For a period of time there were large annual increases in foreign graduates examined, so that in 1940 there were over three times as many tested as in 1936. Since 1940 there have been annual decreases.

The number last year was about half that of 1940, although it was still almost double the 1936 figure.

After a study of medical licensure statistics for the past three years and after numerous conferences with the Department of Education and Board of Regents or representatives our course is clear cut as to what is necessary to maintain good educational standards to prevent discrimination against New York State medical school graduates and continue to license well-trained practitioners of medicine.

The Council of the Medical Society of the State of New York, through its Committee on Medical Licensure, has approved and sent to the Legislative Committee for action:

1. That citizenship as a requirement be incorporated in the Medical Practice Act.
2. In lieu of this, that an amendment similar to Article V, Section 2193 of the California Medical Practice Act be introduced. This is in addition to other accepted requirements that we now have in our Medical Practice Act and would be added to alleviate some of the difficulties we have encountered with foreign licensure.

"If the applicant is not a citizen of the United States, the country in which he has been licensed to practice medicine and surgery will admit to practice therein citizens of the United States upon proof of prior admission to practice medicine and surgery in some state of the United States or upon proof of matters similar to those required in this section for graduates of foreign medical schools."

3. The Department of Education has already instituted a ruling that the Department will not accept the credentials of a graduate of any medical college who matriculated after January 1, 1940, unless the Department of Education or its agent had had an opportunity to inspect and approve such schools.
4. In relation to the number of repeat examinations, a necessary change in the law would have to be made in Section 1258 of the Statutory Law. This insertion was approved by the Council:

"If a candidate fails on the first examination he may have a second examination without fee." This phrase is then to be inserted: "A candidate who, through failures of three examinations, has shown insufficient knowledge for admission to the practice of medicine, may be excluded from further examinations by the Department until he presents evidence of further study in a regular school of medicine satisfactory to the Department."

FINANCIAL REPORT

It is with the utmost difficulty that we have obtained enough paper to print the JOURNAL during the winter of 1944–1945. Our quantity has been cut by the War Production Board. This we were [illegible] allowance, and at the time this report is written our supply is being shipped in small quantities; barely enough for one issue, which, with delays in transit, makes inevitable further lags in the date our JOURNAL is issued. Readers are asked to bear with us if the JOURNAL reaches them some time after its date—our printers cannot print it until they have received the paper.

The financial condition of the publication has improved in 1944, producing a surplus over all ex-

penses of $30,252.29. This figure is without crediting $1.00 per year per member, which is required to conform to post office regulations regarding second-class mail matter. This creditable financial picture is due to two factors; war-boom prosperity and increased efficiency in the business department, which has occurred since we took into our own hands, from an outside contractor, the work of soliciting advertisements. Our two advertising representatives, Mr. Gordon Marshall and Mr. Charles L. Baldwin, Jr., have cultivated the field of acceptable advertisers most assiduously, under the direction of Mr. Dwight Anderson, Business Manager of the JOURNAL and *Directory*.

Improvement in the financial situation of the JOURNAL has been gradual over the last few years. In 1943, the surplus was $6,579.78, without crediting $1.00 per year per member. In 1942 and years preceding, the JOURNAL was conducted with a net cost (deficit). In 1942 this deficit was $8,367.27, in 1941, $15,847.58, and in 1940 it was $15,391.32. In prior years, for which we have records, the JOURNAL ran a deficit which varied from $1.50 to $2.50 per member per year.

The same setup is used for selling technical booth space at Annual Meetings. The 1944 Annual Meeting at the Hotel Pennsylvania showed gross income from this source of $20,870. After the expenses of the meeting were paid, there was a net surplus of $8,790.80. The gross sales amounted to approximately $1,840 more than at the meeting at the Waldorf-Astoria in 1942, which netted a surplus of $1,696.32.

The saving in cost of selling space in 1944, by having the management in our own office, instead of handling it through an outside contractor, was $1,992.

Medical Publicity

This year publicity has been directed chiefly to promotion of medical indemnity insurance, opposition to socialized medicine, and efforts to educate the lay public on the dangers to their health if a bill to license chiropractors, pending in the legislature, should pass. The last activity has been ancillary to the work of the Legislative Bureau and has been conducted in close cooperation with Dr. John L. Bauer, chairman of the Legislative Committee, and Dr. Robert R. Hannon, executive officer.

Releases.—As usual, we provided the press of metropolitan New York City and the State with publicity material on meetings of the District Branches and the postgraduate institutes conducted under the auspices of the Committee on Public Health and Education. All phases of the annual meeting held in New York were covered by the metropolitan press and the wire services, thus obtaining wide coverage in the daily and weekly newspapers throughout the State.

The plans of the Society in regard to developing voluntary medical indemnity insurance received excellent publicity, especially in New York City.

Bulletins.—The following club-talk bulletins were distributed to our regular bulletin list: "Not to Shudder but to Learn," which concerns cancer; "This Thing Called Flu," and "Vitamins and Where to Find Them."

Printed Matter.—Throughout the year we continued to receive requests for our printed leaflets and mimeographed material on socialized medicine and the Wagner-Murray-Dingell Bill. Because of numerous requests received for the leaflet, "Old Doc Politics," there was a new printing of 30,000 made, bringing the total distribution to 185,000. This leaflet was published to help fight the Wagner-Murray-Dingell Bill.

To better familiarize our membership and the public with the need and value of medical indemnity insurance a series of mailings was made. Four editorials entitled "Plain Talk," which appeared in the JOURNAL, were reprinted as a leaflet and distributed together with a special pamphlet, "Damned with Faint Praise." This mailing went to our membership, the Woman's Auxiliary, and to a list of key individuals throughout the State. A reprint of Dr. Herbert H. Bauckus' presidential message was included in the mailing.

Numerous requests from widely scattered organizations throughout the country were received and filled for "Plain Talk" and "Damned with Faint Praise."

In January all members of the Society and the Auxiliary received a pamphlet, "Physician, Decide," which was printed to answer questions and doubts about voluntary medical insurance plans among members of the Society and to give information on the three approved plans already in operation in the State.

Chiropractic.—The most intensive project undertaken was assistance to the Legislative Bureau in defeating the Seelye-Brees Bill in the State Legislature. A 48-page booklet, "Medicine Men and Men of Medicine" by Charles M. Bayer, was published especially for the purpose of defeating this bill, although its educational value will make it of permanent use. The booklet explains the development of the healing cults and presents an elementary explanation of scientific medicine. The menace of the cults, especially chiropractic, to the public health, is emphasized.

A one-page flyer giving briefly the reasons against chiropractic was printed for quick distribution to those who, when informed, would write to legislators. A special representative, Mrs. Harold Fleming, was employed to visit several upstate cities to assist in organizing community groups and work with county medical society officials making effective protests to their legislators.

Distribution.—In terms of quantity distribution, the following figures show the wide use of our material: "Damned with Faint Praise," 24,917; "Plain Talk, 1," 20,292; "Plain Talks on Medical Indemnity Insurance," 23,005; "Insure Your Self-Respect" (reprint of a JOURNAL editorial distributed to chief editorial writers, science writers, and syndicates), 1,309; "Physician, Decide," 20,000.

As of February 20, 1945, more than 35,500 copies of "Medicine Men and Men of Medicine" and 49,000 leaflets explaining briefly the dangers of licensing chiropractors had been distributed. Also 10,000 copies each of three editorials against chiropractic which had appeared in the *Buffalo Evening News*, the *New York Times*, and the *Ogdensburg Journal* were distributed. A flyer was sent to legislators and others showing that passing of the chiropractic bill would stimulate more proposals for licensing the other healing cults, with a résumé of such proposed legislation in other states.

Public Service and Miscellaneous.—A steady stream of requests for information and printed matter on socialized medicine, compulsory health insur-

ance, voluntary
ularly about t
to the Bureau
was supplied to civic groups, women's clubs, forums, high-school and college students, medical students, and other indiv
connection Miss
made talks and
of seventeen grc
civic clubs, and women's club federations. She also held conferences with Woman's Auxiliary leaders throughout the year, seeking to coordinate their activities with those of the Society. Acknowledgment should be made of her excellent contribution to the work of the Public Relations Bureau.

Mr. Anderson and Miss Lyon attended all the
quest.

The Committee on Medical Publicity has the following members:

Dr. Floyd S. Winslow, *Chairman*
Dr. Francis N. Kimball
Dr. Frederick M. Miller, Sr.

PART XIV

War Participation

The Council transmits the following report of its Committee on War Participation, which has the following personnel:

Louis H. Bauer, M.D., *Chairman*. .. Hempstead

REPORT

The War Participation Committee has had very little to do this year with selection of physicians for the armed services. Most of the physicians selected during the past year have been from among the recent graduates.

Numerous calls have been made on the Committee for physicians to serve on induction boards. These requests have been handled by the Secretary's office.

The chief proble

determine their desires as to postgraduate training on their return to civil life. A letter and a questionnaire were drawn up. These have been sent to every man in the service and as soon as they are returned they will be processed.

Another questionnaire has been prepared and sent to every hospital in the State to determine the number of internships, residencies, and opportunities for medical observers which will be available to meet the desires of returning veterans.

It is also planned to find out, through the JOURNAL, the number of physicians who desire assistants.

Many returning veterans may desire financial assistance which is provided by Congress in the so-called G.I. Bill. The provisions of this bill as it affects physicians have been published in the *Journal* of the American Medical Association and this information will be made available to veterans. It was hoped by the Committee that arrangements might be made to finance loans locally where necessary and these loans to be backed by the State Society. A legal opinion, however, has been rendered that the State Society cannot, under the law, either make or endorse such loans. Therefore, this proposition has been regretfully abandoned.

The Committee feels that the Society has no

New York has
posal has been unanimously approved by that body, a plan to aid in the restoration of the members of the Society now in service, to the practice of medicine upon their relief from duty or discharge from the armed services.

This plan proposes to aid in every way the restoration of all of its members now in service, or who have been in service, and of those other regularly licensed men who have had service and who join their local county medical society after discharge from the service; even though they have not been members before they entered the service.

In order to accomplish these purposes it is necessary to make a survey in order to determine the needs, desires, and the nature of the aid you will require to determine these needs, and in order to effect the full intent of the plan, a questionnaire is enclosed to aid you in indicating what you wish to have us do. In order to put this plan promptly into operation, your cooperation in completing the questionnaire at your earliest convenience is requested.

Above all things, we want you to know that your State and County Societies are not going to let you down. They are proud of you, proud of your record, and proud of the reputation of organized medicine which

General Matters

Convention.—The Council Committee on Convention—Dr. John L. Bauer, *Chairman*, Brooklyn; Dr. Walter P. Anderton, New York; and Mr. Dwight Anderson, New York—submits the following report.

REPORT

In the years 1943 and 1944, the Medical Society of the State of New York carried on with the approval of the powers in Washington the usual convention embracing the House of Delegates, the Scientific Sessions, the Scientific Exhibits, and the Technical Exhibits. By utilizing, by including in our programs as much wartime medicine as possible, covering the various fields in surgery and medicine, we received the approval and commendation of Washington, had representatives of the Army and Navy on our programs, and the attendance of many doctors in the employment of the U.S. Government. In 1943, transportation privileges were not yet too difficult to obtain, and the timely and helpful nature of our programs was recognized. So many other scientific bodies had given up their conventions that probably the Convention held in Buffalo was the best attended and the most outstanding success of any New York State medical convention ever held there.

In 1944 the Convention in New York City was held after more deliberation and consideration on the part of Washington, but with their final, full approval. In 1943 and 1944 all social activities, such as banquets and dinners, were excluded. The Conventions were purely scientific. So this year, 1945, your Convention Committee, upon action by the Council, proceeded to make full preparations for the usual Convention to be held in Buffalo on April 30 and May 1, 2, and 3.

On November 11, 1944, the Convention Committee and subcommittees on Arrangements, on Scientific Programs, on Scientific Exhibits, and on Technical Exhibits met together at Hotel Statler in Buffalo. About twenty-five members were present.

Dr. J. G. Fred Hiss, of Syracuse, Chairman of Scientific Exhibits, had in readiness a plan for the exhibits to be of educational value, part and parcel of the scientific program.

Dr. Duncan W. Clark, of Brooklyn, Chairman of the Scientific Program, in charge of Sections and Sessions, demonstrated that he had given considerable thought to his committee work and after outlining the work, he called upon the specific chairmen of the various sections and sessions, who then participated in a very animated discussion.

Mr. Dwight Anderson reported that the demand for booths already exceeded the available space.

The Executive Secretary of Erie County, Mr. Harold P. Jarvis, expressed his willingness to help us in the matter of attendance at various meetings.

Dr. Harold R. F. Brown, Chairman on Arrangements, promised us every courtesy possible.

Those present representing the Sections and Sessions were Dr. Milton C. Peterson, Dr. Rose M. Lenahan, Dr. Stockton Kimball, Dr. Russell C. Kimball, Dr. Frederick W. Williams, Dr. Albert B. Siewers, Dr. Harold H. Joy, Dr. Ellis Kellert, Dr. Carl H. Laws, Dr. Joseph P. Garen, Dr. Frank E. Coughlin, Dr. Stanley E. Alderson, Dr. George E. Slotkin, Dr. Walter S. McClellan, Dr. T. Wood Clarke. There were also present by invitation, Dr. Carlton E. Wertz, Mr. Gordon M. Marshall, and Mr. Charles L. Baldwin.

The various chairmen of the subcommittees had prepared what promised to be a very unusual convention program but in January the authorities willed it otherwise and at the Council meeting on January 11 it was voted that it would be in the interests of all to declare the Convention off and to so report it in the newspapers, and on March 7 the Council, at the request of the Committee on Conventions, Office of Defense Transportation, voted to postpone indefinitely the meeting of the House of Delegates.

It is always a pleasure to have an associate, one who rebounds with something new and valuable. Mr. Dwight Anderson and a coworker in the Public Relations Bureau soon brought forth the idea of a "Convention by Mail." When the far-reaching and inclusive benefits of this plan were explained, we were all delighted and felt that it would set a precedent to be continued in all future conventions.

The Council on February 8 approved of the plan as presented by Mr. Anderson upon request.

Nursing.—The Council Committee on Nursing, consisting of Dr. Norman Moore, *Chairman*, Dr. Peter Irving (deceased), and Dr. Clayton W. Greene submits the following report.

Nursing education and the practice of nursing, both private and institutional, have occupied the attention of the medical profession this year more than previously. The climax recently reached in nurse recruiting has involved physicians in the controversy. The recruiting groups have charged physicians with casualness and indifference and thereby forced from them the admission that the public is largely responsible for the demand for luxury nursing, condemned as unpatriotic at the present time. Physicians, also, have called attention to the changes in quotas for nurses by the armed services, the color discrimination, physical defect standards, academic qualifications, the disqualification of male and married female nurses, and inefficient recruiting methods.

Your committee has studied this debate with considerable interest since problems relating both to medicine and nursing have been raised. One of these is the academic preparation of the nurse. The need for increased numbers of nurses during the war to meet military needs has raised anew the problem—the length of time of training and curricula.

It is felt that, on the whole, the standards of

nursing education have been influenced for the better by the Cadet program. The length of training under this program [illegible] in order that the student [illegible] her own hospital or another for six months' practical work before receiving her diploma. There has been considerable discussion, and some favorable comment, by members of the medical profession of the question of further [illegible] training course. [illegible] tion differs with [illegible]

fessional individual, the standards of her education must be protected. The Committee is of the opinion that the training of young women with lesser qualifications, who belong to the so-called nonprofessional group of nurses, over a shorter period is not without merit.

The question presenting itself in New York State at the moment, in light of Army recruiting policy, is whether professional nursing should continue to be given in the small, endowed, and private nonacademic hospitals where facilities for the basic sciences are inadequate and where there is often a tendency to place emphasis on the student nurse's value to the hospital rather than on fulfilling the requirements of her curriculum. Curtailment of this group of training schools in this State would not necessarily lead to a decrease in the number of student nurses enrolled, for it has been demonstrated that regional training centers combining adequate staff and facilities can prepare a large [illegible] that the small endowed and private nonacademic hospitals now maintaining nurses' training schools might develop shorter courses for practical nurses who could, under supervision, carry on much of the routine general nursing in hospitals. It is recognized [illegible] would have a [illegible] ional status. [illegible] f the public's interest in the type of nursing personnel that continues to serve them. Public interest is believed to be more economic than educational. It appears logical that an effort will be made by the public, the nursing group, or both, to bring economic relief to the former and security to the latter through extension of nursing insurance.

Office Administration and Policies.—This special Committee of the Society, consisting of Dr. George W. Kosmak, *Chairman*, Dr. W. P. Anderton, Dr. Laurance D. Redway, Dr. Kirby Dwight, and Mr. Dwight Anderson, presents the following report.

REPORT

[illegible] your [illegible] and [illegible] with the routine management of the Central Office These sessions dealt mainly with the following principal items, in addition to many minor matters:

1. [illegible] plans for a pension [illegible] Society's employees.
[illegible] surance companies [illegible] the Chase National [illegible] Company. These [illegible] it to date no action taken. In view of the complexity of the situation [illegible] Council referred [illegible] which has apsisting of Dr. Brennan and Dr. Kosmak, with Dr. Ross as Chairman, to make a further study of the plans submitted. In accordance with an opinion previously rendered by the Society's Counsel, any retirement plan would require approval by the House of Delegates before it [illegible] to be decided up[illegible] tant members of [illegible] ecessitated by the death of Dr. Irving. The latter involved mutual consultation with the Publication Committee and the carrying out of new appointments proposed by the Reorganization Committee, to take care of this emergency. These changes were communicated to the Council and approved by them.

3. Rearrangement of the present office space to provide quarters for the newly created Insurance Bureau presided over by Mr. George P. Farrell and more suitable arrangements for the editorial offices were made. With the expanding activities of the Society's business, thought must be given to secur- [illegible] This [illegible] your Committee have required a great deal of time and attention by [illegible] results that [illegible] portant facts [illegible] As it is depe [illegible] of Delegates for its continuance, it is hoped that its accomplishments will have made a favorable impression upon this body for its renewed appointment.

The Special Committee on Office Administration and Policies recommends that the House of Delegates continue this Special Committee, working under supervision of and reporting to the Council, and that the House give the following directive as to continuance of its personnel:

F
M [illegible]
Literary Editor, the Treasurer, and one member of the Board of Trustees, to be appointed by the President of the Society, after consultation with the Chairman of the Board of Trustees."

Reorganization Committee.—By action of the Council of the Medical Society of the State of New York at its meeting on October 12, 1944, a Reorganization Committee was appointed by President Herbert H. Bauckus.

The Reorganization Committee has the following membership:

O. W. H. Mitchell, M.D., *Chairman*....Syracuse
Thomas M. Brennan, M.D.....Brooklyn
Thomas A. McC[illegible]
N [illegible]
Fl [illegible]

Five meetings of the Committee have been held: October 27, November 9, and December 7, 1944, and January 9, and March 6, 1945. At the first meeting it was decided to request the Council and President Bauckus to increase the membership of the Committee to seven members and to request that Dr. George W. Kosmak, because of his familiarity with office management of the Society, and Dr. Kirby Dwight, the Treasurer, be the additional

members. This report was submitted to the Council and approved at its meeting on November 9, 1944.

At the second meeting of the Reorganization Committee, which interprets its function as one of an emergency committee, it was decided to take the following actions:

1. The Chairman of the Committee to communicate with all members of the Council, except Dr. Irving, to request a vote on the following proposal:

"I { do / do not } approve of a sick leave for our Secretary, Dr. Peter Irving, not to exceed three months, with full salary compensation during the time he is absent from his duties."

The result was unanimous in favor of the proposal, and Dr. Bauckus was notified of the decision by Western Union Day Letter.

Dr. Bauckus talked with Mrs. Irving, informing her of the action of the Council and that full compensation would be allowed for the months of December, 1944, and January and February, 1945.

2. It was decided to request Dr. Walter P. Anderton to accept the position of Acting Secretary on part-time basis.

The Committee realized that it didn't have the authority to make such an appointment nor to prepare a contract for such a position. It did believe, however, that in the emergency such action should be taken and that approval would be requested at the meeting of the Council on Thursday, December 14, 1944, with the recommendation that the Board of Trustees provide for the salary of Dr. Anderton.

Dr. Anderton was informed of the action of the Reorganization Committee and agreed to accept the position, effective December 1, 1944. It was therefore necessary that the action of the Council and the Board of Trustees be retroactive to December 1, 1944. At the meeting of the Council on January 11, 1944, due to the death of Dr. Irving the Reorganization Committee made the following recommendation: "The appointment of Dr. W. P. Anderton as acting secretary on a part-time basis beginning February 1, 1945." On motion, the appointment of Dr. W. P. Anderton, as secretary, serving part time, was approved.

There had been much discussion about the management of the affairs of the New York office of the Medical Society of the State of New York: Because of the great increase in activities, it seemed advisable to the Reorganization Committee that the Secretary should not be burdened with the routine office management which is unrelated, or very indirectly so, to the duties of Secretary. The Committee had in mind such activities as those which generally go with the secretarial and clerical services of a central office and which deal with the ordinary routine management of affairs. Such activities and details do not, of course, include those of policy making, final decisions on finances, or matters which, by the Constitution and Bylaws of the Medical Society of the State of New York, are vested in the House of Delegates, Council, Board of Trustees, and certain officers.

The question had arisen concerning the position designated "General Manager" and it is generally agreed that a better designation might well be "Executive Secretary." According to the bylaws, Chapter VIII, there shall be an officer known as a general manager and requirements are set forth for this position. It is required that he must be a physician and, to quote the Bylaws, Chapter VIII, Part B, "He shall have general management of the executive details of the Society's business, subject to the Council; he shall be the coordinator of all activities of the Society; he shall act as Secretary of the House of Delegates, of the Council, of the Board of Trustees. He shall be eligible for election as Secretary of this Society."

It is the opinion of the Reorganization Committee that the duties of the Secretary could be much better performed without burdening him with the duties of general management. This Committee, therefore, recommends that an office manager, to be designated "executive secretary" be employed, whose duties will be concerned, in the main, with office management and the usual business details of such a position. It isn't necessary for the "executive secretary" to be a physician, as has been demonstrated in other medical organizations. Such an executive officer cannot, of course, function as a physician and would be under the immediate supervision of the Secretary, Assistant Secretary, and other officers of the Society. It would not seem wise, at the present time, to attempt precise definition of duties, as experience in the next few months will demonstrate the wisdom of this change in administration.

All of these proposed changes must, of course, be temporary, as final action must be taken at the next Annual Meeting of the House of Delegates or by the Council if the Annual Meeting is not held.

Another matter which has concerned the Reorganization Committee is the NEW YORK STATE JOURNAL OF MEDICINE. The Secretary and General Manager had been active in the general supervision of the JOURNAL. This service, added to his already heavy burden of duties, must now be provided for in the rearrangement. Your Committee believes that the NEW YORK STATE JOURNAL OF MEDICINE has a great future and that the Managing Editor should be relieved of the many duties required of a secretary and general manager. Such a position need not be full time but will require considerable attention by someone especially interested in the management and scientific content. We therefore requested Dr. George W. Kosmak, a member of the Board of Trustees and editor of the *American Journal of Obstetrics and Gynecology* and Associate Managing Editor of the NEW YORK STATE JOURNAL OF MEDICINE, to assume the duties of Acting Managing Editor of the NEW YORK STATE JOURNAL OF MEDICINE. This is a position of considerable responsibility which will require much time. Dr. Kosmak consented to assume these duties until provision is made for someone else to take charge. Already he has contributed much. Without considering the request of Dr. Kosmak to disregard financial compensation, the Committee recommended that he receive an honorarium in keeping with the responsibilities, time, effort, and contribution which such a position entails. Your Committee did not make a recommendation regarding the amount of the honorarium and preferred to have it decided by the Board of Trustees. At the meeting of the Council of the Medical Society of the State of New York on January 11, 1945, the Reorganization Committee submitted the following recommendation: "That Dr. George W. Kosmak be appointed Managing Editor of the NEW YORK STATE JOURNAL OF MEDICINE." On motion the appointment of Dr.

Kosmak as Managing Editor of the NEW YORK STATE JOURNAL OF MEDICINE was approved.

Recently, Dr. Joseph S. Lawrence, who for so many years was in charge of the Albany office and held the position of Executive Officer, has accepted a position with the American Medical Association in the Washington office. We have been most fortunate in securing for this important office Dr. Robert R. F[illegible]or executive ability and [illegible]ucation are well known [illegible]VIII of the Bylaws, Sec[illegible]"Executive Officer will give his full time and undivided attention to the affairs of the Society, subject to the direction of the Council." It is also stated in the same paragraph that "he shall assist the General Manager." This section needs clarification and should be revised after conferences have been held by the Reorganization Committee, Dr. Hannon, Secretary Anderton, and probably other officers of the Society.

The personnel necessary to carry on the routine business in the New York office is a sizable group. The individual duties and responsibilities are widely different. It is, therefore, not easy to determine what their classifications should be and the financial compensation which they should receive. Several of them have been in the service of the Society for many years; others not so long and some, of course, are relatively new or for temporary service. It seems advisable to allow the classification of office personnel to be made by the Secretary, the Executive Secr[illegible] the JOURNAL, Committ[illegible] and Policies, and the [illegible]

At the meeting of the Council on December 14, 1944, [illegible] Com[illegible] ganization Committee which involve changes in the Bylaws be referred to the Committee on Constitution and Bylaws.

2. That because of the illness of Dr. Irving a new Committee on Constitution and Bylaws should be appointed.

These motions were seconded and approved.

Résumé of Instructions of the 1944 House of Delegates and Actions Thereon of the Council, Board of Trustees, and Officers

Regional Centers for Diagnostic Aid (Section 50.)—The House instructed the President to appoint a special committee or subcommittee to survey the [illegible]

Drs. Ivan N. Peterson, George A. Marsden, Peter J. Di Natale, Dan Mellen, Kenneth F. Bott, Walter S. Thomas, Scott Lord Smith, Stephen R. Monteith, and Andrew A. Eggston are conducting a careful survey and their findings and recommendations will be published later.

Establishment of a Bureau of Medical Expense Insurance (Section 50).—The House adopted the following resolution:

"Your Committee concurs in the recommendation of the Planning Committee for the establishment, as soon as possible, of a Bureau of Medical Care Insurance by the State Medical Society under a full-time director with the neces[illegible]

lishment of this Bureau.

"We further suggest that the Director of this Bureau should be thoroughly conversant with insurance practices, and be a physician if possible."

The Council instructed the Committee on Public Relations and Economics and the Subcommittee on Medical Expense Insurance to submit a plan and recommend a director for this new Bureau. Mr. George P. Farrell, Enrollment Supervisor of the Western New York Hospital Service Corporation, of Buffalo, was selected, signed a contract, and in February opened his office in the State Society offices.

Journal Department on Medical Expense Insurance (Section 36).—The House voted as follows:

"[illegible] further recommends that for a period of one year free advertising space, as well as reading matter in the text, be given to those organizations approved by the Medical Society of the State of New York. The amount of space allotted shall be left to the discretion of the Council."

These instructions have been followed by the editors and Publication Committee.

Directory.—The Publication Committee has not attempted issuing a new medical directory because the shortage of paper and difficulty in engaging proper personnel has precluded such an endeavor.

Director of Workmen's Compensation Bureau (Section 73).—The House adopted the following recommendation:

"At the present time, however, your Reference Committee [illegible] situation is clarified [illegible] law, your bureau, as now, should have a part-time director, and that the [illegible] some future [illegible] of the Council and Board of Trustees. If a full-time director is appointed, he should devote himself solely to the duties of that office in the State Society."

The Council has appointed Dr. David J. Kaliski to be Director of the Workmen's Compensation Bur-

eau, to devote his full time to this Bureau and in no other way to represent the Society.

Malpractice Defense and Insurance (Section 77)—The House adopted the following recommendation:

"Your Reference Committee recommends that the Council Committee on Malpractice Defense and Insurance proceed to make a survey of the entire malpractice insurance situation and bring in recommendations to the Council."

The Council referred this survey to the Committee on Malpractice Defense and Insurance. This committee has investigated the matters exhaustively and intends to report to the Council, and its findings will be published as soon as possible.

Workmen's Compensation Fee Schedule (Section 79).—The House resolved:

"WHEREAS, the Medical Fee Schedule of the Workmen's Compensation Law was established by the Industrial Commissioner of the State of New York during normal times; and

"WHEREAS, on and after May 15, 1942, the hospitals of the State of New York were granted an increase in fees by the Industrial Commissioner following a conference and agreement by the representatives of the compensation insurance carriers and the Hospital Association of New York State; and

"WHEREAS, the cost of living has increased within the past few years; therefore be it

"*Resolved*, that the Medical Society of the State of New York take such appropriate action as is necessary with the Industrial Commissioner of the State of New York and the representatives of the compensation insurance carriers that an increase be granted to the medical profession for fees in the present Medical Fee Schedule."

This matter has been considered by the Workmen's Compensation Committee and the Labor Department of the State of New York, and an upward revision of fees for treatment and examinations of Workmen's Compensation cases is in process.

School Health Program (Section 37).—The House adopted a Reference Committee report in part as follows:

"We refer to the matter of instruction of health teachers. At the present time the percentage of teachers qualified to give health instruction is very low. The courses in public-health instructions, available in the normal school in State Teachers Colleges, are not utilized to their full advantage. If we are to have good health instruction in the schools, we must have a sufficient number of well-qualified teachers.

"We, therefore, recommend to the Subcommittee that they place special emphasis on this phase of the subject during the coming year."

This was referred to the Committee on Public Health and Education and considered at meetings in Syracuse on May 23, 1944, and in New York City on June 22, 1944. A syllabus was prepared and special instruction was given high-school teachers in regard to teaching of health matters, under the State Education Department.

Medical Practice Act (Section 82).—A letter was sent to Governor Dewey as result of the following resolution of the House:

"*Resolved*, by the House of Delegates of the Medical Society of the State of New York that it be recommended to the Governor and the Legislature of the State of New York that the Medical Practice Act be more rigidly enforced in the interest of the health and welfare of the citizens of this State."

Publicity (Section 84).—The budget for the second half of 1944 carried an increase in allotment for publicity as advocated in a resolution committed to the Council by the House.

Workmen's Compensation, Deductions from Bills (Section 88).—The House adopted the following resolution:

"*Resolved*, that the Medical Society of the State of New York be requested to arrange with the Industrial Commissioner of the State of New York that no deduction be made in the payment of bills for Workmen's Compensation cases."

The Workmen's Compensation Committee has taken appropriate action, and the matter has been advocated before the Industrial Commission.

Plan for Medical Care (Section 89).—As a result of a resolution in regard to planning "to provide adequate medical care to that part of our population just above the line of indigency," the Dutchess County plan was referred by the Council to the Planning Committee for Medical Policies, which studied the matter.

(For lack of space, it was not possible to publish all of the Annual Reports in the current issue. The remainder will be included in that of April 15.)

Postgraduate Medical Education

Programs arranged by the Council Committee on Public Health and Education of the Medical Society [illegible] this Section of the JOURNAL. *The members of [illegible], Chairman (428 Greenwood Place, Syracuse, M.D.*

Nassau County Lecture on Intractable Ulcer

DR. J. WILLIAM HINTON, associate clinical professor of surgery, College of Physicians and Surgeons, Columbia University, will give postgraduate instruction to the Nassau County Medical Society on Tuesday, April 24 at 9:00 P.M. at Mercy [illegible]. The title of his lecture [illegible] with Emphasis on the [illegible].

The lecture has been arranged by the Council Committee on public health and education.

Pneumonia and Cardiovascular Emergencies

THE St. Lawrence County Medical Society will [illegible] lege, delivered a talk to the society on "The Treatment of Pneumonia," at the A. Barton Hepburn Hospital, Ogdensburg.

These two le[illegible]e Council Committee on [illegible]on. The lecture on the [illegible] was presented as a joint endeavor between the Medical Society of the State of New York and the New York State Department of Health.

Monthly Lectures in Greene County

TWO postgraduate lectures will be given to the Greene County Medical Society and the staff of the Memorial Hospital of Greene County in April and May.

On April 26 Dr. Ralph G. Stillman, assistant professor of medicine, [illegible] lege, will speak on [illegible] Tests and Method[illegible] and on May 31 D[illegible] clinical professor o[illegible] and Surgeons, New [illegible] 'Surgical Treatmer[illegible]

These lectures will take place Thursday evenings at 9:00 P.M. at the Memorial Hospital of Greene County, Catskill.

The March lecture was given by Dr. Harry Bakwin, associate professor of pediatrics, New York University, who spoke on "The Diagnosis of Meningitis."

This instruction is provided by the Medical Society of the State of New York with the exception of the lecture on meningitis, which was presented jointly by the State Department of Health and the State Medical Society.

Treatment of Fractures

THE Otsego County Medical Society heard a lecture on "The Treatment of Fractures by the General Practitioner" given by Dr. Harrison L. McLaughlin, instructor in surgery, College of Physicians and Surgeons, Columbia University, New York City.

It was given on March 14 at the Tunnicliff Inn, Cooperstown.

Cayuga County Lecture

DR. FREDERICK N. MARTY, instructor in clinical medicine, Syracuse University College of Medicine, gave postgraduate instruction to the Cayuga County Medical Society on March 15 at the Auburn City Hospital, Auburn. His subject was "Penicillin Therapy."

Traumatic Surgery

A SERIES of lectures on traumatic surgery has been arranged for the Medical Society of the County of Sullivan by the Council Committee on Public Health and Education, to be given on Wednesdays at 8:00 P.M.

On March 14 the first meeting was held at the Lenape Hotel, Liberty. The first lecture was "Traumatic Surgery with Emphasis on Treatment of Wounds and Shock." Dr. Henry H. Ritter, professor of clinical surgery at New York Post-Graduate Medical School, Columbia University, then spoke on "Fractures in General—the Treatment of Common Fractures." On March 21, at Monticello Hos[illegible] tor [illegible] ate [illegible] Tre[illegible]

On April 4 the lecture was held at the Woodbourne Institute for Mental Delinquents, Woodbourne. Dr. David Goldblatt, assistant clinical professor of surgery at New York Post-Graduate Medical School, spoke on "The Treatment of Burns and Hand Infections." On April 11, at the Lenape Hotel, Dr. Ernest W. Lampe, instructor in trau-

matic surgery at New York Post-Graduate Medical School, will speak on "Bursitis, Sprains, Strains." The meeting on April 18, at Monticello Hospital, will consist of a lecture entitled "The Treatment of Fractures of the Femur and Humerus," by Dr. Walter D. Ludlum, Jr., associate in traumatic surgery, New York Post-Graduate Medical School. On April 25, at the home of Dr. Harry Golembe, 111 Champlin Avenue, Liberty, Dr. David Lyall, assistant surgeon at New York Post-Graduate Medical School and Hospital, will speak on "Wounds, Nerve, and Tendon Injuries."

The May meeting will be at the Lenape Hotel, Liberty. A lecture, "The Care of Head Injuries," will be delivered by Dr. George A. Glass, of New York Post-Graduate Medical School.

This instruction is presented as a cooperative endeavor between the Medical Society of the State of New York and the New York State Department of Health.

Psychiatry

POSTGRADUATE instruction in psychiatry has been arranged by the Council Committee on Public Health and Education for the Saranac Lake Medical Society.

A lecture will be given April 11 at 8:00 P.M. in the John Black Room of the Saranac Laboratory, Saranac Lake. Dr. Foster Kennedy, professor of clinical medicine at Cornell University Medical College, New York City, will speak on "The Neuroses Related to the Manic-Depressive Constitution."

NATIONAL FOUNDATION RELEASES ANNUAL REPORT

The encouraging news that "some of the mystery of infantile paralysis is being dispelled" is contained in the annual report of the National Foundation for Infantile Paralysis, made public in February by Basil O'Connor, president.

Listing grants and appropriations totaling $1,828,859 authorized by the National Foundation between September 30, 1943, and May 31, 1944, for research, education, and the training of physical therapists, the present report covers an eight-month period.

The report also contains the information that a special fund of $2,000,000 for epidemic aid and other emergencies has been established by the trustees, as of May 31, 1944, and that last summer's epidemic —the second worst outbreak of poliomyelitis in the history of the United States—drew upon the newly created fund to the extent of $739,860. This money was used to supplement chapter funds in local communities hard hit by the 1944 outbreak.

During the eight months covered by the fiscal report, the National Headquarters received $5,191,148 as its share of the 1944 March of Dimes appeal, an additional $5,293,232 remaining with the National Foundation's county chapters. Receipts from other sources, including $240,000 donated by the producer of the motion picture "Forever and a Day," increased the total income of the National Foundation for the fiscal period to $5,452,593.

Of the 1943 outbreak, the report has this to say: "Not only was help sent to each epidemic area, but as far as facilities permitted the epidemics became the subject of special study. Grantees of the National Foundation concerned with epidemiology were kept posted on the spread of the epidemic. As information was received from the states it was relayed to these research workers. They then were able to go into the field with their trained staffs and to carry out their investigations early in the outbreak.

"Particularly were extensive investigations conducted in California, Texas, Illinois, and Connecticut. The pattern of spread of cases was investigated; thousands of specimens were collected in accordance with a carefully prearranged plan. Bodily secretions and blood specimens were secured from patients and their contacts and material was collected from the environment in which these persons lived.

"Wild and domestic animals and birds were studied as well as food, water, and sewage. The examination of all this material calls for months of study. The laboratory procedures involved are difficult and expensive.

"Much has been learned from this epidemic. The method of spread of the disease is better understood. Some of the mystery of infantile paralysis is being dispelled. But not enough has yet been learned to set into operation practical control measures. More epidemics need be studied; laboratory methods must be greatly improved before the final answer can be given."

The report recounts also the findings of virus research and aftereffects research which have been conducted in university and hospital laboratories under National Foundation grants. It draws a picture of a broad research and of the development and study of physical therapy as well in the specific field of infantile paralysis.

"In seeking improved methods of treatment it has been necessary to study other diseases," the report states. "The effects of drugs have been studied, not so much by observing their action on infantile paralysis in man, but rather in testing them in laboratory animals infected with similar disease-producing viruses.

"Grants have been made to include studies of other viruses and virus diseases so that the facts learned would both increase the knowledge and develop better methods of study and treatment of infantile paralysis."

The University of the State of New York

The State Education Department

Board of Medical Examiners

This is to notify you that the Board of Regents at a meeting held November 17, 1944,

VOTED, that such determination of the Medical Committee on Grievances in the matter of the application for the revocation of the medical license *heretofore granted to* Louis Herschman, Brooklyn, be accepted and sustained; that, in compliance with the recommendation of said committee, medical license No. 15870, issued under date of October 7, 1920, to said Louis Herschman, permitting him to practice medicine in the State of New York, be revoked, annulled,

Grievances and to carry out the terms of this vote.

Dr. Herschman was registered for the year 1944 from 232 Rogers Avenue, Brooklyn, New York. The order was served on Dr. Herschman on December 5, 1944, and is in full force and effect.

* * *

On October [illegible] of Regents at [illegible] voted that th[illegible] Henry Lee Bl[illegible] and canceled, and that his registration or registrations as a physician be ordered annulled and canceled of record.

Doctor Blank, hav[illegible] Governor of the State [illegible] the Commissioner of [illegible] and has, in accordance with the Commissioner's order, been permitted to have his license restored. The order of the Commissioner was served on Dr. Blank December 29, 1944.

* * *

This is to notify you that the Board of Regents at a meeting held January 19, 1945,

VOTED, T[illegible] division 1, [illegible] medical lic[illegible] July 1, 192[illegible] permitting [illegible] of New Yo[illegible] and that [illegible] physician, [illegible] annulled and canceled of record; and that the C[illegible] wered and [illegible] the Board [illegible] ry out the terms of this vote.

Dr. Dukoff was registered for the year 1945–46 from 38 Fort Washington Avenue, New York City. The order of cancellation was served on Dr. Dukoff on January 29, 1945.

* * *

This letter is to be considered a follow-up of earlier correspondence. The license of Dr. Hyman S. Frank is in suspension for a period of one year beginning December 7, 1944, and ending December 7, 1945. *I believe your record at the present time* indicates that the suspension of his license is scheduled to expire December 31, 1945, which is not quite in accordance with the facts in the case.

* * *

On January 12, 1944, we notified you that the [illegible] the order and until reinstated by the Commissioner of Education.

Dr. Lichtenstein has applied to the Commissioner of Education for reinstatement and has, in accordance with the Commissioner's order, been reinstated as of February 13, 1945.

NEW TYPE MAGNET REMOVES FOREIGN BODIES FROM STOMACH

A new type of magnet, by which magnetizable foreign bodies in the stomach and windpipe can be removed, thus eliminating operations which often are necessary to remove such objects, is described in the *Journal of the American Medical Association* for January 13 by Murdock Equen, M.D., of the Ponce de Leon Eye and Ear Infirmary, Atlanta, Georgia.

The magnet is composed of alnico, an alloy of aluminum, nickel, cobalt, and iron. For the past two years, Dr. Equen says, the new alloy magnet has been available as a small permanent type for use in removing foreign objects from the eye.

The instrument reported for use of the magnet is composed of a tube to which the magnet is attached and which is introduced into the stomach through the mouth and esophagus. At the other end of the tube is a rubber bulb which is used for inflating the stomach. This inflation lifts any collapsed portion of the stomach from the foreign object, such as a pin, allowing the magnet to be passed about freely, and the foreign body is thus unimpeded in being attracted by the magnet.

As Dr. Equen explains, the removal of foreign bodies from the stomach and windpipe by means of the gastroscope and flexible forcepts is a very difficult procedure. The constant shifting of the position of the foreign body, in a space as large as a stomach, makes it very difficult to establish contact between the forceps and the object.

Alnico magnets require a considerably stronger magnetizing force to magnetize them completely than do other types of permanent magnet alloys, the author says. At the same time, alnico has more available external energy or attracting power for a given volume or size than has any other permanent magnet material known at the present time.

Dr. Equen presents in his paper a case report that he says is typical of the entire series of cases of foreign bodies removed by the new magnet. He tells of a girl aged 19 months who had swallowed her mother's hairpin twelve hours previous to the time the baby was brought to him. The new instrument was passed down the esophagus and introduced into the stomach of the child. This was done against a background of a fluoroscopic screen which revealed by means of x-ray the position of the hairpin and also of the magnet. The stomach was then inflated, the pin quickly coming into the range of the magnet to which it was attracted and then withdrawn from the stomach. The entire procedure lasted only eight minutes, he said.

"The new alloy magnet, alnico," Dr. Equen concludes, "is being proved of great value to medicine. For the past two years it has been available as a small permanent-type eye magnet. Only a minority of foreign bodies of the food and air passages are magnetizable, but among those which are the use of this instrument will render unnecessary many abdominal operations and decrease bronchial instrumentation."

Social Hygiene Award to General Ireland

MAJ. Gen. Merritte W. Ireland, USA, former Surgeon General of the Army, received the William Freeman Snow Award on February 7, in Chicago. The Award, established in 1937 and given annually by the American Social Hygiene Association, is "For Distinguished Service to Humanity."

ard was made by
al of the Armies,
an of the Asso-

n in 1891 as a
culminated in his
General of the Army, a post which he held from 1918 until his retirement in 1931. During his term of service he reorganized the Surgeon General's Office on the strength of experience gained during World War I and laid the basis for the present efficient army medical program through the establishment of the Field Service School at Carlisle Barracks, Pennsylvania, and the development of the Army Medical Center at Washington, D.C. and of Army hospital facilities.

"In the years since his retirement," said General Pershing, "General Ireland has served civilian as well as military health and welfare with unabated zeal and statesmanship."

National V. D. Committee Agrees to Recommend Extension of May Act

THE National Venereal Disease Committee, meeting in Washington recently at the request of Federal Security Administrator Paul V. McNutt, agreed to recommend to Congress the extension of the May Act, which prohibits prostitution around military and naval establishments. The act expires May 15, 1945.

and promiscuity.

Thomas Devine, newly appointed director of the Social Protection Division, Federal Security Agency, said that venereal disease control is no longer a problem to be focused on trouble spots or war-impacted areas, but is a matter of concern for all communities.

The fact that 40 per cent of military venereal disease infections occur during furlough shows that the control problem is not confined to communities adjoining camps or war
ment made by Lt.
rector, Venereal Dis

Devine that,

committees

In view of the advances made in modern thera-
disease as a national public menace within a few years.

Simultaneously, it was agreed, steps must be taken to meet the problem of prostitution and promiscuity.

New Drugs to Combat Malaria Are Tested in Prisons

THE Division of Medical Sciences of the National Research Council reported on March 5 on a series of far-reaching tests in which several hundred prisoners in three of the country's large penal institutions have volunteered to serve as living test-tubes for new potent drugs developed by our chemists against malaria, which afflicts 800,000,000 persons over the world.

To carry out the tests under the strictest possible conditions, on a scale never tried before, the prisoners first allow themselves to be bitten by mosquitoes carrying the parasites of malaria.

Then they expose themselves to further and even greater danger by taking varying doses of the new drugs to determine whether the chemicals can safely be given to our fighting men exposed to malaria and how large a dose can be tolerated by the human system.

Pointing out that no promise of reward of any kind has been given to the prisoners, the report stated:

"The men accept full responsibility for any ill effects, aware of the risk and discomfort to themselves and knowing, too, that despite every care, there is a real hazard involved. These one-time enemies to society appreciate to the fullest extent just how completely this is everybody's war.

"No fatalities are expected in the course of the tests, but the element of risk is always present. Instead of being deterred by this, many of the volunteers actually invite danger, in order to share in some measure what their friends and relatives are experiencing on the various battlefronts.

"Upon learning that, through their cooperation, thousands of GI's might be spared the ravages of the tropical malady, the prisoners respond immediately and enthusiastically.

"Honor-bound not

the care-

labo
Ath
Sta
formatory, Rahway, New Jersey.

Since March, 1944, it was revealed, more than a

hundred prisoner-volunteers at Atlanta have been exposed to relapsing vivax malaria (the most frequent type) in final tests of potential antimalarial drugs, "prior to their use in the armed forces."

More than one hundred other volunteers in the two other prisons have taken large doses of new drugs for long periods of time "in order to prove that the drugs may safely be used in the prevention and treatment of malaria by members of the armed forces and by civilian populations."

Nearly eight hundred prisoners have so far volunteered.

Early in 1941, it was revealed, the medical scientists of the country envisaged a concerted effort "to find an easily administered drug which would eradicate malaria." To make this attempt, an integrated and comprehensive program of research was organized by the National Research Council and supported by the Federal government through the Committee on Medical Research of the Office of Scientific Research and Development.

Later the entire program was integrated under the Board for the Coordination of Malarial Studies, a joint body composed of representatives from the Army, Navy, Public Health Service, Office of Scientific Research and Development, and the National Research Council.

Acting under the board are four subcommittees—the Panel on Synthesis, the Panel on Biochemistry, the Panel on Pharmacology, and the Panel on Clinical Testing.

The volunteers, in the course of numerous tests, submit to the withdrawal of as many as 50 cc. of blood daily for over a week and then, at periodic intervals, for a month or more.

When the men become ill with malaria, they receive "the best possible care" in a special unit of the well-equipped prison hospital. As soon as they are well, they return to their jobs in the prison shops.

Periodic observations are continued for months to record every instance in which the disease relapses. For this is the test of a drug which purports to knock out relapsing vivax malaria for good and all.

The experiments have four major objectives: to demonstrate whether the drug is tolerable to men living under ordinary conditions of activity; to determine whether any latent chronic toxic manifestations result from the prolonged administration of the drug; whether, when given daily or weekly, the drug tends to accumulate in the system; and to determine the most satisfactory dosage schedule.

The nature of the drug or drugs, as well as the results, is still a closely guarded secret, but the stage of large-scale human testing is regarded in itself as indicating that the long-sought goal is close to realization.

Cancer Society Seeks Fund to Start Drive for Conquest of Cancer

A COMPREHENSIVE program of research on cancer, organized on a national scale and designed to attack the cancer problem with all weapons known to science by the best brains in the field working through a central coordinating body, was announced on March 5 by the American Cancer Society. This is the first time that any such project to combat cancer has ever been undertaken anywhere, and leaders in the field hold out "high hopes" that the program will contribute greatly to the increase of our knowledge about this scourge and to the development of improved methods for prevention, early diagnosis and treatment.

Until now cancer research has been carried out largely in a few institutions with relatively small funds or by individual investigators working under the handicap of short-term grants-in-aid, which often were not renewed. Progress in the work, one of the most difficult of all problems facing science, was necessarily slow, and lack of coordination and central planning added to its difficulties.

To obtain funds for the new comprehensive program and to insure its continuity over a long term of years, the American Cancer Society will launch a nationwide campaign in April to raise an initial fund of $5,000,000, with similar campaigns to be conducted on an annual basis. Leaders agree that the cancer problem is one touching every individual in the nation, as it takes a toll of 160,000 American lives every year. From the point of view of public health it is a much more serious problem, for example, than infantile paralysis, on which much larger amounts are spent annually than on cancer research.

The national executive council of the American Cancer Society is headed by Eric A. Johnston, president of the United States Chamber of Commerce, and comprises scientists, labor leaders, educators, business, and newspaper men.

The research program will be in charge of a scientific committee of five leaders in the cancer field. It includes Prof. Charles B. Huggins, of the University of Chicago, whose new treatment for cancer of the prostate already has saved many lives; Dr. C. C. Little, one of the country's leading geneticists, managing director of the American Cancer Society; Dr. James B. Murphy, head of the cancer division of the Rockefeller Institute for Medical Research; Dr. C. P. Rhoads, director of Memorial Hospital, New York City, now a colonel in the Chemical Warfare Service, and Dr. Florence R. Sabin, of the Rockefeller Institute, one of the world's most noted scientists.

Rear Adm. Charles S. Stephenson, who recently retired from the Navy Medical Corps, widely known for his outstanding service as an organizer and administrator in the field of preventive medicine, has been appointed secretary of the research division and will serve as its executive officer. He now is engaged, Dr. Little announced, in making a survey of cancer research activities and facilities throughout the country. This survey, Dr. Little added, will be kept up to date by frequent visits and contacts.

35,000 teachers, and that a "pilot" group of about 1,000 teachers and school employees in the Bay Ridge section of Brooklyn began taking examinations on March 12.

Oneida County

The February meeting of the Utica Academy of Medicine was held on February 15 in the Utica at 8:00 P.M.

Dr. John R. Murlin, professor of physiology, University of Rochester Medical School, spoke on "Biological Value of Protein Foods." Dr. Fred G. Jones, newly elected president, presided.*

Orange County

Dr. Homer L. Stephens, of Walden, was elected president of Newburgh Bay Medical Society at the annual dinner meeting in the Palatine Hotel.

Dr. Stephens succeeds Dr. E. C. Thompson, under whose leadership the organization has enjoyed an unusually successful year.

Other officers elected to serve with Dr. Stephens are: vice president, Dr. Arnold Messing, of Newburgh; secretary, Dr. Meyer Zodikoff; treasurer, Dr. C. W. Beattie, of Wallkill; auditor, Dr. Arnold Banks; librarian, Dr. Daniel I. O'Leary; trustees, Dr. C. W. Layne, Dr. Harold Levy, both of Newburgh, and Dr. H. M. Gasparian, of Cornwall-on-Hudson.*

Rensselaer County

"The Treatment of War Wounds", a movie, was shown at the regular monthly meeting of the county society, held at the Troy Health Center. The movie made particular reference to plastic repairs of almost hopeless crushing wounds and burns, the technic being shown in great detail. This picture was enthusiastically received by the doctors present and was followed by discussion.

Walter McKenna, Col., (MC), USA, recently discharged, was present at the meeting and was welcomed back into the society by Dr. John F. Connor, president.

Richmond County

Members of the county society met on February 13 in the Health Center, St. George.

The meeting was held in conjunction with an exhibit of the Health Department in relation to meningitis. A representative of the department spoke.

Guest speakers were William E. P. Collins, superintendent of the Staten Island Hospital, who spoke on medical problems and conditions of the Island's hospital, and Mrs. John Avent, who spoke in behalf of the American Red Cross.

Schenectady County

The regular monthly meeting of the county society was held on March 6 at 8:30 P.M. at the Briggs Memorial Library, Schenectady. Dr. Joseph L. Schwind, assistant professor of anatomy at Albany Medical College, spoke on "Cytology and Diagnosis of Diseases of the Blood."

* * *

After completing nearly two years of study and special training in gynecology and obstetrics in Boston, Dr. Louis P. Tischler has returned to Schenectady and has reopened his offices.

Dr. Tischler is a graduate of Albany Medical College. He served his internship of one year at Ellis Hospital and continued there as resident in surgery for five months. While engaged in the general practice of medicine in Schenectady for eight years, he also assisted at the prenatal clinic of the Union Street Health center. For over a year Dr. Tischler also assisted at the gynecologic clinic at Ellis Hospital.

In addition, he was assistant to gynecologic surgeons for three years.

In 1942 Dr. Tischler continued his postgraduate work in gynecology and surgery at Mount Sinai Hospital in New York city. Thereafter he discontinued his general practice to devote nearly two years to specialized training in Boston. He received appointments to the resident staffs in several teaching hospitals there which are associated with Harvard Medical School. During that period he served as house officer and assistant resident in gynecology and obstetrics at Boston City Hospital, as assistant resident in gynecology at the Free Hospital for Women, and as resident in gynecologic and obstetrical pathology at the Boston Lying-in Hospital.

Dr. Tischler is a member of the county society, the American Medical Association and a diplomate of the National Board of Medical Examiners.*

Westchester County

Community mental hygiene clinics to provide consultation and treatment for returning servicemen and -women and their families, and for children whose behavior problems may develop into serious personality difficulties will be organized by a Mental Hygiene Association of Westchester County, established in Bronxville on February 13.

About seventy-five persons attended the organization meeting in the Christ Church undercroft, despite the storm.

Miss Constance Warren, president of Sarah Lawrence College, was elected president of the association, an outgrowth of a county committee for mental hygiene formed in December.

Chosen as vice-presidents were Dr. Laurance D. Redway, of Ossining, president of the Medical Society of Westchester; Dr. Lawson G. Lowrie, Bronxville psychiatrist; Mrs. Philip Klein, of Scarsdale, chairman of the committee on plan for establishment of the association; and Miss Julia V. Grandin, of Yonkers, executive secretary of the Family Service Society.

Clarence K. Whitehill and Mrs. Liston Noble, both of Scarsdale, were named treasurer and secretary, respectively.*

Yates County

Governor Dewey sent to the State Senate in January for confirmation the nomination of Dr. John A. Hatch, of Penn Yan, as a member of the Board of Visitors at the Willard State Hospital, to succeed Henry R. Brown, of Penn Yan, whose term expired December 31, 1944. Dr. Hatch's term is for seven years.

Dr. Hatch was graduated in 1919 from the University of Buffalo Medical School.

Dr. Hatch is a member of the staff of the Soldiers & Sailors Memorial Hospital of Penn Yan and is a member of the county society, the New York State Medical Society, and the American Medical Association.*

Nutritive Prophylaxis During Pregnancy

Even in normal times, a diet fortified with calcium, phosphorus and vitamin D *is essential* to the expectant (and lactating) mother. But in these days of increased rationing and food shortages, many physicians agree that such nutritive prophylaxis *is vital* Two capsules of Squibb Dicalcium Phosphate Compound with Viosterol, three times daily, supply a total of 7.8 grams of calcium (about one-half the daily requirement)—and an adequate amount of vitamin D to assure its utilization.

Conference on Convalescent Hospitals

SERVICE Command directors of reconditioning conferred with the commanding officers of convalescent hospitals at Lexington, Virginia, on January 3, 4, and 5, and discussed problems of organizing and operating convalescent hospitals under the broadening reconditioning program. The conference was addressed by Col. Augustus Thorndike, MC director of the Reconditioning Consultants Division, Office of the Surgeon General, who stressed the continuation of the original mission of reconditioning: to refit men either for return to duty or to civilian life.

Among the other officers who attended the conference from the Surgeon General's Office were: Lt. Col. Walter E. Barton, MC, Maj. William S. Briscoe, AUS, Maj. Arthur A. Esslinger, AUS, Maj. Henry B. Gwynn, MC, Maj. Edwin M. Loye, AUS, Capt. Arthur C. Allen, MAC, Capt. Alva R. Dittrick, AUS, Capt. John M. Gracie, MAC, and Capt. Burton M. Langhenry, MAC.

Hospital Construction Bill Termed First Step in Good Health Pattern

THE passage of the proposed Senate Hospital Construction Bill will be an "excellent step forward toward solving the perplexing problem of supplying adequate hospital, health services, and medical care to all of the people," testified Dr. Donald C. Smelzer, president of the American Hospital Association, before the Senate Committee on Health and Education on February 26.

Under the provisions of the Bill, introduced jointly by Senators Harold H. Burton, of Ohio, and Lister Hill, of Alabama, construction of new and additional facilities would not be started until war conditions permit, but the sponsors feel it essential that a well-coordinated program be planned immediately to warrant the efficient expenditure of Federal funds at that time.

Authorizing Federal financial assistance to statewide surveys of hospital and health facilities and the development of expansion plans, as well as paving the way for appropriations which would partially absorb the cost of needed additional hospital construction and expansion; the bill would authorize Congress to earmark $100,000,000 in the first year and unstated amounts thereafter. Appropriations, distributed to states according to population, wealth, and need, would be approved by state survey committees, the Surgeon General of the United States Public Health Service and a national advisory committee of eight hospital and health authorities.

"We support Senate Bill 191 not only because it provides for assistance in the construction of nonprofit and governmental hospital facilities but because we believed the proposed grants of Federal funds for that purpose will be the incentive for hospital and medical leaders and the general public to inventory present resources in each state and to develop, as required in this proposed legislation, an integrated program to provide adequate hospital care for every citizen of each state," said Dr. Smelzer.

"These legislative steps are a necessary preliminary in the better distribution of hospital and medical care.

It is the hospitals' hope that the bill will be followed by a more adequate provision of hospital and professional care for the medically indigent, those now unable to pay for such care, and an active support by the government of voluntary prepayment hospital and medical plans such as Blue Cross and Blue Shield.

"It is fortunate that the broad aims of the bill will maintain that which is best in our present system of hospital service," concluded Dr. Smelzer, representing three thousand, two hundred member hospitals of the Association. "This country has not yet fully formulated a proper pattern for the integration of health facilities. Provisions for health centers and special emphasis on the rural health problem indicate the progressive steps possible under this proposed legislation."

At the Helm

The resignation of Dr. Alfred K. Bates, of Auburn, as a member of the Cayuga County Laboratory Board of Managers was reported on February 13 to the Board of Supervisors by the Laboratory secretary. With the resignation was a notation "to fill the vacancy the Cayuga County Medical Society has approved the appointment of Dr. G. Perry Ross." Doctor Bates was appointed for a five-year term on the Board of Managers of the Laboratory at the last annual session of the Supervisors.*

• • •

Mrs. Genevieve N. Lechevet, superintendent of Fox Hospital since February 1, 1923, has resigned her position due to ill health.

The resignation, to become effective May 1, was presented at the annual board meeting January 24.*

• • •

Dr. John S. Hickman, of Jamestown, was reelected president of the Chautauqua Region Hospital Service Corporation at the ninth annual meeting of its Board of Directors on February 13.

Other officers re-elected are: vice-president, J. Gustaf Sundin; secretary, Mrs. E. Snell Hall; treasurer, Harold C. White, Sr.

Other members of the Board for the coming year are Mrs. D. T. Grandin, member of the Board of Trustees of the W.C.A. Hospital; Fred A. Chindgren, member of the Health and Hospital Board of the Jamestown General Hospital; Hugh L. Gillis, assistant superintendent of the Jamestown public schools; Donald P. Braley, president of Watson's Manufacturing Company; Robert Dew, member of the Brooks Memorial Hospital Board, of Dunkirk; Edgar Welch, president of the Board of the Westfield Memorial Hospital; Alfred Farr, member of the Board of the Westfield Memorial Hospital.

Another member from the Brooks Memorial Hospital Board is to be selected by that Hospital.*

Dr. Margaret Bashford, of Yonkers, was granted a temporary appointment as medical inspector in the Yonkers public schools on February 8..

The Board of Education nominated Dr. Bashford to the Municipal Civil Service Commission for non-competitive examination for the position. On receipt of the proper certification by the commission, she will be appointed to serve two hours daily through August 31.

Dr. Bashford received her degree from Cornell Medical School in 1941 and completed internships in pediatrics in the New York Hospital in 1943 and in Boston Children's Hospital in 1944 and completed a residency in pediatrics at Grasslands Hospital.*

Dr. Albert David Kaiser succeeded Dr. Arthur M. Johnson, Rochester city health officer, on April 1, Public Safety Commissioner Woods announced.

Dr. Johnson, who had reached the retirement age of 70 but was kept in the city service at the request of Commissioner Woods, asked to be relieved of his duties on March 31.

Selection of Dr. Kaiser and his acceptance brought surprise and gratification, because of Dr. Kaiser's outstanding reputation in the medical profession of the country. The job will compel Dr. Kaiser to give up his private practice.

Appointment has the approval of the New York State Public Health Council.

Dr. Kaiser graduated from Harvard Medical School in 1913. He received his hospital training in Rochester and Boston.*

• • •

Dr. Samuel W. Mills was elected chairman of staff for 1945 of the Horton Memorial Hospital, Middletown, New York. He succeeds Dr. Anthony Morreale. Other officers elected are Dr. William J. Hicks, vice-president, and Dr. Stiles Ezell, secretary-treasurer.

Newsy Notes

Joseph Huber, brewer and former president of the First National Bank of Brooklyn, left $15,000 each to St. Catherine's Hospital, Wyckoff Heights Hospital, the Brooklyn Home for Blind, Crippled and Defective Children, the Servants of Relief for Incurable Cancer and St. Anthony's Hospital, Little Sisters of the Poor, in Brooklyn.*

• • •

Plans for the establishment of a neuropsychiatric clinic at the School of Medicine and Dentistry of the University of Rochester with funds given by Mrs. Helen W. Rivas, of Leroy, New York, are announced by the university's board of trustees. Of the gifts, a part is designated for the construction and equipment of a building to house the clinic. Funds from a trust set up to operate and maintain the clinic will limit the number of patients to about fifty. According to present plans, construction will start as soon as materials are made available.*

• • •

A total of $152,822 had been subscribed to February 18 to the building fund for the new Arnold Gregory Memorial Hospital, to be constructed in Albion, by the people of the seven central and eastern town of Orleans County.*

A three-hundred-bed veterans' hospital at Saratoga Springs is now assured.

This announcement was made on February 24 to Rep. B. W. Kearney, Gloversville, by Lt. Col. George Ijams, deputy to Gen. Frank E. Hines, head of the Veterans' Administration, Washington.

• • •

The U.S. Veterans' Administration opened negotiations in Albany on February 17 to provide by formal contract hospital facilities and medical care for disabled veterans of World War II. At present there are no formal contracts for such care with any Albany hospital or with any Albany physician.

Lt. Col. Edward H. Gibbons, clinical director of the Veterans' Facility at the Bronx, conferred with Dr. Thomas Hale, medical director of Albany Hospital, for the announced purpose of negotiating a formal contract for care there of veterans of World War II.

At the same time, Lt. Col. Gibbons arranged for a conference also with Dr. Arthur J. Wallingford, president of the Albany County Medical Society, with a view of signing up formally several Albany physicians to provide medical examinations and treatment for veterans of World War II in Albany.

SAME OLD WRONG WAY

A suggestion that all that's printed is not necessarily gospel was made by Dr. Kirby Dwight when he was installed as president of the Medical Society of the County of New York. "In our house," he remarked, "we recently got a book on the bringing up of cats.

"Everything we had ever done in the feeding or training of our cats was wrong." Since Dr. Dwight's last cat died at the ripe old feline age of twelve, he threw away the book, he said, and is raising the current kitten in the same old wrong way.—*N.Y. Herald Tribune, Jan. 23, 1945*

Necrology

William A. Ackroyd, M.D., of Binghamton, died on February 9 after a short illness. Born June 3, 1886, in Albany, he was graduated from Albany Medical College in 1913. He continued his studies in New York City and at Harvard Medical School, specializing in eye diseases. He was a member of the American Medical Association, the Broome County Medical Society, and the New York State Medical Society. He had been on the staff of the Endicott Johnson Corporation's medical division since about 1916, except for the period when he served in World War I.

S. Josephine Baker, M.D., D.P.H., well known in the development of child hygiene services, the N.Y. Department of Health, and in association with the Federal Children's Bureau, died at the New York Hospital on February 22, at the age of 71, after a month's illness.

Dr. Baker, pioneer in the field of child hygiene, was the organizer and director of the first child health bureau to be established under government auspices in 1908 in New York, and served in numerous capacities as a guiding force in the movement which resulted in an outstanding lowering of the mortality rate among children. She was born in Poughkeepsie in 1873, received her medical degree in 1898 from the Woman's Medical College in New York, was an honorary president of the Children's Welfare Federation, a lecturer at Columbia and New York University, and a member of many medical societies. She wrote a popular autobiography, "Fighting for Life," published in 1939.

William J. Baumann, M.D., of Brooklyn, died on January 23 of a heart ailment. Born in Brooklyn, Dr. Baumann attended Long Island College of Medicine in Brooklyn, and received his medical degree from Baltimore Medical College. He served as intern and house surgeon at St. John's Hospital, Long Island City, before beginning his practice in Brooklyn. He was a member of the Kings County Medical Society and the Medical Society of the State of New York.

Harry Berkowitz, M.D., of Queens, died December 8, 1944. He was graduated from University and Bellevue Medical College in 1909. He was a member of the American Medical Association and the Kings County and State Medical Societies.

Joseph McDonald Bobb, M.D., of Buffalo, died on January 30. He was a graduate of Meharry Medical College in 1934, and a member of the National Medical Society and the medical societies of the County of Erie and New York State.

Frank V. Brownell, M.D., who had practiced medicine for many years in Albany, Schenectady, and Canajoharie, died on March 6 at his home in Canajoharie, at the age of 88. Until his retirement in 1938 he was a member of the staffs of the Albany City Hospital and Ellis Hospital in Schenectady.

DeForest W. Buckmaster, Maj., MC, formerly of Jamestown, and former chief surgeon at Ft. Custer and Ft. Brady, Michigan, died at Walter Reed Hospital, in Washington, on February 3 after an illness of several months.

Born in Salamanca, N. Y., he received his medical degree from the University of Michigan in 1921, started practice at Frewsburg, and six years later moved to Jamestown, where he became one of the city's most prominent surgeons.

He was a past-president of the Jamestown and Chautauqua County Medical Societies, a member of the American Medical Association, Western New York Surgical Association, the Buffalo Academy of Medicine, and a fellow of the American College of Surgeons.

Frederic R. Calkins, M.D., pioneer surgeon of northern New York State, died on February 24 in Watertown, at the age of 73. Dr. Calkins observed the fiftieth anniversary of his graduation from Bellevue Hospital Medical College in March of last year. Several years after his graduation in 1894 he began to specialize in surgery, a comparatively new field in those days, and at his death was an outstanding surgeon of the north country. He was formerly chief surgeon of the House of the Good Samaritan and Mercy Hospital, and senior member of the medical firm of Calkins and Farmer, which he founded in 1912 with Dr. Harlow G. Farmer. He was twice president of the Jefferson County Medical Society, a member of the State Society and the American Medical Association, a director of the American Society for the Control of Cancer, and a fellow of the American College of Surgeons.

James William Charters, M. D., of Buffalo, died on January 1. He was graduated from the University of Buffalo Medical College in 1895, and had served as associate physician on the staff of the Millard Fillmore Hospital in Buffalo.

Daniel Joseph Daly, M.D., of New York City, died on February 10. He received his medical degree from the University of Maryland, Baltimore, Medical College, in 1905, and had been practicing in New York City at the time of his death.

Lavinia R. Davis, M.D., of Pulaski, died on February 8 at her home at the age of 81. Dr. Davis, a graduate of the College of Medicine, Syracuse University, practiced in Oneida for over forty years, the city's only woman physician. She was one of the early and ardent advocates of women's suffrage, a leader, state officer, and one-time national lecturer of the Women's Christian Temperance Union. She was a member of the Oneida City Medical Club, the New York State Medical Society, and the New York State Women's Medical Society.

Sydney C. Feinberg, Capt. (MC), AUS, formerly of New York City, died in the service on December 23, 1944. He was graduated from the College of Physicians and Surgeons in 1919, and before entering the service was senior clinical assistant at the Mt. Sinai Cardiac Outpatient Department.

Ross M. Fisher, M.D., of Syracuse, attending physician at Crouse-Irving Hospital for thirty years, died on February 4 at his home after a long illness. He was a graduate of the College of Medicine, Syracuse University, class of 1906, and a member of the Academy of Medicine, the Onondaga County and New York State Medical Societies, and the American Medical Association.

James W. Fleming, M.D., of Utica, eye, ear, nose, and throat specialist, died suddenly on January 31 at the age of 63. Born in Little Falls, Dr. Fleming was graduated from Cornell University and Albany Medical School. He served his internship in Faxton Hospital, Utica, and was a member of the staff of that hospital for thirty-five years. In 1919 he studied at the Manhattan Hospital, specializing in eye, ear, and nose studies. He was a member of the Oneida County and State Medical Society.

John F. Griffin, M.D., of Malverne, specialist in urology, died in his home on January 23 of a heart attack. Dr. Griffin received his medical degree from Dartmouth Medical School. He had been chief of staff of St. Catherine's Hospital in Brooklyn for more than twenty-five years, retiring last November. He was on the staff of Holy Family Hospital and also was a member of the Kings County Medical Society.

John Guttman, M.D., of Brooklyn, died on December 31, 1944. Dr. Guttman was graduated from the Vienna Medical College in 1892. A specialist in opthalmology, laryngology, rhinology, and otology, he was a diplomate of the American Board of Otolaryngology. He was a member of the Kings County and State Medical Societies, the American Medical Association, and the Academy of Medicine.

Eugene J. Hanratta, M.D., of Watervliet, prominent physician of upper New York State, died on February 5 after a long illness. He received his medical degree from Albany Medical College, and had practiced in Watervliet since his graduation. Dr. Hanratta was elected staff president of St. Joseph's Maternity Hospital in Troy fifteen years ago and held the office until his death. For twenty-five years he was staff assistant at the Troy Hospital. He was a member of the Albany County and State Medical Societies and the A.M.A.

William M. Haynes, M.D., of Sherman, died on January 21 at the age of 82. Dr. Haynes had practiced medicine in Sherman for the past fifty years, and was a typical country doctor, covering much of the country in the old days in his horse-drawn buggy. He was graduated from Buffalo Medical College in 1888.

Henry P. Hirsch, M.D., former medical supervisor of the state department of hygiene of the Board of Health in New York City from 1900 to 1920, died February 19 of a heart disease. Dr. Hirsch received his medical degree from New York University in 1891. He was a member of the New York County and State Medical Societies and the American Medical Association.

Herman L. Jacobius, Capt., (MC), AUS, of New York City, was killed in action in the Netherlands on September 28, 1944. A graduate of Cornell University Medical College in 1939, Captain Jacobius served an internship at the Mount Sinai Hospital, New York, and a residency in medicine at the Montefiore Hospital, New York. He took part in the North African campaign and the invasion of Sicily and Italy.

Walter Max Kraus, M.D., of New York City, died on August 18, 1944, at the age of 55. Dr. Kraus was graduated from Johns Hopkins University School of Medicine in 1913, and served in the Army during the World War I. In 1943 he was commissioned a major in the medical corps of the Army, and in 1944 he resigned that position. He was a specialist in neurology and psychiatry. Besides membership in the New York County and State Medical Societies and the American Medical Association he held membership in the American Neurological Association, American Association of Neuropathologists, and the Association for Research in Nervous and Mental Disease.

Michael Saul G. Landa, M.D., of New York City, died on January 1. Dr. Landa was chief of the Ophthalmic Clinic of the Beth Israel Hospital for twenty-two years. He received his medical degree from Dorpat Medical College in Russia in 1900. He was a member of the New York County and State Medical Societies, the American Medical Association, and the Eastern Medical Society.

Francis Joseph Magilligan, M.D., of Brooklyn, died on February 5 at his home. He was 84 and had practiced in Brooklyn for more than fifty years. Born in Brooklyn, he was graduated from Bellevue Hospital Medical School in 1890. He was a member of the Kings County and State Medical Societies and the American Medical Association.

Thomas H. MacKinnon, M.D., of Brooklyn, died on February 10 at his home. Born eighty-one years ago in Nova Scotia, Dr. MacKinnon received his medical degree from McGill University and then practiced for three years in Liverpool, Nova Scotia. He came to Brooklyn in the early '90's. He was a member of the staff of St. Cecilia's Hospital, the Kings County and State Medical Societies, and the American Medical Association.

Ignatz Leo Nascher, M.D., of Port Richmond, died suddenly on December 25, 1944 at the age of 82. Dr. Nascher was graduated from New York University School of Medicine in 1885, after which he specialized in psychiatry.

Francis N. Pitass, M.D., of Buffalo, died on February 1 at the age of 72. Dr. Pitass received his medical degree in 1899 from the University of Buffalo School of Medicine.

Alexander J. Primrose, M.D., of New York City, died on November 8, 1944. Dr. Primrose was graduated from the College of Physicians and Surgeons in 1885.

Joseph Smith, M.D., of Brooklyn, attending neurologist at Kings County Hospital, died February 26 at New York Post-Graduate Hospital at the age of 67.

Dr. Smith was graduated from Jefferson Medical College, Philadelphia, in 1904, and joined the staff of Brooklyn State Hospital the next year, remaining there until he entered the service during World War I. He was the first president of the Brooklyn Neurological Society, a fellow of the American Psychiatric Association, and a member of the Kings County and State Medical Societies, and the American Medical Association. He was also consultant in psychiatry at Jamaica Hospital, Queens, a member of the staff of the New York Neurological Hospital, and attending neurologist at Unity Hospital, Brooklyn.

Esmonde Bathgate Smith, M.D., of Brooklyn, died on February 2 at the age of 58. He received his medical degree from Cornell University Medical College in 1909. He was a member of the Kings County and State Medical Societies, the American Medical Association, and the American Clinical Pathology Society. He was pathologist at Methodist Hospital in Brooklyn.

William C. Smith, M.D., of Scottsville, formerly of Winthrop, died March 2 at his home at the age of 87. Dr. Smith retired from active practice over a year ago. He was a graduate of New York University School of Medicine in 1881, and was St. Lawrence County coroner for sixty years.

Thomas R. Turino, Lt., (MC), USNR, of Brooklyn, was reported by the Navy as missing in action on July 18, 1943, and presumed to be dead in August, 1944. Lt. Turino was graduated from the College of Physicians and Surgeons in 1931. Before his enlistment in the Navy in 1942 he was associate gynecologist and obstetrician at the Brooklyn Hospital. He was a member of the Brooklyn Gynecological Society, the Kings County and State Medical Societies, and the American Medical Association.

Henry H. Unger, M.D., of New York City, died on January 29 at the age of 62. Dr. Unger received his medical degree in 1906 from the College of Physicians and Surgeons, New York City. He was a member of the New York County Medical Society and the Medical Society of the State of New York.

Woman's Auxiliary

To the Medical Society of the State of of New York

Announcement

DUE to the Government cancellation of all conventions our meeting at Buffalo will be confined to an Executive Board Meeting, which will comprise the county auxiliary president or vice-president, or the president-elect, and the members of the executive board. In this way each organized county will be represented. There will be a dinner at 7 P.M., April 30, breakfast at 8:30 A.M., May 1, and a business session at 9:30 A.M. of that day. A luncheon and continued business session will be held in the afternoon.

County presidents will please notify their delegates and alternates of these changes, and those who are attending should make reservations at the Hotel Statler in the name of the Auxiliary as soon as possible.

County News

Nassau County. The regular meeting of the Woman's Auxiliary to the Nassau County Medical Society was held Tuesday evening, February 27, 1945, at the Nassau Hospital Auditorium in Mineola.

Mrs. Louis A. Van Kleeck, of Manhasset, president, presided and Mrs. Freeman Miller, program chairman, introduced the guest speaker, Mr Stanley B. Pinks, a blind man, and his dog, "Sultan."

Mr. Pinks told of the origin of the Seeing Eye Dog project in Austria and its development in Switzerland. By popular demand it was introduced into the United States in 1927. The enterprise has developed here with headquarters in Morristown, New Jersey, where the training program continues. Mr. Pinks described the intensive training program of the dogs and the subsequent training of the prospective owner. The school trains about eight hundred dogs constantly, sending them out at the rate of one hundred a year. The congeniality of man and dog is a strong feature in the success of the training.

After his talk Mr. Pinks allowed "Sultan" to lead him about the auditorium among the audience showing the perfect ease with which he evaded tripping over chairs and other obstacles.

Another speaker of the evening was Dr. Eugene H. Coon, of Hempstead, who spoke on current legislation. Mrs. J. Rembrandt Helfricht was voted on as a new member. Refreshments were served by Mrs. John L. Neubert and her hospitality committee.

The next regular meeting was held on March 27 at 8:45 P.M., at the Nassau Hospital Auditorium in Mineola. An "American Theatre Wing" speaker addressed the members on the topic, "The Returning Veteran," and also gave a sketch called, "The Way Back Home."

Schenectady County. Dr. Beverly L. Vosburgh, medical director of the General Electric Company in Schenectady, spoke to members of the Woman's Auxiliary of Schenectady County County at their luncheon meeting held February 27 at the Hotel Van Curler. Dr. Vosburgh's topic was "Medical Economics."

ACHIEVING MORE WITH LESS

War teaches a dear lesson but we are learning valuable ones from it in medicine. Never before have our soldiers been so well cared for on the battlefield and in the hospitals. The sulfa drugs, penicillin, and blood plasma have played a big part. Prompt treatment has also been of very great value. The importance of giving due consideration to the individual soldier has been demonstrated in this war also, treating the soldier as well as his wound or his disease. Another very impressive observation is the very effective and splendid type of surgery that is being done by the surgeons with limited trained assistance. Surgeons have learned as never before that time counts in an operation and has a very definite relation to the death rate in serious cases. This all sums up to the fact that brass doorknobs and tile floors, three doctor assistants, a bevy of operating room nurses, and then three trained nurses a day, are not always essential for successful surgery.

The essentials in good medicine are what need to be applied, even at home, out at the crossroads, and down by the old millstand. Medical schools need to teach the student how to do better work with less equipment and expense. Just a few men in the big centers cannot solve many medical problems. The application of the effective means must be common knowledge to the whole profession. Teaching and consultation in the centers and by the specialist are imperative, but the essentials, the plain technic and methods must be common knowledge to the rank and file of the profession. You cannot win a big war with officers only.

In establishing a four-year medical school our legislators should think straight and be convinced of these facts. The plan should be to carry effective medicine to every nook and corner of this state and to make available for treatment and teaching purposes all the clinical material within the bounds of our two million population.—*Editorial, Mississippi Doctor, Dec., 1944*

We do appreciate the wholehearted cooperation of the Medical Society of the State of New York

The Yorkshire Indemnity Company of New York

90 John Street *New York City*

Official Carrier of the Group Malpractice Insurance Plan of the Medical Society of the State of New York

The Yorkshire is vitally interested in providing proper insurance for the Hospital risk as there is, in many instances, the overlapping of liability of the doctor and the institution. This interest goes beyond the development of a contract form and is best exemplified by the manner in which inspections are made and suggestions offered to the end that accidents shall be kept to a minimum.

"Over Forty Years devoted to pleasing particular people"

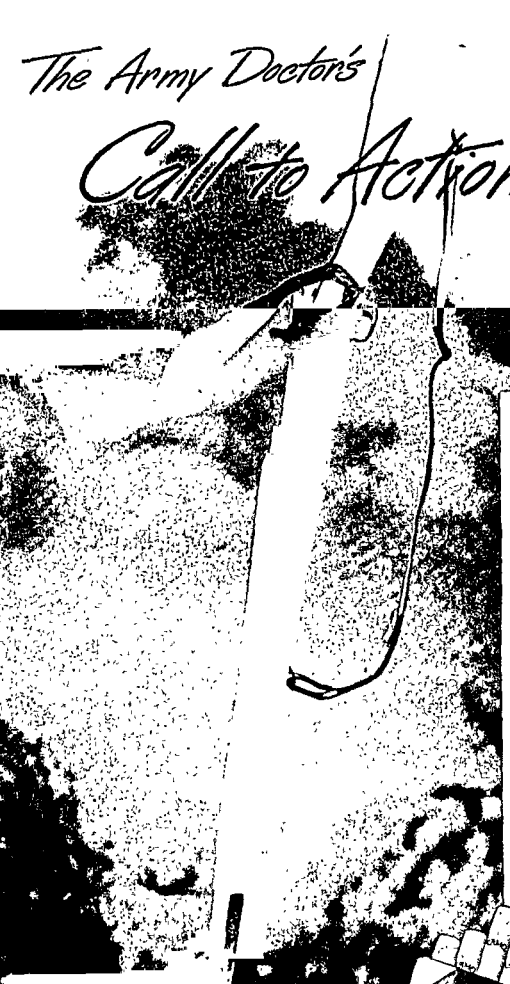
Number 1 of a Series

THE practice of prescribing hemoglobin and erythrocyte substrates upon the diagnosis of pregnancy is accepted. The wise clinician knows that the additional burden of even early pregnancy may accentuate an existing subclinical anemia.

As the gestation proceeds the fetus makes preferential demands upon the maternal organism—diverting needed erythropoietic substances to its own use. These substances *must* be replaced to assure adequate maternal and fetal protection against anemia.

HEPATINIC

presents iron in readily assimilable ferrous form, together with crude (unfractionated) liver concentrate in the form of a pleasant-tasting elixir.



The value of the crude (unfractionated) liver concentrate in Hepatinic is of the highest order, for all the erythropoietic principles are retained. In addition, this unique liver is subjected to a special enzymatic digestion process which converts it to a most readily assimilable form.

FORMULA:
Each fluidounce contains: Ferrous Sulfate 12 gr., Crude Liver Concentrate (equivalent to 660 gr. fresh liver) 60 gr., Thiamine Hydrochloride 2 mg., Riboflavin 4 mg., Niacinamide 20 mg., together with pyridoxine, pantothenic acid, choline, folic acid, vitamin B_{10}, vitamin B_{11}, biotin, inositol, para-amino-benzoic acid and other factors of the vitamin B complex as found in crude (unfractionated) liver concentrate.

Elixir Hepatinic is supplied in bottles of one pint and one gallon

The Army Doctor's Call to Action!

A STRIP of bandage fluttering from a rifle stock... That's the battlefield marker of a wounded soldier . . . that's the Army doctor's *call to action!*

On battlefields thousands of miles from home, the military medical man is proving himself every inch a fighting man. And like the man with the gun, his rest is often limited to a few moments of relaxation... a cigarette. More than likely it's a Camel cigarette, for Camels are such a big favorite with fighting men in all the services.

R. J. Reynolds Tobacco Co., Winston-Salem, N. C.

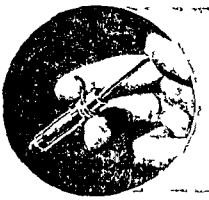
INTRACUTANEOUS TESTING

now simplified!

IDENTIFY SUSPECTED ALLERGENS, Quickly, Easily, Accurately

WITH WYETH ALLERGENIC TESTING SET



Simple Office Procedure:

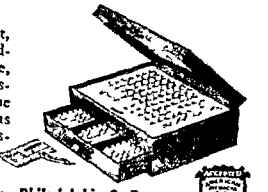
1. PREPARE SYRINGE:

Simply insert TUBEX* of possible exciting allergen into breech-loading syringe—then close breech which locks TUBEX into place

*REG U S PAT OFF

2. INJECT ALLERGEN:

Sterile, unexposed allergen is now ready for intracutaneous testing. Subsequent injections can be made immediately with same needle and syringe by merely flushing cannula with TUBEX of sterile water between tests



3. READ TESTS...

In just 10 minutes! In fact, intracutaneous tests read sooner, if reaction is positive

Wyeth

ALLERGENIC TESTING SET

in handsome cabinet, includes breech loading TUBEX syringe, over 200 TUBEX of essential allergens, one dozen needles, plus other helpful accessories

COMBINED ANDROGENIC THERAPY

(PER ORAL AND PARENTERAL)

Accumulating clinical reports show that prompt results are achieved — in both the male and female — when androgenic therapy is initiated with PERANDREN*, and then followed with METANDREN* Tablets. Both intramuscular and oral forms contain the most effective androgenic substances known, and if desired may be used interchangeably in most indications.

Common Indications for Androgenic Therapy: Impotence, Hypogonadism, Eunuchism, Angina pectoris — Menorrhagia, Metrorrhagia, Menopause, Dysmenorrhea.

PERANDREN (testosterone propionate) and METANDREN (methyl-testosterone) have all the advantages of the natural testicular hormone, testosterone.

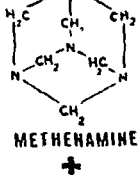
℞ **Pediforme**
FOOTWEAR



for **FLAT-FEET**

The family physician, in health examinations, will not over-look examining the feet of babies and growing children for evidence of flat-feet through heredity tendencies or other causes—and will naturally prescribe measures for correction.

Proper shoes are essential to supplement the doctor's own treatments—but a proper source of supply is essential, too, and the patient of any age-group should be directed to competent and trustworthy fitters of correctly designed shoes of scientific construction. Pediforme footwear have the qualities desired by the doctor and the attractiveness so vital to the sensitive patient.

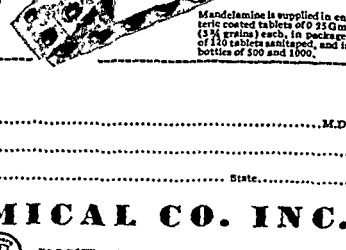
MANDELIC ACID

THE RIGHT COMBINATION for effective Urinary Antisepsis

BY combining the specific antibacterial actions of both mandelic acid and methenamine, the resultant compound—Mandelamine—achieves a far wider range of therapeutic activity while eliminating most of the toxic reactions which are frequently encountered when either of these components is used alone.



In addition to its greater effectiveness and lower toxicity, Mandelamine is of value to the busy physician by virtue of the convenient manner in which it may be administered. There is no need for accessory acidification, restriction of fluid intake, dietary control, or other special measures during the course of Mandelamine therapy. And the average daily dose is 3 or 4 tablets 3 times daily.

Literature, and a physician's sample will be mailed to you upon return of coupon.

MANDELAMINE

Reg U S Pat Off (Methenamine Mandelate)

Mandelamine is supplied in enteric coated tablets of 0 25 Gm. (3¾ grains) each, in packages of 120 tablets sanitaped, and in bottles of 500 and 1000.

NO. 6 OF A SERIES • • • "PREMARIN" THERAPY AT THE MENOPAUSE

Essentially Safe

"Premarin" provides a thoroughly dependable means of ensuring adequate treatment for the menopausal patient who is seen only at infrequent intervals. Although the patient may not be seen by her physician for several weeks, she still can be under his control . . . no interruption in treatment need occur. "Premarin" is highly potent and exceptionally well tolerated, and unpleasant side effects are rarely noted. In "Premarin" the physician will find a medium for estrogenic therapy that is most effective, convenient and essentially safe.

Now available in 2 potencies:
No 866 Bottles of 20, 100 and 1000
No 867 (Half Strength) Bottles of 100 and 1000

COLLOIDAL IRON vs Ionizable Iron

In treating hypochromic anemias, Ovoferrin, colloidal iron-protein, is an easily assimilable hematinic that acts without irritating the stomach or intestine, without dehydrating the bowel, without staining or dissolving tooth enamel.

Being a hydrous oxide of iron, Ovoferrin's advantages over iron salt preparations are noteworthy. For when iron salts break down into iron and acid ions, astringent and irritating side-effects may take place, with distressing results for the patient.

With Ovoferrin none of these gastric upsets occur because Ovoferrin iron remains colloidal, —practically unchanged by gastric juices.

Still a fully-hydrated hydrous oxide Ovoferrin iron reaches the intestine ready for prompt absorption in its colloidal state, readily assimilated. *No dehydration, no constipation, no irritation.*

Ovoferrin's palatability makes it acceptable to the patient with hypochromic anemia, the convalescent, the chlorotic child; in pregnancy and lactation; and in debility states.

Available at drugstores in 11 oz. bottles. Dosage: One tablespoonful in milk or water at mealtime and at bedtime.

No disagreeable taste. Does not stain teeth.

OVOFERRIN *COLLOIDAL ASSIMILABLE IRON*

MADE BY A. C. BARNES CO., NEW BRUNSWICK, N. J.

"Ovoferrin" is a registered trademark, the property of A. C. Barnes Co

A COMPREHENSIVE TREATISE ON "VAGINITIS"

. . . RECENTLY MAILED TO THE MEDICAL PROFESSION

Thirty color-photographic studies of vaginal pathology, photographed by two leading investigators in this field, are incorporated in this informative new compendium on "Vaginitis."

This important booklet covers:

ETIOLOGY · HISTOLOGY AND BACTERIOLOGY
PATHOLOGY · TREATMENT

of the various types of vaginitis and allied conditions. Included is an extensive bibliography on the subject.

If your copy of this instructive dissertation on vaginitis has not reached you, just fill out the coupon and mail it to us.

May 7th—12th CAMP TRADE MARK *7th Annual*

NATIONAL POSTURE WEEK

TWO OF A SERIES of educational posters in full color telling the story of Good Posture as one of the elements in Good Health and Physical Fitness. The Poster on the left broadens the theme to stress the importance of medical counsel, sound nutrition, relaxation and sensible exercise.

IN ITS SEVENTH YEAR, National Posture Week continues its sound and ethical program of focusing the attention of the country on the significance of Good Posture to good health and physical fitness. As the years go on, it is becoming evident that the special events of National Posture Week and the year-round program have encouraged many suffering from poor body mechanics to seek professional counsel.

While the public will be reached through every popular channel of public information, emphasis is again being placed on the distribution of authoritative literature to schools, colleges, medical and government bodies, industrial, professional and civic public health groups.

Physicians, educators and lay groups in the field of public health have shown in practical cooperation and voluminous correspondence that they approve the content and methods of National Posture Week and its year-round physical fitness program. It is our hope that we will continue to merit this support in this year of Victory and during the post-war years of adjustment which will present so many problems to those charged with maintaining the health of the nation.

Good news

FOR PHYSICIANS AND PATIENTS ALIKE!

Walker's Mineralized Vitamin Tablets (package of 50) has been reduced in price to $1.80! Proof that good ethical vitamins need not be expensive vitamins.

In prescribing for multiple deficiencies specify "WALKER"...excellent in quality...pleasant to take ...most economical.

WALKER VITAMIN PRODUCTS, INC.
MOUNT VERNON, NEW YORK

50

WALKER'S MINERALIZED $1.80

FAT FREE FISH LIVER OIL CONCENTRATE, VITAMINS AND MINERAL SALTS,—
EACH TABLET CONTAINING

VITAMIN A (Natural)	5000 Int. Units	CALCIUM PANTOTHENATE	1 0 MG.
VITAMIN B1 (Thiamine)	3.0 Mg.	NICKNAMIDE	20.0 Mg.
VITAMIN B2 (Riboflavin)	2.0 Mg	VITAMIN C (Ascorbic Acid)	30.0 Mg
VITAMIN B6 (Pyridoxine)	1 Mg	VITAMIN D (Viosterol)	500 Int. Units
IRON – 15 Mg., CALCIUM – 50 Mg., PHOSPHORUS – 40 Mg., MAGNESIUM, MANGANESE and ZINC – Each 1/2 Mg			

Each tablet supplies the adult daily minimum requirement of iron and Vitamins A, B1, C, D and three times this requirement of Vitamin B2 plus 20 mg. of niacinamide,—also approximately 2% of the calcium and phosphorus requirements. The need for pyridoxine and calcium pantothenate in human nutrition has not been established —nor has the need for dietary supplementation with magnesium, manganese and zinc been established.

DOSE: ONE OR TWO TABLETS DAILY AS A DIETARY [illegible]
DISTRIBUTED BY

CLINICAL

CONFIRM THE RATIONALE

Testimonials may have to be brushed aside in the critical evaluation of a mode of treatment. But when outstanding clinicians voluntarily state their satisfaction based on critical observation of patient after patient, their findings may well be accepted as substantiation.

Darthronol, the multiphasic systemic approach to arthritis, has merited its wide and rapidly growing acceptance. The many favorable reports of its efficacy in the treatment of chronic arthritis, received from clinicians

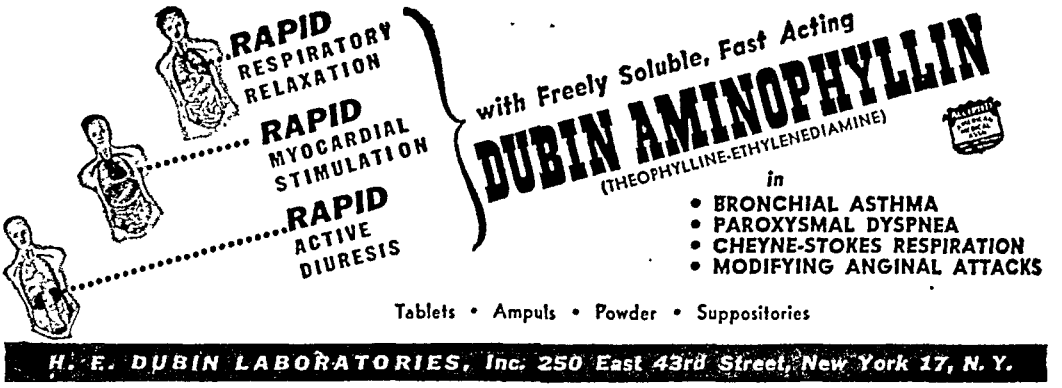
Each Capsule Contains:

Vitamin D (Irradiated Ergosterol)	50,000 U.S.P. Units
Vitamin A	5,000 U.S.P. Units
Ascorbic Acid	50 mg.
Thiamine Hydrochloride	2 mg.
Riboflavin	1 mg.
Pyridoxine Hydrochloride	0.1 mg.
Calcium Pantothenate	0.333 mg.
Niacinamide	10 mg.
Mixed Natural Tocopherols	3.4 mg.

Originally introduced as DARTHRON

REPORTS

OF THIS APPROACH . . .



in every section of the country, are based solely on the subjective and objective improvement of their patients.

The therapeutic value of each of the nine active constituents of Darthronol is well established. Darthronol furnishes in a single capsule not only massive dosage of vitamin D_2 but also adequate potencies of the eight other vitamins so essential for the proper functioning of the many metabolic processes.

Darthronol presents a convenient and effective method of utilizing the newest concepts in antiarthritic therapy by treating not only the local articular involvement, but also the general systemic disturbances.

MORE EFFECTIVE LOCAL CHEMOTHERAPY for Common Ear Infections

White's OTOMIDE

EFFECTIVELY ANTIBACTERIAL, ANALGESIC, ANTIPRURITIC

White s Otomide provides a new, more effective method of reaching and treating suppurative and non-suppurative infections of the middle ear and external auditory canal.

FORMULA:

Carbamide (Urea)	10%
Sulfanilamide	5%
Chlorobutanol (anhydrous)	3%
Glycerin (h.sp.gr.)	q.s.

Advantages of Combining Carbamide with Sulfonamide:

1. Chemically debrides lesion by solvent effect on necrotic tissues.
2. Renders sulfanilamide effectively antibacterial even in the presence of pus.
3. Solubilizes sulfanilamide, effecting higher tissue concentration and increasing diffusibility through living and dead tissues.
4. Non-irritating to living tissue.

Advantages of Chlorobutanol:

Therapeutically compatible with sulfonamides, this recognized, local anesthetic provides effective analgesic and antipruritic properties.

Indications: Local management of suppurative and non-suppurative otitis media, and of sulfonamide-susceptible infections of external auditory canal.

White's Otomide is available in dropper bottles of one-half fluid ounce (15 cc.).

IMPORTANT: Please note that your patient requires your prescription to obtain this product from the pharmacist.

A NOTABLE PRODUCTION ACHIEVEMENT

Copies of this up-to-date chart, containing the essentials of Penicillin therapy, are available on request.

THE record performance of Penicillin manufacturers in achieving large-scale production has resulted in the fulfillment of current military requirements for this remarkable antibacterial agent. Penicillin Sodium Merck now is available to the medical profession for the treatment of civilian patients, having been released by the War Production Board for general distribution through customary supply channels.

In this notable production achievement, Merck & Co., Inc. has been privileged to play a pioneering and progressively important rôle. Basic discoveries made by Merck *microbiologists, and shared with* other Penicillin producers, contributed vastly to the successful development of Penicillin manufacture. By applying chemical engineering technics to the manufacture of this difficultly produced antibiotic agent, Merck independently succeeded in devising and perfecting a practical method of large-scale production based on the mass-fermentation principle.

Penicillin Sodium Merck meets the recognized high standard of quality established for all products bearing the Merck label.

Copious BILE PRODUCTION

When a copious flow of bile of low viscosity is desirable in biliary tract disease unassociated with acute hepatitis, Triketol* meets the clinical requirements.

Triketol, a combination of dehydrocholic and dehydrodesoxycholic acids, representing oxidized bile acids in the unconjugated keto form, is highly purified, of markedly low toxicity, devoid of inert or "ballast material", and readily soluble.

Therefore, it lends itself admirably to the management of biliary tract dysfunctions requiring prolonged medication. The hydrocholeretic action of Triketol induces the free flow of thin liver bile and so assists in flushing the biliary ducts clear of inspissated bile, gravel, often small calculi—the products of "biliary stasis".

Available in tablets 3¾ gr. — Bottles of 40, 100, 500, 1000.

ETHER-IN-OIL Brewer

AN ADJUVANT IN THE TREATMENT OF BRONCHIAL ASTHMA

Definite results in recently treated acute bronchial asthma cases, have proven the beneficial properties of ETHER-IN-OIL used in conjunction with other standard medications.

Six patients, having had an attack of acute asthma from two to five days, were thus treated (Dr. Maietta, *N. E. J. Med.*; Vol. 227; p. 985). All of them responded fairly well, but not satisfactorily to injections of epinephrine. Four of them received one intramuscular injection of ETHER-IN-OIL; the remaining two received 2 each. *Within two hours, the asthmatic symptoms were rapidly controlled.* The patients became quieter, were able to breathe more easily and expectorate more freely. Thereafter, the usual palliative medications effectively controlled the symptoms.

ETHER-IN-OIL (Brewer) is recommended in addition to (or in conjunction with) Brewer's LUASMIN capsules and enteric-coated tablets—oral medication representing timed therapy in the symptomatic control of Bronchial Asthma.

STAY THAT SWORD!

If, in the older fatalistic view of cardiovascular disease, the "Sword of Damocles" seemed to threaten momentary fall, recent studies[1,3,4] suggest that a more optimistic prognosis is often well justified. Indeed, "The rational use of cardiac drugs will help alleviate the disturbing symptoms of heart disease and will often rehabilitate the incapacitated individual so that he can live a reasonably normal and useful existence."[2] Calpurate—a unique chemical combination of calcium theobromine and calcium gluconate—fulfills the clinical requirements of a highly efficacious cardiac drug. Striking results have been noted from its use—"in relieving symptoms of congestive failure, angina and dyspnea."[5] It increases cardiac output through myocardial stimulation... effects potent diuretic action... and is "remarkably free from gastric irritation"[5] (since it is almost insoluble in the stomach, yet readily absorbable in the intestine[3]).

INDICATIONS: Angina pectoris, coronary sclerosis, Cheyne-Stokes respiration, paroxysmal dyspnea and cardiac edema.

PACKAGED: As tablets (each containing 7½ gr. calcium theobromine—calcium gluconate) in bottles of 100, 500 and 1000—or as powder in 1 oz. bottles. Also available with ¼ gr. phenobarbital per tablet when sedation is desired.

MALTBIE CHEMICAL COMPANY • NEWARK, NEW JERSEY

No food (except breast milk) is more highly regarded than Similac for feeding the very young, small twins, premature, or infants who have suffered a digestive upset. Similac is satisfactory in these special cases simply because it *resembles breast milk so closely*, and normal babies thrive on it for the same reason. This similarity to breast milk is definitely desirable — *from birth until weaning.*

ACCEPTED AMERICAN MEDICAL ASSN. Council on Foods

A powdered modified milk product especially prepared for infant feeding made from tuberculin tested cow's milk (casein modified) from which part of the butterfat is removed and to which has been added lactose, olive oil, coconut oil, corn oil, and cod liver oil concentrate.

One level tablespoon of Similac powder added to *two* ounces of water makes *two* fluid ounces of Similac. This is the normal mixture and the caloric value is approximately 20 calories per fluid ounce.

PRO-CU-FER

REG U S PAT OFF.

IN THE MANAGEMENT OF IRON DEFICIENCY ANEMIAS

PRO-CU-FER* contains iron chemically combined with protein and copper, as sulfate, in the correct proportions for effective management of iron deficiency anemias.

When combined with protein, iron is rendered alkali-soluble, and its absorption from the small intestine is greatly enhanced. In addition, this iron-protein combination is well tolerated, causes minimal gastric disturbance, and will not stain the teeth.

With regard to copper, Best and Taylor[1] state: "This metal is believed to act as a catalyst in some stage of hemoglobin synthesis . . . Some experimenters have obtained a certain degree of hemoglobin regeneration with iron alone, though the regeneration was much increased by the addition of copper."

Each tablet represents:

Iron (chemically combined with protein)	25 mg.
Copper (as copper sulfate)	1.25 mg.

DOSAGE — For adults and children: 4 tablets daily, immediately after meals.

Supplied in bottles containing 60 tablets.

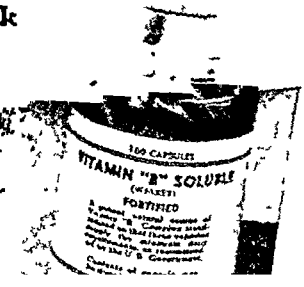
Take Advantage

OF

VITAMIN "B" SOLUBLE (WALKER)

IN ALCOHOLISM THERAPY

Vitamin B holds a well-recognized place in the treatment of alcoholism. Alcoholic polyneuropathy is said by Jolliffe[1] to be unquestionably due to vitamin B_1 deficiency. Romano[2] states that both vitamins B_1 and B_2 have definite value in this condition. It is also believed that the addition of nicotinamide hastens recovery of the patient. (Spies, Sydenstricker, Jolliffe).



Vitamin "B" Soluble (Walker) supplies all the factors of the B complex, plus additional fortification of various constituents. Each capsule contains 3 grains brewers yeast concentrate, 1 mgm. Thiamin HCL, 1 mgm. Riboflavin, 5 mgm. Nicotinamide, 30 mgm. Ascorbic Acid. The dosage potency is regulated by the physician according to severity of the symptoms.

The generous use of Vitamin "B" Soluble (Walker) preceding and following indulgence in alcohol, does much to prevent symptoms of depression and nervous irritability that so commonly occur. In bottles of 30 and 100 capsules.

Liberal samples gladly sent on request

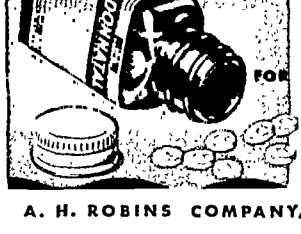
Donnatal RELIEVES SPASM WITH TENSION

In spastic disorders of functional origin—when the chief aim of therapy is to provide both central and peripheral action *with safety*—Donnatal may be employed with utmost confidence.



The outstanding efficacy of Donnatal is the result of a perfectly balanced combination of the principal belladonna alkaloids (hyoscyamine, atropine and scopolamine), in fixed proportions, together with phenobarbital. Thus Donnatal provides:

1. The advantages of the natural belladonna alkaloids *without toxicity.*
2. Effective *non-narcotic* sedation.
3. Marked pharmacologic potency with small dosage at *notably less cost.*

The synergetic implementation of Donnatal makes it an ideal antispasmodic and sedative in a wide range of spastic disorders—such as spasm incident to gastric and duodenal ulcers, *pylorospasm, spastic constipation,* urogenital spasm, cardiospasm, autonomic nervous disturbances, respiratory disturbances, Parkinsonism, vomiting of pregnancy, and other spastic manifestations.

AVAILABLE: In bottles of 100 tablets.

FORMULA: Each tablet contains belladonna alkaloids (hyoscyamine, atropine and scopolamine) equivalent to approximately .5 min. tr. belladonna, plus ¼ gr. phenobarbital.

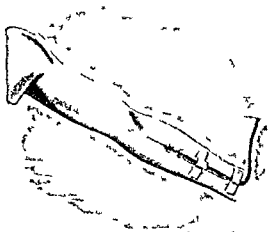
As the Carbohydrate Content of the National Diet Increases

The changes which have occurred in the national dietary during the war period, especially the increased consumption of carbohydrates, lend new importance to dietary supplementation with B vitamins. To assure better utilization of a diet high in carbohydrates, and to prevent or correct deficiencies of vitamin B complex factors, NOVIPLEX provides a rational, adequately potent formula.

Because it contains the entire B complex, as obtained from high potency yeast concentrate, in addition to crystalline factors in approximately the proportion required by the human organism, NOVIPLEX supplies *all* of the natural B vitamins, including choline, inositol, and biotin.

NOVIPLEX



Each capsule of Noviplex contains:

Thiamine hydrochloride (B_1).....1 mg.
Riboflavin (B_2, G).....1 mg.
Nicotinamide (niacinamide).....8 mg.
Pyridoxine hydrochloride (B_6)...0.5 mg.
Calcium pantothenate.....1 mg.

Plus all other factors naturally occurring in yeast concentrate. Noviplex is supplied in bottles of 100, 500 and 1000 capsules.

MANUFACTURING CHEMISTS TO THE MEDICAL PROFESSION SINCE 1858

Lilly blood processing

PASSES

Two Million Mark

AN OCCASION of major proportions was observed early in February when Eli Lilly and Company completed processing into plasma the two millionth pint of blood. Blood comes to the Lilly Laboratories from Red Cross donor centers in Atlanta, Chicago, Cincinnati, Columbus, Indianapolis, Louisville, Milwaukee, and St. Louis. Mobile bleeding units operate out of all these centers to accommodate donors in the smaller surrounding cities and towns. Blood is sent from donor centers daily in insulated refrigerator boxes and reaches the processing plant by overnight express.

Plasma is employed to combat shock which so often accompanies battle injuries. Various substitute fluids have been suggested from time to time, but human plasma is most satisfactory. Dried plasma has the advantages of completeness from the physiological standpoint, stability, ease of transportation in large quantities, and rapidity with which the solution can be prepared. Every package of blood plasma processed by Eli Lilly and Company is supplied to the Government at exact cost of production. Plasma prepared by this Company is not available for civilian needs. Eli Lilly and Company, Indianapolis 6, Indiana, U. S. A.

Virus Diseases, II

A connecting link between bacteria and the viruses is a group of very small, pleomorphic organisms classified as Rickettsia They are the infecting organisms of typhus, Rocky Mountain spotted fever, and trench fever In size they are about midway between Bacillus prodigiosus and the large virus of psittacosis They stain poorly with bacterial stains, but they can be cultivated only on living tissues They exist only in living cells Thus, in size, staining reaction, and parasitism they fit perfectly the conception of the degradation of a bacterium toward the lower level of a virus Their intermediate hosts are arachnids—ticks, mites, fleas, and lice

In like manner the large viruses of psittacosis, lymphogranuloma, and trachoma, already mentioned as being sensitive to the sulfonamides, are now being referred to as the lymphogranuloma group It seems likely that they will be given a classification between the rickettsia and the smaller viruses With further studies other subdivisions will doubtless be recognized

The remarkable variation in size of virus bodies and a comparison with the rickettsia and the bacteria is shown by the following dimensions in millimicrons

B prodigiosus	750
Rickettsia	300
Vaccinia virus	125–175
Bacteriophage (large size)	100
Tobacco mosaic virus	33
Yellow-fever virus	17–25
Poliomyelitis virus	10–15
Foot-and mouth disease virus	8–12
Hemoglobin molecule	6 7
Egg albumin molecule	4

Of great theoretic interest is the greater complexity both of structure and function in the largest viruses as compared with the smallest ones Chemical analysis shows little difference between the composition of bacteria and that of the virus of vaccinia Protein and carbohydrates, sulfur, and phosphorus exist in about the same proportions in both They are both agglutinated by immune sera From these and other considerations, leading authorities conclude that this virus differs from a coccus, for instance, only in being smaller and in lacking certain enzymes necessary for an independent existence It is the lack of these enzymes that condemns it to a parasitic mode of life It can live only in an intracellular environment where the enzymes are provided by the host, or where

the parasitic virus may find ready-made the substances which it is, itself, not capable of synthesizing.

In 1906, Paschen described minute bodies, now called elementary bodies, in the cells of vaccinia lesions. The much larger cell inclusions previously seen under the microscope are now thought to be tightly packed masses of Paschen bodies. The virus of vaccinia is approximately 150 millimicrons in diameter. The Paschen bodies are about the same size and have been proved to be highly infectious. They probably constitute the virus itself.

In contrast to the complexity of the virus of vaccinia is the simplicity of structure found in the much smaller virus of tobacco-mosaic disease. In 1935 Stanley salted out from infected tobacco tissues fine needle-shaped rods which reproduced the disease even after repeated dissolving and recrystallization. Analysis proved them to be crystals of nucleoprotein. Because they grow in only two planes they are called para crystals. Three years later true twelve-sided protein crystals were obtained from tomato plants infected with bushy-stunt virus. These also reproduced the disease after repeated solution and recrystallization. It is believed that these bodies are single enormous protein molecules, probably the simplest form of life capable of reproduction. No crystalline form has yet been found among the viruses which infect animals.

What conclusion can be drawn from this gradation of pathogens from a single giant molecule to an organism like a bacterium with its complex structure and its specialized functions by which it synthesized organic matter from inorganic, and by which it is enabled to grow, reproduce, and move from place to place? How shall we explain the transition from one to the other?

To the earlier students of the subject it was natural to read into the picture an evolutionary progression upward from the lowest to a higher plane of life. The explanation offered by most bacteriologists today is the exact opposite. To them it appears to be a simple case of parasitism. All parasites are examples of a phenomenon which has of late years become evident in human society. That is a willingness to exchange independence for security. Parasitic worms are descended from free-living species of earlier times.

Bacteriologists are well acquainted with the loss of function from disuse. For example, the colon bacillus is a rugged individualist. It can synthesize the materials necessary for its well-being from a few simple carbon compounds, ammonia, and salts. By contrast, the influenza bacillus has learned to depend on the tissues of its hosts for many of its needs, and has therefore lost some of its enzymes. Consequently, it cannot grow on the simple culture media on which Bacillus coli thrives. It must have relatively complex foods, even including tissue extracts. Its colonies are pinpoint in size, but if almost any other bacterium is planted beside it, it immediately begins a more vigorous growth. Its neighbor has furnished the enzymes which it lacks. It is also to be noted that it is one of the smallest bacteria. Many other illustrations could be cited.

The rickettsia are bacteria which have acquired the parasitic habit to the extent that they no longer synthesize certain enzymes. The molecules concerned with the making of those enzymes undergo the atrophy of disuse. Hence the bacterium becomes smaller. Having lost the power to synthesize the materials necessary to its existence it must live inside a living cell, although that cell need not be an actively proliferating one.

The lymphogranuloma group of viruses represents a further degradation. These have surrendered still more enzymes, lost a corresponding number of molecules, and are consequently smaller. Also, they now require the substances furnished by a metabolizing cell. Their parasitism has become more nearly complete. And so the process continues until a stage is reached at which no enzyme-producing molecules are left and the organism consists only of a single mass of complex protein. It retains only the nuclear material with its inherent power of division. It is a naked nucleus without a cell of its own to nourish it, and so it must adopt a cell in order to survive. It has become the ultimate in parasitism.

It is impossible, of course, to prove the correctness of this theory, and all workers in

the field do not accept it. It is quite as logical to assume a naked nucleus as the beginning instead of as the end of the process.

In that case the lower forms ascend by a series of increments, adding instead of losing new enzymes and molecules, until they attain the dignity of independent existence and the size, functions, and complex organization of the bacteria. Whether we adopt the theory of parasitism and successive degradation or that of evolutionary upward progression may depend on whether we are pessimists or optimists.

Current Editorial Comment

Progress and Conservatism

The tendency to resist change, which seems to be an ever-present factor in human behavior, is nowhere better exemplified than in the history of medicine. For centuries it was heresy to question or to depart from the teachings of Galen. When Semmelweiss proclaimed that childbed fever was infectious and transmissible, he was driven insane by the persecution which he suffered at the hands of his contemporaries. The leaders of our profession bitterly opposed the introduction of the ligature by Paré, of antisepsis by Lister, and of vaccination by Jenner. Even ether as an anesthetic was branded as a nostrum.

The amazing tempo of medical progress today seems proof that the days of reaction have passed. On the contrary, we seem to lack even a healthy skepticism. Present-day practitioners eagerly accept and use new drugs, appliances, and technics even before their value has been scientifically established. In the recent past we have seen the waxing and waning enthusiasm for vaccines indiscriminately used, for Bier's passive hyperemia, the maggot treatment of osteomyelitis, the tannic-acid treatment of burns, nephropexy, plication and fixation of the cecum, and now the use of vitamins to prevent colds and for patients showing no vitamin deficiency. In the long run this is all to the good. It is in accord with St. Paul's injunction, "Prove all things; hold fast to that which is good." A receptivity amounting to gullibility is better than an unreasoning opposition to everything that is new.

We see the discovery and immediate application of an amazing category of new methods and new therapeutic weapons and we rejoice that the bad old days are gone forever. But there is danger that our rejoicing may end in smug complacency. While holding fast to things that are good, we may fail to jettison those that are false. John Tyndall once wrote something to the effect that man's mind is like a garden. It would be easy to plant the seeds of new truths were it not so difficult to destroy the weeds of old errors. This has too often been demonstrated by what we euphemistically call conservatism.

A notable example of the persistency of a deeply rooted fallacy is the treatment of peritonitis by drainage. The fallacy was proved clinically by Robert T. Morris in 1897 and experimentally by Yates in 1905. British Army surgeons in 1918 proved it when they reduced the mortality of gunshot wounds of the abdomen from 100 per cent to about 50 per cent by closing the peritoneum and omitting the drains. Many reports from our own civilian surgeons have confirmed it. Steinberg, in his recent monograph on peritonitis, makes this significant statement: "It is an interesting commentary that although most of the opinion expressed in the literature is opposed to draining the peritoneal cavity the procedure is employed extensively in actual practice." Nondrainage, except in a few specific types of injury, is now standard practice in the medical services of our own Army and Navy. In spite of incontrovertible evidence the great majority of American surgeons cling to a harmful practice rather than to give up a perniciously false belief.

The greatest threat to medical progress today is not technical, but sociologic. The exigencies of war will not permit obstructive rigidity in medicine or surgery. Progress in those fields is assured. On the other hand, war activates the ferment of social unrest and speeds up the sociologic changes which now constitute our most vital problem. We are living in a period of social and economic change when the preservation of all that we hold good calls for the highest quality of statesmanship. A die-hard resistance to all change will be as fatal as the attempt of a ship's captain to ride out a typhoon while at

anchor. His safety lies in his freedom to sail either with or into the wind as his judgment dictates.

Fortunately for us, our Society has leaders who are aware of the storm and who are capable of steering us through it. The Planning Committee on Medical Policies is our Board of Strategy. For two years it has been preparing the blueprints of a program. When its report reaches the House of Delegates it is to be hoped that it will receive dispassionate consideration. Life is adaptation to environment. Without changes we shall perish. It is no time to turn our faces backward. The House of Delegates has not always looked forward. Only a few years ago it rejected in its entirety a proposal for voluntary nonprofit sickness insurance, a policy which the Society is now making every effort to promote and encourage.

Correspondence

Hematogenous Osteomyelitis

To the Editor:

May I be permitted to comment upon Dr. Flynn's paper in the JOURNAL, issue of March 1, and upon the discussion of the paper by Dr. Wetherell?

It seems difficult to understand why the profession has not, up to the present, obtained and understood the correct interpretation of the course of events in acute hematogenous osteomyelitis, of the correct conservative attitude to assume in the treatment of this disease, and of the proper place of chemotherapy in the latter.

It must be understood that hematogenous osteomyelitis is a phase of a general infection originating from some surface lesion through the medium of bacteriemia and that the bone is only one of the many expressions of the many possible metastatic manifestations. It is very regrettable that the discussions in the literature do not sufficiently emphasize this. The treatment of the bone lesion must therefore necessarily be that of a local lesion as against the treatment of the general infection which is present in various grades of severity at the beginning of the disease.

It is true that the original general infection can disappear spontaneously, owing to the natural protective forces of the body, and that this happens in both mild and more severe general infections many more times than the profession has been led to believe. And it is equally true that nature will do far more for the patient in the early stages of development of the local bone lesion than surgery can. All the newer knowledge concerning the role of chemotherapy and the time and place of local surgical therapy must be interpreted with these facts in mind. Very few of the chemotherapeutic drugs actually kill the infecting organisms. Most of them act by inhibiting the biologic activities of the bacteria, which then assume a dormant state (bacteriostasis). Destruction of the bacteria (bacteriolysis) is then accomplished by the ordinary antibacterial agencies of the body. The drugs must be administered for a sufficient length of time and in sufficient concentration and bacterial intimacy to enable the latter to work adequately; otherwise, bacterial activity is not inhibited, symptoms recur, and the disease increases. Therapeutically this acts as an enhancement of the normal antibacterial powers of the body and in the ordinary milder case is many times not absolutely necessary, as evidenced by the numbers of spontaneous remissions of the bacteriemias. In severe grades of infection the chemotherapy is a need the imperativeness of which varies directly with the grade of infection, and the effect of which is at a maximum when the pathogen is matched with the proper drug.

Chemotherapeutic agents act best when the bacteria are in the circulating blood or the fluid content of hollow cavities or spaces, i.e., in the stage with bacteriemia. They are ineffective when the bacteria are locked away out of ready contact, and in hematogenous osteomyelitis this means within a clotted blood vessel. When the thrombophlebitis spreads outside of the confines of the bone—as in one case reported by me* to the extraosseous thrombophlebitis—if accessible, it must be excised before the bacteriemia can be controlled. In any case, when the desired effect of the drug is only temporary, it leads to masking of symptoms, to unperceived symptomless advance of the pathologic process, to unexpected recrudescence of the symptoms, and to unheralded complications.

The results of chemotherapy are not always predictable, owing to the deficient exercise of the bacteriostatic power of the drug, to the occasional difficulty of maintaining the proper concentration of the drug, to the necessity of matching the proper drug to the provocative organism, to the occurrence of certain toxic effects of the drugs themselves, and to the difficulty inherent in removing inaccessible foci of infection by surgical means, which is always necessary.

The observed results have varied all the way from very satisfactory effects to no effects at all. In the satisfactory cases, the proper interpretation of good results is difficult, owing to the possibility that such beneficial results have occurred spontaneously, as they have done many times in the past before this form of chemotherapy was available.

In cases of acute hematogenic osteomyelitis, chemotherapy is especially and perhaps only indicated in the stages of general infection (bacteriemia). Its most important secondary effect is the prevention of metastatic foci. As soon as this is accomplished definitely and permanently, the problem then becomes that of the treatment of any local lesion which the chemotherapy has not been able to prevent—i.e., for the present purpose, any focus of osteomyelitis.

In the treatment of the residual local bone lesion, there are two main objectives: (1) the conservation and/or the salvage of tissue and architectural form, and (2) the retention of function. Much more is accomplished by restricting any operative attack to the incision and drainage of accessible abscesses than to any ill-advised form of osteotomy. Nothing can replace the undisturbed inherent conservative reparative efforts and results of the natural intrinsic powers of the body.

The profession should give and the patient should demand sound surgical judgment based upon good clinical appraisal of the relative importance of the general infection and the local bone lesion and of the integration and summation of the two.

SIGMOIDITIS

ANTHONY BASSLER, M D , F A C P , LL D , New York City

THE sigmoid, or pelvic colon, is the narrowest and most movable part of the large bowel Held in place by a varying length of mesosigmoid, *its main function is that of collecting* feces for ejection By extension it is subject to the pathologies of the colon and rectum, being more susceptible to those of the colon than of the rectum The sigmoid has more the structure and function of the colon, the structure of rectum is simpler and similar to that of an excretory tract

Viewed endoscopically, the rectum is paler, smooth, and large in caliber, the sigmoid is deeper in color, velvety, and narrow The rectosigmoidal reflex operates at the location that joins the sigmoid with the upper end of the rectum, and operates without marked sphincteric muscular control, like the ileocecal valve Defecation is brought about by tension in the sigmoid overcoming the rectosigmoidal area, contracture of the abdominal and pelvic musculature and relaxation of the anal sphincters Normally the rectum is empty of feces

Symptoms of Sigmoiditis

Constipation —Errors in the defecation mechanism of sigmoid function are responsible for more constipation than any other cause and its main cause is a chronic sigmoiditis Such rectums contain feces, the rectosigmoidal region is chronically relaxed, the sigmoid is deficient in muscular power, and there is a lack of the feeling of satiety which should follow a complete emptying of the sigmoid Much attention has been paid to colonic stasis, spasms, and atony as causes for constipation and too little to the sigmoid itself Often local treatments to the sigmoid will cure the symptom of constipation far better than diets, laxatives, and purgatives

Pelvic, Abdominal, and Back Pain and Distress —These are common symptoms of sigmoiditis, usually accompanied by constipation, and often presenting tenderness to pressure and distinct stiffening of the sigmoid Headaches, states of ill being, and other symptoms may be present Menstrual disturbances and those connected with internal female structures are seen at times

Anal Moisture and Passing of Mucus —These are not uncommon in chronic sigmoiditis and often are erroneously believed to be due to rectal conditions (such as proctitis, which usually is secondary to sigmoiditis), or to colon states in which the diagnosis of colitis is made

Hemorrhage —Quite alarming frank hemorrhage *may ensue from eroded blood vessels in the* sigmoid proper and minor types of bleeding are common Varicose veins are not uncommon in sigmoiditis One here must always keep in mind the more common causes of internal hemorrhoids and carcinoma

Polyps —Small polyps in the sigmoid are second in frequency to those in the colon, and are as common as those found in the rectum These have importance in the development of carcinoma so often found in the sigmoid, and they are produced by chronic sigmoiditis

Ulcerative Colitis —The vast majority (90 per cent) of instances of the so-called nonspecific ulcerative colitis begins as sigmoiditis or proctosigmoiditis and subsequently involves the colon Preventive medicine calls for diagnosing and treating sigmoiditis to prevent this serious disease Often the treatment of sigmoiditis will markedly benefit a not too late instance of ulcerative colitis

Diarrhea —Soft, mushy, acid types of stools may occur over weeks of time, the hypersensitive sigmoid often being stimulated by foods A short-spelled diarrhea may take place followed by pain in the sigmoid for weeks Whether these are due to chilling infection, or allergy is not clear But such cases are often accompanied by chronic sigmoiditis

Pruritis Ani and Dermatologic Conditions — Anal itching, both transitory and intractable, may be due to sigmoiditis Of course there are other reasons for intractable pruritus ani, but this one must be thought of also Small and large areas of perianal erythema, with and without vesiculation, may be encountered These are often of questionable origin but generally they are due to sigmoiditis

Diagnosis

The diagnosis can best be made by sigmoidoscopy, which is not merely proctoscopy, because the interior of the sigmoid must be visualized, not only the rectum Three things are essential for this purpose

(1) The sigmoid must be empty, this is best accomplished by a dose of castor oil the night before, or some type of a stimulating enema an hour or two before the examination is made (soapsuds or an Epsom salts enema is best for

Read at the Annual Meeting of the Medical Society of the State of New York New York City May 10 1944

FIG. 1. Atonic type. No peristalsis. Rectosigmoidal reflex gone.

FIG. 2. Spastic irritative type. Much leaking at anus. No constipation. Left-sided abdominal distress. Saccharobutyric toxemia.

this). In some instances both are employed.

(2) The position accomplished by the Hanes table is best. In the absence of this, the lower extremities on a bed with the elbows on the floor would answer. The knee-shoulder position, because of spinal twist, renders finding the entrance into the sigmoid difficult. The knee-both elbows close to the knees is more satisfactory because then the spine is straight. The Sims position, with the hips raised, is often unsatisfactory for sigmoidoscopy but perfectly practical for only a rectal examination. Because of the difficulty of finding the narrow opening and the distress at times when the sigmoid is entered, the Hanes table, which prevents movement, soiling, and the dropping back of the sigmoid, is much to be preferred.

(3) A proper instrument and proper technic of passing it is essential. The average proctoscope is too short and its caliber too large. The rectum from sigmoid to anus is about 7 inches (18 cm.) in length, which is about the length of a proctoscope. For advancing into the sigmoid several more inches are necessary. Thus the instrument should be at least 12 inches (30 cm.), and one 16 inches (40 cm.) is to be preferred to the latter. The average proctosigmoidoscope is not smaller than $^5/_8$ of an inch (1.5 cm.) in diameter, and most of them are larger. Such an instrument (even with experience) would permit of satisfactory sigmoidoscopy in only about 40 per cent of patients. Therefore, a smaller caliber tube should be employed. The one recommended (which is also practical for proctoscopy) is half an inch (0.8 cm.) in caliber, and this permits of sigmoid observation in 87 per cent of instances at the time of the first examination.* An inflation bulb attachment is rarely necessary although occasionally desirable.

The anal canal and instrument should be greased with vaseline rather than with lubricating jelly. The tube should be warmed, the tip passed into the lower rectum, the obturator withdrawn, and the tube advanced up the lumen under direct vision. Time, patience, and considerations of the patient's distress are essential. After sufficient experience it rarely takes much more than five minutes to make a satisfactory examination of the rectum and sigmoid. When the tip of the tube reaches the upper rectum usually its advance is blocked. One then searches for the junction of the sigmoid with the rectum. When this is patulous and straight ahead, or slightly to the left, the opening is observed quickly. In many instances, however, the junction is more to the left side, or it is situated under one or between two folds of mucosa and thus easily escapes observation. If the tip of the instrument has rounded shoulders instead of a

* In the remaining 13 per cent the mesosigmoid is too short, or because of a lower position of the distal portion of the sigmoid it is below the junction opening. Because of spasm and other conditions at least up to 3 inches of the sigmoid is not visible. Here one should make several attempts at the examination, and if not successful, one would have to depend upon the x-ray for a diagnosis.

sharp edge, one can safely press around until the sigmoidal opening is located. Occasionally the rectosigmoidal junction is held rather firmly closed by spasm. This is seen mostly in instances of spastic colon and spasmophilic and hypersensitive individuals. A pledget of cotton soaked in saturated solution of magnesium sulfate held against it for half a minute will cause it to relax. The sigmoid should be entered slowly because, as a rule, there is considerable distress, desire for defecation, or a spasm is set up. As one advances the instrument the sensation is that the sigmoid seems to strip down on the tube. If possible at least 5 inches of the sigmoid should be visualized, and with a long enough instrument 8 to 12 inches of the interior of the sigmoid can be seen. A few puffs of air would assist if the sigmoid seems stuck together.

In chronic sigmoiditis the mucosa may appear thickened, deepened in color, and the lumen contracted. Such a mucosa, being friable, may bleed easily. On the other hand, the mucosa may be paler than normal, appear thinned out, and the lumen larger. In the first instance the circular fibers of the sigmoid may be spastic and difficult to enter, and the examination may be distressing; or it may be patulous and offer no resistance, making the examination quite painless. Microscopic examination of the sigmoid in such cases would show degenerative changes in the ganglionic cells, thinning of the musculature, obliteration of the arterioles and venules with detachment, and lyses in the epithelial and somatic cells. Superficial small ulcers, stercoral in character, diverticula, polyps, and immobility from adhesions may be present. Under ideal conditions, in the last two years the author has been able to accomplish direct vision of thirty-two polyps, tumor in 17 out of 51 instances of carcinoma of the sigmoid, fourteen sites from which massive hemorrhage have come, the pocket mouths in eleven instances of diverticula, 22 instances of ulcers, 18 of varicose veins, and the easy diagnosis of practically all of the cases of sigmoiditis, both chronic and subacute. In acute sigmoiditis with diarrhea when the mucosa is edematous and swollen and pain and distress are present, direct sigmoidoscopy may not be possible. In the beginning with these examinations one is not so successful. With experience, this is overcome, and examinations are far less distressing to the patient.

The sigmoid can also be examined by x-ray. In addition to the different lesions best diagnosed in this way (cancer, stricture, pelvic-brim adhesions, etc.), dilated and spastic states, reduplications and redundancies may be included. After the barium enema, films should be made at once and these should be anterior-posterior and oblique, so as to note the back wall of the rectum and sigmoid. Rugal pattern films are unsatisfactory for diagnosis. Irregular serrations and definite spasms are characteristic of chronic sigmoiditis. Such irritative states are the earlier manifestations, definite atony being late findings, but sigmoiditis may exist without either of these. Therefore direct sigmoidoscopy is best for the diagnosis although the x-ray should not be eliminated in the diagnosis of all sigmoidal lesions. In the female an angulated or gnarled-up looking sigmoid may be noted. For a complete examination a digital examination should precede the rectal and sigmoidal examinations. Often a carcinoma of the sigmoid, or one growing in the sulcus above one of the rectal valves may be felt and not be visualized or even noted by x-ray.

Treatment

The successful treatment of chronic sigmoiditis is simple. The items in this are:

1. The use of hemicellulose additions to the diet or hydroscopic substances (agar, plantago, etc.) to keep the stool from inspissating, thus overcoming constipation. Mineral oil may be used. Laxative and purgative drugs and salines never, a normal saline cleansing enema or glycerine suppository occasionally being much preferred if the diet and specific treatments do not succeed in accomplishing one or two daily movements. If the stools are acid, the basic diet should be high in protein, low in fat, and only 3 or 5 per cent vegetables; if alkaline, a full vegetable and fat diet with very limited proteins of not more than 100 Gm. a day.

2. The special treatment consists of two parts: (*a*) the rectal instillation of from 2 to 6 ounces (60 to 180 cc.) of the following: iodoform, 2 drams (8.0 Gm.), bismuth subnitrate, 4 oz. (120.0 Gm.), cod liver oil, ½ pint (500 cc.), and cotton-seed oil, ½ pint (500 cc.). This is put in evenings before retiring and if necessary the quantity is lowered so it does not act as an enema and is retained during the night. (*b*) In the morning a small retention enema of 6 oz. (180 cc.) is taken and held as long as possible in which is dissolved a teaspoonful (4 cc.) of ichthyol and the same quantity of fluid extract of hydrastis. Since the patients conduct these injections, it serves convenience to have them done with a 6 or 4-oz. syringe, or rubber hand bulb with a perhaps No. 26 rectal tube. These treatments are lessened as the case responds, being taken less frequently and modified as to one or the other. In the more serious states the oil mixture is best; in the lesser types or average instance of sigmoiditis, the ichthyol hydrastis is to be preferred. This, if used alone, can be instilled before retiring in amounts that

would be retained. Treatments should be kept up for weeks because chronic sigmoiditis responds slowly to treatment, and occasional observation of the sigmoid is desirable to note modifications of treatment.

If the sigmoid is tender or diverticulitis exists, rest, local heat, or short-wave treatments are helpful. In marked spasm atropine or belladonna up to physiologic doses may be useful. In obstruction, perforation, sinus formation, malignant disease, pelvic-brim adhesions, recurrent diverticulitis, and occasionally in marked redundancy with twisting, surgery would be in order. In the average case of sigmoiditis the medical treatment is satisfactory if the local treatments are kept up long enough.

Conclusions

Chronic sigmoiditis is a common clinical condition which usually escapes pointed attention. Its recognition and treatment accomplish the handling of some of the cases which heretofore had not been explained. As a condition it is easily diagnosed and can be satisfactorily treated medically.

Discussion

Dr. Lester S. Knapp, *Buffalo*—Any subject which involves pathology of the sigmoid is bound to necessitate careful study and examination of this area, due to the fact that it is in the sigmoid that indications of 90 per cent of all the serious bowel diseases are found.

Chronic sigmoiditis is somewhat like chronic appendicitis; it may simulate many conditions, and if a diagnosis of chronic sigmoiditis is made without complete study, many errors of a serious nature will be made. A complete study of the sigmoid without x-ray examination in suspected sigmoiditis is also a pitfall. X-ray has become such a popular adjunct to diagnosis that we have a tendency now to x-ray and take their report as final. This will also cause many failures. It is also true that with examination, first by sigmoidoscope and followed by x-ray studies both of which are negative, errors will be made.

Any patient with bowel dysfunction which can be explained by chronic sigmoiditis should be reexamined at definite intervals and not allowed to be discharged by the physician. As an example, I grouped 18 cases of so-called vitamin deficiency diagnosed by x-ray findings with negative sigmoidoscopic examination. Over a period of one and one-half years repeated x-ray examination following vitamin therapy was done at four- to six-week intervals. So far I have resected four cases of carcinoma found early. Each of these cases had had at least three series of colon examinations by x-ray. The x-ray findings were quite similar in the fact that a segment showed lack of haustration, and string effect, with no evidence of an ulcer in the first examination. The carcinoma was eventually found in that segment. All of these cases responded to vitamin therapy for one to three months. Whether this is of value no one can say, but it does necessitate follow-up of cases.

Another disease that can complicate our picture without thorough investigation is diverticulosis and diverticulitis. When this condition exists an ordinary diagnosis of chronic sigmoiditis is fraught with peril to the patient. These patients, when taught how to live, may avoid any complications for their natural life, but with complications a most severe surgical problem is involved. Perforation, obstruction, and abscess are the problems that tax the abilities of any surgeon. In the past we have taken conservative methods, due to high mortality figures of surgery and the fact that a large percentage of cases get well by medical methods. Possibly in the near future, due to better technic and better postoperative care, we can increase our surgical attack to this group who go on to this difficult problem, before a hopeless condition is present.

In the cases of chronic ulcerative colitis which have never had a fulminating episode, mistakes can be made. Chronic ulcerative colitis is, in my mind, one of the most vicious and terrifying diseases. I would prefer to see a carcinoma case come into my office than one of chronic ulcerative colitis.

To see a healthy young individual start with an innocuous diarrhea which responds, in the first or second episode, to ordinary medical means, and continue repeating these attacks with such a steady debilitating decline, and with the final diagnosis made when the physician finally thinks an x-ray advisable; to have a report of a colon, shortened, thickened, and without function, a picture of a useless colon, when nothing but serious surgery can save his life—this is also our problem. These patients should be examined and studied in the earlier attacks as Dr. Bassler has described in order to find this picture of ulcerative colitis. X-rays in earlier stages will not always give you this diagnosis. After negative x-rays, endoscopy will show the typical picture.

Careful medical check-up to group these cases, to eliminate specifics, allergics, and deficiencies, should be done, so that this serious group of cases can have early attention. To do so, a team is necessary which includes the internist, proctologist, and surgeon.

We have been conservative with this disease because of mortality figures also. At the present time our so-called cures are entirely the result of ileostomy and colectomy. We have all seen rather long periods of remission, but not cures, by medical treatment. I believe that in this disease we have put off more radical procedures because of fear, and that attempts to save a colon must be made if any ultimate gain in this disease is to be accomplished.

We have already found that by avoiding handling of the colon, by approved methods, and by knowing the pitfalls of performing an ileostomy, with our postoperative care, with chemistries, fluid balances, and chemical therapy, we have lowered our

figures of mortality. Further developments will arrive with our earlier diagnosis, proper grouping, and earlier surgery.

Papillomata and adenomata will be found in early stages so that we can fulgurate and destroy them as office procedures. It is fully proved that these benign tumors all too frequently undergo malignant change. Even in multiple polyposis, the hereditary type that Dr. McKenny described, early diagnosis will allow the destruction of polyps to a level where ileosigmoidoscopy can be done before colectomy to prevent permanent ileostomy.

[illegible] us a picture of [illegible] of which early [illegible] is much better results with less complications.

HEALTH ALERTNESS COURSE FOR ELEMENTARY SCHOOL TEACHERS

To acquaint the elementary school teacher with the newest ideas and procedures in health practices a fifteen-week course entitled "The Health of the Elementary School Child" is being sponsored in New York City by the Kips Bay-Yorkville District Health Committee in cooperation with the Department of Health, the Board of Education, and the Department of Public Health and Preventive Medicine of Cornell University Medical College.

The course is a discussion forum offered especially for the elementary school teacher because of the part that health plays in the whole field of child development. It considers not only the physical aspects of child health, but also emphasizes the psychologic, social, and economic accompaniments of health problems. The fifteen weekly sessions [illegible] two-point [illegible] Board of [illegible] Tuesday [illegible] t Health Center. The opening session was held on Tuesday, February 13, and the final one will take place on May 29. Topics so far discussed are the health rationale of the typical child, normal physical and emotional development of the elementary-school child, child development and mental hygiene, the intellectuall[illegible] the emotionally [illegible] icable diseases and [illegible] n the classroom. [illegible] were prominent doctors and leaders in the field of medicine, psychiatry, and public health.

The schedule and the speakers for the remainder of the sessions are as follows: April 10, "School Health Program and Role of Teacher in That Program," Dr. Leona Baumgartner, director of the Bureau of Child Hygiene, Department of Health; April 17, "Meeting the Health Needs of Children in the School Environment," Dr. Myron E. Wegman, director of research and training, Bureau of Child Hygiene; April 24, "Classroom Programs for Health for the Normal and Below-Par Child," Dr. C. C. Wilson, professor of health and physical education, Teachers College, Columbia University; May 1, "Visual Problems in the Classroom," Dr. Conrad Berens, attending surgeon, ophthalmology and laryngology, New York Eye and Ear Infirmary, St. Luke's Hospital, and "Aural Problems," the speaker to be announced later; May 8, "Health Department Services for School Children," Dr. Philip Ollstein, supervising physician, school health, Division of Research and Training, Bureau of Child Hygiene, and instructor in department of public health and preventive medicine, Cornell University Medical College; May 15, "The Teacher, the Health Staff, and Home Relationships," Miss Mary E. [illegible] sellor, B. [illegible] Economic [illegible] Gillen, director, Kips Bay-Yorkville District Health Committee, and instructor, department of public health ar[illegible] Medical [illegible] Relations[illegible] Dr. Jam[illegible] Yorkville Health District, Department of Health.

TWO CHURCHES WILL SEND MEDICAL UNIT TO ITALY

The first privately financed American medical unit has been organized to aid war-stricken Italians, provided with funds from the Congregational Christian and Unitarian Churches.

Dr. Elmer L. Sebringhaus, University of Wisconsin medical professor, told the Congregational Christian Missions Council today that the two denominations had allocated $100,000 for the unit and prom[illegible] Workir[illegible] the unit [illegible] two labo[illegible] executive [illegible] University of Minnesota, is aiding Dr. Sebringhaus in organizing the unit.

Purposes of the mission will be to study control of epidemics and the spread of tuberculosis among undernourished people, as well as diseases of underfed children.

GROSS INTRACEREBRAL HEMATOMAS

Report of 16 Surgically Treated Cases

WALLACE B. HAMBY, M.D., Buffalo, New York

WHILE the more common types of intracranial hemorrhage are well known, spontaneous, limited, removable intracerebral hematomas are less familiar. Twelve years ago Robinson found only 2 cases reported in the English literature, but recently numbers of these cases have been treated. This paper is concerned with 16 such cases of diverse causes, encountered at operation. Fourteen patients recovered after treatment. Cases due to cranial injury with skull fracture have been omitted from the series.

Case Reports*

To facilitate study of the cases, they are grouped into several categories. Seven of the patients suffered also from arterial disease, hypertension, arteriosclerosis, or bacterial endocarditis.

Case 1.—A 49-year-old-man had been treated previously for hypertension. On October 7, 1943, nausea, visual failure, and staggering were noted. On December 1, 1943, there were papilledema and left homonymous hemianopsia. Blood pressure was 190/110. The heart was enlarged.

Diagnosis: Right occipital neoplasm. On December 15, 1943, the ventriculogram showed a right occipital cyst (Fig. 1) which drained 30 cc. of clear yellow fluid. Right occipital craniotomy was performed. The convolutions were xanthochromic. A 5-cm. subcortical cyst was found and a 60-cc. polypoid old black clot was removed. The capsule was well defined and pigment stained; it was connected to the posterior horn of the right lateral ventricle and several arteries ran from the posterior horn into the capsule. Recovery was uneventful.

Case 2.—A 39-year-old-woman, three weeks before admittance, had suffered numbness and weakness of the right hand. There was progression in seven days to right spastic hemiplegia. A week later she had headache, semicoma, and motor aphasia. Blood pressure was 150/110. Examination revealed semicoma, aphasia, right hemiparesis, mild right hemihypalgesia, and papilledema.

Diagnosis: Left frontal neoplasm or vascular accident. On July 5, 1935, ventriculography was done. A left temporal mass was seen, and left frontotemporal craniotomy was performed (Fig. 2). The posterior second frontal convolution was fluctuant. A cyst was entered 1.5 cm. below the surface. Forty-five cc. of thick, chocolate-colored fluid was aspirated, and lavage with saline solution was done. Recovery was uneventful.

Case 3.—On January 26, 1939, a 73-year-old-farmer, after exertion, had a chilly sensation, emesis, and headache. The pain persisted, with ataxia of hands and legs. Blood pressure was 160/98. The patient was senile, uncooperative, and arteriosclerotic. His eyes showed left homonymous hemianopsia, sparing the macula. He had a weak left grip, and Babinski sign on the left. Spinal fluid pressure was 240 mm. of bloody fluid.

Diagnosis: Arteriosclerosis and subarachnoid hemorrhage from right occipital aneurysm or neoplasm. Encephalography on January 27, 1939, showed a right occipitoparietal mass. Right parietotemporal craniotomy was done (Fig. 3). The cortex was xanthochromic, and a multilocular cavity, 6 by 4.5 by 2 cm., containing dark liquid blood and an old clot was exposed. Its walls were shaggy and deeply stained. Recovery was uneventful.

Case 4.—A 46-year-old-man was admitted on March 4, 1941, with nausea, emesis, and malaise. On March 5, 1941, he had sudden unconsciousness followed by confusion and frontal headache, persisting with frequent emesis. Vision was blurred and he had progressive ataxia. Blood pressure was 200/140. Examination revealed reduced visual acuity, early papilledema, coarse left horizontal and vertical nystagmus. He had left lower facial paresis, and equivocal bilateral Babinski. There was marked ataxia and dyskinesia of the left arm and leg.

Diagnosis: Left cerebellar hematoma. On March 15, 1941, ventriculography disclosed obstructive hydrocephalus. Suboccipital craniectomy showed a cyst filled with dark, oily blood, and a black clot occupying the entire left hemisphere. The walls were of white matter; the cerebellar arteries were atheromatous. Atelectasis developed and the patient died in twenty-four hours. Autopsy revealed atelectasis, pneumonia, cardiac hypertrophy, coronary arteriosclerosis.

Case 5.—On November 22, 1942 a 48-year-old-man, while driving his car, felt sudden severe pain in his right forehead and orbit, radiating into the right temple; he had bouts of emesis and vertigo.

The patient's blood pressure was 168/110. His right pupil was dilated and fixed. There was mild papilledema and left upper homonymous quadrantanopsia. X-ray showed the pineal shadow in the midline. Spinal fluid pressure was 350 mm.; the fluid was clear and colorless.

Diagnosis: Right temporal lesion, possibly hematoma. On November 28, 1942, ventriculography showed a right temporal mass. At right frontotemporal craniotomy (Fig. 4) there was a thin subdural layer of blood. The cortex was yellow, and the temporal convolutions were widened. A solid, 60-cc. clot was seen in the temporal lobe. Recovery was uneventful.

Case 6.—A 48-year-old-man fell 5 or 6 feet on December 13, 1940; he was not unconscious, and continued working. The next day he collided with objects on his left side, then developed weakness of the left arm and leg, and headache. On December 15, 1940, Jacksonian seizure started in the left arm. Hemiplegia progressed, with headache. His blood pressure was 210/128. He had left homonymous hemianopsia. The left reflexes were abolished, and

Read at the Annual Meeting of the Medical Society of the State of New York, New York City, May 10, 1944.

* To conserve space and yet to present all pertinent data, the case reports are deliberately condensed to a "telegraphic" brevity.

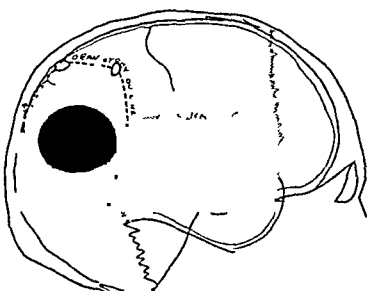

FIG 1 Case 1—Right occipital hematoma associated with hypertension

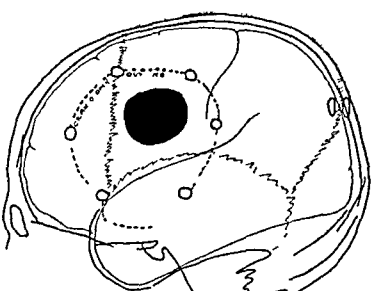

FIG 2 Case 2—Left postfrontal hematoma associated with hypertension

he had left hemihypesthesia and spatial agnosia of the left leg Spinal fluid pressure was 410 mm and the fluid was slightly xanthochromic

Diagnosis Arterial hypertension with right temporal hematoma or parasagittal parietal meningioma On March 11, 1941, ventriculography showed a right sided mass Right parietotemporal craniotomy was done (Fig 5), and a 4 cm parasagittal meningioma was removed Below the tumor bed was a 6-cm cavity containing an old blood clot His convalescence and recovery were stormy

Case 7—A 24-year old woman at the age of 6, had had scarlet fever, followed by rheumatic fever, endocarditis, and pulmonary tuberculosis with cavitation Six weeks before admission she had transient attacks of headache and four weeks before, sudden severe headache followed by persistent semicoma and aphasia Spinal fluid was normal, but under increased pressure Her blood pressure was 116/88 temperature 104 F , pulse 103, respirations, 29 She was malnourished and listless with motor aphasia She had nuchal rigidity, dilated right pupil, paresis, and right midline pineal calc was 280 mm , norm subacute bacterial viridans was present in the blood culture

Diagnosis Bacterial endocarditis, with left frontal abscess or hemorrhage On August 3, 1939 encephalography showed a left postfrontal mass *Left postfrontal exploratory trephinement* was done (Fig 6) and ity containing old Improvement was home on October 31 1939 There was no autopsy

In addition to Case 6, hematomas were associated with intracranial neoplasms in four others

Case 8—A 13 year old boy had x ray therapy for a year for intrathoracic tumor One week before admission he had sudden severe head pain and numbness of the left leg The patient was a sickly poorly developed, and poorly nourished boy He had poor right vision, the right globe was fixed, with ptosis, the right pupil was dilated and fixed, and papilledema was present He had mild left hemiparesis and ataxia Left proprioception was impaired, with bilateral Babinski There was clinical and x ray evidence of an irregular, large, calcified chest tumor

Diagnosis Thoracic tumor, right parietal metastasis with hemorrhage

On August 13, 1936 bilateral occipital trephinement was done The ventricles were not entered A right opped On August 15 craniotomy was done entricle was filled with there was a hard diffuse mass in the medial and posterior ventricular walls There was immediate improvement, but death occurred eight months later, no autopsy was performed

Case 9—A 46-year old man, two years before admission, had suffered personality changes and mood swings One year before right hemiplegia developed without aphasia, and severe emesis persisted for ten days with subsequent improvement Recently, paresis of the right hand developed, with mental dullness and right frontal headache The patient was emaciated, cooperative confused and disoriented He had ataxia of the right hand Spinal fluid pressure was 250 mm , the fluid was xanthochromic

Diagnosis *Left frontal neoplasm* On September 9, 1943 ventriculography showed obstructive hydrocephalus Suboccipital craniectomy disclosed a yellow right cerebellar hemisphere containing a 5-cm cyst of partially organized old blood and a soft, dark, hemorrhagic tumor Pathologic diagnosis was made of hypernephroma Recovery was uneventful

Case 10—A 17-year old girl had had, three and a half months before admission a convulsion of the left side of the face and tongue Jacksonian recurrence involved the entire right side She developed weakness and astereognosis of the right arm, suboccipital headache, and blurred vision

Although the inadequacies of the method are realized to conserve space a composite diagrammatic method of illustration was chosen Upon tracings of air roentgenograms or skull plates have been superimposed diagrams of the position of the lesions and of the operative approaches

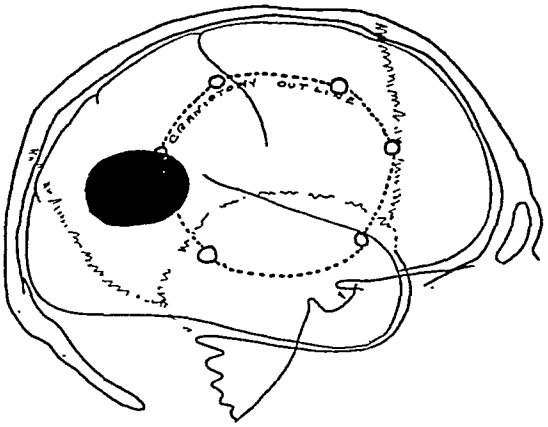

FIG. 3. Case 3—Right occipitotemporal hematoma associated with hypertension.

She had a dilated right pupil, impaired right corneal reflex, and coarse left nystagmus. Right hemiparesis, astereognosis, dyskinesia, ataxia, loss of two-point discrimination in the arm, and a little ataxia of the leg were found.

Diagnosis: Left parietal neoplasm. On January 22, 1942, encephalography showed a left parietal mass. At left parietal craniotomy (Fig. 8) the lower end of the left postcentral gyrus was widened and stained dark brown. The subcortical cavity contained 60 cc. of semisolid clot and old liquid blood. The walls were shaggy and pigmented. The biopsy revealed astrocytoma. Recovery was good; the patient was active three years later.

Case 11.—A 31-year-old-woman had a mastectomy for carcinoma on June 17, 1941. In February, 1942, progressive, generalized convulsions began, followed by left temporal and vertex headaches. On August 20, 1942, she started to have continuous generalized headache, relieved by lumbar puncture. She became increasingly drowsy for three weeks. Examination showed moderate aphasia, left frontal and occipital tenderness, and left papilledema. Spinal fluid pressure was 170 mm. and showed slightly xanthochromic fluid.

Diagnosis: Left frontal metastatic carcinoma. On September 23, 1942, ventriculography showed a left frontotemporal mass. Left frontotemporal craniotomy was done (Fig. 9) and showed an old subarachnoid clot. The temporal cavity was filled with oily, dark blood and old clots. The walls were soft and shaggy. Biopsy showed no evidence of neoplasm. Six months after recovery there was evidence of multiple cerebral lesions.

One of the following four hematomas originated in an aneurysm, and the other three are believed to have had such an origin.

Case 12.—A 50-year-old-man, admitted on December 3, 1942, had been unconscious for twenty-four hours. On December 11, 1942, he became drowsy and incoherent. On examination the patient was drowsy, aphasic, and apraxic. He had left papilledema, right hemiparesis, and right Babinski sign.

Diagnosis: Intracranial hemorrhage.

On December 13, 1943, bilateral temporal exploratory trephinements and left subtemporal decompression were done (Fig. 10). A temporal subarachnoid hemorrhage and a softened temporal lobe were found. A subcortical cyst was encountered from which 30 cc. of old purple blood was aspirated.

The patient improved in two weeks, then suffered a convulsion and died. Autopsy revealed extensive hemorrhage into the left temporal lobe extending into the lateral ventricle. There was a pea-sized aneurysm with an opening on its cerebral surface, on the middle cerebral artery, partly fixed in position by an older organized clot.

Case 13.—A 45-year-old-woman was admitted on January 21, 1942, with an attack of spontaneous subarachnoid hemorrhage. On January 25, 1942, she suffered severe occipital pain and emesis. Her blood pressure was 108/64. She was in a semi-stupor, with nuchal rigidity. The left corneal reflex was diminished; she had slight left ptosis, left homonymous hemianopsia, left lower facial paresis, and marked paresis of the left arm. Spinal fluid pressure was 290 mm. of bloody fluid. Her alertness fluctuated, but she did not improve.

Diagnosis: Bleeding right temporal aneurysm or neoplasm. On February 13, 1942 encephalography showed a right temporal mass. Right temporal craniotomy was done (Fig. 11). The gyri were widened and yellow. A subcortical cyst contained 60 cc. of old liquid blood and clots; the walls were shaggy. Recovery was uneventful and sustained.

Case 14.—A 51-year-old-woman had, on December 25, 1941, a sudden, severe headache, right frontal to occipital, which lasted seven days. On January 28, 1942, she had sudden nausea and projectile emesis; she fell and became unconscious. Next day, she had photophobia, mental dullness, poor memory, and mild aphasia. Her blood pressure was 114/62. She was drowsy, with incomplete motor aphasia. There was questionable papilledema, right hemiparesis, and Babiński. Spinal fluid pressure was 170 mm.; the fluid was slightly xanthochromic.

Diagnosis: Spontaneous subarachnoid hemorrhage, probably aneurysmal. On February 6, 1942, encephalography showed a left frontal mass. Left frontal craniotomy (Fig. 12) revealed an incompletely encapsulated subdural hematoma containing old liquid blood and 30 cc. of solid clot. The subarachnoid space was filled with a clot. She had an incomplete recovery, and then a relapse into coma. On February 11, 1942, the wound was reopened. A left frontal, 4-cm. cyst containing liquid blood and a clot was found. Recovery was gradual and complete.

Case 15.—A 36-year-old-man on October 30, 1941, following coitus, suffered sudden right hemiparesis and dilated right pupil. He improved for ten days, and then on November 25, 1941, again after coitus, became unconscious. On awakening, he was aphasic, with right hemiparesis. His blood pressure was 132/84. He was confused and uncooperative. The right pupil was dilated, and he had small hemorrhages around the optic discs, but no edema. The right side displayed mild hemiparesis, hyperreflexia, and Babinski sign.

Diagnosis: Aneurysm of circle of Willis, with recurrent bleeding. On December 15, 1941, encephalography showed a left frontal mass. Left frontal craniotomy (Fig. 13) revealed a xanthochromic cortex; the posterior end of the third frontal convolution was widened and softened. Sixty cc. of oily, old blood and clot were removed from the base of the frontal lobe. He recovered with residual hemiparesis.

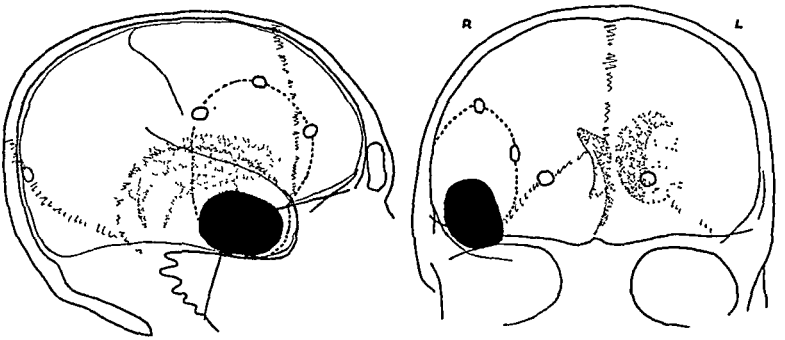

FIG. 4. Case 5—Right temporal hematoma associated with hypertension.

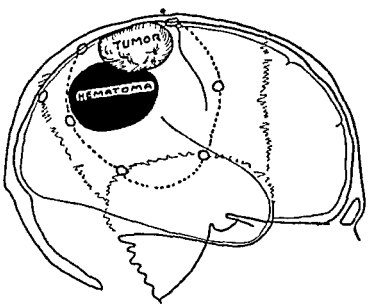

FIG. 5. Case 6—Right parietotemporal hematoma associated with right parietal parasagittal meningioma.

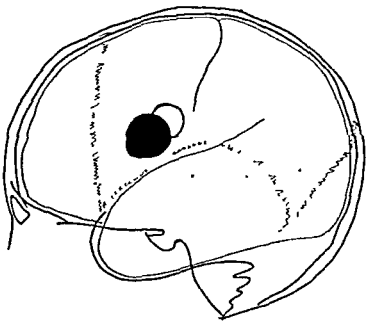

FIG. 6. Case 7—Postfrontal hematoma associated with subacute bacterial endocarditis.

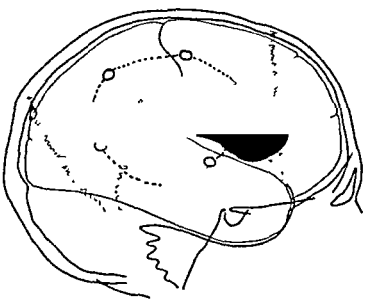

FIG. 7. Case 8—Right ventricular hematoma associated with metastatic tumor.

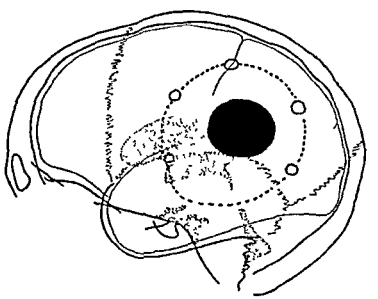

FIG. 8. Case 10—Left parietal hematoma associated with parietal astrocytoma.

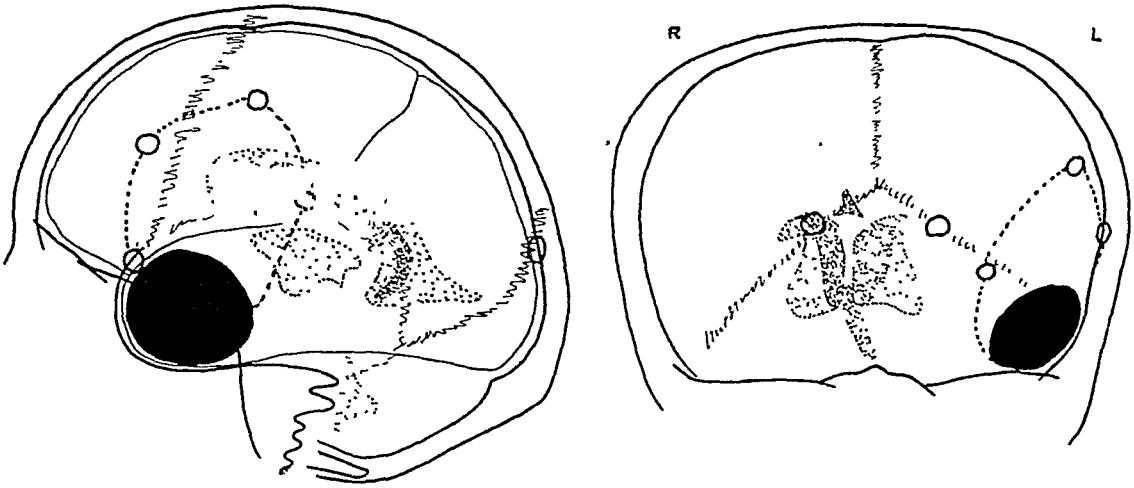

FIG. 9. Case 11—Left temporal hematoma associated with metastatic carcinoma.

The following is the only case in the series with a course suggesting "delayed post-traumatic hemorrhage."

Case 16.—A 54-year-old-man, on September 6, 1943, fell 18 feet. He was unconscious, with occipital laceration. Skull x-rays were normal, with pineal calcification in the midline. On September 13, 1943, he suffered headache, mild confusion, disorientation, and left hemiparesis. Two days later the pineal shadow was shifted 1 cm. to the left, and all symptoms progressed. His blood pressure was 130/85. He was drowsy, confused, and irritable, and had left hemiparesis.

Diagnosis: Right subdural hematoma. On September 24, 1943, right parietal exploratory trephinement was done. The subdural space was normal. Forty cc. of dark purple, thick blood was aspirated from a cyst 4 cm. from the surface. Lavage was done with normal saline solution and then with colloidal thorium dioxide suspension. Recovery was uneventful.

Roentgenographic Findings

In addition to two preoperative examinations that showed a pineal shift in the interval of a week, postoperative studies have been enlightening. The propensity of thorium dioxide suspensions for precipitating in the walls of a cavity provides a method for following the progress of a cyst after drainage. Thus Freeman[1] produced ventriculograms and Kahn[2] followed the progress of brain abscesses. Roentgenograms made immediately after drainage of the hematoma (Fig. 14) showed a cavity with irregular outlines, probably due to retained clot. The pineal shadow was midline. Eleven days later the cavity had rounded out, perhaps due to liquefaction of residual clot. The pineal shadow again was displaced to the right. One hundred and twenty-eight days later, the shadow was smaller and denser, as though by contraction of the walls, and the pineal shadow was midline. It is proposed to follow this to a stationary state by studies at six-month intervals.

Discussion

Previous reports have stressed particular types of hemorrhage amenable to surgery. This is the most efficient way of getting information on a single type, but for a comprehensive view of the problem, all types must be considered jointly; otherwise an unexpected, coexistent lesion may be missed. Thus, Meredith[3] and Craig and Lipscomb[4] emphasized that for the diagnosis, as well as for treatment, surgery is advisable in all cases of expanding intracranial lesions. Frugoni, Baker, and Adson[5] advised at least burr-hole exploration, even if a malignant tumor is suspected.

Cause.—(*a*) Trauma: Browder and Turney[6] reported 29 operations in 80 cases of intracerebral hematomas, 25 with skull fractures. Their paper is an excellent consideration of this phase of the problem. Cases with hematoma related to fracture have been excluded from this discussion.

(*b*) Delayed post-traumatic hemorrhage (Spätapoplexie): In 1891, Bollinger[7] presented his 4 cases of hemorrhage and softening in the brain following cranial trauma. Subsequently, many papers have been written on the subject, many treating conditions widely different from his cases, only one of which included gross cerebral

hemorrhage The modern concept of the lesion still is confused Some[8] require that the symptoms start within seven to ten days with gradual progression Others[9] consider an apoplectic onset most important Some writers require that no pre existing vascular disease be evident, while Wechsler[10] says that most of the cases have pre-existing vascular disease and trauma is only a precipitating factor Courville[8] found no definite pathologic basis for the syndrome and considers the hemorrhage due to pre existing vascular disease the trauma being incidental DeVeer and Browder,[11] however, found a possible anatomic basis for Spät-apoplexie At autopsy a tear was found in the intima and thrombosis in an artery adjacent to a branch vessel They speculated that had no thrombus occurred, an aneurysm might have developed with later hemorrhage Some[12] believe that hemorrhage following almost any trauma is due to the trauma Courville[8] states that an effective trauma is invariably followed by other evidence, such as contusion In this series, only Case 16 falls into this category Another, Case 6 also followed trauma, but was complicated by the presence of both a neoplasm and hypertension

(*c*) Association with vascular disease As would be expected the majority of these hematomas occurred in patients with vascular disease In the first 6 cases the hematomas were associated with hypertension or arteriosclerosis and the seventh with bacterial endocarditis Luther work[13 14] on this topic was concerned with selecting from the common apoplectics a group of patients who might recover after surgical removal of the clot Bagley[15] suggested as surgically favorable cases those with an acute onset but with gradual progress of the clinical picture and the development of signs of increased intracranial pressure In general these criteria still stand In addition to the common arteriosclerosis and hypertension, other vascular diseases such as eclampsia[16] and purpura[17] may be complicated by hematoma formation

In many so called 'spontaneous" cases, no active bleeding point can be found This is true especially with the lesions in the posterior temporal and occipital areas and since the blood pressure generally is not elevated Craig and Adson[18] believed these to have a venous origin

(*d*) Association with aneurysms It usually is supposed that when an aneurysm of a major cerebral vessel ruptures into the cerebral substance, the blood enters a ventricle with a fatal outcome Richardson and Hyland[19] found 22 percent of massive intracerebral hemorrhages encountered in routine autopsies due to ruptured aneurysms of the circle of Willis

Attempting to find and obliterate aneurysms

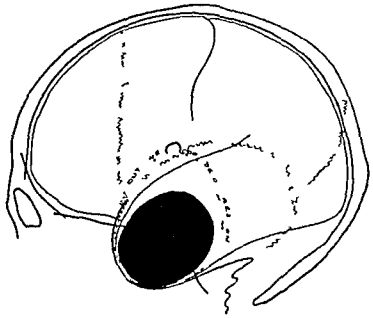

FIG 10 Case 12—Left temporal hematoma due to ruptured aneurysm of middle cerebral artery

of the circle of Willis I have operated upon 4 patients each having a hematoma in the frontal lobe Case 12 of this series was one similar, clinically to these, but the cyst was emptied The patient made good progress for twelve days, then died suddenly The hemorrhage was from an an eurysm of the middle cerebral artery Cases 13 14 and 15 presented almost identical clinical and surgical findings and the hematomas are believed to be of aneurysmal origin also These lesions are most common near the rostral part of the circle of Willis, in the frontal lobes[19 20] The clinical course starts with subarachnoid hemorrhage the acute effects of which may clear Signs then develop of an expanding cerebral lesion This may be confirmed by air studies[21] which have not been productive of mischief in my experience At operation one finds the subarachnoid space filled with clotted blood The hematoma is evacuated and the walls of the cavity usually are shaggy and stained with blood pigments In one of my unreported cases the aneurysm was present in the floor of the cavity The aneurysm usually is not visible and since one has little reason to explore for it no source of the hemorrhage is found If the aneurysm heals, as it often does in cases without proved hematoma formation the case is listed as 'spontaneous" just as one must so classify such cases of subarachnoid hemorrhage Statistical studies indicate that so called spontaneous subarachnoid hemorrhage must be considered to be due to aneurysm unless proved otherwise

(*e*) Association with neoplasms In 94 autopsy cases, Globus and Saperstein[22] found that hemorrhage into a brain tumor is not a determining factor in sudden death Hemorrhage may cause precipitation of symptoms in these patients, how-

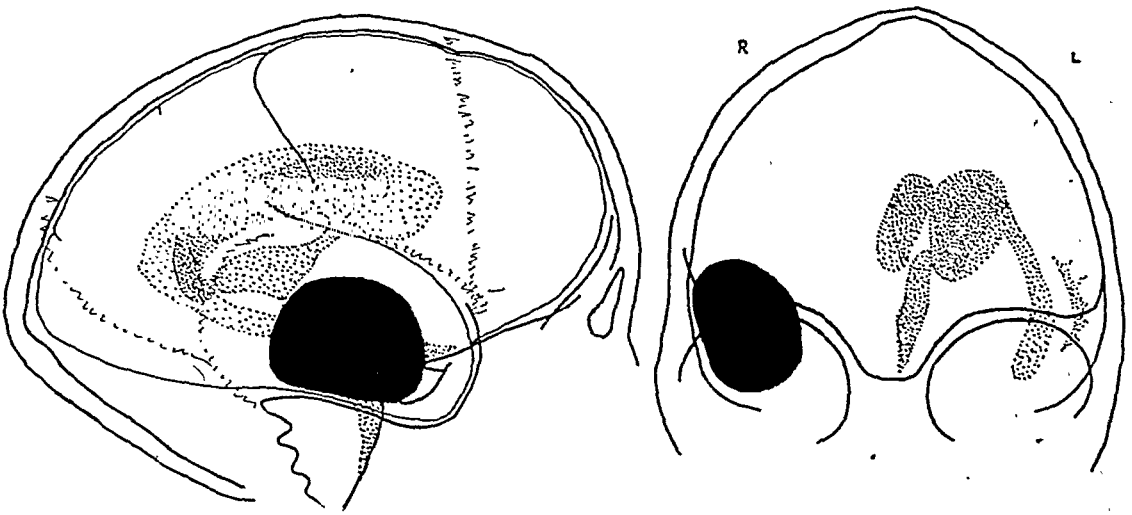

FIG. 11. Case 13—Right temporal hematoma due to ruptured aneurysm (?)

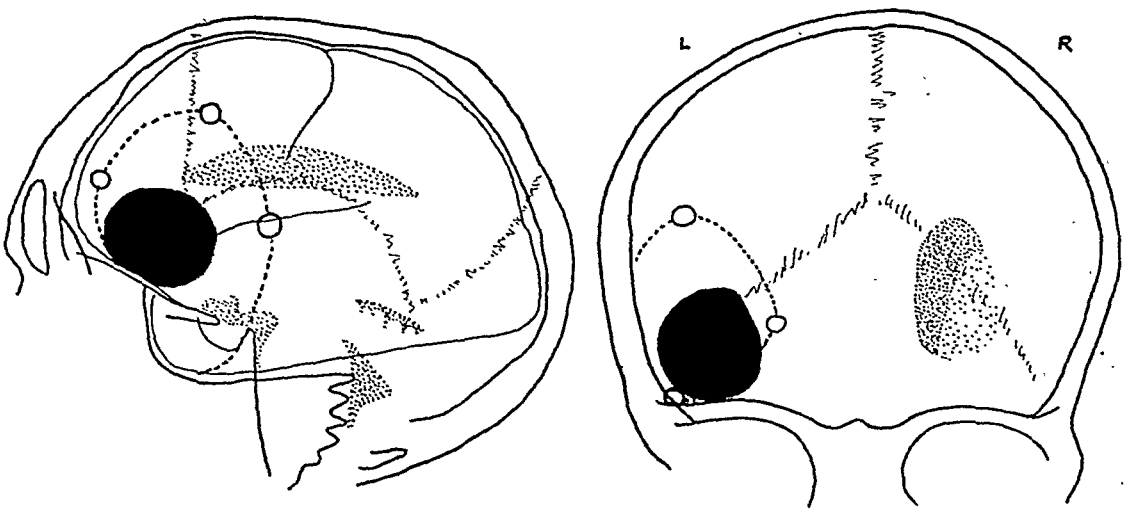

FIG. 12. Case 14—Left frontal hematoma due to ruptured aneurysm (?)

ever. In 14 subcortical hematomas, Wilkins found 4 due to tumor, 8 to trauma, and 2 spontaneous. Craig and Lipscomb[4] reported a case of ventricular hemorrhage due to a hemangioma on the medial wall of the ventricle. Meredith[3] reported another ventricular hemorrhage, the cause of which was not verified. Case 8, of ventricular hemorrhage, was associated with a ventricular wall metastasis. Hemorrhage into a tumor may give the first evidence of the existence of the lesion, and removal of the clot may be followed by gratifying recovery even when the tumor is not removable.

Location of the Lesion

In this series, the hemorrhage was located in the frontal lobe in 4 cases,[15,17,18,23] temporal in 5,[1,5,9,24,25] parietal in 1,[11] occipital in 3(Cases 7,8, 16), cerebellar in 2,[6,12] and in the lateral ventricle in 1.[4] Various writers have been impressed with an apparent predilection of these lesions for certain areas. Six of Pilcher's[26] 8 cases were posterior temporal or parietal. Browder and Turney's[6] traumatic hematomas were predominantly in the temporal and parietal areas. Courville[8] found the hematomas usually in the frontal and temporal areas after trauma. In most of Bagley's[15] favorable cases the hemorrhage was in the temporal lobe. Apparently, he used the subtemporal decompression as his approach to most of these lesions and this may have influenced the position of the verified hemorrhages. Craig and Adson's[18] cases predominated in the temporal and parietal areas and in discussion of their paper, Naffziger emphasized the posterior location of these lesions. Except for one in the cerebellum, all of Wilkins'[27] cases were in the temporal or parietal lobes. Meredith[3] was impressed with the paucity of cases in the cerebellum, but these have been reported by several others.[15,17,26,27] Possibly if the cause of the hemorrhage could be ascertained in all cases, this would be found to be the determining factor in the location of the lesion.

Age of the Patients

Although some writers have been impressed by the youth of the patients harboring these lesions, the ages in this series ranged from 13 to 73 years, an average of 41.8 years.

Mechanism of the Hemorrhage

The effect of the ceaseless force of the arterial blood pressure upon an arterial wall weakened by arteriosclerosis, aneurysm, etc., can be imagined. These factors are not necessarily at play in all cases. After autopsy study of cases of spontaneous cerebral hemorrhage, Globus[25] concluded that the hemorrhage occurs into areas of softening produced by earlier vascular occlusions. He reached a similar conclusion[20] in the case of aneurysms: the altered blood flow caused by the aneurysm produces the prehemorrhagic area of softening. Richardson and Hyland,[19] however, found that the aneurysm usually was partly imbedded in the adjacent cortex. With rupture the hemorrhage lacerated the white matter, producing intracerebral hematomas of varying size. Bagley[15] reported a case of spontaneous subarachnoid hemorrhage that cleared, the patient dying later of an unrelated lesion. Sections showed a healed tear extending completely through the sclerotic internal carotid artery. This indicated that a patient may survive a direct tear through a major intracranial vessel, and suggests that the antecedent softening is not necessary in the development of the nonfatal lesions under discussion here. Case 13 is an example of an aneurysmal rupture producing a large cavity in the adjacent brain. This was not a terminal event and the patient could have survived it, had the vascular lesion healed.

Fate of the Hematoma

In the traumatic cases, Browder and Turney[6] found clotted blood in the patients dying a few hours after injury. Twelve to fifteen hours later the clot was "syrupy" and suitable for aspiration. I was unable to reach any conclusion as to the type of clot to be found at any particular stage of these lesions. When such a clot is aspirated, old fluid blood can be obtained from almost all of them and when the cyst is opened, practically all of them contain solid clot, at any time after the hemorrhage. Probably these clots undergo the changes described by Gardner[23] and by Zollinger and Gross[28] in cases of subdural hematoma: The blood partly coagulates, then undergoes gradual liquefaction. This is suggested by the course of events in Case 16. It is doubtful if aspiration alone empties any of these lesions. If the patient grows worse, the lesion should be reaspirated,[15] or opened directly. In Case 1, of two months' duration, 30 cc. of clear, golden-yellow fluid was aspirated from the hematoma which, when opened, contained 60 cc. of black clot that had separated into polypoid masses. The capsule was firmer than the surrounding brain, suggesting tissue organization. In "younger" lesions the walls are more likely to be soft and shaggy and the contents of plum-colored, oily-appearing liquid and softer, gelatinous clotted blood. The lesion, if not fatal, or not drained, may persist for a long time. The cavity[24] gradually becomes smaller and, as necrotic tissue is absorbed, its irregular margins become smooth. Yellowish-orange coloration, due to the presence of blood pigments, may re-

main for months, or years, in the wall. As in the case of abscesses, encapsulation,[13 26] scar formation, and even calcification may occur. Fluid-filled cysts may persist for years after the hemorrhage, and in the walls tough scars may develop.[29] Epilepsy has developed both in operated cases and in those surviving without operation.

Conclusions

Localized cerebral hematomas may occur in any part of the brain and have a variety of causes. They are most frequent in patients with cerebral vascular disease, as are the fatal hemorrhages, but they may occur without obvious cause. Evacuation of the hematoma is attended by a high percentage of recovery. Surgery should be considered in cases with apoplectic or gradual onset, with progression of signs and the development of evidence of increased intracranial pressure. Encephalography or ventriculography should be used if localization is not evident. If the patient's condition is poor, trephine aspiration of the clot usually will prove beneficial. Flushing out the cavity with colloidal thorium dioxide suspension will make possible later roentgenographic check upon the progress of the lesion. Aspiration does not eliminate the solid clots that are present in most hematomas, if symptoms return, the clot should be evacuated completely.

Cases with spontaneous subarachnoid hemorrhage that develop increasing intracranial pressure and signs of localization to the frontal or temporal lobes are likely to have hematomas of aneurysmal origin amenable to surgical treatment. While some of these may later rupture fatally, others heal, especially if long bed rest is insisted upon. In cases that recover without drainage, intracerebral hematomas may persist for years as cysts with organized walls. These may even calcify and may act as foci for convulsive seizures.

Summary

Sixteen cases are presented of gross intracerebral hematomas that were drained, with 14 recoveries and 2 deaths. One death was due to massive pulmonary atelectasis, and the other to a fatal recurrent hemorrhage from a ruptured aneurysm of a major cerebral vessel. Seven of the cases were associated with cerebral arterial disease and 5 with intracerebral neoplasms (3 metastatic, 1 meningioma, and 1 astrocytoma). One case was proved (and 3 were suspected) to be due to ruptured aneurysms of the major blood vessels. One case was of delayed post-traumatic intracerebral hemorrhage.

The locations, causes, and mechanism of the hemorrhages and the fate of the lesions are discussed.

Acknowledgment—Cases 4 and 6 are included in this report through the courtesy of my associate, Maj. William F. Beswick, now with the Armed Forces.

Discussion

Dr. Leo M. Davidoff, *New York City*—Dr. Hamby is to be congratulated upon the accumulation of so impressive a series of what is undoubtedly a relatively rare neurosurgical condition, namely, gross intracerebral hematoma. He is further to be congratulated upon his ability either to verify, or at least to suspect, the cause of the hemorrhage in practically every case. Exclusive of cases of hemorrhage occurring into pre-existing tumors, of which I have not kept a separate record, my experience with this lesion consists of 9 verified cases at operation. Two of these were in patients with hypertension and arteriosclerosis, and I shall not dwell on these. One case was in a patient in whom an aneurysm was suspected but could not be verified. Although he died following operation, unfortunately no postmortem examination was obtainable. One patient was a woman of 48 with pre-existing hypertension who, ten days before operation, fell

down three or four steps, developed progressive signs of cerebral involvement, was suspected of a subdural hematoma, and proved to have an intracerebral hematoma. Plain x-rays of the skull showed a definite linear fracture, indicating a traumatic precipitating cause in a patient potentially susceptible to hemorrhage because of her hypertension. One of my patients was a 30-year-old garage mechanic who struck his head against the underside of a car while standing in a pit beneath it. Ten months later he was operated upon for an intracerebral mass. It proved to be a hematoma located in the region of the corpus callosum, and at the bottom of the clot a mass about 1.5 cm. in diameter was found, more solid than the clot itself, was removed without any difficulty, and on examination proved to be a knot of veins obviously representing a venous angiomacongenital in nature, with thrombotic vessels. It was our conclusion that this was a case in which the hemorrhage was precipitated by the trauma in an individual susceptible to bleeding because of the venous tumor. Still another most unusual case was in a 37-year-old-woman with no evidence of hypertension who had a spontaneous subarachnoid hemorrhage and was suspected of a leaking aneurysm. She showed at the time of her hospitalization a positive left Babinski sign. She recovered completely, however, except for the Babinski sign, and was discharged home. Six months later she began to complain of headaches, was brought back into the hospital and showed early papilledema and slight hemiparesis of her left leg. Electroencephalogram showed a localized lesion in the right superior frontal region. Exploration was made in this region, and a brownish discoloration and flattening of the convolutions in the superior, posterior frontal area was found, which led to a diagnosis of intracerebral hemorrhage. The contents of the hematoma were exactly like what Dr. Hamby has described. There was one unusual feature about this case, however, and that was that the lining of the cavity was a membrane colored green, orange, brown, and yellow, and looking exactly like the membrane that one sees in a subdural hematoma. It could easily be removed and left behind a smooth cavity of white matter. As the membrane was being separated, it led to the medial aspect of the brain, where we found that it passed through the brain substance and was attached to the inferior margin of the falx, where a thrombosed vein was found included in the pedicle. Our conclusion in this case was that we were actually dealing with a subdural hematoma imbedded in the brain tissue. There was no history of trauma.

Our final group of cases consisted of three children, two boys, one of 14 and one of 17, and one girl, also of 14 years of age. The symptoms in these children began spontaneously. In the 17-year-old boy there was a rapid development of only two days, leading to an emergency operation. In the girl, symptoms developed gradually over a period of seven months, and in the other boy in about three months. In all instances, the hemorrhage was located in the posterior and superior frontal region, two left and one right. In none of the cases was there any blood in the cerebrospinal fluid, no connection with the ventricles, and no evidence of aneurysm. In none of the cases was a definite history of trauma obtained, although in children of that age unrecognized or unreported trauma, for fear of bringing down the wrath of the parents, is possible.

The cause of these cases remains unknown. If I were forced to speculate, I would think that we are dealing here with venous angiomas that have ruptured, rather than with small arterial aneurysms.

STANDARD UNIT ADOPTED FOR PENICILLIN

The Conference for the Standardization of Penicillin recently held in London under the auspices of the Health Section of the League of Nations decided upon a pure crystalline preparation of a sodium salt of penicillin G as the International Standard, and defined the International Unit as the penicillin activity contained in 0.6 micrograms of the International Standard.

Agreements of this kind were first reached for antitoxins, when in 1921, the Health Committee of the League took up the question of measuring the activity of a number of modern biologic remedies in order to obtain international uniformity by agreements to use a common set of standards and units. Standards for vitamins, hormones, insulin, digitalis, arsphenamine (powder used for protozoan infections) were subsequently decided upon, with the result that today the activity of over thirty biologic products is being assessed in terms of international standards. They are distributed throughout the world for the League by the National Institute for Medical Research, London, and the State Serum Institute, Copenhagen, even in war times.

The Penicillin Conference, to which Sir Alexander Fleming, father of the miraculous drug, came, as well as three delegates each from the United States, and Great Britain, and one each from Australia, Canada, and France, also adopted a Working Standard. This Working Standard, for distribution to laboratory workers, consists of a calcium salt of penicillin, 2.7 micrograms of which were accepted as containing one International Unit of penicillin. Both the International and the Working Standards are to be deposited with the National Institute for Medical Research in London.—*Conn. State M. J., Jan., 1945*

PRACTICAL EXPERIENCE WITH CONGENITAL HEART DISEASE

HYMAN GREEN, M.D., Boston, Massachusetts

(Associate physician, Children's Hospital; consulting pediatrician, Beth Israel Hospital, Boston)

SUCCESSFUL ligation of a patent ductus arteriosus in 1939[1] has aroused renewed interest in congenital heart disease. As a result, more and more cases come to us for diagnosis and possible operation. One does not want to operate unnecessarily, and under an incorrect diagnosis, so the criteria for operation must be present before it is undertaken. Like sympathectomy for hypertension and complete thyroidectomy for congestive heart failure, the ligation or section of a ductus arteriosus can easily fall into disfavor if its importance is not properly evaluated.

Congenital heart disease was, until recently, an insignificant part of the teaching of cardiology in most medical schools and pediatric clinics. As a general rule, the diagnosis submitted by a practicing physician referring a case of congenital heart disease demonstrates his meager knowledge of anatomic cardiac diagnosis, but he persists in offering one. For example, he may write, "Please admit this case of mitral regurgitation to your clinic and report on it. I should be greatly interested to know the condition of the foramen ovale." When we looked up the incidence of congenital heart disease as a cause of infant mortality in Boston, it was found that the diagnosis on a death certificate meant nothing. One doctor certified the death of every infant who died of cyanosis as caused by disease of the foramen ovale.

The purpose of this paper is to present types of congenital heart disease which can be diagnosed, together with pertinent data, in an attempt to dissuade pediatricians from calling every case of congenital heart disease septal defect or patent ductus arteriosus. It is extremely difficult, in the first six months, to make a correct anatomic diagnosis of congenital heart disease, by x-ray or by any other physical means. Most infants die in the first few months of conditions incompatible with life such as aortic atresia, persistent truncus arteriosus, transposition of the great vessels, a bilocular or trilocular heart, ectopia cordis, and other combinations or defects. It is nevertheless important to have an x-ray picture of an infant with dyspnea or cyanosis, with or without a murmur, since the cause may be a diaphragmatic hernia, a congenital air cyst, a lung anomaly, an absent pericardium, or pulmonary hemorrhage. A case in point is an infant twenty-four hours old who had intermittent cyanosis. When he was held up he was not so blue as when he was lying down. The heart was percussed on the right side. X-ray examination showed part of the intestines in the left side of the chest, pushing the heart to the right. There was a diaphragmatic hernia.

Another important factor in early life, from the point of view of diagnosis, is an enlarged thymus gland. Twenty years ago this was considered the cause of convulsions or cyanosis in infants. As a result, such patients were subjected to x-ray treatments for these symptoms. The thymus gland is large at birth and does alter the cardiac contour and outline. Its size may be altered by x-ray treatments, but these have no effect on the underlying heart condition. It is still the custom in many parts of the country to treat enlarged thymus glands regardless of the symptoms or underlying condition. It is my belief, however, that the thymus gland is rarely the cause of death in infancy, so the treatment for its enlargement is unnecessary.

Another reason for the difficulty of correct diagnosis in the first six months to one year of life is that there are changes in pressure in the heart chambers caused by postnatal adjustments of the circulation. Hence it is not uncommon to find that murmurs do not appear until later. In the second year of life the thymus becomes involuted and the thorax is a little longer, and one is then able to diagnose certain defects more accurately. At least, from this time on, serial x-ray films taken at intervals of six months assume a characteristic outline with which one becomes familiar. It is the duty of the pediatrician to familiarize himself with the x-ray pictures in cases of heart disease by studying their outlines carefully and not accepting a written report from a roentgenologist at its face value. Two decades ago a correct anatomic diagnosis of a congenital heart lesion was more or less a matter of chance. Now, at least some defects are easier to diagnose. A survey of the autopsies during the last ten years in a large general hospital in the East showed that 50 per cent of the cases of congenital heart disease were diagnosed correctly as to anatomic lesions, and this percentage was considered satisfactory by one of the leading cardiologists in the country.[2] Now, besides a careful physical examination and

Read by invitation at the Annual Meeting of the Medical Society of the State of New York, New York City, May 10, 1944.

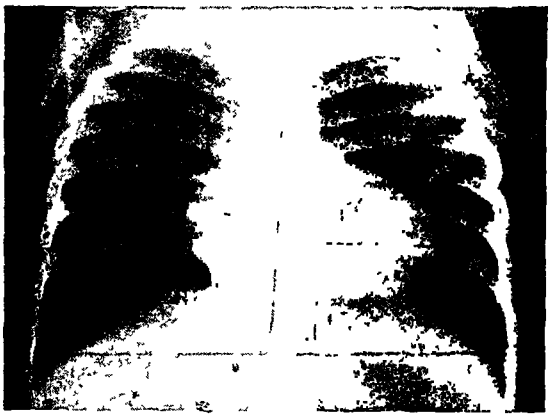

FIG. 1. Prominence of right auricle and right ventricle because of marked enlargement. No shadow in region of pulmonary conus, so that right ventricle is shaped like a sheep's nose.

history, there are aids, laboratory and otherwise, to a correct anatomic diagnosis. These aids are not necessary in all cases but may be used in more difficult ones. They include the circulation time, the blood volume, the venous pressure, the phonocardiogram, x-ray examination, with and without diodrast, the electrocardiogram, puncture of the femoral arteries to obtain arterial blood for oxygen determination, palpation of the femoral arteries, the blood pressure of the arms and legs, the sedimentation rate, a complete blood examination, a vital-capacity determination, and a metabolism test. It is not possible to discuss all these aids to diagnosis here, and they are not available to pediatricians in general practice, but in severe cases which are difficult to diagnose these data should be obtained. According to a recent survey made by Levy *et al.*,[3] of all the congenital heart cases found in Army inductees, cases of interventricular septum were the most frequent. Next in frequency was patent ductus arteriosus, and next coarctation of the aorta. This is not the order of frequency in a children's clinic devoted to congenital heart disease, for the order found there is first, defect of the interventricular septum, next, patent ductus arteriosus, the tetralogy of Fallot, then defect of the interauricular septum, then a few cases of coarctation of the aorta, and last, the tetralogy of Eisenmenger. These conditions will now be discussed.

Defect of the Interventricular Septum.—An infant or older child without cyanosis, usually without cardiac enlargement, and with a loud, rough, blowing, systolic murmur, heard most usually over the body of the heart or over the lower end of the sternum, can be said to have a defect of the interventricular septum. There is nothing particularly significant in the cardiac contour as shown by x-ray. The electrocardiogram is usually normal. This diagnosis, then, is not much of a problem so far as the pediatrician is concerned.

Patent Ductus Arteriosus.—An outstanding diagnostic feature of this anomaly is a to-and-fro murmur at the base of the heart in the second left interspace, with a marked thrill. The murmur has been described as resembling the noise of a subway or of a train in a tunnel. It is systolic and diastolic in character. It is often heard only at the base. In some of these cases, if one listened only at the apex, nothing would be heard. For this reason it has been our policy always to listen at the base for murmurs of congenital heart disease. If the defect is large, there may be peripheral signs of aortic insufficiency. The diastolic pressure is usually low, there is no cyanosis, the vital capacity is unchanged, and the electrocardiogram usually shows no axis deviation. If there is right axis deviation, one must exclude the presence of some other congenital lesions. Fluoroscopically, there is a so-called "hilar dance." X-ray examination shows the pulmonary conus to be prominent, and there may be some degree of dilatation of the left auricle and enlargement of the left ventricle. The phonocardiogram indicates a nearly continuous murmur which reaches maximum intensity immediately before and after the second sound.

The question is often asked how soon these cases should be operated on. The answer is that they cannot be operated on before the diagnosis is made, and this is rarely done before one year of age. In our clinic, 70 patients have been operated on since 1939, the youngest of them being eleven months of age. There were three surgical deaths.[4] Following operation the diastolic pressure increases immediately and the pulse rate slows as a concomitant of decrease in cardiac output. The indications for operation[5] are a delay in growth and development, a large arteriovenous shunt producing signs of an aortic regurgitation, and subacute bacterial endocarditis. Naturally, section of the ductus is preferable to ligation. Bacterial endocarditis may be treated with chemotherapy for a few weeks. If there is then no improvement, surgery is indicated.

Tetralogy of Fallot (Fig. 1).—This defect is primarily different from the other two in that these patients have cyanosis. It is not unusual in our clinic to find in one afternoon 4 to 5 cases of cyanosis in varying degree in children of all ages. These patients have dyspnea, cyanosis, clubbing, and a heart murmur which is not particularly characteristic. Hence, we proceed to x-ray

FIG. 2. Low-power view of a postmortem dissociated tooth displaying marked engorgement of the capillaries in the dental pulp.

examination, which we believe to be pathognomonic. It shows a prominence of the right auricle and right ventricle due to marked enlargement. There is no shadow in the region of the pulmonary conus, so that the right ventricle is shaped like a sheep's nose. The electrocardiogram shows preponderance of the right ventricle. The red cell count is usually from 5,000,000 to 9,000,000.

In analyzing the cases which came to autopsy in our hospital, we discovered that four other defects were found in the hearts of these children besides the four described by Fallot, namely, pulmonary stenosis, enlargement of the right ventricle, defect of the interventricular septum, and dextroposition of the aorta. We also found an enlarged aorta to make up for the small pulmonary valve, an enlarged aortic valve because of the fact that blood from both ventricles was flowing through the aorta, a hypoplastic pulmonary artery, since less blood was flowing through this channel, and an enlarged right auricle caused by increased pressure of blood in the right ventricle. This we have described as an octology (Emerson

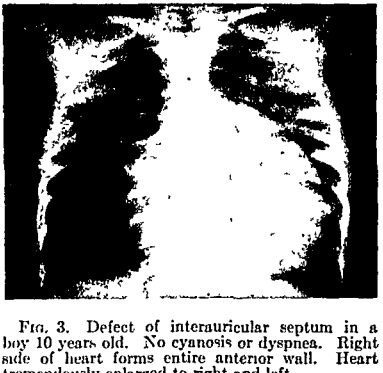

FIG. 3. Defect of interauricular septum in a boy 10 years old. No cyanosis or dyspnea. Right side of heart forms entire anterior wall. Heart tremendously enlarged to right and left.

and Green).[6] It is our belief that diodrast is not necessary to make the diagnosis of this condition.

It is interesting that pediatricians who examine patients with congenital heart disease with *cyanosis are prone to give very poor prognoses.* Some predict that the infant will never grow up, and still others that he will suddenly drop dead. No one can give an accurate prognosis in cases of cyanosis, but the more correct the diagnosis, the better will be the judgment used in making a prognosis. Feigin and Rosenthal[7] recently reported two cases of tetralogy of Fallot in patients 53 and 43 years of age, respectively. White's case was a famous musician with this condition who lived to his sixtieth year.[8]

The clinical manifestations in this group are slowness in growth and development, a tendency to underweight, onset of cyanosis from birth to five months of age, onset of dyspnea from one and one half to ten months of age, a tendency to squat when the walking age is reached (possibly a means of adjusting the circulation and obtaining relief from pain), toothache, frequently noticed in these cases, caused by engorgement of capillaries in the dental pulp (Fig. 2), and finally, thromboses as a result of slowing of the circulation. These last may be either venous or arterial. They have occurred in the cerebrum, aorta, and subclavian veins.

Defect of the Interauricular Septum (Fig. 3).— In this condition, there is usually no cyanosis. The heart is tremendously enlarged to the right and left. There is usually a prominence of the left precordium. In spite of the cardiac hypertrophy it is remarkable that these children do

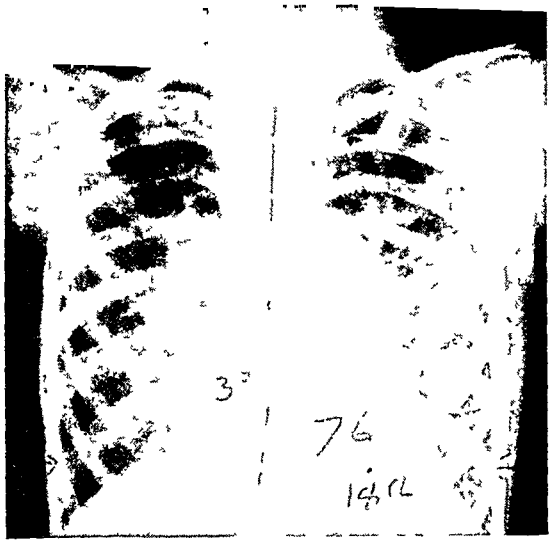

FIG. 4. Tetralogy of Eisenmenger. Pulmonary artery shows bulge in region of conus, as contrasted with an absence of shadow in tetralogy of Fallot

not have much dyspnea. The interauricular defect may be in the upper part of the septum, when it is called persistence of the ostium secundum, or in the lower part, when it is called persistence of the ostium primum. Abbott has described persistence of the ostium primum as occurring in cases of mongolism. However, we have found it in perfectly normal children who have grown up and carried on in high school. In these cases, the right side of the heart forms the entire anterior wall, the pulmonary artery is large, and the aorta is usually below the normal average.[9] Valvular lesions with this condition affect the mitral orifice. All the branches of the pulmonary artery are enlarged. The aortic knob is almost entirely missing. The diaphragm is in a low position, because of simple weight depression.

Coarctation of the Aorta.—A narrowing of the aorta at a point distal to the origin of the left subclavian artery constitutes coarctation of the aorta. It is of varying degrees. If it is pronounced, collateral circulation and widened and tortuous intercostal arteries constitute the picture. The heart is usually normal in size, with some hypertrophy of the left ventricle. As a result of the tortuous intercostal arteries erosion of the ribs takes place. The youngest patient reported by Roesler was six years of age. This is not a common condition in childhood. Up to 1942, 47 cases of the adult type were reported diagnosed during life in children below the age of 15 years.[10] The x-ray picture is not characteristic. It usually shows the absence of the aortic

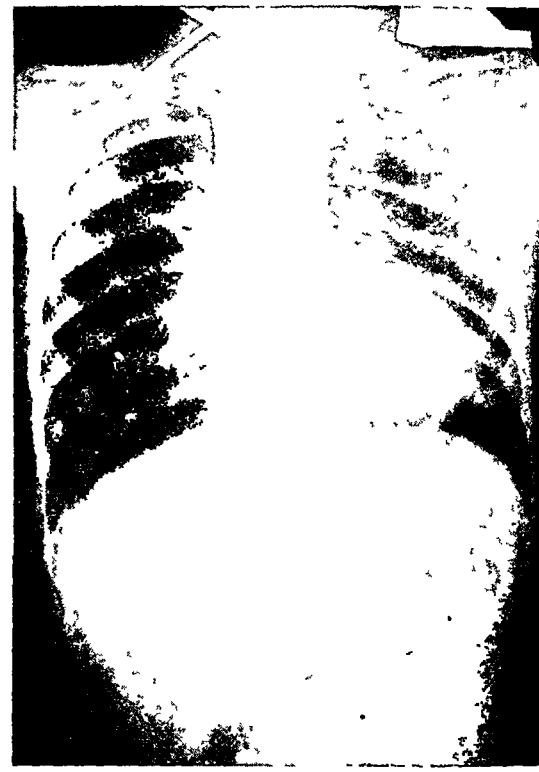

FIG. 5. Diodrast injection in a 7-year-old girl with tetralogy of Fallot, showing inferior vena cava and portal circulation. This child had a right hemiplegia.

knob in the adult, but as this aortic shadow in early life is usually absent or inconspicuous, this sign is not reliable in youth. The blood pressure of the arms and legs gives a clue to this condition, since it is generally low or absent in the legs and higher in the arms. Normally, the reverse is true. Hence it is our practice to palpate routinely for pulsations in the femoral arteries. If these are absent the blood pressures are taken as described. Injections of diodrast demonstrated the collateral circulation in the vessels of the neck in one of our cases. Experimental surgery on animals has been attempted to correct this condition.[11]

Tetralogy of Eisenmenger (Fig. 4).—This condition was described ten years later than the tetralogy of Fallot. Clinically the differences between the two are relatively less cyanosis and clubbing in the Eisenmenger type, hoarseness in the Eisenmenger type, but not in the Fallot, pulmonic insufficiency with a diastolic murmur in the Eisenmenger type, a contrast in the accentuation of the pulmonary conus as shown by x-ray and by percussion, and possibly a difference of transmission of systolic murmurs.[12] The x-ray picture is characteristic, since the pulmonary

artery in the Eisenmenger type shows a bulge in the region of the conus, as contrasted with an absence of shadow in the tetralogy of Fallot There is also preponderance of the right ventricle by the electrocardiogram. In the cases reported, patients have lived for thirty-two, thirty-three, twenty, sixty, ten, thirty-one, and thirty-two years, respectively

Use of Diodrast (Fig. 5)

In the last few years, injection of 70 per cent diodrast has been used by workers in this field We did considerable work with this before the war, but have since used it sparingly, because we have had insufficient help There is no question that some congenital heart lesions can be clearly visualized by the use of diodrast However, it must be carefully used and only by those who have had adequate experience with it Sussman[13] and his coworkers have found it useful in the diagnosis of pulmonary lesions, dextrocardia, and coarctation of the aorta We have used it in the cases difficult to diagnose and in cases of possible diaphragmatic hernia producing shadows which cannot be distinguished from the heart itself

Conclusions

From the foregoing the following conclusions may be drawn The more correct the anatomic diagnosis, the more careful and accurate will be the prognosis Murmurs do not necessarily imply the presence of patent ductus arteriosus The proper anatomic diagnosis of congenital heart disease can be made by coordinating and correlating the findings by x-ray and electrocardiogram, the clinician's findings, and frequent visits to the pathologic autopsy table Diodrast is a valuable aid if used properly and in experienced hands Last, the hope for a longer life for these children lies in surgery and chemotherapy.

FACTORS CONTRIBUTING TO THE FAILURES IN BILIARY-TRACT SURGERY

ROBERT P. DOBBIE, M.D., Buffalo, New York

I WILL discuss briefly certain phases of the management of benign biliary-tract disease, all of which are well known but many of which are often ignored or forgotten. The internist is usually the first to be consulted by the patient suffering from this common and serious disease, so upon him must rest the primary responsibility for diagnosis and cure.

At the present time, the only satisfactory treatment of calculus biliary-tract disease is surgery, and therefore, the operating surgeon is responsible for his share of the treatment and end results.

Biliary-tract disease comprises, for the most part, biliary-tract infection, associated in most instances with stones and the eventual complications of both. These complications are commonly stated to be acute cholecystitis with or without stones; cystic duct obstruction with hydrops or empyema of the gallbladder and the complications thereof; common duct stone with the varying degrees of associated cholangitis, hepatitis, impaired liver function, and eventual biliary cirrhosis; acute and chronic pancreatitis; and malignancy of the gallbladder and ducts.

It is well recognized that the morbidity and mortality of biliary-tract disease is directly dependent upon these complications, and it should be quite apparent that the earlier the disease is treated surgically in anticipation of and in prevention of these complications, the more satisfactory the results will be. One who sees these cases in any number, whether he be internist or surgeon, cannot help but be impressed with the fact that indifference or delay in treatment often causes regret and results in many undesirable and serious sequelae.

The failures in biliary-tract surgery are death, operative or postoperative complications preventing cure, or the persistence or recurrence of symptoms or ill health. Few, if any, will deny the gratifying results obtained by surgery in the great majority of treated cases of calculus biliary-tract disease, and though there is considerable room for improvement, great strides have been made in the past decade, and results are becoming progressively more satisfactory as regards both morbidity and mortality. These results are dependent upon the accuracy of diagnosis; the promptness of surgical treatment; the skill of the surgeon; and the adequacy of the surgery performed.

Read at the Annual Meeting of the Medical Society of the State of New York, New York City, May 11, 1944.

The factors contributing to the failures in biliary-tract surgery in the past, and at present, are perhaps well listed as follows:

1. Inaccurate diagnosis and the failure to recognize or heed the early signs and symptoms of the disease and its early complications
2. Delayed surgical treatment, due in most part to:
   (*a*) Lack of appreciation of the advantages of early surgery
   (*b*) Failure to appreciate the relative safety of early surgery
   (*c*) Indifference or lack of cooperation on the part of the patient
3. Inadequate surgical treatment, the result of:
   (*a*) Poor surgical judgment
   (*b*) Inadequate surgery which is avoidable
   (*c*) Inadequate surgery which is unavoidable
4. Postcholecystectomy syndrome due to dyskinesia of sphincter mechanism

It is the author's opinion that most of the failures experienced following surgery are directly attributable to one or more of the causes listed, and for this reason a few brief but pertinent comments pertaining to each seem indicated.

Inaccurate Diagnosis and Failure to Recognize Early Signs, Symptoms, and Complications

Experience shows that from the clinical symptoms presented, one cannot consistently or accurately estimate and appraise, preoperatively, the nature and degree of pathology present. Real biliary colic is often absent or at least not manifest in the history of some individuals who are harboring stones in the gallbladder, or even in the ducts.

Contrariwise, typical and repeated attacks of colic may occur in those displaying little or no other evidence of stones or chronic biliary tract disease, and may in fact be due to disease outside the biliary tract. On occasions, at operation or autopsy, we have been surprised to observe varying degrees of pathology in the biliary tract which were never intimated in the history or clinical findings. Also, serious coincidental or associated lesions never suspected are at times uncovered, to the embarrassment of the clinician.

It is quite true that such instances, and many others which could be mentioned, are the exception rather than the rule, but they suffice to emphasize the importance of accurate diagnosis and to demonstrate that the history alone, although extremely important, is far from infallible and not as reliable as has been so universally taught in the past

If we are to determine the presence of early biliary tract disease, we must avail ourselves of additional existing aids to augment the history, in an effort to substantiate or disprove our suspicions relative to the presence of this disease Of these aids, the cholecystogram is outstanding and offers us the most accurate method available for diagnosing early gallbladder pathology. Such studies, however, attain this distinction only when employed with most meticulous care and under the supervision of a thoroughly capable and experienced roentgenologist The various methods of technic in carrying out the procedure, though important, have no place in this presentation, but it is important that we realize what aid we can expect and the degree of accuracy which is now obtainable

It is true that not more than 30-35 per cent of gallstones will be demonstrated on the plain film, because only this percentage of stones contain calcium

Only when demonstrated is the diagnosis positive, and the report of no demonstrable stone shadows on such a plain film is, of course, of no significance

On the other hand, the information obtained from cholecystography is impressive and accurate to an unbelievable degree, approximating that shown in the following listed types of radiographic reports [1]

1 Nonfunctioning gallbladder or nonvisualization As a criterion of existing gallbladder pathology, the diagnosis should be correct in 90-95 per cent of cases studied with dye

2 Poorly-functioning or faint visualization Gallbladder pathology will be demonstrated in 88-90 per cent of those cases so reported. It is advisable to add, however, that such a report of radiographic interpretation is quite infrequent and reserved for only the occasional borderline case

3 Normally functioning or good visualization· This radiographic diagnosis will be accurate in 80–85 per cent of those cases proved at operation Such statistics, of necessity, are obtained from a series of individuals presenting typical clinical symptoms and upon whom cholecystectomy was performed in spite of the negative radiographic findings

4 Reports of stone visualization (*a*) In nonfunctioning gallbladders with stones, the percentage of accuracy will be the same as that obtained with the plain film—30–35 per cent as far as the presence of stones is concerned But it can also be, I believe, fairly stated that, in a considerably higher percentage, stones will be found because a very high percentage of diseased gallbladders contain stones with or without calcium, and only those containing calcium can be demonstrated in a gallbladder which cannot be visualized (*b*) In functioning or visualized gallbladders, the presence or absence of stones should be demonstrated with a theoretic accuracy of 100 per cent Practically, however, a percentage of accuracy approaching 95 per cent may be reasonably expected

In commenting upon the above statistics pertaining to the accuracy of x-ray diagnosis, it should again be emphasized that the results obtained are dependent upon the care with which such studies are conducted, and with such care there is no other single clinical test which can approximate this record in the diagnosis of biliary-tract disease

Delayed Surgical Treatment

Though it seems superfluous, it is difficult to refrain from comparing the desirability of early surgical treatment with the disadvantages of delayed or late surgery. It seems entirely illogical and unjustifiable to ignore, or at least not to recommend, surgical interference in cases of early or mildly complicated gall-tract disease because of the lack of severe or disabling complaints or repeated attacks of typical colic and jaundice, when one knows that weeks, months, or years later the same patient will in many instances require more extensive surgery at a less opportune time and under conditions far less favorable, due to complications which are the result of progressive, protracted, and, at times, irreparable disease

At this later date, the necessary surgery is, as the disease has become, more complicated, more serious, and of greater risk to life, and the results, therefore, are less satisfactory The attitude taken above is not exaggerated or far-fetched On several occasions, upon inquiring of an elderly woman patient with long-standing jaundice, who has suffered for twenty or thirty years with typical signs and symptoms of gallstone disease, as to why she had not submitted to surgery at an earlier date, the usual reply has been that it was never advised, or it was thought too risky and dangerous by her physician Such an attitude on the part of either physician or patient can only be explained, though not excused, by failure to appreciate the relative safety of early and adequate surgical treatment of biliary-tract disease

FACTORS CONTRIBUTING TO THE FAILURES IN BILIARY-TRACT SURGERY

ROBERT P. DOBBIE, M.D., Buffalo, New York

I WILL discuss briefly certain phases of the management of benign biliary-tract disease, all of which are well known but many of which are often ignored or forgotten. The internist is usually the first to be consulted by the patient suffering from this common and serious disease, so upon him must rest the primary responsibility for diagnosis and cure.

At the present time, the only satisfactory treatment of calculus biliary-tract disease is surgery, and therefore, the operating surgeon is responsible for his share of the treatment and end results.

Biliary-tract disease comprises, for the most part, biliary-tract infection, associated in most instances with stones and the eventual complications of both. These complications are commonly stated to be acute cholecystitis with or without stones; cystic duct obstruction with hydrops or empyema of the gallbladder and the complications thereof; common duct stone with the varying degrees of associated cholangitis, hepatitis, impaired liver function, and eventual biliary cirrhosis; acute and chronic pancreatitis; and malignancy of the gallbladder and ducts.

It is well recognized that the morbidity and mortality of biliary-tract disease is directly dependent upon these complications, and it should be quite apparent that the earlier the disease is treated surgically in anticipation of and in prevention of these complications, the more satisfactory the results will be. One who sees these cases in any number, whether he be internist or surgeon, cannot help but be impressed with the fact that indifference or delay in treatment often causes regret and results in many undesirable and serious sequelae.

The failures in biliary-tract surgery are death, operative or postoperative complications preventing cure, or the persistence or recurrence of symptoms or ill health. Few, if any, will deny the gratifying results obtained by surgery in the great majority of treated cases of calculus biliary-tract disease, and though there is considerable room for improvement, great strides have been made in the past decade, and results are becoming progressively more satisfactory as regards both morbidity and mortality. These results are dependent upon the accuracy of diagnosis; the promptness of surgical treatment; the skill of the surgeon; and the adequacy of the surgery performed.

Read at the Annual Meeting of the Medical Society of the State of New York, New York City, May 11, 1944.

The factors contributing to the failures in biliary-tract surgery in the past, and at present, are perhaps well listed as follows:

1. Inaccurate diagnosis and the failure to recognize or heed the early signs and symptoms of the disease and its early complications
2. Delayed surgical treatment, due in most part to:
   (*a*) Lack of appreciation of the advantages of early surgery
   (*b*) Failure to appreciate the relative safety of early surgery
   (*c*) Indifference or lack of cooperation on the part of the patient
3. Inadequate surgical treatment, the result of:
   (*a*) Poor surgical judgment
   (*b*) Inadequate surgery which is avoidable
   (*c*) Inadequate surgery which is unavoidable
4. Postcholecystectomy syndrome due to dyskinesia of sphincter mechanism

It is the author's opinion that most of the failures experienced following surgery are directly attributable to one or more of the causes listed, and for this reason a few brief but pertinent comments pertaining to each seem indicated.

Inaccurate Diagnosis and Failure to Recognize Early Signs, Symptoms, and Complications

Experience shows that from the clinical symptoms presented, one cannot consistently or accurately estimate and appraise, preoperatively, the nature and degree of pathology present. Real biliary colic is often absent or at least not manifest in the history of some individuals who are harboring stones in the gallbladder, or even in the ducts.

Contrariwise, typical and repeated attacks of colic may occur in those displaying little or no other evidence of stones or chronic biliary tract disease, and may in fact be due to disease outside the biliary tract. On occasions, at operation or autopsy, we have been surprised to observe varying degrees of pathology in the biliary tract which were never intimated in the history or clinical findings. Also, serious coincidental or associated lesions never suspected are at times uncovered, to the embarrassment of the clinician.

acute appendicitis has been made. It is even difficult at times to delay operation, though it may be to the patient's best interest, because of pressure from family, relatives, or friends. The lay public is dependent upon and seeks the help and advice of the physician in whom he or she has confidence, and the influence of that physician is tremendous. The response of the patient to the advice given will be, in the great majority of cases, in direct proportion to the time and effort spent in explaining the situation and convincing him of the disadvantages resulting from delay.

Inadequate Surgical Treatment

At the same time that one is extolling proudly the virtues and the safety of early biliary-tract surgery, it must also be admitted that in many instances and in many ways the surgical treatment administered has been either ill-advised or inadequate. Such inadequacy accounts in no small way for many of the failures and some of the fatalities and reflects unfavorably on a most creditable form of therapy. To be sure, at times errors in judgment or technic are unavoidable and will be made in spite of great care and skill, but far too often these errors are the result of poor surgical judgment, unskillful surgery, or a combination of both.

One could develop this theme at great length and in a most convincing manner, but, for the sake of brevity, it seems sufficient to list some of the more obvious as well as common factors contributing to the failures in biliary-tract surgery.

Errors Attributable to Poor Surgical Judgment.—(*1*) Improper selection of cases for operation due to faulty diagnosis; lack of appreciation of the relative reliability, significance, and limitations of an accurate, detailed history; failure to eliminate other sources of disease which may account for symptoms (gastrointestinal, renal, cardiac); lack of respect for the properly taken and interpreted cholecystogram; (*2*) careless or inadequate preoperative study and preparation as well as poor postoperative observation and care; (*3*) unwise selection of the opportune time for operation, the anesthetic, and the surgical procedure.

Errors Attributable to Inadequate Surgery Which Are Avoidable.—(*1*) Ill-advised cholecystostomy with complete removal of stones; (*2*) well- or ill-advised cholecystostomy without the complete removal of stones obstructing the cystic or common ducts; (*3*) ill-advised cholecystectomy in the presence of a normal cholecystogram; (*4*) incomplete cholecystectomy with residual stones and infection in the remaining gallbladder stump; (*5*) portions of cystic duct allowed to remain with contained infection and stones; (*6*) trauma to hepatic or common ducts and other important associated structures; (*7*) failure to identify, visualize, and satisfactorily explore suspicious ducts; (*8*) failure to recognize the signs of infection or obstruction of ducts; (*9*) incomplete identification and removal of existing duct stones in the course of exploring the open duct (unavoidable at times); (*10*) lack of appreciation of the use and merits of the operative and postoperative cholangiogram; (*11*) failure to remove a normal-appearing gallbladder in which no stones can be palpated but which has shown a pathologic cholecystogram (many will contain numerous small calculi); (*12*) failure to explore the extrahepatic ducts in a patient whose history and clinical findings suggest duct obstruction, but in whom the gallbladder appears normal.

Errors Attributable to Inadequate Surgery Which Are Unavoidable.—(*1*) The acute, fulminating, complicated case which demands urgent surgery regardless of risk or condition; (*2*) local complications which make the proper surgery impossible or impractical, making a compromise type of procedure necessary; (*3*) anesthetic reactions which force a hasty conclusion to an otherwise carefully planned procedure; (*4*) failure to identify and remove all duct stones in spite of conscientious and skillful search (usually avoidable).

There are, no doubt, many other factors not included among those mentioned, but the more frequent ones, and particularly those which are avoidable, are emphasized to bring out the need for constant vigilance in order to avoid failure.

In addition, however, one should not fail to mention the frequently described, so-called postcholecystectomy syndrome, supposedly due to dyskinesia of sphincter mechanism.

The annoying postoperative persistence of attacks of colic is most distressing to both the patient and physician, and this situation unfortunately occurs not too infrequently. Though many studies have been made and much has been written about it by competent observers, the problem is not well understood. It is the author's impression that the frequent errors in judgment, diagnosis, and surgical technic mentioned previously can and do account for many of the patients assumed to be suffering from biliary dyskinesia.

Such a stand is strengthened by the fact that the syndrome is most frequently observed in those patients in whom the removed gallbladder has contained no stones, for which reason one must seriously consider the possibility or even the probability of error in diagnosis, and the resultant failure to identify the original existing and aggravating pathology. Also, because many show only temporary postoperative distress, a

likely possibility is that one may have overlooked infection, débris, and calculi which are later spontaneously eliminated from the ducts.

If this supposition is correct, improvement in surgical judgment and greater perfection in surgical technic will do much to decrease the incidence of this particularly annoying condition and to decrease further the number of operative failures.

Summary

The treatment of biliary-tract disease is, in most instances, surgical. There are many pitfalls in the diagnosis as well as in the surgical management. The operative results in benign biliary-tract disease, relating to both morbidity and mortality, are dependent upon the skill and judgment of the internist and surgeon. The record is remarkably good and progressively improving.

The internist is, as a rule, the first to see the patient and naturally must assume much of the responsibility for early, accurate diagnosis and surgical therapeusis. The cholecystogram is of extreme importance and help. Uncomplicated disease is easily and safely treated. Complicated disease is much more serious, and technical operative difficulties are often great, particularly in relation to the demonstration and removal of all stones from the ducts. The operative and postoperative cholangiogram is of considerable aid in detecting residual duct stones. It is the surgeon's responsibility to see that the surgical procedure performed is well advised and adequate in order that failures may be kept at a minimum. The importance of early surgery to avoid complications and the more frequent and more thorough exploration of the ducts are stressed. Additional factors not infrequently contributing to failures are listed.

PENICILLIN IN LOZENGES

Giving patients penicillin lozenges to dissolve in their mouths like cough drops is an effective method of using the mold chemical to combat strep sore throat, trench mouth, and other mouth and throat infections, two British scientists, Dr. Alexander B. MacGregor and Dr. David A. Long, report.

Pain, fever, and disease germs were banished in twenty-four hours in some cases. All the trench-mouth patients, 25 at the time of the report, were free of symptoms within twenty-four hours, and within five days their mouths had completely healed and they could stop taking the medicine. Up to three and one-half months later there were no relapses, although the British doctors point out that procedures to eliminate gum pockets and stagnation areas will be necessary to prevent reinfection at a later date.

In cases of acute streptococcal tonsillitis there was "great relief" in twenty-four hours and within forty-eight hours all the patients were free of fever. A grown person severely ill with scarlet fever began taking solid food within twenty-four hours after the lozenge treatment was started. No other treatment was given, not even mouth washes, to these and the trench-mouth patients.

Hope that the lozenges might clear up the chronic carrier state was doomed to disappointment, however. *Streptococcus* germs were banished from the throats of the carrier while they were taking the lozenges, but in most of the patients the germs returned soon after the treatment was stopped. A medical student, however, was kept free of the carrier state long enough to finish his training in obstetrics, which the doctors point to as of practical value.

The lozenges also proved effective in combating germs in surgical cases such as tonsillectomies, tooth extractions, and the like.

The lozenges, three-fourths of an inch square by one-eighth of an inch thick, are made of gelatin and penicillin with a small amount of preservative. They have a "very slightly bitter taste" which apparently is not noticeable when there is any infection in the mouth or throat. Well persons who tried the lozenges did not find the bitterness "actively unpleasant."

The lozenge is put in the cheek and left there to dissolve without chewing or sucking. As soon as one has entirely dissolved, the patient takes another. One is taken at bedtime and during the night if the patient awakens. One patient by mistake ate ten of them during the first five minutes of treatment, but otherwise there was no trouble getting patients, even children, to take the lozenges as directed.—*Science News Letter, Jan. 6, 1945*

TRAUMA IN RELATION TO PEPTIC ULCER

IRVING GRAY, M D , F A C P , Brooklyn, New York

THE cause and pathogenesis of ulcer of the stomach and duodenum continues to be a subject of theoretic discussion and investigation The frequency of professional and incidental traumatization to the abdomen and more especially to the epigastrium which is unassociated with the onset of an acute peptic ulcer cannot be estimated There are, however, occasional instances in which severe, direct trauma to the epigastrium can cause acute peptic ulcer

Acute Peptic Ulcer Caused by Trauma

Case 1 —A woman aged 31 years was in a taxi-cab collision sustaining injuries to the abdomen Within twenty four hours she began to vomit blood and noticed tarry stools Previous gastric history was essentially negative After two weeks, the patient ceased vomiting and the stools returned to normal X ray study of the upper digestive tract seventeen days after the injury revealed findings indicative of an ulcer in the region of the pylorus and a defect in the duodenal bulb Subjective symptoms such as pain with occasional vomiting were present for approximately nine months after the accident, at the end of which time x ray examination revealed the stomach and duodenal bulb to be normal

Case 2 —A man of 37 years who had never had previous digestive complaints was forcefully struck in the upper abdomen by a wooden plank Within twenty four hours he began to complain of epigastric pain occasional vomiting, and discomfort after meals, there was no hematemesis X ray study one month after the accident revealed changes in the duodenal bulb indicative of an ulcer of the first portion of the duodenum Within three months, the symptoms subsided and x ray examination revealed normal findings

Case 3 —A man 41 years of age received a crushing injury to the upper abdomen in an automobile accident when he was caught between the steering wheel and the body of the truck. Persistent dull pain in the epigastrium with discomfort after meals continued for several weeks During the first few weeks, the stools were tarry X ray study three weeks after the accident revealed normal findings but a second examination two months later, showed evidence strongly indicative of an ulcer on the lesser curvature of the stomach A third x ray study, four months later, failed to reveal any evidence of a gastric ulcer

Case 4 —A man 41 years of age, fell off a scaffold for a distance of approximately 8 to 10 feet and struck the right upper abdomen against a plank He complained of pain and distress after eating, and occasional vomiting, there was no hematemesis, nor blood in the stools He had no previous history of any gastric symptoms The patient was first seen approximately six weeks after the accident Physical examination was essentially negative except for tenderness in the epigastrium and right upper abdomen

X ray study revealed the presence of an irregularity at the base and mesial aspect of the duodenal bulb A diagnosis of duodenal ulcer was made Gastric symptoms gradually abated and four months after the accident, x ray examination of the upper digestive tract revealed a normal duodenal bulb

These cases are cited as instances of acute peptic ulcer caused by trauma In 1933, Eusterman and Mayo[1] reported the case of a boy, aged 16, who was in an automobile accident and struck the epigastrium on the back of an empty tire rack X-ray study revealed the presence of a penetrating ulcer on the lesser curvature of the stomach Gastric symptoms persisted for more than five months The patient responded favorably to medical treatment Subsequent x ray studies disclosed a diminution in the size of the niche until finally no defect was visible A case is cited by Fertig[2] of a young man, aged 28, who was kicked in the midabdomen by a horse Two and a half hours after the accident operation seemed imperative No lesion of the stomach could be discovered when the abdomen was opened Death occurred several weeks later due to excessive hematemesis Postmortem examination revealed the presence of four small ulcers on the lesser curvature An eroded artery in the depths of the largest ulcer was held responsible for massive hemorrhage In a case reported by Hausbrandt[3] a young man of 21 received injuries to the thorax and abdomen when he was knocked down and kicked by a bull Postmortem examination revealed, among other findings, three large and several small ulcers on the anteroposterior surface of the stomach

Acute peptic ulcer may follow direct injury to the upper abdomen In our experience and in the case cited by Eusterman and Mayo, there is evidence to indicate that complete healing of an acute ulcer can and does occur Death may follow, however, in instances as cited, when the tear or bruising of the mucous membrane is associated with erosion of the arterial vessels Injury to the gastric mucous membrane or submucosal hemorrhages may occur with consequent digestion of the injured part The extent of the pathologic process in

Read at the Annual Meeting of the Medical Society of the State of New York New York City May 10 1944

the gastric wall is the determining factor in relation to the complications that may arise.

The remarkable regenerative power of the gastric mucous membrane is well known. Without this power of the mucous membrane of the stomach to regenerate, gastric surgery would be impossible. In view of this well-known fact, it is reasonable to believe that, as a rule, injury to the mucous membrane of the stomach by any direct force is usually followed by healing.

Perforated Gastric Ulcer Due to Trauma

Case 5.—A man, 35 years of age, was struck directly in the epigastrium by a box which fell a distance of six feet. Within fifteen minutes thereafter he began to complain of epigastric pain which became generalized and increasingly severe. Operation seven hours after the accident revealed the presence of a perforation of an ulcer situated on the anterior wall of the stomach near the lesser curvature in the region of the pylorus. There was a minimal scar at the base. The patient denied any previous history of digestive symptoms.

Case 6.—A man, 51 years of age, had a direct blow to the epigastrium when he was struck by a drum containing oil. He had sudden onset of pain immediately thereafter. The pain became generalized and increasingly severe. Operation four hours after the incident described revealed a ruptured ulcer in the region of the pylorus. The ulcer was reported as being one-eighth of an inch in diameter.

No mention was made of any induration, thickening, or other signs of chronicity. The patient denied any past history of digestive complaints.

Case 7.—A man of 61 fell against the edge of some boxes, striking the upper abdominal region. There was immediate onset of pain which became progressively worse. Operation several hours later revealed a ruptured ulcer on the anterior surface of the stomach about two inches above the pylorus. The ulcer was indurated and about the size of a dime. There was no previous history of gastric symptoms.

Case 8.—A man, 50 years of age, was struck in the abdomen by a plank "while pulling it out from a pile of lumber." There was immediate onset of pain in the epigastrium. The pain gradually became more continuous and more severe. Operation revealed the presence of perforation of an ulcer at the pyloric end of the stomach, on the lesser curvature and anterior surface.

Case 9.—The patient was a man, 43 years of age. Eighteen months prior to the accident described, he was operated on for a chronic duodenal ulcer, at which time a partial gastrectomy was done. During this period of eighteen months the patient was relatively free from any digestive complaints. He received a direct blow to the midabdomen when he tripped and fell, striking the "upper part of the stomach against a corner of beef." He began to complain of pain within ten minutes after the incident described. The pain became progressively worse and generalized. At operation a perforation of a small ulcer on the anterior wall of the stomach near the lesser curvature was found, approximately two inches above the site of the previous operation.

Case 10.—The patient was a man, 43 years of age, with a known history of digestive disturbances for approximately two years. Epigastric pain had become progressively worse, and during April, 1944, had been associated with vomiting at times. On the morning of the day of the alleged incident, he complained of pain and "feeling uncomfortable" after breakfast. The patient states, "I bent down and lifted up a heavy can of ashes; first time I have done this and I had very bad pain in the stomach." The symptoms became progressively worse and the patient was operated on. A perforated ulcer in the midgastric area on the lesser curvature of the stomach was found. The ulcer was indurated and about the size of a dime.

In this last instance, the history would indicate that the patient had digestive symptoms which had become increasingly severe a month prior to the incident described. The clinical symptoms suggest that the ulcer was at the stage of perforation when the patient was engaged in unusual effort.

Direct injury to the upper abdomen can cause perforation of a pre-existing ulcer, as is revealed by these case citations. It is a well-known clinical fact that in most instances perforation occurs after the intake of food, when there is increased intra-gastric pressure. In the cases cited above (except Case 10) the symptoms of ulcer were "silent." It is possible that the failure to elicit a history of past digestive complaints may have been due to the fact that medico-legal problems were present in each instance. In one instance (Case 9) the patient had recovered from a partial gastrectomy performed eighteen months previously for a chronic duodenal ulcer. Shortly after a direct blow to the epigastrium, the patient complained of pain, and at operation perforation of a peptic ulcer on the lesser curvature of the stomach was found. Unfortunately, a description of the local findings could not be ascertained. The question arose in this instance whether the trauma had caused an acute peptic ulcer that went on to perforate or whether the patient had a pre-existing, chronic peptic ulcer and that perforation followed the direct blow. The short time interval between the onset of abdominal complaints and the history of injury would favor the deduction that there had been a pre-existing peptic ulcer which had been caused to perforate by the direct injury.

Perforated Duodenal Ulcer Due to Trauma

Case 11.—The patient, 44 years of age, slipped and fell against a crate, "hitting the pit of the stomach against a board." The patient began to com-

plain of pain in the upper abdomen immediately after the injury The pain became progressively worse and generalized At operation several hours later, perforation of an indurated ulcer was found on the anterior surface of the duodenal bulb There was no past history of any digestive complaints

Case 12—A man 30 years of age, was engaged in driving a truck and installing refrigerators He slipped and fell and struck the upper abdomen against a refrigerator and had immediate "sharp pain in the right upper stomach" At operation, a perforation was found of a pre-existing, chronic duodenal ulcer The patient denies having had any previous digestive disorders

Case 13—A man 21 years of age, was working as a laborer on ovens The patient states, "I was carrying a box, passing through a door the box fell from my hands as I slipped and I fell on top of the box hitting the stomach" Pain in the region of the umbilicus started about half an hour after the episode described Several hours thereafter, it became progressively worse and generalized Twelve hours later he was operated upon and a ruptured duodenal ulcer was found The patient denies having had any previous digestive complaints

X-ray examination revealed the presence of findings indicative of a chronic ulcer of the first portion of the duodenum

In all three instances, the past history was "silent" for digestive complaints It is well recognized that spontaneous perforation or hemorrhage may be the first sign of chronic duodenal ulcer The variation in the clinical history of patients with pre existing ulcer may be due, as Labman[4] pointed out, to the alterations and sensitivity among individuals Direct trauma can and does produce perforation of a pre-existing duodenal ulcer, and it is reasonable to expect that the onset of pain will follow immediately after the history of a direct blow A continuity of symptoms with increasing severity of the abdominal pain is to be expected when trauma has caused the ulcer to perforate

Pre-Existing Peptic Ulcer, Aggravated by Injury

Case 14—A man 58 years of age, had a past history of digestive disorders for three to four years The patient was employed as a general superintendent in a building He fell against a radiator, striking the upper abdomen Prior to this episode, he had had a few digestive complaints The symptoms had been controlled by proper diet and therapy There was immediate onset of pain in the abdomen with vomiting of food after meals which persisted for about three to four months X-ray examination seventy two hours after the injury revealed the presence of an ulcer of the lesser curvature of the midgastric area X-ray study three months later revealed a return of the gastric contour to normal The patient was told that he "had a stomach ulcer when x-rayed three years ago" At no time was there any vomiting of blood or blood in the feces

Case 15—The patient was a male adult, 57 years of age, with a known gastric ulcer for approximately five to six years The patient stated, "While loading a truck of gravel, a sand bank caved in and I was caught between the truck and bank, I was hit in the upper part of the stomach" The patient vomited blood six to eight hours after this *incident and vomited on occasions for the first* forty-eight hours The patient had hypertensive, arteriosclerotic heart disease Gastric symptoms had been controlled with diet and medication X-ray examination of the stomach revealed the presence of an ulcer on the lesser curvature of the stomach in the region of the pylorus On examination six months after the accident, all gastric symptoms had subsided

The above two cases are illustrative of a known, pre existing peptic ulcer aggravated by a direct blow to the upper abdomen The symptoms produced by the injury were transient

Case 16—The patient was a man, 35 years of age Approximately "twenty five years ago he was struck hard in the upper stomach when pushing a cart, he had blood in the stools and was treated for intestinal hemorrhage for six weeks Ten years ago, he was in an automobile accident and was struck in the abdomen by the steering wheel, he vomited blood and had blood in the stools for about one week This time, he slipped and fell and struck *the stomach on a bumper and about eight hours* later, he vomited blood and had blood in the stools Vomiting lasted two days and the blood in the stools about two weeks' X ray examination revealed the presence of findings indicative of a chronic ulcer of the first portion of the duodenum

Case 17—A white man, 39 years of age, had had a known duodenal ulcer for the past seven years The patient was symptom free for five years He had "an altercation and was punched all over the stomach high up" Forty-eight hours later, the patient noticed blood in the stools and began to complain of pain after meals with occasional vomiting Blood was present in the feces for approximately ten days Gastric symptoms subsided within six weeks X ray study revealed the presence of findings indicative of a chronic ulcer of the first portion of the duodenum

Case 18—The patient was man of 62 with a known duodenal ulcer for at least thirteen years Approximately twelve years ago, he had a spontaneous episode of hematemesis and melena X-ray study at that time revealed the presence of a duodenal ulcer Following a direct blow to the upper abdomen when the patient tripped and fell, *there was a recurrence of digestive complaints* The patient stated that he had had "no stomach trouble for at least five years" He continued to have distress one to two hours after meals and also night pain, although the patient was on proper diet and therapy Approximately one week later, he had an attack of hematemesis and melena w

lasted for about one week. X-ray study after cessation of symptoms revealed the presence of an ulcer of the first portion of the duodenum.

The three cases cited above are illustrative of the onset of hematemesis or melena, or both, following a direct injury to the upper abdomen. In one instance (Case 3), there had been three episodes of bleeding following direct injury to the epigastrium on three distinct occasions over a period of twenty-five years. This patient stated that he had been comparatively well and had had few digestive complaints in the intervals. In the cases described, there was only a temporary period of disability due to the injury.

Case 19.—The patient was 40 years of age, with a known duodenal ulcer of three years. He was free of digestive symptoms until the onset of vomiting following exposure to smoke from fire on a ship. Vomiting persisted and was associated with hematemesis. Vomiting of blood was copious. The patient was admitted to the hospital and, despite blood transfusion and supportive therapy, he died.

Case 20.—A 40-year-old man had acute lead poisoning manifested by upper abdominal symptoms. Nausea and vomiting were associated with the presence of occult blood in the stools. X-ray examination of the upper digestive tract revealed the presence of pylorospasm and ulcer of the first portion of the duodenum. Gastric symptoms subsided within several months after the attack of lead poisoning. The patient recovered from the lead poisoning approximately one year after the initial attack and returned to work. After working two days, "the smell of the paint made me sick and I began to vomit blood." Because of the profuse vomiting of blood, the patient was hospitalized. On admission, the critical condition of the patient prevented any surgical intervention. Despite continuous blood transfusion and supportive therapy, the patient died. The essential finding on postmortem examination as related to the gastrointestinal tract was the presence of an ulcer in the first portion of the duodenum with an erosion of the pancreaticoduodenal artery.

These two cases are cited as illustrative of the aggravation of a pre-existing duodenal ulcer. Trauma or injury to the epigastrium, when direct, may aggravate an underlying ulcer of the duodenum. There are occasional instances, however, when such symptoms as vomiting caused either through some unusual event or by virtue of an occupational contact may precipitate acute gastric symptoms such as hematemesis.

Pre-Existing Peptic Ulcer Revealed by Routine Activities

Case 21.—A 34-year-old man had been operated on for a ruptured peptic ulcer ten years previously. Two years and one year, respectively, prior to the present history, the patient had had a spontaneous attack of hematemesis. The patient's work on screens necessitated his reaching and stretching. He had a spontaneous episode of hematemesis during working hours. No unusual event occurred on the day the patient had a hemorrhage.

Case 22.—A man, 42 years of age, was superintendent of an apartment house. The patient had a known, chronic duodenal ulcer, and five years previously had had an attack of melena. During the winter months he had been accustomed to lift ten to fifteen ashcans daily. He noted tarry stools one evening after a day's routine activities. There was no history of any unusual event transpiring on the day the patient noted the tarry stools.

These two cases are illustrative of the spontaneous onset of bleeding in individuals known to have had chronic peptic ulcer. There had been episodes of spontaneous bleeding on previous occasions. The assumption that the present incident of bleeding was related to routine physical activities is not warranted.

Case 23.—The patient was a man, 47 years of age, with a known chronic duodenal ulcer for at least seven years. In the course of his regular work as a shoe salesman for a period of several years, he lifted a carton of shoes one day and had "a sharp pain in the stomach." Signs and symptoms of ruptured ulcer were present. This patient had a known duodenal ulcer for seven years and was operated on for a ruptured duodenal ulcer. Some fifteen months following recovery from the operation, he had a spontaneous gastric hemorrhage. There was no evidence whatsoever to indicate any complications as a result of the operative procedure. During the life cycle of peptic ulcer, spontaneous episodes of hemorrhage occur, and in this instance it is reasonable to conclude that the patient's routine activities were in no way responsible for the gastric hemorrhage.

Case 24.—A man, aged 38, was working as a carpenter's helper, lifting lumber daily. He complained of pain in the stomach following heavy lifting one day. The symptoms persisted and x-ray examination of the upper digestive tract revealed findings indicative of an ulcer of the first portion of the duodenum. There was superficial abdominal tenderness and the pain was relieved by the use of a support for the abdominal muscles. There were no past or present symptoms referable to the ulcer. A diagnosis of abdominal muscle strain as the cause of the symptoms was made.

Case 25.—A man, 30 years of age, had been working for two years as an electric welder on ships. There was no past history of any digestive disturbances. The patient states, "because of the gases and fumes around the ship, I became nauseous and had some pain in the stomach." X-ray study of the upper digestive tract revealed the presence of an ulcer on the lesser curvature in the midgastric area. All digestive symptoms subsided within one week after the patient's occupation was changed

These cases are illustrative of the fact, which is

well recognized, that peptic ulcer may exist without clinical symptoms In one patient (Case 4) abdominal muscle strain as a result of his work developed X-ray study revealed the presence of a duodenal ulcer which was not clinically active In the second patient (Case 5) gastric symptoms arose, which were temporary The clinical symptoms due to the patient's work brought him to a physician, and an underlying "silent" peptic ulcer was revealed

Temporary Aggravation of Peptic Ulcer Due to Occupational Factors

Case 26 —A man, 56 years of age, was exposed to the inhalation of carbon monoxide in his work The patient had an attack of mild carbon monoxide poisoning manifested by dizziness, nausea and vomiting The nausea and vomiting persisted for several hours and were followed by the vomiting of blood and appearance of tarry stools The patient had a known pre existing ulcer for at least four years The vomiting of blood ceased within forty eight hours and blood was absent from the stools one week after the incident described Subsequent x ray examination revealed the presence of a chronic ulcer of the first portion of the duodenum *There was complete cessation of all gastric* symptoms within two months after the patient first became acutely ill

Case 28 —A 40-year-old man had been employed *as a painter for about twenty years The onset* of acute lead poisoning was manifested by nausea and vomiting and abdominal colic X-ray study of the gastrointestinal tract revealed the presence of an ulcer of the first portion of the duodenum Following the removal of the patient from his occupation and after treatment for the lead poisoning, the gastrointestinal symptoms subsided within a period of four to six months Subsequent x-ray examination revealed no complications of the pre-existing ulcer

Case 29 —A man, 48 years of age, had been working as a pipe fitter on a ship for about two years and "was all around welders and burners" The patient complained of nausea Vomiting then set in and 'had pains in the stomach off and on" There was no previous history of any digestive disturbances X ray examination revealed the presence of an ulcer of the first portion of the duodenum The symptoms gradually subsided following change of occupation and the patient was entirely well subjectively within six weeks after the onset of symptoms

These three case reports are illustrative of a temporary aggravation of a pre-existing ulcer due to occupational factors Recovery in each instance was uncomplicated

Discussion

Experimental work on animals reported by various authors would indicate that direct trauma over the region of the stomach can be followed by the presence of acute peptic ulcer [5–7] Microscopic examination of the stomach of these animals showed, in some instances, a separation of the mucosa and submucosa by hematoma Ritter[5] concluded that the peptic action of gastric juice would have produced an ulcer in a short time Subsequent animal experiments of a similar nature performed by other investigators[8–10] revealed the fact that the mucous-membrane injuries healed quickly Tears of the mucous membrane and hemorrhage into the walls of the stomach in these experimental, traumatized animals occurred more frequently when the stomach was full than when the stomach was empty. There is a natural tendency, after such trauma, toward healing There is adequate proof to indicate that in some instances direct, severe force to the epigastrium can produce an acute peptic ulcer in the human being

The question as to whether or not a single trauma such as a direct blow to the epigastrium can produce a chronic ulcer of the stomach and duodenum still remains a debatable subject Crohn and Gerendasy[11] report the onset of a duodenal ulcer following a direct blow to the *epigastrium in a patient 45 years of age* There had been no history of any digestive complaints prior to the accident Two years after the injury, symptoms of duodenal ulcer still persisted It has been estimated that about 5 per cent of the adult population "have or have had a gastroduodenal ulceration It is probably equally true that in some of these individuals the ulcer may possibly be dormant or latent"[12] In view of the well-known fact that the mucous membrane of the stomach regenerates rapidly and in view of the clinical experience that ulcer may exist without symptoms, any assumption that a single, direct blow can cause chronic peptic ulcer is entirely hypothetic Limiger and Molineus[13] have specified the following postulates that must be fulfilled before trauma can be held to be the cause of ulcer

1 Proof of the absence of gastric disease prior to the accident
2 The trauma must be severe and localized to the epigastric region
3 The immediate onset of symptoms
4 The continuation of symptoms and signs that point to gastric ulcer

Although proof of absence of gastric disease prior to injury is in most instances difficult to obtain, the fact remains that the absence of clinical symptoms does not mean normal integrity of the gastric and duodenal mucous membrane There are reports in the literature[14–17] in which it has been assumed from the clinical point of view that one single injury caused a

chronic ulcer of the gastroduodenal tract. Any such assumption, as stated previously, is entirely hypothetic, in view of the well-known fact, as indicated in the case citations above, that peptic ulcer may exist without any clinical symptoms whatsoever. Not infrequently, perforation or hemorrhage may be the first symptom or sign of chronic peptic ulcer. The effect of trauma in any given case can only be evaluated after a thorough analysis of the history and complete examination of the patient.

Discussion

Dr. Henry A. Rafsky, *New York City.*—The causal relationship between trauma and peptic ulcer is a most interesting and also a very controversial subject.

I have observed patients who developed ulcer symptoms, including gastric bleeding as well as perforation, after severe physical trauma. The question always arose as to whether the patients had an ulcer before the injury. In the absence of a previous history this was a most difficult question to decide. In duodenal ulcer if the x-ray examination after an injury shows a niche and this disappears as well as the deformity, then we can definitely state that the patient did not have the ulcer before the injury. Penetrating ulcers of the stomach may develop very quickly, as I have demonstrated upon a previous occasion, and may heal completely so far as we can determine by means of an x-ray examination. In the cases I reported the gastric ulcers developed after an emotional disturbance. This brings up an important question, namely, which is the more important factor, the injury or the psychic trauma resulting from the former? An injury severe enough to cause an ulcer is certainly attended with a severe emotional disturbance.

I recall seeing a patient who was struck by a tree. Although he suffered no injury to his abdomen, the episode was followed by severe gastric bleeding. In this case there was no doubt that the ulcer symptoms followed the injury, but they could not be attributed to direct trauma of the abdomen. During the present global conflict it has been demonstrated that either individuals in the armed forces or civilians subject to a severe mental strain as a result of air raids may develop ulcer symptoms without any physical injury. Many of these individuals have no previous ulcer history. Personally, I am inclined to believe that an individual with an ulcer diathesis and a sensitive autonomic nervous system, if injured, may develop an ulcer or an acute exacerbation of an ulcer which is due more to the psychic trauma than to the actual physical injury.

NEW DUTCH MEDICAL ASSOCIATION

In anticipation of the tremendous demands that will be made upon Holland's medical profession when the country's still occupied provinces will have been freed and immediate alleviation must be brought to millions of victims of frost and famine, the physicians in the liberated area have formed a association to centralize their functions for a speedy rehabilitation of public health.

Throughout the years of enemy occupation, the medical profession has been one of the few groups which uniformly refused to adopt Nazi methods and which remained steadfastly united in their resistance against the diabolic ideology. Although hundreds of doctors were thrown into concentration camps and thousands saw their possessions confiscated by the tyrants, they carried on their struggle against such measures as sterilization, the killing of the weak and insane, and the medical examination of men unfit for forced labor. So tenacious was the attitude of these physicians and so persistently did they rebuke the Nazi rulers for their crimes against the people's health, that in the end the German authorities were compelled to let them carry on their healing-work in peace—or at least, without too much interference on the part of the authorities.

A central medical information bureau has now been established in Tilburg, in North Brabant province, while a fortnightly periodical, *Medisch Contact* (Medical Contact), will keep the members of the new organization informed regarding health conditions as they will be found in the northern provinces.

At the same time, the association will represent the physicians in matters of an economic nature.—*Release from the Netherlands Information Bureau, Feb. 16, 1945*

INTESTINAL HELMINTHS IN NEW YORK AND VICINITY

H W Brown, M D , New York City

IN A NORTHERN area, such as New York and vicinity, the intestinal parasites which are present are, in general, of two types

1 Intestinal parasites that are introduced into this area by the migration of their hosts from more southern areas where the infection was acquired Thus in this vicinity one may see patients infected with Ascaris Lumbricoides, the large roundworm of man, Necator americanus, the hookworm, Trichuris trichiura, the whipworm, Strongyloides stercoralis, and Schistosoma mansoni Persons from the rural south, as well as those from tropical areas are found from time to time in New York harboring these parasites

2 The second group of intestinal parasites that one encounters in medical practice in this general area are those which may be acquired here For example, Trichinella spiralis, which is obtained from eating infected pork, accounts for from one to seven deaths a year in New York State, and from 127 to 241 cases have been reported annually since 1934 Likewise the tapeworms, Taenia saginata and T solium, which are acquired from eating infected beef or pork, are reported from time to time in this area Probably the most common intestinal helminth found in New York and vicinity is Enterobius vermicularis, the pinworm or seatworm of man Although this worm seldom, if ever, results in the death of man, it causes considerable irritation and inconvenience Since my time is limited I shall discuss in some detail the problems presented by this parasite

E vermicularis is a small white worm, the female is 8–13 mm in length, and the male only 2–5 mm long Instead of passing eggs, as is the habit of many of the intestinal worms, the female Enterobius stores the eggs that she produces within her body until she becomes gravid containing as many as 11,000 eggs These eggs are small and are characterized by being flat on one side and containing a small larva within When the female becomes gravid with eggs, she migrates out to the anal region and wanders around in this area, causing intense pruritus Due either to scratching of the host or to drying, the worm bursts, freeing thousands of eggs in the anal region Within a few hours these eggs complete their development to the infective stage and are either carried to the mouth on dirty hands soiled through scratching or hands that are contaminated with eggs through contact with contaminated bed linens clothes, or hands Once in the mouth, these eggs hatch and a small larva is free in the upper intestine This worm gradually grows and develops over a period of four to six weeks, migrating down the intestine as it does so After fertilization the female produces eggs and in about six weeks after the ingestion of the egg the gravid female now migrates out to the anal area Thus it will be seen that the infection is one acquired through poor personal hygiene and associated with infected persons and environment

There is considerable disagreement as to the damage done by the presence of E vermicularis There is no question, however, that the intense pruritus is very irritating and results in loss of sleep It is possible that they may produce a mild inflammation of the intestinal mucosa and irritate exposed sympathetic nerve endings, producing insomnia, nervousness, etc Recently Dr Wright and coworkers have shown that children who have been freed of their pinworms gain on an average of 2 74 pounds in the following two weeks Occasionally these parasites are found in the appendix, but the evidence available at present is rather inconclusive as to its role in the causation of appendicitis

Diagnosis

Since the female pinworms do not pass eggs in the stool but store them in their body until they migrate from the host stool examinations for the presence of eggs are very unreliable Recently Dr M C Hall has devised a cellophane tipped swab which is extremely valuable in making laboratory diagnosis A square of nonwaterproof cellophane about three-fourths of an inch square is folded over a small glass rod and held in place by a rubber band This swab is scraped around the anal region and, as the cellophane becomes moistened by contact with the skin it becomes sticky and any pinworm eggs in the anal region may become attached to it The cellophane is then removed, placed on a microscope slide in a diluted sodium hydroxide solution and a cover slip applied Examination is made by low power of the microscope One examination discloses about 70 per cent of the infection, whereas examinations on six consecutive days will diagnose practically 100 per cent of the infections

Treatment

The most effective treatment of Enterobius infestation is gentian violet by oral administration The recommended dose is 0 010 Gm per year of age, the total dose arrived at by multiply-

ing the age of the child by this figure, and dividing by 3, as the material is given before each meal for a period of eight days. The adult dose of gentian violet is 0.065 Gm. (1 grain) three times a day for eight days. This regimen of treatment will cure the majority of patients. If necessary, however, the treatment series may be repeated. Headaches, nausea, vomiting, and diarrhea may accompany the treatment with gentian violet and may necessitate temporary cessation of medication. Other drugs useful in treatment of this condition are tetrachloroethylene and hexylresorcinol.

Inasmuch as pinworm infection tends to be a family infection contracted at home, it is necessary to treat all of the family who are infected at the same time, otherwise there will be reinfection in the household. It is also important to educate the patients as to the source of their infection so that there can be improvement in their personal hygiene, such as hand-washing after toilet and avoidance of scratching the anal region. Bed sheets, underclothes, and night clothes should be boiled every two or three days to kill any eggs which may have been deposited on them, while the patients are under treatment.

FOUNDATION FOR TROPICAL MEDICINE MAKES AWARDS

A gold medal and an honorarium of $500 for outstanding service in the field of tropical medicine were presented Monday, February 5, at the University Club, New York City, to Rear Admiral Edward R. Stitt, retired, former Surgeon General of the United States Navy, by the American Foundation for Tropical Medicine.

The presentation was made on behalf of the Foundation by Col. Richard Pearson Strong, MC, director of tropical medicine at the Army Medical School, Washington, D.C., and recipient of last year's award, before representatives of business, medical, and educational institutions.

The medal and honorarium were established in 1944 through a gift by the Winthrop Chemical Company. Known as the Richard Pearson Medal and bearing a profile of Dr. Strong on its face, it is to be awarded annually for distinguished service in tropical medicine.

In conferring the award, Colonel Strong declared that "Rear Admiral Stitt is an exponent of scientific truth in his medical publications and reviews. His leadership, inspiring example, and devotion to work in the field of tropical medicine through many years have justly won for him the epithet of 'Father of Tropical Medicine in the United States.'"

The citation reviewed Admiral Stitt's numerous contributions to the growth of scientific knowledge of tropical diseases, dating back to 1914 when he wrote the first American textbook of tropical medicine. He was Surgeon General of the United States Navy from 1920 to 1928 and has held professorships in the schools of tropical medicine at Georgetown University, George Washington University, and the University of the Philippines; he has been a lecturer at Jefferson Medical College, Philadelphia, and lecturer and commanding officer of the United States Naval Medical School. He was a member of the National Board of Medical Examiners from 1915 to 1929, and held the presidency from 1926 to 1928.

Since 1941 Admiral Stitt has been a lecturer on tropical medicine at the Army Medical School.

Principal speaker at the presentation meeting was Maj. Gen. George C. Dunham, of the Office of Co-ordinator of Inter-American Affairs, who delivered an address on "Tropical Medicine and International Relations."

Dr. Henry E. Meleney, professor of preventive medicine at the School of Medicine, New York University, and newly elected vice-president of the Foundation, presided at the meeting. Col. Thomas T. Mackie, president, was unable to be present at the meeting because of his assignment with the American Typhus Commission to the Burma-India theater of operations.

BOARD OF OBSTETRICS AND GYNECOLOGY EXAMINATIONS IN JUNE

Part II of the general oral and pathology examinations held by the American Board of Obstetrics and Gynecology for all candidates will be conducted at Atlantic City, New Jersey, by the entire Board from Thursday, June 14, through Tuesday, June 19, 1945. The Hotel Shelburne in Atlantic City will be the headquarters for the Board. Formal notice of the exact time of each candidate's examination will be sent him several weeks in advance of the examination dates. Hotel reservations may be made by writing direct to the Hotel.

Candidates for re-examination in Part II must make written application to the Secretary's Office not later than April 15, 1945.

The Office of the Surgeon-General (U.S. Army) has issued instructions that men in service, eligible for Board examinations, be encouraged to apply, and that they may request orders to detached duty for the purpose of taking these examinations whenever possible.

Candidates in military or naval service are requested to keep the secretary's office informed of any change in address.

Deferment without time penalty under a waiver of our published regulations applying to civilian candidates will be granted if a candidate in service finds it impossible to proceed with the examinations of the Board.

Applications are now being received for the 1946 examinations. For further information and application blanks, address Dr. Paul Titus, Secretary, 1015 Highland Building, Pittsburgh 6, Pennsylvania.

THE AUGMENTATION OF STILBESTROL EFFECT IN MENOPAUSAL WOMEN BY VITAMIN C

Leo Bonnin, M D , Queens, New York

(From the Endocrine Service, Metropolitan Hospital)

THE synthesis of vitamin C, its availability, and the development of more accurate chemical methods of determination have given great impetus to an analysis of the various phases of its activity While its role in human metabolism remains somewhat obscure, the experiments of a number of investigators are informative

Some authors describe a relation between vitamin C and the hormones controlling sexual development and activity Andrews showed, in numerous animal experiments, that vitamin C metabolism is partially under endocrine control [1] He sympathizes with the view that ascorbic acid may be considered a hormone in some species rather than a vitamin He and his associates found that the corpus luteum of pregnancy in the guinea pig contains twice as much vitamin C as that of the nonpregnant female [2]

Plasma ascorbic acid consistently decreases after the injection of equine gonadotropic hormone into either the bull or steer The return to normal plasma ascorbic acid levels proceeds slowly unless additional vitamin C is administered The decrease in vitamin C may be sufficient to interfere with the physiologic process which, theoretically, the gonadotropic hormones should have induced Cio and Schteingart [3] improved gonadal function in both sexes by administering supplemental doses of vitamin C They used normal rats for their experiments Perhaps ascorbic acid has some practical therapeutic value in habitual abortion

Ascorbic acid is intimately involved in the production of virile sperm in the bull and in the early phases of the reproductive processes in the cow [4] Ascorbic acid therapy in impotent bulls resulted in increased vitamin C content of both semen and blood plasma, accompanied by a corresponding improvement in the bull's capacity for breeding

Certain types of sterility in the cow also proved amenable to this form of treatment The injection of gonadotropic hormones and ascorbic acid on successive days into adult rabbits is said to produce larger ovaries than in animals receiving the hormone only

Following the simultaneous injection of 25 rat units of gonadotropic hormone and 50 mg of ascorbic acid daily, Cio and Schteingart observed a twofold increase in development of the testis and penis, and of female genitalia in comparison with the changes following the use of hormone alone Ascorbic acid alone produced no change in the size of the gonads in normal immature and adult rabbits during short periods of treatment

Case Reports

These studies suggested a preliminary trial of the therapeutic value of vitamin C in augmenting the effect of estrogens in menopausal women The results are as follows

Case 1 —(1338/40) B I , age 43 had hot flashes headaches, vertigo, and blood pressure of 200/120 The menstruation had stopped five years previous to examination The patient was given stilbestrol, 0 05 mg daily, orally, for nine weeks without results However, fourteen weeks' medication with 0 5 mg stilbestrol and 75 mg of vitamin C daily brought the blood pressure down to 150/110 The patient had no further complaints After stopping vitamin C and administration of stilbestrol alone, impairment occurred The blood pressure rose to 190/120, and the hot flashes returned

Case 2 —(343441) N L , age 40, suffered surgical menopause after an operation one year previous to examination She had hot flashes and precordial pains Her blood pressure was 140/120 Combined stilbestrol and vitamin C therapy improved the condition of the patient in four weeks Administration of 0 5 mg stilbestrol was continued in the evening Four weeks later the patient returned with a bad relapse Only after combined therapy did improvement occur again

Case 3 —(1910441) B B , age 53, had climacteric syndrome, with the last menstruation one year previous to examination Stilbestrol alone was useless although 0 5 mg daily in the evening was given for eleven weeks After four weeks of combined therapy the blood pressure went down to 140/90 and remained at this level for the next month Her general condition improved

Case 4 —(287742) Q W had climacteric syndrome, menstruation had stopped three years previous to examination, and she had hot flashes, dizziness, and blood pressure of 200/100 Stilbestrol therapy for three weeks, 0 5 mg daily, proved useless After three weeks of combined therapy, however, her blood pressure went down to 140/90 Her general condition was much improved

Case 5 —(1875541) M B had climax hypertensive heart disease, irregular menstruation, hot flashes, dyspnea cardiac distress, and swelling of both feet in the evening Urine analysis was normal, and she had no heart murmurs Her blood pressure was 190/100 Medication with theobromine sodium salicylate was useless Combined

stilbestrol and vitamin C therapy resulted in improvement after three weeks. Her blood pressure went down to 160/90, and edema nearly disappeared. This patient took, in spite of prescription of vitamin C and stilbestrol, only stilbestrol, because she could not obtain vitamin C. Although she took 0.5 mg. of stilbestrol twice daily for five weeks, the blood pressure went up again to 220/120, and the edema relapsed.

Case 6.—(117742) A. W., age 40, suffered surgical menopause after operation seven months previous to examination, with precordial pains and dizziness; her blood pressure was 190/120. Stilbestrol therapy for four weeks proved useless. After combined therapy for three weeks she had no further precordial pains. Her blood pressure went down to 160/90.

Case 7.—(48242) M. F., age 45, had climacteric syndrome for one year, very irregular menstruation, many hot flashes, and blood pressure of 170/120. Stilbestrol therapy for seven weeks alone was useless. However, after four weeks' combined therapy her blood pressure went down to 140/90, menstruation became regular, and remained this way for many months under application of vitamin C alone without stilbestrol.

I do not want to mention in this report many other case histories which showed improvement after stilbestrol and vitamin C therapy, because I started immediately with this combination without trying stilbestrol alone. I was, furthermore, able to find some theoretic confirmation of my clinical results. We took the vitamin C blood level of 3 climacteric patients who never had taken stilbestrol. Then we injected subcutaneously 0.5 mg. of stilbestrol and again examined the vitamin C blood level after twenty-four hours. In the first case the level went down from 56 mg. to 50 mg., in the second case, from 40 mg. to 25 mg., and in the third, from 47 mg. to 34 mg. We took some more tests in other patients, but these did not return the next day for the control examination. Further experiments are under way. However, it was very interesting to note that in all reported cases the vitamin C level after application of only 0.5 mg. stilbestrol went down 25 per cent in the average. The reported figures represent mg. per 100 cc. of plasma.

The clinical and theoretic experiments show that apparently ascorbic acid is utilized in increased amounts whenever the quantity of available male or female sex hormone is augmented.

It was especially interesting to note that the blood level of vitamin C did not go down to the previous level even in a control examination taken three weeks after the injection.

Summary and Conclusion

1. Stilbestrol-vitamin C therapy was successful in 7 cases of female climacterium in which stilbestrol alone was not satisfactory.

2. It may be possible to stabilize the results obtained with stilbestrol-vitamin C therapy with vitamin C alone.

3. Our criteria of treatment are based on the general condition of the patients as reflected in subjective complaints and changes in physical examination.

4. The blood level of ascorbic acid is diminished after injection of 0.5 mg. of stilbestrol.

SURVEY OF ANTIBIOTICS

An open meeting of the New York Institute of Clinical Oral Pathology will take place at the New York Academy of Medicine, 2 East 103rd Street, New York City, on Monday evening, April 30, 1945, at 8:15 P.M.

A symposium entitled "A Survey of the Antibiotic Problem" will be held and the following investigators will participate: Daniel Laszlo, M.D., Mt. Sinai Hospital, New York, "The Role of Biotics and Antibiotics in Chemotherapy"; Frank Lamont Meleney, M.D., associate professor of clinical surgery, College of Physicians and Surgeons, Columbia University, and director of the laboratory of surgical bacteriologic research, "The Problem of Penicillin in Treatment of Mixed Infections"; Leo Stern, D.D.S., Mt. Sinai Hospital, New York, "The Treatment of Acute and Chronic Infections of the Jaws with Antibiotics"; Kenneth M. Kahn, Lt. Col., MC, AUS, chief of section for otolaryngology, Halloran General Hospital, Staten Island, "The Relative Value of Antibiotics in the Treatment of Otolaryngic Diseases"; Louis I. Grossman, D.D.S., associate in oral medicine, and head of the Root Therapy Clinic, "Evaluation of Antibiotic Agents for Root Canal Treatment"; Ludwig von Sallmann, M.D., department of ophthalmology of the College of Physicians and Surgeons, Columbia University, "The Role of Iontophoresis in Ocular Therapy with Antibiotics"; Alvin E. Strock, Senior Assistant Dental Surgeon (R), U.S. Public Health Service Hospital, Manhattan Beach, Brooklyn, "Treatment of Ulcerative Stomatitis (Vincent's Infection) with Penicillin."

For further information address all communications to the Executive Secretary, 101 East 79th Street, New York 21.

Diagnosis

CLINICOPATHOLOGIC CONFERENCES

Fourth Medical Division of Bellevue Hospital

Date January 18, 1945

Conducted by Dr Max Trubek

Dr Marian T Schitroni A 57-year old Swedish barge captain was admitted on July 7, 1944 complaining chiefly of pain and stiffness in his arms and legs and profuse sweating The past history revealed that he was a marked chronic alcoholic, had had bronchial asthma for twelve years with repeated attacks and had been treated for bronchopneumonia on our Service in December, 1942 He had otherwise been well until eight weeks before admission when "overnight" he had a sudden onset of severe pain and stiffness in the muscles of his calfs, thighs and ankles, followed in one week by similar involvement of his arms and shoulders, with gradual loss of function in his arms The muscles of his neck were next involved so that he could not turn his head In a few days he became unable to swallow anything but liquids His appetite, however, remained fairly good Since onset of illness bowel movements were effected only with cathartics A cough, present seven months, had been aggravated just before admission with two recent episodes of blood streaked sputum There was no associated chest pain Dyspnea on moderate exertion and swollen ankles were present for about two weeks There had been a marked loss in weight over a period of several months, but the patient could not estimate the amount The past history and systemic reviews were otherwise entirely negative

Examination on admission revealed an emaciated middle-aged, white man, lying quietly in bed, apparently in no acute distress, but moving with extreme caution The temperature was 101 8 F, pulse 108, respiration 20, and blood pressure 108/65 Head, ears nose, and throat were negative The fundi showed slight tortuosity of the vessels with increased light reflexes The arteries and veins were equal in width The neck was not remarkable, there was no general glandular adenopathy The chest showed fair expansion There were some moist râles and slight dullness at both bases posteriorly The heart sounds were of fair quality, the aortic second sound was equal to the pulmonic second sound There was a soft systolic blow at the apex The abdominal and rectal examinations were negative, and the reflexes were physiologic The hands showed slight swelling of the proximal interphalangeal joints with poor flexion of the hands and a weak grip greater on the left and slight ulnar deviation of the fingers There was no pain, redness, tenderness, or warmth The wrists showed slight limitation of motion There was good, but cautious motion in the elbows shoulders hips, knees, and ankles with 1 plus edema of the ankles There was no difficulty with active or passive motion of the neck or with swallowing at the time of examination The large muscle groups of the limbs showed marked wasting especially of the proximal groups

Laboratory Data —The white blood count varied between 10 800 and 22,700 with normal differentials, the red blood count was between 3 5 million and 4 2 million with 9–10 Gm of hemoglobin The urine showed good specific gravity with 1 plus albumin and on one occasion only, moderate white blood cells The serology was negative Albumin globulin ratio was 2 1/2 7, uric acid 2 0, nonprotein nitrogen, 26, calcium, 7 9, phosphorus, 3 4, potassium, 25 0, sodium, 306, chlorides, 528, cholesterol, 74, esters, 27, acid phosphatase, 2 0, and alkaline phosphatase, 13 8 A twenty-four-hour urine excretion showed 465 mg of creatinine and 155 mg of creatine Two spinal taps revealed 27 cells and total protein between 50 and 66, but the taps were otherwise negative A gastric analysis showed no free hydrochloric acid The glucose tolerance was normal Electrocardiograms showed low voltage and sinus tachycardia X-rays showed widening of the supracardiac aorta, diffuse engorgement of both lungs, slight hypertrophic changes of the midcervical spine calcification of the pelvic vessels, and several punched out areas in the distal phalanges X-rays of the skull and a flat plate of the abdomen revealed no abnormalities

A precipitin test for trichinosis was positive in 1 1,280 dilution on August 14 and on August 24, but the complement fixation test was negative A skin test had not been done

Course —The patient complained of increasing pain and tenderness in his muscles He ran a low-grade, irregular fever with occasional rises to 101 F On the fourth hospital day a diagnosis of dermatomyositis was suggested and the creatine and creatinine excretion determination and muscle biopsy were suggested The biopsy

specimen was taken from the lateral thigh muscles and reported as showing changes which were diagnostic of periarteritis nodosa. The case was re-evaluated in the light of that diagnosis but gastrointestinal, genitourinary, and cardiac manifestations were not present and the greatest eosinophilia percentage reported was 4 per cent. The patient was given supportive therapy, including transfusions, but he lost weight visibly, went progressively downhill, and died on the eighty-fifth hospital day.

Discussion

DR. MAX TRUBEK: The patient was emaciated but did not appear cachectic, nor did he show any diagnositic evidences of an advanced malignancy. There was muscle tenderness and marked weakness. Because of the long-standing history of asthma, the leukocytosis, and the continued fever, the probability of periarteritis nodosa suggested itself. The precipitin test for trichinosis has proved unreliable in our experience as a definitive diagnostic test. We were led to discard it, in this instance also, along with a lot of confusing and irrelevant laboratory data, much of which could not be properly coordinated. The creatinuria was simply a manifestation of muscle wasting. The presence of eosinophilia would have given us a little more assurance for the diagnosis, but enough major components of the necessary criteria were present to justify muscle biopsy. The diagnosis of trichinosis was further discarded after histologic examination, and that of periarteritis nodosa seemingly confirmed. There were no clinical symptoms or laboratory confirmation suspicious of involvement of heart, kidneys, or gastrointestinal tract. The pulmonary shadows could fit into the description of recurrent eosinophilia pneumonitis which has been described as an occasional manifestation during this disease.

Dr. Appelbaum, will you discuss this case?

DR. EMANUEL APPELBAUM: I had the privilege of examining this patient on one occasion and I subscribed to the diagnosis of periarteritis nodosa. As you have heard, the outstanding clinical features in this case were the presence of peripheral neuropathy, marked cachexia and anemia, signs of chronic bronchitis and asthma, and evidence of sepsis as shown by the persistent low-grade fever, moderate leukocytosis, and an elevated erythrocyte sedimentation rate. In addition, there was albuminuria. It seemed to me that a diagnosis of periarteritis nodosa was justified on the basis of these features. The muscle biopsy showed the vascular lesions typical for periarteritis nodosa.

We have discussed the diagnosis of this difficult and remarkable disease on many occasions. It is my impression that these discussions have helped members of our staff in making the correct antemortem diagnosis of this disease in at least ten instances. I think this is a good record.

It is, of course, well known that periarteritis nodosa is a disease of diverse symptomatology, as would be expected, since the arterial system of any organ or set of organs may be involved. Moreover, the various organs may show different stages of the disease. These pathologic variations make the intravitam diagnosis very difficult. About twenty years ago Meyer and Brinkmann proposed a diagnostic scheme which included the combination of chlorotic marasmus, polyneuritis and polymyositis, gastrointestinal manifestations, and evidence of renal damage. More recently I suggested the formulation of a more comprehensive diagnostic pattern by adding to the Meyer-Brinkmann tetrad the evidence of diffuse vascular involvement, signs of infection, eosinophilia, and the presence of skin lesions. A presumptive diagnosis of periarteritis nodosa is, in my opinion, justified if a patient manifests many features of the diagnostic pattern or a few of the features in a marked degree. For an absolute diagnosis a skin or muscle biopsy is, of course, essential. As previously mentioned, our case had a few of the important diagnostic features and, in addition, yielded a positive muscle biopsy.

The cause of periarteritis nodosa remains obscure. There is, however, growing evidence in favor of an allergic basis for this disease. For instance, asthma has been noted in about 20 per cent of the cases of periarteritis nodosa. Varying grades of eosinophilia have been encountered in about 25 per cent of the cases. Vascular lesions indistinguishable from periarteritis nodosa have been produced in rabbits by the injection of serum or vaccine. The patient presented this morning had bronchial asthma but no eosinophilia. In this connection it may be noted that an attempt has been made to separate as a distinct clinical entity a group of cases with bronchial asthma associated with recurring pulmonary infiltrations and periarteritis nodosa.

In regard to the spinal-fluid report in this case, I believe that the slight pleocytosis and increase in protein are indicative of either central or peripheral nerve involvement.

The positive trichinosis precipitin test raises the interesting question of a possible relationship between trichinosis and periarteritis nodosa. This subject was discussed at one of our previous conferences. At that time I pointed out the close similarity between the two diseases and I called particular attention to a paper by Reimann. You will probably recall that this author reported one case with a muscle biopsy showing periarteritis nodosa lesions and the finding at nec-

ropsy of encysted trichinella in the muscles and another case with periarteritis nodosa and a positive precipitin test for trichinosis At the present time one can only speculate on the possible relationship between the two diseases

Dr Gelfand, you saw this patient What is your impression?

Dr Maxwell Gelfand When I first saw this patient about the fourth day of his admission to the hospital, the most striking findings were in his musculoskeletal system There was marked muscle weakness, tenderness, fatigue, stiffness and atrophy His hands showed swelling of the interphalangeal joints, limitation of motion, and wristdrop His ankles were swollen and also showed limited motion There was evidence of generalized wasting with considerable weight loss and temperature

Despite the absence of cutaneous manifestation and periorbital edema, I entertained the diagnosis of dermatomyositis and I suggested creatine and creatinine excretion studies and skin biopsy

Dr Otto Steinbrocker There is often a skin involvement in dermatomyositis The marked tenderness and elevated sedimentation rate suggested periarteritis nodosa under our observation

Dr Gelfand Several cases have been reported without skin lesions It depends on the stage of the disease in which the patient is seen

Presentation of Pathology

Dr Henry Spitz

Anatomic Diagnosis

Periarteritis (polyarteritis) nodosa heart, mesentery diaphragm, spleen, gallbladder, pancreas kidneys, testes, gastrointestinal tract, pectoral muscle
Atrophy of skeletal muscles
Infarcts of myocardium, healed and healing
Fibrinous pericarditis with organization
Arterio- and arteriolosclerosis of kidneys
Hypertrophy and dilatation of heart
Chronic passive congestion of liver, spleen, and lungs
Anasarca
Edema of lungs
Emphysema of lungs
Chronic bronchiolitis

The unusual feature of this case is the fact that the lesions found at autopsy were much more widespread than one would expect from the clinical picture The heart was enlarged and along the entire course of all the branches of the coronary arteries there were pinhead- to pea sized pale nodules No gross aneurysms, hemorrhages, or thromboses were found The nodules were separated by portions of grossly uninvolved vessel The myocardium was the seat of multiple fresh and healing infarcts The epicardium was covered by fibrinous exudate showing beginning organization In the mesentery vascular changes similar to those seen along the coronary arteries were numerous and widespread The kidneys showed gross evidence of arteriosclerosis which was more marked on the right than on the left

Microscopically, vascular lesions characteristic of periarteritis nodosa were found in almost every organ as indicated in the anatomic diagnosis In the heart they involved large and small branches of the coronary arteries whereas in the other organs mostly the small arteries and arterioles were effected The lesions showed several stages of development as described by Arkin * The arterioles in most of the organs showed recent necrosis and dense cellular infiltration of the media and adventitia as found in stage 2 The larger branches and occasional arterioles showed early or advanced organization and in some of the vessels old scar tissue replaced part of the circumference of the artery with destruction of the elastic elements Especially in the coronary arteries intimal fibrosis extended well beyond the point of the original damage to the blood vessel wall The kidney showed similar lesions extending from the interlobular to the afferent arterioles and occasionally into the glomeruli, causing necrosis, cellular infiltration, and fibrosis of several loops or the entire tuft In these areas of acute or subacute vascular changes there was a dense infiltrate in the interstitium of inflammatory cells, mostly lymphocytes, plasma cells, and occasional eosinophils The lungs showed emphysema, evidence of chronic passive congestion, and of long standing chronic bronchitis and bronchiolitis Eosinophils were quite prominent in the inflammatory infiltrate There were also scattered areas of pneumonia present in all lobes The brain showed no gross or microscopic evidence of periarteritis nodosa No traces of trichinosis were seen in the sections examined

JUST REWARD

It is encouraging to learn of a certain doctor who has just completed forty years of practice and is retiring with a comfortable fortune of $80,000 amassed through his courage, enterprise, initiative hard work professional ability, the careful investment of his savings, and the death of an uncle who left him $79,999

Additional Annual Reports

To the 1945 House of Delegates

Medical Society of the State of New York

PART IX

Legislation

The Council Committee, charged with the duty of studying legislation and putting forth the positions taken by the Society, was continued with the same personnel:

John L. Bauer, M.D., *Chairman*..... Brooklyn
Walter W. Mott, M.D..... White Plains
Leo F. Simpson, M.D..... Rochester

The Committee makes the following report as of February 11, 1945. A supplementary full report will be ready for the House of Delegates at its next session.

REPORT

The Council Committee on Legislation respectfully submits the following as a preliminary report.

Executive Officer.—As of September 1, 1944, the position of Executive Officer of our State Medical Society was left vacant by the resignation of Dr. Joseph S. Lawrence. As you know, he accepted the call of the A.M.A., to become the Director of the Council Committee on Medical Service and Public Relations. He is conducting, in Washington, D.C., a sort of research bureau on legislation affecting medical matters. This will prove to be very serviceable to most Senators and Congressmen as well as valuable to the interests of organized medicine. The State Medical Society was very fortunate to secure the services of Robert Roger Hannon, Ph.C., B.S., M.D., who has been secretary of the State Board of Medical Examiners, Department of Education, at Albany since 1939. He is a graduate of Johns Hopkins Medical School, as is Dr. Lawrence. He has had some military training, has been a student of Tropical Medicine, and has taught at the Peking Union Medical College, Peking, China, as well as at Johns Hopkins, Cornell Medical School, University of Rochester, and Albany Medical College. He has done medical research at Johns Hopkins, has been an associate of the Rockefeller Hospital, and also served as superintendent of the New York Hospital for several years. You can readily see that Dr. Hannon has come to us well equipped to comprehend and cope with our problems—the protection and improvement of the welfare and interests of the public, our patients.

About December 1, Dr. Hannon began his services with us. The Department of Education has not as yet filled his former position with them, so that he has been not only Executive Officer, but has been loyally helping out with some of his duties of his former position.

1945 Legislative Session.—As a rule, during the heated legislative session it has been possible for our Legislative Bureau at Albany to hire additional help to send out bills, bulletins, and other material to the county legislative chairmen and others. This year, so far, Dr. Hannon and Miss Briggs, the faithful secretary, have had to do practically everything themselves.

The 1945 legislative session opened on January 3. Almost at once there was a deluge of bills. The counties on the senatorial and Assembly districts were reapportioned, resulting in five additional Senators but no additional Assemblymen. Membership in the Senate and in the Assembly has undergone a considerable change, with many new faces.

The Temporary Commission.—The temporary commission to make studies, surveys, and investigations of programs for medical care of persons in the State, especially the needy sick, with an appropriation of $40,000, to terminate as of February 15, 1945, has been functioning this year. This commission includes two Senators and two Assemblymen and ten other members appointed by the Governor, namely, the chairman, Basil C. MacLean, a hospital administrator, four physicians, two laymen, and three nurses.

Senate Int. 2 and *Assembly Int. 66* are new bills to continue the commission until February 15, 1946, the Governor to appoint two more licensed physicians to the Commission.

The Chiropractic Bills.—*Senate Int. 94* and *Assembly Int. 98* were rushed to the front on January 8. Assemblyman Brees, of Endicott, is, as usual, a strong protagonist, as well as the introducer in the Assembly. For a number of years, Mr. Brees was the Public Relations Counsel of the Chiropractors and, as Assemblyman, their spokesman. Chiropractic is not supported by the Department of Education. No school or college, worthy of recognition, teaches it. The U.S. Army, Navy, and Marine Corps do not recognize or accept it, nor does any hospital of standing. Two thousand or more so-called chiropractors operating illegally in New York State make up the pressure group. How can they instruct in the treatment of diseases and disorders which do not even exist, according to the tenets of chiropractic? Will the 1945 Legislature give their stamp of approval, mislead the public as to chiropractic by recommending licensure and a separate five-man examining board for chiropractic, made up of four chiropractors and one physician? Will they permit lower examination requirements than all physicians have met before entering upon the practice of medicine? Has diagnosis proved unnecessary? To safeguard the public, the medical profession demands high standards—ever higher and higher. Every effort has been made to inform the public so that people, as properly informed individuals, could talk with their legislators or write to them.

The Public Relations Bureau.—The Bureau has been most active and helpful. They have sent out booklets, pamphlets, brochures, and letters to the press, to the legislators, to Chambers of Commerce, to fraternal organizations, and to every doctor in the State. It has a field representative, Mrs. Harold M. Fleming, who is traveling throughout the State contacting important persons in key positions, under the supervision of Dr. Hannon, Executive Officer, and Mr. Dwight Anderson, Director of Public Relations. The President of the State Medi-

cal Society, Dr Herbert H Bauckus, the Secretary, Dr Walter P Anderton, the editorial staff of our JOURNAL, Dr O W H Mitchell and his committee and subcommittees, Dr Ralph T B Todd, Dr David J Kaliski, in fact every officer and committee member and bureau have given unstintingly of their time and effort in order that there might be enough informed people to contact our Legislature, so that legislators might not be led to believe that there is a popular demand for chiropractic, but rather that the demand comes from the chiropractors themselves Will the legislators continue to support a continuance of "Equal standards of education and training for all who would practice upon the human body, regardless of what they call themselves"?

Other Bills —Some of the bills introduced have had to do with workmen's compensation, with reclassification of nurses, with tuberculosis hospitals, with Health Insurance Bills, such as Joseph's, Jack's and Austin's, with emergency milk supply measures, with construction of an adequate Veterans' Hospital in Brooklyn, with provisions for costs of emergency blood transfusions with inspections of laboratories outside New York City with the length of term or size of State Regents, with forged narcotic prescriptions, with hospital liens with permitting hospitals to practice medicine with another Commission on Physical Fitness, with a rental bill on commercial space (Dr Hannon at tempting to include doctors' offices) with the inclusive costs of medical examinations of intoxicated drivers, with venereal disease provisions, with home relief payments with the enrichment of flour as to vitamins and minerals etc

On Friday, February 16, at Hotel Ten Eyck in Albany our *annual conference of the Chairmen of the Legislative Committees of the County Medical Societies* was held

Will every doctor turn to the December 2, 1944, *Journal* of the A M A, and on pages 915 and 916 [illegible] chiropractic calling

In conclusion we wish to thank the Woman's Auxiliaries of the State and county medical societies for the active cooperation which they showed not only during the Legislative session but throughout the entire year The great possibilities of the assistance of the doctors' wives have been like a dream come true

PART XIII

Report of the Counsel

To The House Of Delegates, Gentlemen

Your Counsel herewith submits his report of the activities of the Legal Department of the Medical Society of the State of New York for the period from February 1, 1944 up to and including January 31 1945

Necessarily, in making a report of this character, brevity must be sought, with the result that only the barest outline of the work done in our Department can be given

During the reporting period your Counsel's office staff has remained intact The splendid work of my associates Mr Thomas H Clearwater, the attorney for the Society, and of Mr John J DeLuca has continued During the summer of 1943, Mr Robert J Bell, who for nearly ten years was associated with your Counsel and his predecessor, the late Mr Lorenz J Brosnan entered the service of the United States Navy Mr Bell's active service in the Navy continued for more than one year and a half and during that time he was promoted to the rank of lieutenant Mr Bell has recently been retired from the Navy to inactive duty, and he has rejoined your Counsel's staff and will resume his efficient work

We cannot leave this subject without paying tribute to the splendid spirit of industry, loyalty, and devotion manifested by your Counsel's entire staff, both legal and clerical

In making his report your Counsel adheres to the convenient category employed in previous years whereby his activities have been divided into three main divisions (*a*) the actual handling of malpractice actions before courts and juries and in the appellate tribunals, (*b*) counsel work with officers, committees and individual members of the Society, and (*c*) legislative advice and activities

Litigation —In previous years your Counsel and his predecessors called to the attention of the members the dangers attendant upon careless, hasty, and unjustified criticism by one physician of the work of another, which gives rise to many malpractice actions We feel that it is important to do so again at this time Such criticism and such comments by one physician upon the work of another, even though not maliciously made and with no intent to instigate litigation, frequently plant in the mind of a patient the idea of a malpractice action Experience shows us that many malpractice actions originate from such careless remarks

Likewise, we again call attention to the ever-present hazard of a malpractice action to the practicing physician It must be remembered that in malpractice actions the rights of physicians are in the hands of lay jurors who may often be influenced by its ma or not

In this connection it should be noted that your Society, having taken cognizance of these conditions years ago, has sponsored a group plan of insurance, the splendid record of which has continued Although a great percentage of the members carry such insurance, during past years as well as in every preceding year a substantial number of your members have found themselves confronted with the defense of malpractice actions without the benefits of this insurance Invariably, such physicians regret their failure to have taken advantage of the Group Plan, which has now been in successful operation for nearly twenty-five years The Plan merits the loyal support of every member of the Society

We wish to mention at this point the Yorkshire Indemnity Company, the carrier under the Group Plan for over nine years It has in every way met all of its obligations and has continued to demonstrate its enthusiastic support of the successful operation of the Group Plan Mention should be made of the excellent cooperation furnished by Mr. Horace Crowell, Jr, assistant secretary of

the Yorkshire Indemnity Company, and in charge of its Claim Department. Your Counsel and his associates are in frequent conference and consultation with him. We feel that mention should also be made of the excellent cooperation of Mr. Alan O. Robinson, vice-president of the said Company, and of Mr. Thomas J. Finnegan and Mr. Lawrence S. Cunningham, of its staff.

We likewise record our appreciation of the splendid work of your Insurance Committee under the chairmanship of Dr. J. Stanley Kenney. We have conferred on a number of occasions during the reporting period with Dr. Kenney in relation to the problems of the Insurance Committee. It should be noted that during this period the Insurance Committee has made an extensive survey of the insurance field with reference to other carriers who might assume the obligations of the Group Plan. We refer the membership to the report of the Insurance Committee which sets forth the findings of its survey.

We have also conferred with the authorized indemnity representative of your Society, and with his office staff, on various matters pertaining to the operation of the Group Plan.

With these preliminary statements, we note that there were initiated within the present reporting period 90 cases. This figure is practically the same as 87 cases reported a year ago, but is substantially lower than the figures reported in previous years. It must be taken into consideration that many physicians are members of the armed forces, and undoubtedly upon their return to private practice, cases which have been suspended for the duration of the war may still be instituted against them, and consequently, after the cessation of hostilities and return of physicians to private practice from the armed forces, it must be anticipated that these figures will show a substantial increase. No one can predict with accuracy what the transitional years following the war will bring, but an increase of litigation in general must reasonably be expected.

The 90 cases referred to do not include a number of claims instituted against physicians during the reporting period, most of which are still outstanding and in some of which suits may actually be brought. The preventative work done by your Counsel and his office staff is of equal importance with the actual work of litigation. Throughout the year we are in frequent consultation with claimants and their attorneys and often we have been successful in demonstrating to them that no meritorious claim exists, so that many of these claims do not actually develop into law suits.

Table 1 shows that during the present reporting period we disposed of 84 cases. Thirty-five of these cases were settled and 49 terminated successfully in favor of the physician. During the reporting period there were no judgments for the plaintiff against any physician. We note from Table 1 that there were pending, as of January 31, 1945, 370 cases.

Counsel Work.—During the period of this report your Counsel and Mr. Clearwater have attended the Annual Meeting of the Society and the regular meetings of the Council of your Society and have conferred with members of such bodies upon numerous legal problems which have presented themselves.

During the reporting period there have been many changes in the administration of your Society, including the changes necessitated by the untimely deaths of Dr. Peter Irving, Secretary of the Society, and of Dr. Edward C. Podvin, the Assistant Secretary. Your Counsel has been repeatedly in consultation with respect to the numerous legal problems which presented themselves attendant upon such changes. Your Counsel conferred with the Council and with the Board of Trustees on various occasions with respect to the preparation and execution of the contract entered into between the Society and Dr. David J. Kaliski, Director of the Bureau of Workmen's Compensation. Our Counsel also handled the preparation and execution of the contracts entered into between the Society and Dr. Robert R. Hannon, Executive Officer, and with Mr. George B. Farrell.

Your Counsel, acting with the Committee on Bylaws, has examined various proposed amendments to the Constitutions and Bylaws, both of your Society and of a number of component county medical societies, and has rendered advice and made suggestions in connection therewith.

Your Counsel has conferred at various times with members of the various committees and members of the Board of Trustees on many phases of their work and activities.

Your Counsel was constantly in touch by telephone and correspondence with the late Dr. Peter Irving, Secretary and General Manager, and since Dr. Irving's death with Dr. Walter P. Anderton and with Mr. Dwight Anderson in connection with the many questions that frequently arise in their work. In addition, your Counsel receives frequent requests for opinion, both oral and in writing, on legal problems which it would be impossible to refer to in other than a very sketchy way within the limited space of this report. A few of the matters on which advice has been given during the last year are the following:

Responsibility of the county society in connection with criminal charges of bortion; intravenous injections by nurses; consent to surgery upon minors; legality of sterilization operations; birth

TABLE 1.—NUMBER OF SUITS INSTITUTED AND DISPOSED OF IN 1944–1945

certificates therapeutic abortions advice regarding medicolegal treatises contract between physician and corporation hospital's right to exclude physicians from staff disclosures of confidential information to governmental agencies, practice of medicine by interns, responsibility of physicians for subsequent care of hospital ward patients, legality of postmortem cesarean operations, necessity for surgical assistants at operations, physician's testimony in matrimonial action, disposition of report of physical examination, forms of consents for operations, responsibility of surgeon for acts of hospital subordinates and liability of physician for malpractice during service in armed forces

It should be noted that daily, either by personal inquiry at your Counsel's office or by telephone calls, various members of the Society seek advice and assistance on various problems arising out of their relations with their patients Most of these inquiries present emergency situations which can not be handled by correspondence, but they actually involve a considerable amount of time and work

Legislative Advice and Activities—During the past year your Counsel and Mr Clearwater have conferred with numbrous persons representing varying points of view in connection with proposed changes to the law regulating the practice of medicine A considerable part of this work has been devoted directly to the recent changes in the law regulating fee splitting and various proposed further revisions of the law with respect thereto Your Counsel and Mr Clearwater have frequently conferred with the present Executive Officer of the Society and his predecessor regarding legislative matters We have in recent months and also during the time subsequent to the reporting period conferred frequently with your Society's officers and with Mr Dwight Anderson regarding various phases of opposition to the chiropractic bill pending before the Legislature at the time of writing, and in addition, Mr Martin recently attended the public hearing upon said bill before the Legislature Mr Clearwater attended the annual conference of the Council Committee on Legislation with the Chairman of the County Society Legislation Committees held at Albany

Conclusion—Your Counsel, in closing this report, wishes to record his appreciation for the work of his own staff, and also to acknowledge with grateful thanks the advice and assistance of your Society, which has helped us both in Court and in consultation, in the defense of malpractice actions Without such cooperation and assistance it would not have been possible for your Counsel to have obtained the results shown in this report

Respectfully submitted
WILLIAM F MARTIN, *Counsel*

Amendments to Constitution and Bylaws

To the House of Delegates Gentlemen

The Committee on Constitution and Bylaws, in the interests of the more efficient discharge of the administrative functions of the Society, hereby recommends to the House of Delegates for its favorable consideration the following amendments to the Bylaws

A In Chapter VII, Section 6 of the Bylaws, delete the second and third sentences, which read as follows "These minutes shall be copied from a stenographer s notes with such deletion only as will not modify, alter, or becloud the history of the actions of the said bodies The stenographer s typewritten copy shall be preserved until ordered destroyed by the House of Delegates" Insert the following language in place of the deletion "He shall perform such other duties as may be prescribed from time to time by the House of Delegates or the Council" amending said section so as to read as follows

"Section 6 The Secretary shall attend all meetings of the Society the House of Delegates, the Council, the Board of Trustees and the Board of Censors, and shall keep minutes of their respective proceedings He shall perform such other duties as may be prescribed from time to time by the House of Delegates or the Council'

B In Chapter VII, Section 7 of the Bylaws, delete the following words from the first sentence thereof "be responsible for and have general charge of the Society's offices and the employees therein He shall be" Insert in place of said deletion the following language "countersign all checks issued by the Treasurer on funds of the Society, he shall be"

Section 7 The Secretary shall countersign all checks issued by the Treasurer on funds of the Society, he shall be the custodian of the seal of the Society, and of all books of records and papers belonging to the Society, except such as properly belong to the Treasurer, and shall keep an account of and promptly turn over to the Treasurer all funds

of the secretaries of the county societies, he shall keep a proper register of all the registered physicians of the State by counties He shall aid the officers of the District Branches in the organization and improvement of the county societies and the extension of the power and influence of the Society He

and Board members of their election, and committees of their appointment and duties He shall affix the seal of the Society to all credentials issued to members of the Society elected by the House of Delegates and to such other papers and documents as may require the same He shall make an annual report to the House of Delegates He shall supply each county society with the necessary blanks for making their annual reports to this Society Acting in cooperation with the Council, he shall prepare and issue all programs He shall be a member of the Council He shall be ex officio a member of all boards and committees without vote He shall record the name and date of admission of each member of the Society"

C Repeal entire Chapter VIII of the Bylaws entitled "Direction of Activities"

D In Chapter XVIII, Section 2 delete the following "given at a previous annual meeting of the House of Delegates, and before the same can be acted upon it shall be published once before the annual meeting in the", and insert in place of said

deletion the following: "published one month before the annual meeting in the," so that said Section 2 of Chapter XVIII shall read as follows:

"Section 2. Notice of the proposed amendment shall be published one month before the annual meeting in the official bulletin or journal of the Society."

Respectfully submitted,
THOMAS M. BRENNAN, M.D., *Chairman*
GEORGE W. KOSMAK, M.D.
WALTER P. ANDERTON, M.D.

Reports of the District Branches

First District Branch

To the House of Delegates; Gentlemen:

The thirty-eighth Annual Meeting of the First District Branch of the Medical Society of the State of New York was held Tuesday, October 24, 1944, at Bellevue Hospital, 28th Street and First Avenue, New York City.

Dr. Peter Irving and the staff accomplished an excellent piece of work in facilitating the activities involved in producing such an excellent one-day clinic for the First District Branch.

A guide map of the entire hospital was part of the program and greatly assisted in quickly locating the designated buildings and various clinics.

We are greatly indebted to Dr. Wilbur S. Tillett, Third Medical Division, for the splendid clinic arrangement.

Following is the program presented:

Medicine, First (Columbia) Medical Division—conference with presentation and discussion of cases by Dr. I. Ogden Woodruff and staff; clinicopathologic conference by Drs. I. Ogden Woodruff and David M. Spain and staff; ward rounds with presentation and discussion of selected cases by Dr. I. Ogden Woodruff and staff.

Chest Diseases—ward rounds (medical) with Dr. J. Burns Amberson, Second (Cornell) Medical Division; and ward rounds with Dr. Asa Lincoln and staff.

Neurology—conference on "Arachnoiditis Following Spinal Anesthesia" and ward rounds, Dr. Foster Kennedy and staff, Third (New York University) Medical Division. The following round table conference with presentation of cases was heard: "Penicillin in the Treatment of Subacute Bacterial Endocarditis," by Dr. William S. Tillett; "Evaluation of the Surgical Treatment of Essential Hypertension," by Dr. Herbert Chasis; "The Clinical Use of Demerol," by Dr. R. C. Batterman; "The Treatment of Thyrotoxicosis," by Dr. Elaine P. Ralli; "The Treatment of Acute Myocardial Infarction," by Dr. Arthur C. DeGraff.

Pediatrics—presentation and discussions: "Care of the Premature Infant," by Dr. J. Lewis; "The Treatment of Pneumonia," by Dr. R. Niemer; "The Problems of Adolescence," by Dr. Harry Bakwin; "Poliomyelitis," by Dr. Alfred Fischer; "Childhood Tuberculosis," by Dr. Edith Lincoln.

Syphilology and Dermatology—"Recent Advances in the Treatment of Syphilis," by Dr. Evan Thomas; "Recent Advances in the Treatment of Gonorrheal Infection," by Maj. Ruth Thomas, U.S.P.H.S.; "The Treatment of Industrial Dermatoses," by Dr. Frank Combes, Fourth (New York University) Medical Division; "Treatment of Hyperthyroidism with Thiouracil," by Dr. Harry A. Solomon; "Newer Developments in the Treatment of Meningococcic Meningitis," and "Penicillin in the Treatment of Empyema," by Dr. Emanuel Appelbaum; "The Importance of Heredity in Medical Disorders," by Dr. Max Trubek; and "Chrysotherapy in Rheumatoid Arthritis," by Dr. Otto Steinbrocker.

Surgery, First (Columbia) Surgical Division—operations by Drs. C. J. MacGuire, Roderick V. Grace, Gaston A. Carlucci, and Phillip C. Potter; ward rounds with Drs. Walter W. Fischer, Vincent Hurley, Wallace Sheridan, and Louis Davidson, Second (Cornell) Surgical Division; operations and staff conference by Dr. Guilford Dudley and staff.

Urology—operations by Dr. Howard Jeck and staff; Third (New York University) Division; abdominal and general surgery by Drs. W. Howard Barber, Hippolyte M. Wertheim, Thomas J. Galvin, Victor Carabba, and Samuel Standard; fractures—rounds with demonstrations of various methods of treatment by Drs. Irwin E. Siris and John A. Lawler.

Surgical Research—lantern slide demonstration and studies of surgical convalescence by Drs. CoTui and George R. Gerst; surgical staff conference, Dr. Arthur M. Wright, director.

Anesthesia—therapeutic nerve block: incidence of postoperative anesthetic complications; reflex circulatory derangement during surgery; anesthetic clinics—therapeutic nerve block: (*a*) lumbar, (*b*) sympathetic, and (*c*) paravertebral, suprascapular for painful shoulder and other cases available, presented by Dr. E. A. Rovenstine, director of anesthesia.

Ophthalmology—grand rounds with Drs. Daniel B. Kirby, Donald W. Bogart, Fourth (New York University) Surgical Division Adult Surgical Service; operative clinic with Drs. Arthur McQuillan, William Hinton, Kenneth Lewis, and Lester Breidenbach.

Orthopedic Service—ward rounds with Drs. Arthur Krida, John McCauley, William Walker, and Albert Schein.

Children's Surgical Service—operative clinic with Drs. Fenwick Beekman, Philip Allen, and Charles W. Lester.

During the business meeting, following the luncheon, the following officers were elected: president, Dr. Scott Lord Smith, Poughkeepsie; first vice-president, Dr. Harold F. Morrison, Tuxedo Park; second vice-president, Dr. Stephen R. Monteith, Nyack; secretary, Dr. I. J. Landsman, Bronx; treasurer, Dr. Henry W. Miller, Brewster.

Dr. Herbert H. Bauckus, President of the Medical Society of the State of New York, addressed the assembly. His topic was "Medical Insurance."

The First District Branch wishes to express its deep gratitude and sincere appreciation, through the Director, Dr. Herman Jacobs, to Bellevue Hospital and the men connected with the various services, for the painstaking efforts and resultant splendid arrangements and excellent luncheon

which made this meeting a most successful and outstanding event

Respectfully submitted,
JAMES G MORRISSEY, M D

February 15, 1945

Second District Branch

To the House of Delegates, Gentlemen

The thirty-eighth annual meeting of the Second District Branch of the Medical Society of the State of New York was held on October 25, 1944, at the United States Naval Hospital, at St Albans

An opportunity was given those who had not previously done so to inspect the hospital facilities Small groups were conducted through the hospital by members of the medical staff, nurses, and Waves At 11 00 A M the visitors and their hosts gathered in the auditorium, where four very interesting papers were read by members of the hospital staff The first paper, "Transportation of the Naval Wounded," was read by Capt Frederick A Jostes, who had recently returned from the South Pacific, where he was in charge of this work The second was on "The Repair of Peripheral Nerves in Naval Casualties," by Lt Comdr Thomas I Hoen, the third, "The Treatment of Meningitis, Including the Use of Penicillin," was by Comdr John K Durkin and the fourth "The Treatment of Delayed and Nonunion of Fractures in Naval Casualties," by Capt Herbert C Fett All of these papers were of timely interest and were well received

Following the morning session, luncheon was served in the officers' mess hall, after which the physicians returned to the auditorium

At the afternoon session the group was addressed briefly by our host, Capt Lester L Pratt the commanding officer, after which a brief executive session was held Dr Everett C Jessup, of Roslyn, was elected president and Dr Charles C Murphy, of Amityville, second vice president It was unanimously voted that Dr John B D'Albora be retained as first vice president and that he be advanced to the presidency of the organization at the first executive session following his discharge from the army

After a brief greeting and address by Dr Herbert H Bauckus, President of the Medical Society of the State of New York, the scientific meeting was resumed

The afternoon program, a symposium on tuberculosis, consisted of the following papers "The Problem of Rehabilitation of the Tuberculous Patient," by Dr James R Reuling, president of the Queensboro Tuberculosis and Health Association, "Medical Management of Tuberculosis," by Dr George G Ornstein, associate professor of medicine, New York Medical College, and "Modern Concepts of Surgical Management of Pulmonary Tuberculosis" by Dr Herbert C Maier, director of surgery, Triboro Hospital All these papers were well received

A moving picture of the invasion of Tarawa closed one of the most successful meetings our branch has ever held For this success we are largely indebted to our host Captain Pratt, and his staff, who so wholeheartedly participated in the program

As at last year's meeting, after our expenses were met there remained a balance which was forwarded to the American Red Cross, U S Naval Hospital, St Albans Chapter The amount of the check this year was $277 (This amount was contributed entirely by the Second District Branch—*Editor*)

Respectfully submitted,
FRANCIS G RILEY, M D, *President*

February 21, 1945

Third District Branch

To the House of Delegates, Gentlemen

In addition to the May meeting of the Executive Committee held in Albany to plan the program, the principal activities centered around the annual meeting This was held at the Potts Memorial Institute, Livingston Columbia County, on Thursday, September 21, 1945 The scientific program consisted of the following presentations "Rehabilitation of the Tuberculous," by Dr Harry A Pattison, Director, Potts Memorial Institute, "Headache," by Dr Harold G Wolff, associate professor of medicine, Cornell University Medical College, New York City, "Therapeutic Applications of Penicillin," by Dr Ward J MacNeal, professor of bacteriology, New York Post-Graduate Medical School, and "Purpose, Organization, and Function of the New York Guard," by Martin DeForest Smith, Maj N Y G, Surgeon, 3rd Brigade

The annual business meeting was held and the following officers were elected to take office for the following two years president Dr John L Edwards, Hudson, first vice-president, Dr Fred C Holcomb, Kingston, second vice-president, Dr Harry Golembe, Liberty, secretary, Dr William E Rausch, Albany, and treasurer Dr William M Rapp, Catskill

The annual dinner followed the meeting and was also held at the Potts Memorial Institute, through the courtesy of Dr Harry A Pattison Dr Herbert H Bauckus, President of the Medical Society of the State of New York, addressed the group on the present state of medical [illegible] State of New York

the annual meeting was adjourned *sine die*

Respectfully submitted,
STEPHEN H CURTIS, M D, *President*

February 15, 1945

Fourth District Branch

To the House of Delegates, Gentlemen

The Fourth District Branch of the Medical Society of the State of New York held its thirty-eighth annual meeting on October 3, 1944, at the [illegible] York Sanatorium, [illegible] Control of Tuberculosis in Northern New York," and Dr Clarence J Tidmarsh, Professor of Medicine, McGill University, Montreal, spoke on "Gastric [illegible]

[illegible] dent, Dr Denver M Vickers, of Cambridge, first vice-president, Dr G S Pesquera of Mt McGregor second vice-president, Dr F Leslie Sullivan, of Scotia, secretary, Dr Joseph Geis, of Lake Placid, treasurer

Dr [illegible] the Medical Society [illegible] ddressed the meeting [illegible], a recently

elected member of the Board of Regents from the fourth district, also addressed the meeting and was also guest speaker.

Respectfully submitted,
F. LESLIE SULLIVAN, M.D.

Fifth District Branch

To the House of Delegates; Gentlemen:

The newly elected officers of the Fifth District Branch are as follows: president, Dr. Dan Mellen, Rome; first vice-president, Dr. Sherman M. Burns, Oswego; second vice-president, Dr. H. Dan Vickers, Little Falls; secretary, Dr. James E. McAskill, Watertown; and treasurer, Dr. O. D. Chapman, Syracuse.

The presidents of the component county societies are: Herkimer—Dr. D. F. Aloisio, Herkimer; Jefferson—Dr. Leon L. Samson, Alexandria Bay; Lewis—Dr. David J. O'Connor, Croghan; Madison—Dr. Arthur S. Broga, Oneida; Oneida—Dr. Frederick M. Miller, Jr., Utica; Onondaga—Dr. Dwight V. Needham, Syracuse; and Oswego—Dr. Harold J. LaTulip, Oswego.

A meeting of the officers was called in Rome, New York, in June to make arrangements for the annual meeting. A symposium on tuberculosis was suggested as the feature of the program. This particular topic had not been discussed for some time and was felt to be opportune. Col. A. J. Canning very kindly allowed us to have our meeting at Rhoads Hospital, Utica, and also made preparations for dinner.

The Thirty-Eighth Annual Meeting of the Fifth District Branch of the Medical Society of the State of New York was held at Rhoads General Hospital, Utica, on Tuesday, September 19, 1944. The Auxiliary was entertained and they reported a most enjoyable time. The following scientific program was presented:

2:00 P.M.—movies: "Psychiatry in Action."

2:45 P.M.-5:30 P.M.—"Symposium on Tuberculosis," medical discussion by Dr. S. Eric Simpson, Watertown; surgical discussion by Dr. Ethan Flagg Butler, Elmira; discussion of chest x-ray in industry by Dr. William C. Jensen, Utica; and a lecture entitled "Tuberculosis in Military Service," by Capt. Daniel J. Feldman, Utica.

6:00 P.M.—Dinner, followed by an address by Dr. Herbert H. Bauckus, of Buffalo, President of the Medical Society of the State of New York.

8:00 P.M.—"Rehabilitation of the War Veteran," by Dr. Roy B. Woodward.

The Executive Committee of the Fifth District Branch donated a prize of $25 to that county woman's auxiliary from which county there was the largest percentage of physicians registered at the meeting. The Auxiliary of the Oneida County Society was the winner of the prize.

Respectfully submitted,
DAN MELLEN, M.D., *President*

Sixth District Branch

To the House of Delegates; Gentlemen:

The thirty-eighth annual meeting of the Sixth District Branch of the Medical Society of the State of New York was held on September 28, 1944, at the Arnot-Ogden Memorial Hospital in Elmira with an attendance of over 100.

The program of the morning session included a discussion of "The Use of Thiouracil in the Treatment of Hyperthyroidism" by Dr. F. S. Hassett, attending physician, Arnot-Ogden Memorial Hospital and St. Joseph's Hospital, in Elmira, and a lecture on "Protruded Intervertebral Discs: Their Diagnosis and Treatment" by Dr. Wallace B. Hamby, professor of neurologic surgery and assistant professor of neurology, University of Buffalo School of Medicine.

During the afternoon session Dr. Paul C. Clark, assistant professor of clinical medicine, Syracuse University College of Medicine, spoke on "Penicillin Therapy," and Dr. Ethan Flagg Butler, of Elmira, discussed "Surgical Treatment for Pulmonary Tuberculosis."

Dr. Herbert H. Bauckus, President of the Medical Society of the State of New York, addressed the meeting at luncheon.

Respectfully submitted,
CLIFFORD F. LEET, M.D.

Seventh District Branch

To the House of Delegates; Gentlemen:

The thirty-eighth annual meeting of the Seventh District Branch was held on Wednesday, September 27, 1944, at the United States Naval Hospital in Sampson. Capt. Claude Carr, Commandant, and his staff were our hosts. The total attendance was 163. Among those present were members of several county societies outside the Seventh District Branch. A representative from St. Albans Naval Hospital also attended the meeting.

The morning session was provided by our hosts. It began with a short address of welcome by Captain Carr, who then turned over the meeting to Lt. Comdr. H. W. Retan. The first part of the program was devoted to sound movies depicting the Navy's experiences in the Pacific. A series of papers was presented by members of Captain Carr's staff. These were on "Penicillin Experiences at the U.S. Naval Hospital, Sampson"; surgical: Comdr. Charles C. Thomas, (MC), USNR, Chief of Surgery; medical: Comdr. Arthur J. Horton, (MC), USNR, Chief of Medicine; and South Pacific experience: Comdr. Eugene F. Foy, (MC), USNR, recently returned from active service. "Tropical Diseases and Their Problems for the Civilian Practitioner" was presented by Lt. Comdr. Lopo de Mello, (MC), USNR, Dermatologist and Malaria Control Officer, U.S. Naval Hospital, Sampson.

Dinner was served at noon in the mess hall, with the compliments of the Commanding Officer and his staff.

Dr. Knickerbocker, president of the Seventh District Branch, presided over the afternoon session. Dr. Herbert H. Bauckus, President of the Medical Society of the State of New York, introduced the officers of the State Society. A paper on "Blood Proteins and Body Metabolism—Influence of Amino Acids Given Parenterally" was presented by Dr. George H. Whipple, Dean and professor of pathology, and Dr. Sidney C. Madden, associate professor of pathology, University of Rochester School of Medicine and Dentistry. Another on "Postgraduate Training for Physicians Returning from War Service" was read by Dr. Albert W. Snoke, acting director of Strong Memorial Hospital, Rochester, and Dr. John S. Lawrence, acting professor of medicine at the University of Rochester

School of Medicine and Dentistry A third paper entitled "Practical Use of Electroencephalography" was read by Lt Minter M Jackson, H-V(S), USNR, Psychologist, U S Naval Hospital, Sampson

All the papers were concise, snappy, and much appreciated by the audience A short talk by the Hon John Tabor, member of Congress from this district, showed us that he was with and for the medical profession and opposed to any governmental interference that would in any way hamper the individualistic practice of medicine, as would be the case if the Wagner Murray-Dingell Bill were enacted

A rising vote of thanks was tendered to Captain Carr and his staff for their hospitality and share in making this such a successful meeting

Respectfully submitted,

H J KNICKERBOCKER, M D , *President*

February 22, 1945

Eighth District Branch

To the House of Delegates, Gentlemen

The thirty ninth annual meeting of the Eighth District Branch was held at the Prospect House, Niagara Falls, on Thursday, October 5, 1944 There were 100 members present

The morning session began at 10 A M with Dr Reuben J Erickson, of Albany, giving a most interesting and instructive talk on "Pulmonary Tuberculosis—Early Diagnosis and Differential Diagnosis"

The second paper was given by Dr Percy S Pelouze, of Philadelphia, on "Gonorrhea from the Viewpoint of the General Practitioner" Dr Pelouze's talk was very instructive and was greatly enjoyed by members present

After luncheon the meeting was addressed by Mr Dwight Anderson Publicity Director, and Dr Carlton E Wertz Dr Herbert H Bauckus State President, also spoke to the members on the loss to our Society by the deaths of Bishop Duffy, of Buffalo, and Al Smith, former Governor of New York State Dr Bauckus spoke at length on the medical plans as an answer to the socialization of medicine

The afternoon session was continued with a talk by Dr Frederick N Marty, of Syracuse, on "Penicillin Therapy" This was followed by a talk by Dr James L Poppen, of the Lahey Clinic, Boston, on "Surgical Treatment of Hypertension" These papers were both fully discussed by members present

The absence of Dr Peter Irving and Dr Joseph Lawrence was noted with regret

Respectfully submitted,

PETER J DI NATALE, M D , *President*

March 2, 1945

Postgraduate Medical Education

Programs arranged by the Council Committee on Public Health and Education of the Medical Society of the State of New York are published in this section of the JOURNAL. *The members of the committee are Oliver W. H. Mitchell, M.D., Chairman, (428 Greenwood Place, Syracuse); George Baehr, M.D., and Charles D. Post, M.D.*

Cancer Teaching Day in Buffalo

A CANCER teaching day will be held in the Hotel Statler, Buffalo, on April 26. The program will be presented under the auspices of the Medical Society of the County of Erie, the Buffalo Academy of Medicine, the Eighth District Branch of the State Society, the University of Buffalo, School of Medicine, the Medical Society of the State of New York, and the New York State Department of Health, Division of Cancer Control.

The afternoon meeting will be called to order at 4:00 P.M. Dr. A. H. Aaron, president of the Medical Society, County of Erie, will deliver the opening remarks. Dr. Donald Guthrie, surgeon-in-chief, Robert Packer Hospital, Sayre, Pennsylvania, will speak on "Diagnosis and Surgical Treatment of Carcinoma of the Breast." Dr. Lloyd F. Craver, attending physician at Memorial Hospital, New York City, will then discuss "What Can the General Practitioner Do About Lowering Cancer Mortality?"

General discussion will be invited.

The evening meeting will be held at 8:00 P.M. Cochairmen of the meeting are Drs. John W. Kohl and Leon H. Smith. The program will consist of two lectures: "The Diagnosis and Curability of Intraoral Cancer," by Dr. Hayes Martin, attending surgeon, Memorial Hospital, New York City; and "Carcinoma of the Colon," by Dr. John H. Garlock, attending surgeon, Mt. Sinai Hospital, New York City.

Penicillin Therapy—St. Lawrence and Jefferson Counties

POSTGRADUATE instruction arranged by the Council Committee on Public Health for the St. Lawrence County Medical Society will be given on May 10 at 1:15 P.M. at the A. Barton Hepburn Hospital, Ogdensburg. Dr. Frank L. Meleney, associate professor of clinical surgery, College of Physicians and Surgeons, Columbia University, New York City, will deliver a lecture entitled "Penicillin Therapy." On May 10 at 6:00 P.M., at the Black River Valley Club, Watertown, Dr. Meleney will deliver the same lecture to the Jefferson County Medical Society.

This instruction is provided by the Medical Society of the State of New York with the cooperation of the New York State Department of Health.

REHABILITATION OF THE WAR DEAFENED

The Army is ready for the men who lose their hearing in this war. Three rehabilitation centers have been established—at Butler, Pennsylvania, Chickasha, Oklahoma, and Santa Barbara, California—to aid the soldiers deafened by the blast of explosives, head wounds, sudden altitude changes in flying, or by acute illness.

It takes six to ten weeks for one of the deafened soldiers to reach one of the hospitals from the front lines, and during that time he may have become worried and depressed about his condition. Therefore, in addition to diagnosis and treatment of deafness, the rehabilitation center otologist must deal with psychologic aspects of the injury. A cheering pamphlet, illustrated by Maj. Munro Leaf (creator of Ferdinand the Bull), is given to the soldier before he leaves the war zone. It explains in humorous cartoons what will be done for him.

On arrival at the center, the soldier is thoroughly examined, with special attention to vision. The hearing loss is determined, and an appropriate mechanical hearing aid is prescribed.

All this takes about a week, after which time he is permitted to go home for a furlough before starting his two-months' training period. In the meantime, the Red Cross has notified his family of his ailment and has suggested how to make him feel at ease.

Thirty-five half-hour lessons in lip reading, twice a day, are the main course in the training center's rehabilitation curriculum. In addition to straight conversation, the men are taught by motion pictures how lip reading can enable them to cope with any of life's situations. Loss of hearing has also caused most of the afflicted men to speak oddly, with slurred consonants and dropped vowels. These defects are corrected by recordings and individual and group lessons.

The ordinary hearing instrument costs the government about $150 with an extra cost of $3 to $4 a month to maintain the 45-volt battery.

Some soldiers will need a 90-volt battery device the rest of their lives, at a cost of $20 a month to the government.—*Modern Medicine*

William F Martin, Esq
Counsel, Medical Society of the State of New York

Recovery for Mental Anguish

IT HAS long been the law of this state that there may be no recovery at law in a negligence action for mere fright or shock alone occasioned by negligence. A case defended by your Society's counsel a few months ago is an interesting example of the practical application of that rule.*

It seems that a child was born in one of the hospitals in New York City which was in need of immediate special care to save its life. Those in charge rushed to see that the necessary steps were taken so that such care was provided the child was placed in an oxygen crib and its life was in fact, saved. There was some inevitable confusion, in the course of which, by inadvertence, it was noted on the record that the child was a girl, although the fact was that it was a boy. Consequently the parents were first told the child was female, and it was not until some days later that they were correctly informed that the sex was male.

Later an action was instituted against the hospital to recover damages in the sum of $25,000. The complaint alleged in substance that the plaintiff mother became a patient of the defendant hospital and that on the same day of admission a child was born to her at that hospital, that the hospital aided the attending physician in the delivery of the child and the aftercare of the mother. It was stated that the hospital had contracted with the mother and father to render such medical care and treatment as might be necessary to the physical as well as to the mental benefit of the mother. It was alleged that the hospital by its agents, servants, and employees for several days after the delivery represented to the parents that the mother had been delivered of a child of female sex and that thereafter the agents, servants and employees of the hospital informed the plaintiffs that the sex of their child was male i
a result of
contract o
employees
they were
was female instead of male that as a result of such carelessness negligence, and breach of contract the plaintiffs suffered severe physical and mental anguish feeling that the child given to them was not their own and that in the future they will continue to suffer much physical and mental pain. The parents together sought damages against the hospital in the sum of $25,000. It should be noted that the parents made no claim that they had been given a child other than the one born to them. There was no assertion that they received the wrong baby.

Your counsel made an application in Special Term of the Supreme Court for judgment dismissing the complaint for failure to state facts sufficient to constitute a cause of action against the hospital. The Court duly granted the motion with a written opinion, in the course of which the following was stated:

'Construing the complaint most liberally in favor of plaintiffs, it is impossible to perceive any breach of any contractual obligation on the part of the defendant hospital which
for legal insufficiency
alleged nor any breach.
Indeed, aside from the use of the term contract' or 'contracted' there is nothing in the complaint to indicate that the action is *ex contractu*. No attempt to plead breach of contract has even been made.

At most the action is in tort, and as such is fatally defective for lack of physical injury. True, the pleader has described the consequences to the plaintiffs of this unfortunate incident as 'severe physical and mental anguish.' It is clear, however that no actual physical injury has been claimed. There may have been purely mental anguish, agony,
ave even given
but in either
s in this State
that in the absence of accompanying physical or corporeal injury there can be no recovery for mental suffering or the consequences of such disturbance resulting from a negligent or careless act, as distinguished from one that is willful. Mitchell v Rochester Railway Co, 151 N Y 107. Comstock v Wilson, 257 N Y 231, Curtin v Western Union Telegraph Co 13 App Div 253 Stahl v Necker Inc, 184 App Div 85, Smith v Rector, etc Trinity Church, 140 Misc 301, affd 234 App Div 840.)

In the Comstock case, (*supra*) the court said at page 235: "Mental suffering or disturbance, even without consequences of physical injury, may in fact constitute actual damage, nevertheless the
Accordingly the motion to dismiss must be granted."

D D T RELEASED FOR EXPERIMENT

A limited quantity of D D T, the war developed insect killer, has been released for distribution for agricultural and other civilian experimentation, the War Production Board announced on February 12. Formerly requests for D D T for research work required application to W P B for individual allocations of the chemical. The material can now be obtained directly from D D T producers without further permission from W P B.—*N Y Herald Tribune, Feb 13, 1945*

Medical News

Foundation for Infantile Paralysis to Train Physical Therapists

BECAUSE of the critical need for qualified physical therapists for infantile paralysis victims, the National Foundation for Infantile Paralysis has appropriated $1,267,600 for the training of these specialists, it was announced on March 18 by Basil O'Connor, president of the foundation.

"Today," he said, "there are only 2,500 qualified physical therapists, of whom more than half are in the armed forces. With earlier and more extensive use of such methods of treatment, so imperative in the treatment of infantile paralysis, twice the number already trained could be used for this disease alone. It is estimated that an additional 5,000 could be used right now, not only for the treatment of infantile paralysis, but also for aiding recovery from many other diseases and disabilities."

The $1,267,600 program developed under guidance of a special committee includes the allocation of $1,107,000 for scholarships to train new physical therapists, $82,000 for fellowships to provide additional teachers, and $78,600 for general development of the field of physical therapy.

Preparation for entrance into approved schools of physical therapy requires graduation as a nurse or physical educator or two years of college training including biology and other basic sciences.

Surplus of Penicillin Is Released to Doctors for Treating Civilians

WITH the Government relinquishing formal control over penicillin, the drug will henceforth be distributed for civilian use through normal trade channels.

Dr. John N. McDonnell, director of the War Production Board's Office of Penicillin Distribution, said on March 15 that it would make 1,280,000 vials of the drug available through March 31 and would allocate 1,500,000 through April and succeeding months.

The vials, each containing 100,000 Oxford units, the normal dose, will be sold by pharmacists at $2.40 apiece only to doctors, because the drug in this form must be administered hypodermically under medical supervision.

Dr. McDonnell pointed out that until production increased no penicillin would be available in ointments or pills. The amounts now being released represent surplus over military requirements for sick and wounded. Meanwhile, doctors warned against indiscriminate and unsupervised use of penicillin in throat lozenges, chewing gum, tooth paste, jellies, and skin creams.

Output is still rising, it was pointed out, and the April allocation of 1,500,000 vials presumably will be raised considerably in ensuing months. E. Allen Newcomb, secretary of the National Wholesale Druggists' Association, said that his organization is sending out bulletins giving instructions for proper refrigeration of penicillin.

War Objectors to Serve in N. Y. Mental Hospitals

ONE hundred conscientious objectors have been assigned to work at three New York State Mental Institutions to relieve manpower shortages, Dr. Frederick MacCurdy, mental hygiene commissioner, announced on March 5.

Within the next thirty days, twenty-five members of the Mennonite sect were established at Hudson River State Hospital, Poughkeepsie. A similar unit was set up at Wassaic State School for Mental Defectives, and assignment of a third group of approximately fifty men to Pilgrim State Hospital, Brentwood, followed shortly.

With approval of Governor Dewey, negotiations for use of the men were made with the National Selective Service Headquarters. More conscientious objectors may be assigned to state hospitals, Dr. MacCurdy said.

Shortages in ward service personnel, ranging from 32 to 65 per cent, have caused great difficulties in maintaining proper standards of care, the commissioner declared, and "the assignment of conscientious objectors to ward services is a step in the department's efforts to ease the critical situation."

Dr. MacCurdy pointed out that conscientious objectors already had been placed at public mental institutions, including veterans' facilities, throughout the country.

"They have rendered substantial service during the war emergency," he said.

They receive maintenance and a small financial allowance. They are subject to Selective Service regulations and the rules of the institutions in which they serve, although they gain no civil service status.

DDT Will Add Civilian Role to War Duty

THE War Production Board has authorized producers of DDT—the full name is dichlorodiphenyltrichloroethane—to release about 100,000 pounds of the lethal powder to civilian research agencies during the first six months of 1945.

The potent agent that forced the capitulation of body lice when it was first tried in North Africa, that conquered a typhus outbreak before it could become epidemic in Naples, that swept malarial mosquitoes out of Saipan when American troops went in, already has its civilian duties outlined.

Beginning in March and continuing until June, crews organized by the United States Public Health Service and state public-health agencies will visit 300,000 homes in one hundred counties of eleven Southern states to spray the houses with a DDT compound.

If its previous performances are repeated, all flies and mosquitoes that touch the ceilings or walls for three months after the spraying will undergo certain deaths.

Thomas D. Mulhern, secretary of the New Jersey Mosquito Extermination Association, in charge of mosquito control at the State Agricultural Experiment Station, announced in New Brunswick.

Protection against Rickets

in once-a-month dosage with

Infron

Pediatric

(Trade Mark)

The clinical investigations of Wolf[1, 2, 3] and Rambar,[4] show conclusively that once a month dosage with Infron Pediatric is convenient, rational, safe and effective

only one capsule is required each month

Each capsule contains 100,000 U S P units of electrically activated, vaporized ergosterol (Whittier process) —highly purified and especially adapted for this use One package contains six capsules—a six months' supply

Infron Pediatric is readily miscible in feeding formulas, fruit juice or water Can also be added directly to cereals

Infron Pediatric is available only in hermetically sealed vials

New Jersey, that enough DDT has been made available for extensive mosquito-control experiments in that state this summer.

New York is not expected to participate in any mosquito-control tests with DDT, it was explained at the district offices of the United States Public Health Service here, since mosquito control is a relatively minor problem here, but DDT will find other uses in this state.

County News

Albany County

Dr. Gilbert Dalldorf, since 1919 director of laboratories of Grasslands Hospital, Valhalla, Westchester County, was appointed on March 14 Director of the Division of Laboratories and Research of the State Health Department to succeed Dr. Augustus B. Wadsworth, who recently retired.

Announcement of the appointment was made by Dr. Edward S. Godfrey, Jr., State Health Commissioner. In assuming his new duties on April 16, Dr. Dalldorf will fill one of the most important posts in public health in the state.

Dr. Dalldorf, who was born in Davenport, Iowa, has conducted extensive studies in deficiency diseases in affiliation with the department of physiologic chemistry, Teachers College, Columbia University. He is the author of many technical articles and has collaborated in the preparation of several books on medical subjects.*

Broome County

Both pros and cons of socialized medicine were discussed by Dr. H. I. Johnston, Binghamton physician, when he addressed members of the Civic Club of Binghamton in the Monday Afternoon Clubhouse on February 28.

Present chairman of the Compensation Board of Broome County Medical Society, Dr. Johnston is immediate past chairman of the Economic Committee of the county society, which since 1935 has been studying the subject of socialized medicine and more specifically, that of prepayment medical insurance. He is a member of the Medical Society of the State of New York and the American Medical Association.

Dr. Johnston was introduced by Mrs. Robert B. Guy, chairman for the afternoon. The hostess was Mrs. Webster L. Bagley.

Presiding at the tea table were Mrs. Edward Wehle and Mrs. Joseph Deacon, and serving were Mrs. Lyle E. Warner, Mrs. Robert Lee, and Mrs. Harry Barney.*

Chautauqua County

In keeping with an announcement that the wildlife unit of the U. S. Department of Interior will work with all health agencies in a fight to block further spread of rabies in Western New York, the Jamestown Medical Society, has unanimously passed a resolution urging more drastic measures in this area to control the disease.

Among the actions specifically recommended is stricter quarantine and control of all dogs, compulsory vaccination, and cooperation with other agencies to stamp out rabies, fatal to human beings.

The action of the Medical Society followed reports that a steadily increasing number of rabid dogs have bitten persons throughout the city and county.*

Chemung County

Dr. Rene Breguet, chief medical officer and psychiatrist at the Elmira Reformatory, who has served twenty-six months in the Army Medical Corps with a commission as captain, has returned to Elmira on terminal leave, following a serious illness. He will be given a medical discharge.

Dr. Breguet has served in several Army hospitals in the United States and Africa. He was on duty at the Walter Reed General Hospital and Army Medical Center, Washington, when he became ill and was a patient there. After fully recovering from his illness, he will resume his duties at the Reformatory.*

Dutchess County

A regular meeting of the county society was held in the pavilion of the Hudson River State Hospital, Poughkeepsie, March 14, at 8:30 P.M.

The scientific session included the following talk: "Pyuria and its Significance," by Dr. Roy B. Henline, attending urologist, New York Hospital, Welfare Hospital, and Riverside Hospital, urologist, New York Foundling Hospital, New York City, consulting urologist, Mt. Vernon, Yonkers, and Newburgh hospitals.

Also, information on how the physician can best supply the needs of medical assistance to returning veterans was given in full and in detail by Mr. T. Yawn, manager, and Mr. E. L. Daniels, Veterans' Representative of the U.S. Employment Service.

Erie County

Teamwork of skilled surgeons on American battlefronts plus the use of modern drugs—penicillin, sulfonamides, and plasma—have been responsible for the reduction of mortality from 15 per cent in World War I to the present 3 per cent, declared Dr. W. Ward Plummer before members of the county society on February 27 in Hotel Statler, Buffalo.

Dr. Plummer is civilian consultant to the orthopedic section, Second Service Command hospitals.

Stressing the Army's policy to continue every effort compatible with the injuries of these battle casualties, Dr. Plummer pointed out the specialized types of surgery accomplished in special centers throughout the country. He said that no man was released until he could use his artificial extremities successfully. Facilities for rehabilitating these men have been greatly improved since World War I, he added.

He also paid tribute to the "tremendous part" played by the medical corpsmen on the battlefields.*

* * *

Bestowing its accolade upon Dr. Nelson G. Russell, the University of Buffalo on February 22 accorded community recognition to a man who has devoted half a century to healing the sick and the advancement of medical science.

The elder statesman of Buffalo medicine, chairman of the city's Advisory Board of Health, and chairman of the Board of Managers of Meyer Memorial Hospital, Dr. Russell long has been held in high esteem both by the medical men and by the thou-

TABLETS FOR *Oral* USE—
AMPULS FOR *Injection*

There has long been a real need for a potent, mercurial diuretic compound which would be effective by mouth. Such a preparation serves not only as an adjunct to parenteral therapy but is very useful when injections can not be given.

After the oral administration of Salyrgan-Theophylline tablets a satisfactory diuretic response is obtained in a high percentage of cases. However, the results after intravenous or intramuscular injection of Salyrgan-Theophylline solution are more consistent.

Salyrgan-Theophylline is supplied in two forms:

TABLETS (enteric coated) in bottles of 25, 100 and 500. Each tablet contains 0.08 Gm. Salyrgan and 0.04 Gm. theophylline.

SOLUTION in ampuls of 1 cc., boxes of 5, 25 and 100; ampuls of 2 cc., boxes of 10, 25 and 100.

sands of persons whom he has attended in these 50 years.

He has always been in the vanguard of medical thinking and practice. An outstanding diagnostician, he has been especially noted for his work in pathology, in heart disease, and in lung ailments.

A staunch believer in the scientific approach to medicine and a pioneer in that technic, Dr. Russell has coupled it with a deep interest in the personal element of each patient. He was the founder of the milk dispensaries which have become Buffalo's well-baby clinics.

For half a century he has been associated with the University of Buffalo Medical School, with the Buffalo General and Meyer Memorial hospitals. Both in his teaching and in his practice, he has devoted special attention to young men in the medical profession, giving them responsibilities, stimulating their interest, and making good doctors of them.

Dr. Russell won his greatest acclaim, outside of the Buffalo area, during the last war. A veteran of the Spanish-American War and of the New York Guard, he entered World War I as chief of medical service of the 23rd General Hospital.*

Kings County

Dr. Daniel Kravitz, of the Brooklyn Eye and Ear Hospital, and Dr. Raymond L. Pfeiffer, of Presbyterian Hospital, New York City, spoke recently at a scientific session of the Brooklyn Ophthalmological Society in the Hotel Towers.

Heading the general discussion which followed the talks was Dr. Robert H. Stockfish, of the Jersey City Medical Center.

Dr. Michael J. Buonaguro, president of the society, was chairman at a dinner for the executive committee and guests before the evening session. Other officers of the society are Dr. Allen Hull, vice-president; Dr. Benjamin C. Rosenthal, secretary-treasurer, and Dr. Louis Freimark, associate secretary-treasurer.

. . .

Dr. Mark Straus, of Brooklyn, who served in Spain with the Loyalist forces, has been named chairman of the medical and allied professions division of the Joint Anti-Fascist Refugee Committee.

Dr. Leo M. Davidoff, of Brooklyn, is honorary chairman of the medical division.

The Joint Anti-Fascist Refugee Committee is launching a campaign to be known as the Spanish Refugee Appeal to raise $750,000 for the relief of Spanish Republican refugees. Most of the funds will go to aid Spanish exiles in France, many thousands of whom are ill and starving, according to the committee.

Dr. Straus, a graduate of the Sorbonne, is visiting physician at the Kings County Hospital and a member of the Kings County Medical Society.*

. . .

The stated meeting of the county society and the Academy of Medicine of Brooklyn was held on February 20 at 8:45 P.M. in MacNaughton Auditorium. Dr. Bronson S. Ray, associate professor of surgery, Cornell University Medical College, and attending surgeon (neurosurgeon), New York Hospital, spoke on "Surgical Aspects of Carotid Sinus Reflex," and Dr. Joseph Stokes, Jr., professor of pediatrics, University of Pennsylvania, Philadelphia, discussed "Studies on Prevention and Treatment of Certain Acute Infectious Diseases."

Nassau County

The regular monthly meeting of the county society was held on February 27 at 9:00 P.M. in the auditorium of Mercy Hospital, Rockville Centre. Following the business meeting Dr. William Goldring, associate professor of medicine, New York University College of Medicine, spoke on "Hypertension and Hypertensive Heart Disease."

. . .

Dr. Arthur Frucht, formerly of Westbury, has been discharged from the Army and has resumed practice in Nassau County.

. . .

Dr. Claire Burton Reinhardt, executive secretary of the Nassau County Cancer Committee, addressed the Freeport Athena Club on March 2 on the topic "An Ounce of Prevention."

The talk was sponsored by the community service department of the club, Mrs. Frederick E. Jansen, chairman.

Dr. Reinhardt was graduated from the Massachusetts Institute of Technology and completed her Doctor's degree at Yale. She has occupied her present post for the past three years.*

New York County

Dr. Ernest L. Stebbins, Health Commissioner, will go to Italy soon as an agent for the United Nations Relief and Rehabilitation Administration and the United States Public Health Service to study health problems in that country, it was disclosed on March 9. Dr. Stebbins, to whom Mayor La Guardia has granted a leave of absence at the request of the Federal authorities, will help set up a program intended to check the spread of tuberculosis and other diseases in Italy.

He will continue his duties as Health Commissioner, pending travel orders from Washington. He has taken the necessary physical examinations and inoculations. While in Italy he will make a study also of the food problem as it relates to national health. He will submit a detailed report to Washington.

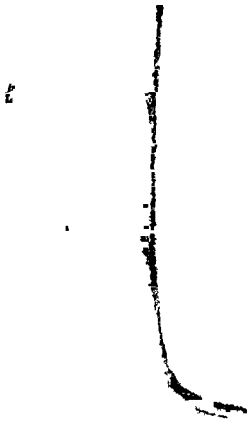
Dr. Stebbins was appointed Health Commissioner on July 16, 1942, succeeding Dr. John L. Rice. During his absence his duties will be taken over by Dr. Frank A. Calderone, Deputy Health Commissioner.*

Oneida County

The February meeting of the Utica Academy of Medicine took place in the Hotel Utica on February 15. Following dinner at 7:00 P.M. the scientific session was held at 8:00 P.M. Dr. John R. Murlin, professor of physiology at the University of Rochester Medical School, spoke on "Biological Value of Protein Foods."

. . .

Dr. Richard H. Hutchings, of Utica, has been reelected a director of the National Committee for Mental Hygiene, it was announced February 17 in New York City.



Among five new members is Lt. Col. John M. Murray, psychiatric consultant to the U.S. Army Air Surgeon, stationed at Fort Thomas, Kentucky.*

Onondaga County

A joint meeting of the county society and the Syracuse Academy of Medicine was held at 8:30 P.M., March 6, at the University Club, Syracuse. The scientific program consisted of a symposium on bacterial endocarditis. Dr. Orren D. Chapman spoke on "Bacteriology," Dr. George H. Reifenstein discussed "Pathology," and Dr. Edward C. Reifenstein spoke on "Diagnosis and Treatment." A business session of both organizations followed.

• • •

Dr. George L. Wright, Syracuse fire department physician, has taken over police department duties as well, Mayor Kennedy said on February 27.

Mr. Kennedy conferred with Dr. Wright on February 26 and was informed that the physician, ill earlier this year, was willing to work for both departments, replacing for police the services of Dr. Harry L. Gilmore, who was elected coroner last fall.

During Dr. Wright's illness, Dr. Gilmore had been carrying out police physician duties and some for fire department members.*

Putnam County

The directors of the Putnam County Health Association met on Monday, February 26, with Miss Louise Campbell, Field Advisor of the State Committee on Tuberculosis and Public Health, at Carmel High School. Also attending the meeting were Dr. Bertrand E. Roberts, District Health Officer, representatives of the county society, the school nurses, and district nurses. Tentative plans were made for the x-ray survey which will be held in each community throughout the county during the week of May 14.

Queens County

The county society discussed maternal mortality in a round-table meeting on February 27 in the Medical Society Building, Forest Hills.

Dr. Ralph L. Barrett, director of obstetrics in Knickerbocker Hospital, Manhattan, presided at the session, in which participants included Drs. Frederick Carpenter, Henry C. Eichacker, Edward A. Flemming, James P. McManus, and Harry P. Mencken.

The discussion followed a dinner at 7 P.M. in the Forest Hills Inn, at which Dr. Barrett spoke.*

• • •

The society met on March 16 at 4:30 P.M. in the County Society Building to hear a lecture entitled "Laboratory Aids in the Diagnosis and Management of Cardiovascular Disease" by Ernst P. Boas, associate physician at Mt. Sinai Hospital. The lecture was arranged by the Committee on Graduate Education of the county society.

Rensselaer County

Dr. Vincent T. Laquidara, of Troy, Lt., MC., recently returned from duty with the fleet, is now assigned as medical officer at the Navy recruiting station in Buffalo.

Before his present assignment, Lt. Laquidara took part in the invasion of Southern France on board one of the Navy's attack cargo ships. Standing off St. Maxime, he saw our amphibious troops pour ashore to overwhelm the Germans.

On active duty since June 1, 1943, Dr. Laquidara has variously been stationed at the naval training center at Sampson, Soloman, Maryland, and Norfolk, Virginia.*

St. Lawrence County

The county society held its spring meeting in the Hepburn Hospital Nurses Residence auditorium on Thursday, March 8 at 1 P.M. The speaker was Dr. Russell Cecil, of the faculty of the Cornell University Medical Clinic, New York City. His subject was "Arthritis."

The business meeting was preceded by a luncheon in the Seymour House.*

Schenectady County

The county society heard Dr. Joseph L. Schwind, assistant professor of anatomy at Albany Medical College, speak on "Cytology and Diagnosis of Diseases of the Blood" at a meeting on March 6 in Briggs Memorial Library at Ellis Hospital.*

Tompkins County

Dr. Howard B. Slavin, assistant professor of medicine and bacteriology at the University of Rochester, spoke at the county society meeting in Memorial Hospital on February 20. He discussed penicillin therapy.

Westchester County

"Psychosomatic Medicine" was the subject for the regular meeting of the Westchester Medical Society held on February 20 at New York Hospital, Westchester Division.

Dr. James Flexner, of White Plains, presented a paper on "The Medical Approach to Psychosomatic Problems" and Dr. James H. Wall, assistant medical director of the New York Hospital, presented "The Psychiatric Approach to Psychosomatic Problems."*

• • •

The Medical Society was invited to hold its April meeting at Eastern Aircraft, North Tarrytown.

There was a conducted tour through the plant with opportunity to observe construction of the Avenger torpedo bomber. A brief business session was held, followed by discussion of industrial health problems and collation.

Necrology

Sigmund Arthur Agatston, M.D., ophthalmologist, of New York City, died on March 5 of a heart attack after reading a paper at a meeting of the New York Society for Clinical Ophthalmologists. Dr. Agatston was born in Austria and received his medical degree from the College of Physicians and Surgeons, Columbia University, in 1900. He was senior assistant surgeon at the New York Eye and Ear Infirmary, attending ophthalmologist to the Sydenham Hospital, consultant at Montefiore Hospital, and emeritus associate ophthalmologist at Bellevue Hospital. A

fellow of the American Medical Association, the American College of Surgeons, the American Academy of Ophthalmology and Otolaryngology, and the New York Academy of Medicine, he was also president of the Harlem Medical Society, and past president, New York Society for Clinical Ophthalmology.

Robert Bailin, M.D., of Brooklyn, died on February 12 at the age of 52. He was graduated from the New York Homeopathic Medical College in 1917, and was a member of the A.M.A. and the County of Kings and State medical societies.

William A. Behan, M.D., F.A.C.S., of Binghamton, died on February 24 at the age of 65 after a short illness. Born in Pennsylvania, Dr. Behan was graduated from the New York University College of Medicine in 1910. He interned at Bellevue Hospital and was resident surgeon there before going to Binghampton, where he became closely associated with that city's hospitals. At the time of his death he was cochairman of City Hospital's surgical division, and chief of staff of Lourdes Hospital. He was a member of the Broome County and State medical societies, and of the A.M.A.

Robert K. Brewer, M.D., of Syracuse, head of the department of physiologic chemistry in Syracuse University College of Medicine, died of a heart attack at his home on March 22. He was a graduate of the University of Wisconsin, and had been a member of the Syracuse Medical College faculty since 1909. He was author of many research reports in scientific journals, a member of the A.M.A., and consulting chemist at the Memorial and Psychopathic Hospitals in Syracuse.

Devillo N. Bulson, M.D., of Rockville Centre, Long Island, died on March 22 at the age of 89. Dr. Bulson was graduated from the Eclectic Medical College in Albany in 1886, and practiced in Rockville Centre until his retirement in 1920. He was prominent in the civic affairs of Rockville Centre, having organized and served as president of the Nassau County National Bank of Rockville Centre, and village president and trustee.

Francis C. Evers, M.D., of Mount Vernon, died on February 17 at his home of a heart attack at the age of 52. Born in New Yor City, Dr. Evers received his doctorate in medicine from Fordham University in 1917. Upon his graduation, he volunteered for service in World War I and served in the U.S. Navy as a lieutenant. At the time of his death he was medical director of the New York Life Insurance Company.

Samuel Wallace Fowler, M.D., pioneer in the modern injection treatment of hernia, died on March 21 at his home in New York City. He was 75 years old. Dr. Fowler was graduated in 1895 from the College of Physicians and Surgeons, Columbia University, and served his internship at Newark City Hospital, Newark, New Jersey. He was instructor in urology at Vanderbilt Clinic and at Bellevue College Clinic, and also in syphilology at New York Hospital. From 1929 until his death, he specialized in the injection treatment of hernia, publishing extensively in the medical and surgical press on the history of the method, the status of research, and the modernizing of the technic in hernia treatment.

Alexander Dickinson Ghiselin, Sr., M.D., of New York City, and Southbury, Connecticut, died at his home in the Bronx on January 6 at the age of 63. Dr. Ghiselin received his medical degree from Marion-Sims Beaumont Medical College in Missouri in 1894.

George DeWayne Hallett, M.D., F.A.C.S., of New York City, died on March 14 at the age of 79. Dr. Hallett was connected with the Flower and Fifth Avenue Hospitals for more than four decades. He was graduated from the New York Homeopathic Hospital in 1889, and was a diplomate of the American Board of Ophthalmology, a member of the American Academy of Ophthalmology and Otolaryngology, the New York State Homeopathic Society, and the Alumni Association of New York Medical College.

Giles E. McClary, M.D., of Syracuse, died at his home on March 6 at the age of 82. A graduate of Rush Medical College, now a part of the University of Chicago, in 1886, Dr. McClary had practiced in Syracuse for fifty-five years, and was consulting physician at Crouse-Irving Hospital. He held membership in the Onondaga County and State Medical Societies, and the A.M.A., and was affiliated with Syracuse University College of Medicine.

Ludwig Michaelis, M.D. of Queens, died on March 1 at the age of 51. Dr. Michaelis received his medical degree from the University of Koenigsberg in 1920, and at the time of his death was assistant clinical physician at Queens General Hospital.

Archie L. Oberdorfer, M.D., ophthalmologist, died on March 12 at Memorial Hospital in New York City. He was 67 years old. Dr. Oberdorfer, senior attending surgeon at the Harlem Eye and Ear Hospital, had been head of the department of opthalmology there for the last forty-three years. Until recently he had been examining the eyes of inductees at Grand Central Palace. He received his medical degree from the University of Virginia Medical College in 1904, and was a member of the A.M.A., the New York State, and Harlem medical societies.

Robert Earl Patterson, M.D., of New York City, died on February 11 of coronary thrombosis. He was 50 years old. Dr. Patterson received his medical degree from McGill University Medical College in 1921, and was a member of the A.M.A., the New York County and State medical societies, and the Society of the New York Eye and Ear Infirmary.

Henry Rafel, M.D., neurologist, of New York City, died on December 14, 1944, at the age of 89. Dr. Rafel was graduated from Erlangen Medical College, in Germany, in 1894.

Albert Sidney Reed M.D., of New York City, died on December 14, 1944, at the age of 75. He was graduated from the New York Homeopathic Medical College and Hospital in 1895. He was a member of the Queens Clinical Society, the National Medical Association, and the American Institute of Homeopathy.

Reed A. Sauter, M.D., of Schenectady, died suddenly at his home on March 8, at the age of 75. Dr. Sauter was graduated from Albany College of Pharmacy, and later entered Albany Medical College, receiving his medical degree in 1895. He was a member of the New York State and Schenectady County medical societies. He had been a practicing physician in Schenectady for nearly fifty years.

Morris Weissberg, M.D., of Brooklyn and Elwood, died on March 17 at the age of 56. Dr. Weissberg was a specialist in internal medicine. Born in Russia, he came to this country as a boy, and was graduated from the Long Island College of Medicine in 1914. He had been consulting physician at Bushwick Hospital, Brooklyn, and St. Luke's Hospital, Newburgh, and at Evangelical Deaconess Hospital in Brooklyn.

Giovanni Zoilo, M.D., of Brooklyn, died on February 2 at the age of 67. Dr. Zoilo received his medical degree in Naples in 1905, and was assistant clinical physician at Cumberland Hospital, Brooklyn.

Improvements

Forty radios have been sent from Syracuse to the station hospital at the Rome Army Airfield and to Rhoads General Hospital in Utica, where they will provide entertainment for wounded service men who have few other opportunities for amusement, Red Cross officials in Syracuse disclosed.

Delivery of the war-precious sets was begun four days after the camp and hospital committee of the Syracuse and Onondaga county chapter of the ARC received an appeal from both hospitals. The radios were rounded up through the cooperation of Syracuse newspapers and radio stations.*

• • •

Purchase of equipment valued at more than $3,000 was ordered by the Flushing Hospital board of trustees on February 20 at its regular meeting.

The purchases will include an operating table, two anesthesia machines, and a high-frequency electrical surgical unit to be used in the urology and eye departments.*

• • •

Portable inhalator equipment was recently donated to St. Jerome Hospital, Batavia, by members of the McAuley League. The new equipment, purchased with revenue obtained by the league from various sales, is of the latest design, and will be carried on the hospital's ambulance for use in case of drowning, heart failures, and other emergencies.*

• • •

Three contracts for construction work at Rhoads General Hospital were awarded in February, it was announced by Col. A. J. Canning, hospital commanding officer. Construction projects are a new gymnasium, a central surgical supply building, and an addition to the occupational therapy building.

Work on the latter two projects was under way in February and construction of the gymnasium was started March 15.*

• • •

Tompkins County Memorial Hospital was presented on March 1 with an incubator for premature babies and three other pieces of outstanding equipment by the Young Woman's Hospital Aid. An oxygen tent, fracture bed, and overhead frame were the other gifts.

The infant incubator provides within the machine all equipment for the complete care and examination of the infant.*

At the Helm

Maj. James A. Brussel, MC, was appointed assistant director of Willard State Hospital on March 1, 1945. Major Brussel has been on active military duty since October 29, 1940, and currently is with the New York Port of Embarkation doing transport neuropsychiatry.

• • •

The new director of Oswego Hospital, Oswego, is Chester Jermyn. For a number of years, he has occupied the position of office and maintenance manager of the hospital.

Other appointments are: Miss Mary O'Brien, as superintendent of nurses; Miss Regina Woods, assistant superintendent of nurses; Mrs. Jane Gillen, night supervisor; and Amelia Colby, dietician. Each of the above will serve under the director. Heretofore, there has been no head to whom the supervisors were responsible, it was said, with the result that the institution was not efficiently managed at times.

All of the appointments, President Penney announced, were of a probationary nature until April 1 and permanent appointments were not made until after that date.*

• • •

Dr. Ray Palmer Baker was re-elected president of the Samaritan Hospital, Troy, Board of Directors at the annual meeting on February 21. Highlights of the meeting were annual reports which showed the work of the hospital in maintaining efficient service to the community in spite of wartime conditions and the recommendation of the president that the hospital should look ahead now to the role it will play in the postwar world.

Also re-elected were E. Harold Cluett as first vice-president, David B. Plum as second vice-president, Ernest L. Warncke as secretary, and Edgar C. Stillman as treasurer.

Three new members of the corporation and Board of Directors were named. Henry J. Sidford will replace R. O. Kennedy on the board. Stephen H. Sampson succeeds the late Hobart W. Thompson, and Arthur H. Wellington replaces Gorham Cluett.

Members re-elected to the corporation and to the board for five-year terms are Livingston W. Houston, Harry McGrath, Mr. Plum, William Leroy Shields, and Maurice Whitney.*

• • •

Dr. Nathaniel H. Ives, practicing physician in Mount Vernon for half a century, was elected an honorary life member of the Board of Managers of Mount Vernon Hospital "in recognition for his fifty years' service to the hospital," at a meeting of the board.

Dr. Ives began his practice in Mount Vernon in the fall of 1895 when Mount Vernon's hospital was a little wooden building at the site of the present Nurses' Home. Since that time he has made trips almost daily up and down the steps to the hospital, which, in Dr. Ives' own words, is "a lot of steps."

During his half century of service to the community, Dr. Ives has sponsored many young doctors who came here, helping them to establish a practice, while he has become one of the best known mem-

The board of trustees of Jamaica Hospital announced on March 3 the re-election of Clarence Ludlum, of Jamaica, as president and the re-election of all other officers of the board.

They are: Howard O. Wood, of Jamaica, and Mrs. M. A. Van Nostrand, of Forest Hills, vice-presidents; Mrs. John Adikes, of Jamaica Estates, secretary; Robert W. Higbie, Jr., of Kew Gardens, assistant secretary; Donald Kittel, of Jamaica Estates, treasurer; and George M. Gross, assistant treasurer.

Walter P. Burden, of Forest Hills, and A. Kenneth MacLachlan, of Jamaica, trustees whose terms expired, declined re-election.

In their places were named Otto Sambach of Queens Village, and Arthur L. Nash, of Hollis.

Dr. Marlo P. Bates, of Woodhaven, was elected attending obstetrician and gynecologist, to succeed Dr. Howard W. Neail, of Jamaica, who has retired from active practice. Dr. Neail was given the title of obstetrician and gynecologist emeritus.

Dr. Edward J. Buxbaum, of Jamaica, heads the medical staff. Other officers are Dr. Miller A. Sanders, of Forest Hills, vice-president; Dr. Daniel Porte, of Jamaica, secretary-treasurer.

Francis C. Leupold continues as administrator of the hospital.*

• • •

Dr. Garner Scullard, of Watertown, pathologist of both the House of the Good Samaritan and the Mercy Hospital for more than seven years, has resigned to become pathologist of the Warren City Hospital of Warren, Ohio.

The resignation will be effective May 1, at which time he will take over his new duties in the Warren 218-bed hospital.*

• • •

Dr. Carl E. Muench, superintendent of Crouse-Irving Hospital, Syracuse, has been appointed medical director of the hospital at the annual meeting of the board of directors.

Miss Dorothy Pellenz, assistant superintendent, has been promoted to superintendent, and Miss Elsie E. Hillen reappointed head of the school of nursing. The twelve directors of the hospital have been re-elected.

A postwar planning committee has been named, consisting of Harry Davies, Charles E. Cooney, George R. Fearon, and R. T. Frank Dolan.*

• • •

Dr. Robert Campbell has been elected president of the Park Avenue Hospital staff for the coming year.

Other officers and department heads named at a recent staff meeting are: Dr. Frederic Kleker, vice-president; Dr. John Hart, secretary; Dr. Guy VanAlstyne, chief, and Dr. James Hondorf, assistant chief of surgery; Dr. Clyde Sutter, chief, and Dr. John J. Finigan, acting chief of medicine; Dr. Arthur Woggan, obstetrics; Dr. James Flynn, x-ray; Dr. Charles Reitz, proctology; Dr. Frederick Garlich, urology; Dr. Nathan McDowell, ear, nose, and throat.*

• • •

Rana S. Cooper has resigned from the five-member Board of Managers of the Broome County Tuberculosis Hospital.

He said his resignation, effective Tuesday, stemmed from the "pressure of private business."*

Newsy Notes

Seventeen rooms at the United States Naval Hospital in St. Albans, Queens, furnished by lodges and auxiliaries of the metropolitan council of B'nai B'rith, were dedicated on March 18. The rooms, for the use of wounded service men, were equipped by the Jewish organization as part of its nationwide war service program.*

• • •

Immediate use of the Albany Hospital clinic for the benefit of wounded and disabled veterans of World War II was arranged on February 26 at a conference between George J. Pickett, Albany Veterans' Service Officer, and Dr. Thomas Hale, Jr., medical director. Dr. Hale consented to the arrangement even though the contract negotiated last week by Lt. Col. Edward H. Gibbons, of the U.S. Veterans' Administration, and clinical director of the Veterans' Facility at the Bronx, has not yet been formally signed.*

• • •

Effective March 1, private duty nurses in six Rochester hospitals were restricted to the seriously ill, according to an agreement effected among members of Rochester Hospital Council.

The new restrictions are necessary in the face of constant shrinking of the number of available nurses as the result of daily enlistments in the armed forces and the growing need for nurses in the service, according to Frederick J. Weider, president of the council.

The six hospitals are Genesee, Highland, Park

Outline for a $1,000,000 postwar development program at City Hospital, Syracuse, has been disclosed.

The city council was invited to discuss details of the program with the hospital's Board of Managers.

The program includes a 70-bed addition to the hospital in a new building approximately the same size as the six-story Doctors' Memorial, a new two-story addition to the maternity wing, a five-story addition to Phelps Nurses Home, construction of a third floor at the Kilmer Memorial Pathological Laboratory, a new one-story receiving ward, and a two-story storage building adjacent to the central receiving room.

Estimated cost of the proposed construction is $780,400, with equipment cost placed at $152,000 and $70,000 set up for architectural fees and other expenses.*

Presiding at the first meeting of the recently elected Board of Directors of the Oswego Chamber of Commerce, President Willard J. Hall advised the directors that he had appointed as members of the Special Hospital committee, authorized by the chamber membership at their annual meeting, February 6, to consider ways and means of providing more adequate hospital facilities for Oswego, the following: George M. Penney, Dr. Grover C. Elder, Harry C. Mizen, Alfred G. Tucker, W. A. Dougherty, Dr. W. McD. Halsey, and Kirk H. White.

The special committee is largely made up of men who are, or have been in the past, in close touch with hospital affairs by reason of service as officers of the hospital or members of its board of trustees, executive committee, or medical staff. The committee was recommended by the chamber membership to be appointed as the result of a brief address made by Dr. Elder at the annual meeting of the chamber in which the overcrowded condition which has existed at the hospital for several months was graphically set forth, and the urgent need of expansion of present facilities or the provision of an entirely new building presented.*

WILL AMINO ACIDS BE EXPLOITED LIKE VITAMINS?

"Nutritionists may have another lion by the tail," Mrs. Miriam Zeller Gross, of New York City, declares in the February issue of *Hygeia, The Health Magazine*. "Last time the lion's name was vitamins. This time it is amino acids.

"The last lion got away from the control of food scientists and rampaged high, wide, and handsome, ridden by the advertisers and the promoters, until corralled by the joint efforts of the medical profession, the government, and food scientists. These same food scientists are now watching developments and hoping that the lessons learned at the height of the vitamin craze will help prevent the exploitation of nutrition's recent findings. They also hope that otherwise intelligent citizens will not create a furor for amino acids as they did for vitamins by snatching at tablets, capsules, and drops to correct everything from toothache to inability to hang pictures straight.

"Like the vitamins, amino-acid products are designed primarily for sick people unable to get adequate nourishment through regular food sources. Also like vitamins, amino acids are usually obtained by eating the proper foods. People who suffer from amino-acid hunger usually do so through ignorance or carelessness.

"Proteins must be broken up into other, smaller substances before our bodies can assimilate them. These tiny protein fractions which food scientists think of as 'building blocks' are called amino acids. . . ."

Mrs. Gross, in explaining the functions of amino acids, says that "our digestive machinery separates the Sunday roast and cheese soufflé into amino acids so that our blood, bones, and all other body fluids and tissues may use these building blocks and rebuild their own proteins. The separation of proteins into amino acids is an intricate chain of chemical processes which begins when the teeth cut up food and it is mixed with saliva, then swallowed and combined with the digestive juices, which decompose the proteins and separate them into their amino acids.

"Scientists have discovered twenty-three amino acids so far, but there may be more. Probably all twenty-three are necessary, although it seems imperative now that only eight to ten be contained in our foods. Scientists are not agreed as to whether the nonessential amino acids are not required or are manufactured within our bodies, perhaps from substances gained through the essential amino acids.

"Generally speaking, foods of animal origin contain all the needed amino acids in varying amounts and combinations, but vegetable proteins supplement those of animal origin. Meat does not head the list of important protein foods. If we value the ideal amino-acid combination as to kind and proportion at 100, food ratings would include whole-egg protein at 91, whole milk at 85, meat (animal tissue) 82, white flour 52, and navy beans 38. It may be years before we know the ratings of all foods.

"Scientists point out that the important thing to get from their amino-acid findings is the realization that it is necessary to eat a balanced diet; that just getting your carbohydrates, fats, and vitamins is not enough. Considering the importance of amino acids and the amount of knowledge already gained, industrial laboratories should be commended highly for reserving amino-acid products to be administered by physicians for sick people. It will be interesting to see what happens next."

MEDICAL SUPPLY FLOWN BY U S TO CHINA REDS

Communist China, which for years has been cut off from sorely needed medical supplies, is being provided with American Red Cross medicines and equipment flown to the remote area by the China Wing of the Air Transport Command

Nearly ten tons of sulfa drugs microscopes x ray equipment, surgical instruments and other medical supplies were in the first shipment flown to the isolated Communists at Yenan by veteran pilots Col Floyd H Davidson, of Atherton, California, and Maj Thomas D Park, of Dallas, Texas

The supplies were delivered to Bethune Memorial International Peace Hospital, located in one of the systems of caves of bombed-out Yenan

Dr Ma Hai teh, the head, an American from North Carolina who prefers to be known by his Chinese name, called [illegible] st medicine I've seen in [illegible]

The medicines wer[illegible] operation of the Chungking government from various agencies which released part of the supplies they had received from the Red Cross The transfer was approved by the central government — *N Y Herald Tribune, Feb. 2, 1945*

Woman's Auxiliary

To the Medical Society of the State of New York

County News

Broome County. Members of the Women's Auxiliary to the Broome County Medical Society were entertained at tea February 28, in the home of Mrs. John D. Bowen in Binghamton. Proceeds of the tea were contributed to the Red Cross Drive. Miss Iris Graham sang two solos, accompanied by Vernon Christian, while David Ludden and Thomas Hujar entertained with the flute and accordion. Dr. Bowen presented several piano selections.

Mrs. Henry D. Watson and Mrs. Howard W. Davis presided at the tea table, which was decorated with pink snapdragons and pink tapers. Mrs. Mark Williams was chairman of the hospitality committee and was assisted by Mrs. J. C. Zillhardt, Mrs. Carl Benson, Mrs. B. L. Matthews, Mrs. D. O. Chamberlain, Mrs. Hugo Lott, Mrs. Vincent M. Maddi, Mrs. Alfred Loewenstein, Mrs. Watson, and Mrs. Davis.

Erie County. We are most grateful to the members who staffed the War Bond Booth during the month of February. Their efforts brought $14,116.95 in bonds and stamps.

The program committee was entertained with a dessert luncheon by Mrs. Joseph W. Madden at her home on Friday, March 9.

Mrs. Walter L. Machemer was hostess to the American Red Cross Knitting Group of the Auxiliary at luncheon at her home Thursday, March 8, and Mrs. J. Herbert Donnelly was hostess at luncheon at her home March 22. Another afghan has been completed and presented to the Red Cross.

Mrs. Jesse G. Levy called a meeting of the Public Relations Committee at her home Sunday, March 11 to outline plans for the public meeting on "Control of Cancer" which was held in the ballroom of the Hotel Statler on April 18. Every effort was made to fill the ballroom to capacity.

The Executive Board met on Tuesday, March 13 in the Board Room of the Medical Society, Mrs. William Rennie presiding.

On Tuesday, March 27 luncheon was served in the Chinese Room of the Hotel Statler at 12:30 P.M promptly. A meeting was called at 2 P.M., followed by a "Potpourri of Reading" by Miss Frances Hepinstall. Reservations were in charge of Mrs. Stuart A. Good and Mrs. Joseph W. Madden. The hospitality committee was assisted by Mesdames Isidor Adler, Thomas G. Allen, Jr., Marvin Amdur, and Charles S. Alaimo. We hoped to see present at this meeting our suburban members who had been snowbound all winter.

Queens County. The executive board of the Woman's Auxiliary of the Medical Society of Queens entertained 150 persons at a luncheon and bridge in January in the Colonial House, Flushing.

The guest speaker was Dr. Edward C. Veprovsky, president of the county medical society. The proceeds from the affair were used to buy necessities for convalescing servicemen at St. Albans and Fort Totten Hospitals.

Mrs. Herman Enselberg was general chairman for the event and Miss Lucy Lanza, cochairman. Mrs. Meyeron Coe, president of the unit, Mrs. Patrick De Canio, and Mrs. William Blaso were hostesses.

Members of subcommittees assisting in arrangements were Mrs. Edward C. Veprovsky and Mrs. William Flanagan, tickets; Mrs. J. Gibson Hill, Mrs. Michael Pollack, and Mrs. Joseph Desane, awards.

Sgt. Doris Packer, of the Flushing recruiting office of the WAC's, was a guest at the affair and asked for women to volunteer in the Women's Medical Corps.

The next meeting of the auxiliary was on February 27 in the Queens Medical Building in Forest Hills. A board meeting was scheduled for March 6 at 1:30 P.M. in the Medical Building. Mrs. Meyeron Coe, president, conducted the executive committee meeting. Mrs. William Brons, war activity chairman, reported that $25 was donated to Fort Totten Hospital for cigarettes. The club voted a donation of $20 for the Red Cross War Fund.

Plans were made for a spring luncheon to be held May 9, at the Aviation Terrace, La Guardia Airport, at 12:30 P.M. Mrs. Herman Enselberg, chairman, will be assisted by Miss Lucy Lanza.

Mrs. Enselberg reported on the luncheon held in February, the proceeds of which went to purchase articles for the servicemen at St. Albans and Fort Totten Hospitals.

The auxiliary voted to donate the money collected for the Carl Boettiger Memorial Fund to the Queens Medical Library.

The next meeting was held March 27, at 8:30 P.M., in the Medical Building, and the next executive meeting was held on April 3, at 1:30 P.M.

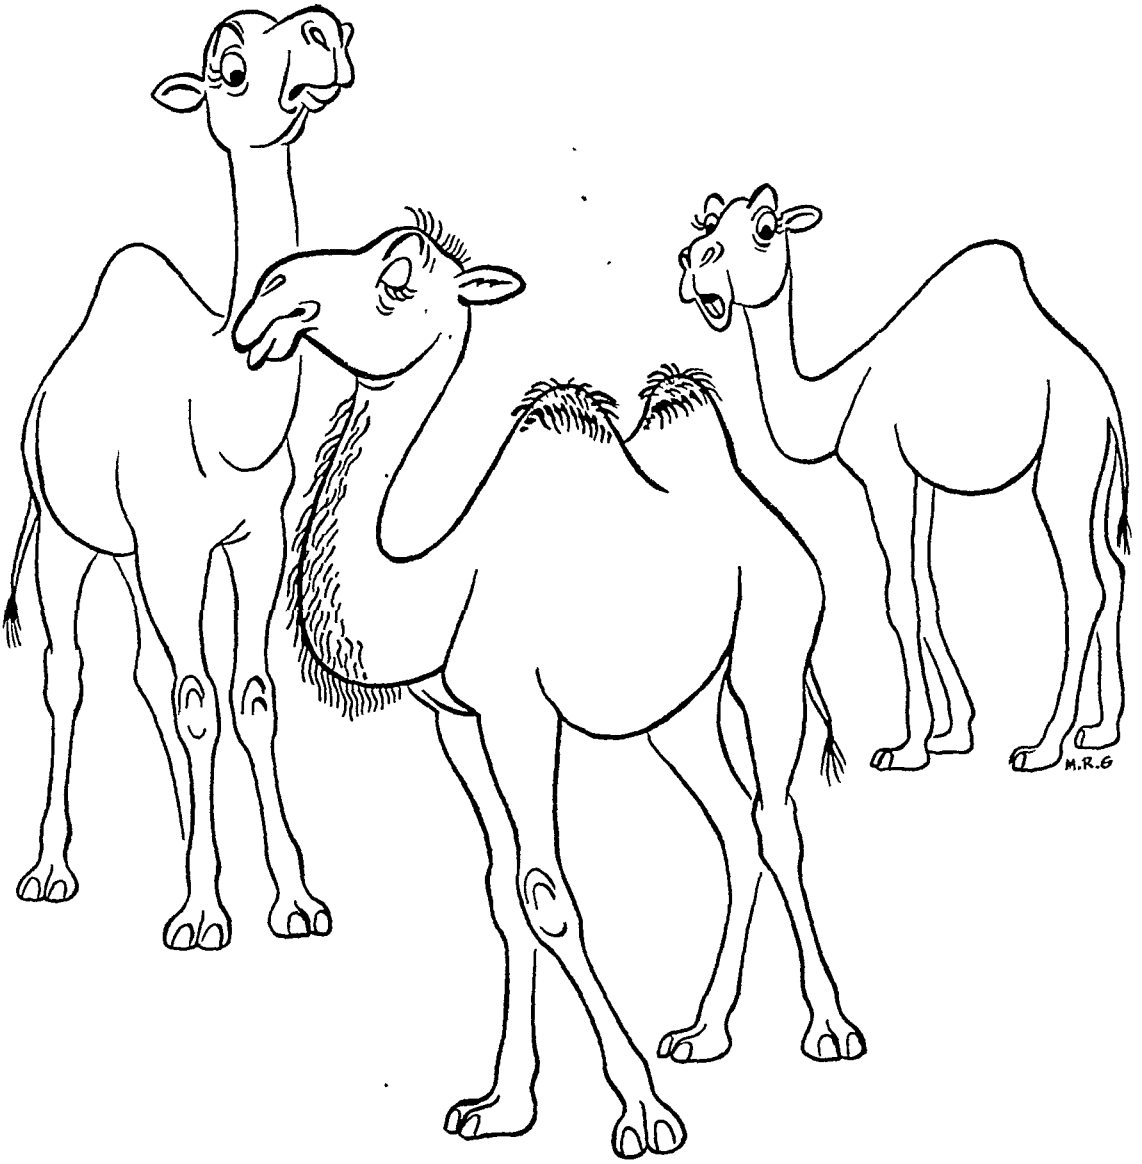
Quality carries on

"you certainly 'measure-up', young lady"

The physician prescribing Biolac is certain of this... the nutrition of his Biolac Babies "measures-up" to optimum standards.

For Biolac (supplemented with vitamin C) is a *complete* infant formula. Adequate vitamins A, B_1, B_2 and D, as well as iron and carbohydrate eliminate calculating extra formula ingredients. The high-protein level of Biolac provides for normal growth and optimum health. Because of the scientifically adjusted milk-fat content, Biolac is readily assimilated—with a minimum of fat upsets. Small, soft curds and ample lactose assure ease of digestion and a natural stool closely resembling that from human milk.



Easily calculated... quickly prepared. 1 fl. oz. Biolac to 1½ fl. oz. water per pound of body weight

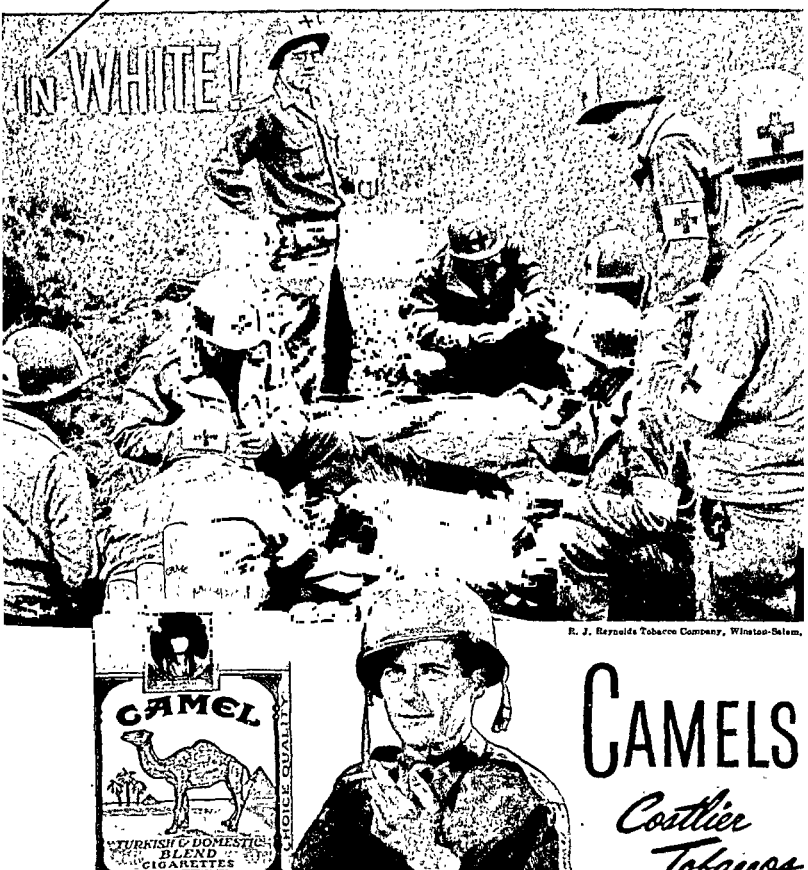
BORDEN'S PRESCRIPTION PRODUCTS DIVISION
350 MADISON AVENUE · · NEW YORK 17, N. Y.

Biolac is a liquid modified milk, prepared from whole and skim milks, with added lactose, and fortified with vitamin B_1 concentrate of vitamins A and D from cod liver oil, and ferrous citrate. Evaporated, homogenized and sterilized. Vitamin C supplementation only is necessary. Available in 13 fl. oz. cans at all drug stores.

Biolac—"BABY TALK" FOR A GOOD SQUARE MEAL

Different in form

Unusual for honey-like liquid form and solely professional publicity, Maltine with Vitamin Concentrates affords prescription control appreciated by physicians. Moreover, its potency, economy and pleasant citrus flavor find equally high favor with patients. Each fluid ounce contains:



Vitamin A ..... *10,000 U.S.P. Units*
Vitamin D ..... *1000 U.S.P. Units*
Vitamin B_1 ..... *3 Milligrams Thiamine Hydrochloride*
Vitamin B_2 ..... *4 Milligrams Riboflavin*
Nicotinamide ..... *40 Milligrams*
Pantothenic Acid ..... *350 Micrograms*
Dicalcium Phosphate ..... *17 grains*
Maltine ..... *q.s.*

Available through pharmacies in bottles of 12 fluid ounces. The Maltine Company, New York. Established 1875.

Maltine with Vitamin Concentrates

Combat Team

They're armed with tourniquets and plasma instead of guns and grenades. • They're the combat team of medical science—the medical officer and the aid men—and they're fighting men, through and through. • It isn't a showy fighting job—just hard, dangerous work that goes on even when the guns are quiet. So often, rest for the men of medicine is limited to a few moments of relaxation with a friendly cigarette. More than likely it's a Camel cigarette; for Camels, with their mildness and full, round flavor, are such a big favorite with fighting men in *all* the services.

THIS IS SULAMYD

Acetylization of sulfanilamide in the preparation of SULAMYD (Sulfacetimide-Schering) differs essentially from that occurring within the liver and results not only in a compound of lower toxicity, but one of enhanced therapeutic effectiveness.

SULAMYD is a readily absorbed, easily excreted, rapidly acting bacteriostatic drug for the treatment of urinary tract infections, especially those due to B. coli, the organism which is most frequently responsible.

SULAMYD is available in tablets of 0.5 Gm. (7.7 grains), in bottles of 100 and 1,000, and as a powder in bottles of 5.0 Gm. for the preparation of laboratory standards.

SAFE, SIMPLE, EFFECTIVE *ORGANOTHERAPY*

Cavolysin in OBESITY

Cavolysin (formerly Lipolysin) increases fat oxidation through stimulation of metabolic processes . . . for safe, gentle and gradual reduction of excess poundage. A dependable pluriglandular preparation of high purity. *No dinitrophenol.*

AMPULS: boxes of 12 and 100. Each 2 cc. (feminine) derived from ovarian subst. 20 grs. (masculine supplies orchitic subst. instead of ovarian); thyroid 3 grs.; suprarenal cortex 3 grs; ant. pituitary 3 grs.; lymphat. gland 3 grs

TABLETS and CAPSULES: Bottles o 100. Each (feminine) contains ovarian subst. 0 31 gr. (masculine has orchitic instead of ovarian); thyroid 0.9 gr.; thymus 0.31 gr.; ant. pituitary 0.39 gr.

Send for literature. Address Dept. N.

CAVENDISH PHARMACEUTICAL CORP. • 25 West Broadway • New York

"SINCE many of the conditions obtaining among troops during war time are simultaneously factors which predispose to the endemic and epidemic spread of amebic dysentery among military personnel and civilians . . . these diseases assume great significance . . . not only to the medical departments of the armed forces but to the civilian physician as well"

—Lt. Com. W. L. Voegtlin, USNR N W Med., *43* 69 (1944)

Increased investigation into "tropical diseases has disclosed the unsuspected prevalence of amebic dysentery in the United States

In suspected or frank cases, and for the treatment of "carriers,"

Diodoquin

(5, 7 D iodo-8-Hydroxyquinoline)

"meets the requirements of an amebicide free from toxicity and practical for routine use . . ."*

Diodoquin — an original product of Searle Research — contains 63.9% iodine in a tasteless, oral form which is non irritating and of negligible toxicity Council Accepted Available in bottles of 100, 500 1000 tablets Item No 1168600 on the Army Supply Table

Menopause Symptoms • Senile Vaginitis • Pruritus Vulvae

Effective Relief with

Schieffelin
BENZESTROL
(2 4 di (p hydroxyphenyl) 3 ethyl hexane)

• Clinical reports agree that Schieffelin Benzestrol satisfactorily alleviates not only menopausal vasomotor reactions but also other associated climacteric symptoms, such as headaches, joint pains, nervousness and fatigability.

Dose: Oral 2 to 3 mg. daily.

Intramuscular ½ to 1 cc. every 4 to 7 days.

• Schieffelin Benzestrol is used in relieving symptoms of senile vaginitis and associated pruritus vulvae by converting the atrophic epithelium to the adult functional type. For localized therapy in this condition Schieffelin Benzestrol is available as an ellipsoid tablet for vaginal insertion.

Dose: 1 or 2 vaginal tablets inserted daily.

Literature and samples on request.

The OUTSTANDING AGENT *in Arthritis Therapy*

A survey of the literature clinically outlining the usage of Ertron in chronic arthritis leaves no doubt as to the distinguished value of this agent. Clinically proven . . . safe . . . effective.

No similar agent has the tremendous weight of clinical evidence as reported from independent sources—leading hospitals, clinics, teaching institutions and private practice.

The clinical work has been done on Ertron . . . the bibliography specifies Ertron . . . the results reported apply only to this product. Ertron alone—and no other product—contains electrically activated vaporized ergosterol (Whittier Process).

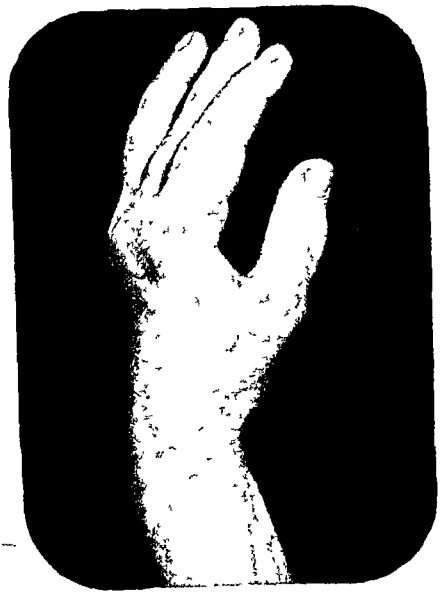
ON ITS RECORD. The record of Ertron, a mass of clinical evidence taken from the literature over a ten-year period, is the basis for its wide acceptance today. Given the test of time, it has been repeatedly shown that this is one form of therapy that should be given consideration in treating each case of chronic arthritis seen in practice.

ERTRONIZE THE ARTHRITIC

ERTRONIZE MEANS: Employ Ertron in an adequate daily dosage over a sufficiently long period to produce optimal results. Gradually increase the dosage to that recommended or to the toleration level. Maintain this dosage until maximum improvement occurs.

ETHICALLY PROMOTED

Supplied in bottles of 50, 100 and 500 capsules



Parenteral for Supplementary Intramuscular Injection

NUTRITION RESEARCH LABORATORIES

CHICAGO

Ertron is the registered trade mark of Nutrition Research Laboratories

Views of the left hand of a male, aged 29 years; illustrating a *late atrophic arthritis;* duration of disease, 9 years; occupation, food storage, refrigeration.

This picture shows a terminal stage of rheumatoid arthritis. It illustrates, in addition to usual features of discoloration of the skin and wasting of the soft tissues, the presence of a cyst-like but actually a subcutaneous nodule on the second proximal interphalangeal joint of the index finger. Such nodules of a tubercle type occur, according to authorities, in about 10 per cent of patients with this disease. The fingers show atrophic changes involving particularly the third or middle digit. General involvement including an ankylosing spondylitis or poker spine and locked jaws. This patient is also bedridden. X-ray shows marked subluxation in the metacarpal phalangeal articulations. There is irregularity of the articular aspects of the proximal interphalangeal joints and pronounced decrease of the distal interphalangeal joints. There is also loss of joint space of the carpal bones and resultant ankylosis. Note the generalized decalcification.

Pregnancy, Needed Weight-Gain, and Proteins

One of the tasks imposed upon the gravid organism is to produce new tissue to the extent of almost one-fifth of its own normal body weight.* Unless protein supply in the diet is adequate, quantitatively as well as biologically, the hazard for the maternal organism increases and the development of the fetus may be impaired. The proteins of meat are of the right kind not only to lay down these new tissues, but also to provide for the stepped-up functions during pregnancy, for which proteins are essential.

*"During pregnancy the average normal woman gains approximately 18-22 pounds, which represents the growth of the uterus, breasts and other organs as well as the fetus and placenta. In other words, a pregnant woman in nine months reproduces tissue almost equivalent to one-fifth of her own normal body weight. It must not be forgotten that the chief function of protein is to supply the tissue-building material of the body, that the need for this material is increased during pregnancy and that the protein deficiency in the diet of the nonpregnant woman may become dangerous when maternity intervenes. . . . It is reasonable to assume that protein foods satisfy appetite earlier than the others and make it content with fewer calories. In this respect we have found high protein diets of value for weight restriction during pregnancy." (Arnell, R. E.; Guerriero, W. F.; Goldman, D. W.; Huckeby, E., and Lutz, A. M.: PROTEIN MALNUTRITION in PREGNANCY, New Orleans M. & S. J. 95:114 [Sept.] 1942).

★ IODINE...A PREFERRED ANTISEPTIC ★

Its Toxicity is Low

The human leucocyte cell withstands a concentration of 1:600 iodine before its resistance is overcome. Leucocytic activity was found to be inhibited at much lower concentrations by other tested germicides.*

The low toxicity of Iodine in relation to its bactericidal action, is one of several reasons for its preference in surgery, in first aid... wherever an antiseptic for general use is needed.

YOU NEED THIS

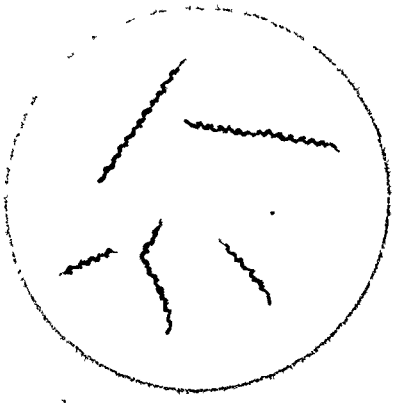
EXTRA FACTOR...

IN MUCOUS MEMBRANE ANTISEPSIS

IN THE TREATMENT of mucous membrane infection, ARGYROL provides more than bacteriostatic action . . . more than decongestive results.

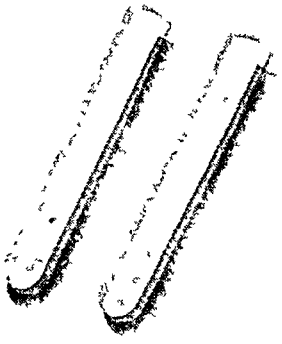
It also provides an EXTRA FACTOR . . . *physiologic* stimulation of tissue defense function.

ARGYROL is often termed the *physiologic* antiseptic. For in addition to being contra-infective and contra-congestive, it is protective, soothing to nerve ends, and stimulating to glands. Its action is more than surface action: it is *synergetic* with the deep-seated tissue defense mechanism. ARGYROL provides combined physico-chemical and bacteriostatic properties that have proved of value to physicians for nearly a half-century.



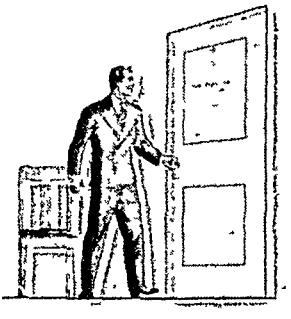
In prescribing for patients, make sure that you specify Original Package ARGYROL.

ARGYROL — *THE PHYSIOLOGIC ANTISEPTIC WITH SYNERGETIC ACTION . . .*



* *Made only by the* A. C. BARNES COMPANY, NEW BRUNSWICK, N. J.

ARGYROL is a registered trademark, the property of A. C. Barnes Company



The *Effectiveness* of ANTISYPHILITIC THERAPY

depends
not on disappearance of spirochetes alone

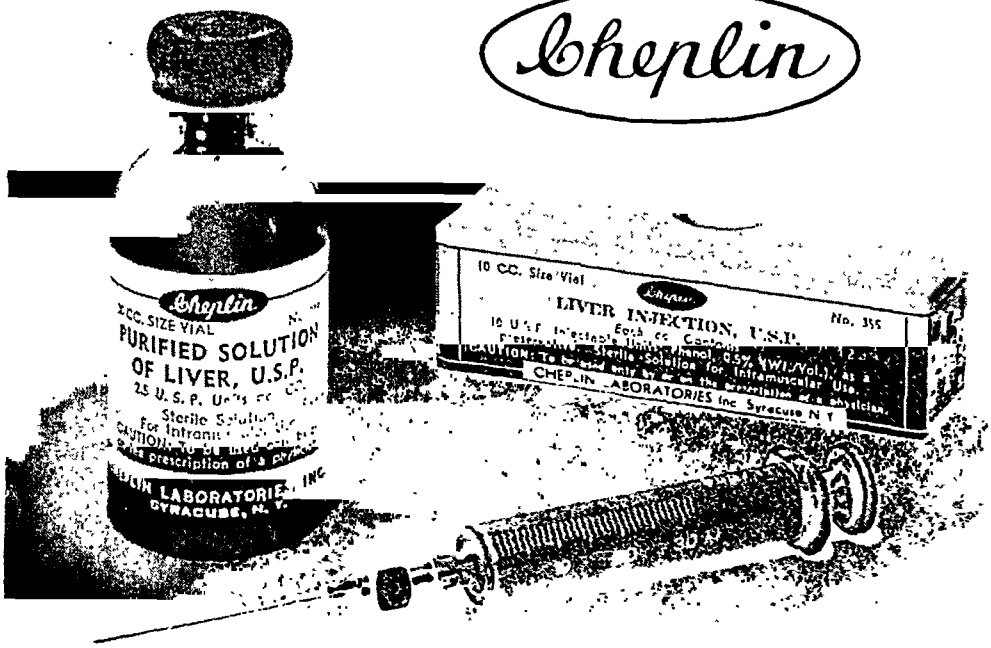
nor merely
the reversal of positive Wassermann reaction

but on
whether the treatment is such that within the shortest possible time the patient receives maximum protection against relapse and the infection of others.

PEOPLE who feel well balk at the idea of taking weekly injections, particularly if the injections are painful or make them feel ill. Therefore, once the early signs of syphilis disappear, many patients become indifferent to treatment. A recent survey shows that:

> *only 1 out of 4 clinic patients with early syphilis, undergoing the standard 70-week course, continues treatment long enough to receive minimal protection against infectious relapse.*

A realistic approach to the problem is provided by the use of Mapharsen, a rapidly administered arsenical that minimizes the discomfort of injections; one which is well tolerated by the patient; and one which gives a high degree of protection in a short period of time. Consideration of these factors increases the possibility of securing sufficient cooperation on the part of the patient to insure the continuance of therapy beyond the point where relapse or the infection of others is possible.



Whatever method you choose, use

MAPHARSEN

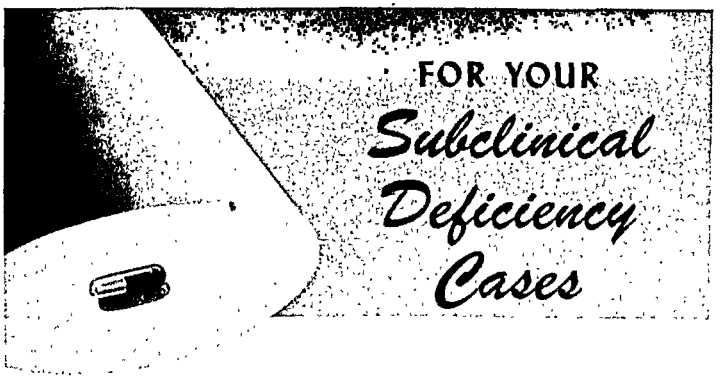
Meta-amino-para-hydroxyphenylarsine oxide (arsenoxide) hydrochloride

PARKE, DAVIS & COMPANY, DETROIT 32, MICHIGAN

Cheplin

LIVER INJECTION U. S. P.

Favorable hematopoietic response is observed with parenteral use of this sterile, purified, clinically-assayed liver solution. CHEPLIN LIVER INJECTION gives the degree of reticulocyte response and erythrocytic maturation desired in treating pernicious anemia in relapse. Also supplied for maintenance of restored blood levels in pernicious anemia and in treatment of certain other macrocytic anemias. *Literature on request.*



LIVER INJECTION U.S.P. supplied in:

2.5 U.S.P. injectable units per cc. in 2 cc. ampules, 10 cc. and 30 cc. vials.

10 U.S.P. injectable units per cc. in 5 cc., 10 cc. and 30 cc. vials.

SYRACUSE 1, NEW YORK

Seldom does nutritional deficiency result from the absence of a single element from the diet. Usually "under par" cases present a coexistent mineral and vitamin deficiency.

For your nutritional deficiency patients who fall into the subclinical group, try VALACAPS. This preparation presents the minerals most often found lacking in the diet, iron, calcium, and phosphate . . . plus vitamin D, factors of the B complex, and manganese.

The various ingredients of VALACAPS, except calcium and phosphate, are present in amounts calculated to prevent occurrence of specific deficiency symptoms, and to correct existing corresponding mineral-vitamin deficiencies.

VALACAPS

Nutritive Therapy

When the nutritive status of any patient is severely impaired, supportive therapy centers about four essential measures[1].

1. High caloric, high protein diet, within the tolerance of the patient.
2. The natural B complex[1] in adequate dosage.
3. Additional administration of vitamins[2], calcium, and iron, if and as indicated.
4. Prompt administration of thiamine, riboflavin, niacinamide and ascorbic acid *in dosage which clinical experience[1,2] has shown to be effective.*

For this last, Squibb makes available the "basic" formula of Jolliffe[2] and Spies[1] founded on years of successful clinical experience—Squibb Basic Formula Vitamin Tablets. Each tablet supplies: 10 mg. thiamine; 5 mg. riboflavin; 50 mg. niacinamide, and 75 mg. ascorbic acid.

For documentation of this new concept, write on your prescription blank, "Nutritive Therapy." Send to Squibb Professional Service Dept., 745 Fifth Ave., New York 22, N.Y.

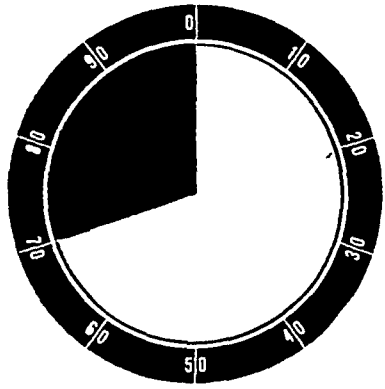
Basic Formula SQUIBB

MANUFACTURING CHEMISTS TO THE MEDICAL PROFESSION SINCE 1858

PROOF

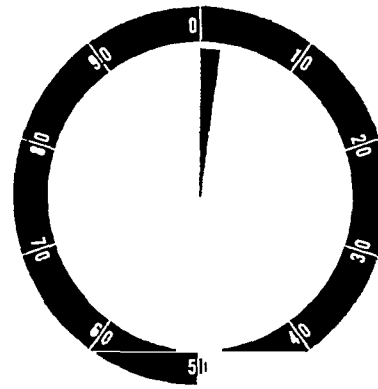
➡ ➡ *The usual precipitous depression of hemoglobin following donation of 500 cc. of blood was prevented by Licuron-B. Premedication with iron salts alone did not prevent this hemorrhagic anemia, and upon blood donation the level of hemoglobin fell as though no medication had been given. These patients required an average of 26 days to recover from this anemia. In those receiving Licuron-B the hemoglobin values described an almost horizontal line in spite of blood donation.*

Licuron-B is the bi-active antianemic. (1) It provides the copper-iron ratio which is basic therapy in hypochromic anemia. (2) It raises the nutritional status of the patient with liver B-vitamins augmented by the crystalline vitamins, thiamine, riboflavin and niacinamide.



LAKESIDE LABORATORIES, *Milwaukee, Wisconsin*

*Shapiro, S; Segard, C. P., and Tabachnick, E. N.: Prevention of Hemorrhagic Anemia After Blood Donation in Normal Adults, New York State J Med 45 394, 1945. (Reprints of this article will be sent upon request).



Licuron-B

Effective, safe, ***LOCAL*** *chemotherapy*

HIGH LOCAL CONCENTRATION

LOW SYSTEMIC ABSORPTION

High Local Concentration: One pleasantly flavored Sulfathiazole Gum tablet chewed for *one-half to one hour* promptly provides a high concentration of locally active sulfathiazole (average 70 mg. per cent) *that is maintained throughout the chewing period.*

Low (negligible) Systemic Absorption: Blood levels of the drug, even when maximal dosage is employed, are almost negligible—rarely reaching 0.5 to 1 mg. per cent.

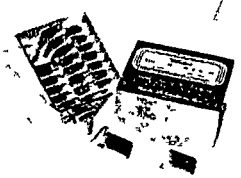
* *A product of* WHITE LABORATORIES, INC.

in oropharyngeal infections

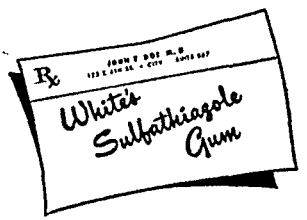
HIGH and PROLONGED salivary concentration of sulfathiazole is brought directly to the site of oral and pharyngeal infections following the use of—

White's SULFATHIAZOLE GUM

Even a single tablet of White's Sulfathiazole Gum chewed for *one-half to one hour* provides a high concentration of locally active sulfathiazole. The medication is brought into immediate and *prolonged* contact with oropharyngeal areas which are not similarly reached by ordinary measures of topical chemotherapy. Moreover, resulting blood levels of the drug, even with maximal dosage, are so low that systemic toxic reactions are virtually obviated.



INDICATIONS: Local treatment of sulfonamide-susceptible infections of oropharyngeal areas:



a. acute tonsillitis and pharyngitis;
b. septic sore throat;
c. infectious gingivitis and stomatitis;
d. Vincent's disease

Also indicated in the prevention of local infection secondary to oral and pharyngeal surgery.

DOSAGE: One tablet chewed for *one-half to one hour* at intervals of one to four hours depending upon the severity of the condition.

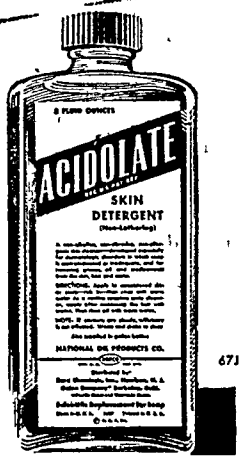
Available in packages of 24 tablets, sanitaped, in slip-sleeve prescription boxes.

manufacturers

IMPORTANT: Please note
tient requires your

SANITIZE THE SKIN

with the modern sulfated-oil cutaneous detergent, to avoid the possible aggravation of symptoms known to occur when soap is used.



PREFERRED BECAUSE

★ it has the same physiologic pH as skin.

★ it contains high-molecular-weight fatty acids, known to be non-irritating.

★ it completely emulsifies skin soil, without lather, and being water-miscible, rinses off easily with any kind of water.

★ it is non-abrasive, non-alkaline, pigment and perfume free.

INDICATIONS

1. Detergent in dermatologic disease . . . 2. Detergent for soap-irritable skin . . . 3. Removal of excessive natural and residual medicinal oil and grease from skin, scalp, and hair . . . 4. Soapless surgical scrub-up . . . 5. Management of acne vulgaris.

Pediforme Footwear

for CORRECTIVE TREATMENTS

No animal laboratory tests can supply information as a guide to the proper choice of therapeutic footwear. Only the hard-earned experience gained over a generation of fitting shoes to all conditions of feet, and learning from the experience of individuals in all age groups who have not been fitted properly before, can provide the essential knowledge adequate for manufacturing and fitting helpful shoes.

Add to this the recommendations of specialists in medicine and you have a dependable source for beneficial footwear that supplements your treatments of any member of the family.

?nstantaneous STANDARD RECORDINGS *with Portable* Cardiotron

ou probably know all about electro-ardiographs, doctor, but you haven't seen nything like CARDIOTRON. This direct-:cording instrument sets new standards f speed, accuracy and simplicity of oper-tion. It saves your time and enables nmediate diagnosis by providing perma-ently recorded standard cardiograms as oon as you connect it to the patient.

Vith CARDIOTRON there is no time lapse —you can make your diagnosis at once, because developing and other photographic procedures are completely eliminated. CARDIOTRON is sensitive to the minutest variation in cardiac activity—yet it is rugged enough to withstand the roughest treatment. Rigorous tests guarantee its accuracy. And, since no ink or other fluid is used, there is no possibility of clogging. CARDIOTRON'S light weight is another factor which makes it ideal for office or bedside use.

HAVE YOU PATIENTS
With Any of These Conditions?

Spencer Abdominal Supporting Corset shown open revealing Inner support This is a SEPARATE section, adjustable to the corset section and the patient's figure by means of flat tapes that emerge on outside of corset

Hernia?

Enteroptosis with Symptoms?

SacroiliacSprain or other Back Injury?

Spinal Arthritis?

Postoperative Conditions?

Maternity or Postpartum Conditions?

Breast Problems?

When you prescribe a Spencer Support you are assured it will meet your specific requirements and the patient's figure needs, *because* it will be individually designed, cut and made for the one patient who is to wear it

Every Spencer Support is individually designed for the patient of non-elastic material Hence, the support it provides is constant, and a Spencer can be—and IS—guaranteed NEVER to lose its shape. Spencer Supports have never been made to *stretch to fit,* they have always been *designed to fit.* Why prescribe a support that soon loses its shape and becomes useless before worn out? Spencers are light, flexible, durable, easily laundered

For service, look in telephone book under "Spencer Corsetiere" or write direct to us

Rhus
Toxicodendron
Rhus
Spring...and the Itchy Rhus
When the vesicular, itching eruption of *Rhus* dermatitis begins to torment your skin, there no longer can be any doubt that spring is here again. But the annoying symptoms of ivy and oak poisoning may be minimized, in the majority of cases, by prophylactic inoculation with 'Ivyol' Poison Ivy Extract. And if treatment of *Rhus* dermatitis is indicated, this efficient preparation is of definite value in relieving the pruritic symptoms.
'Ivyol' Extract contains purified principles of poison ivy (1:1000) in sterile olive oil. Administration by intramuscular injection is relatively painless because of the bland character of the vehicle employed. 'Ivyol' Extract is supplied in packages containing one or four 0.5 cc. vials, each vial representing a single dose. Sharp & Dohme, Philadelphia 1, Pa.
Prophylaxis: Contents of one vial, intramuscularly, each week for four weeks.
Treatment: Contents of one vial, intramuscularly, every 24 hours until symptoms are relieved.
'IVYOL' Poison Ivy Extract
For the Prophylaxis and Treatment of Poison Ivy and Poison Oak Dermatitis

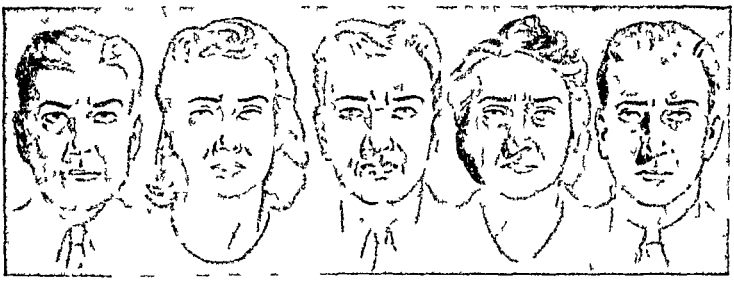
BLOOD ENRICHMENT

IN IRON-DEFICIENCY ANEMIA

The blood in iron-deficiency anemia is markedly benefited by Copperin administration: hemoglobin percentages quickly rise; red blood cells increase in quantity and improve in quality.



Due to the action of the catalyst, copper sulphate, the amount of iron ammonium citrate per capsule is reduced to only 32 Mgm. But as ALL the iron is made available, maximum therapeutic effect is obtained. Copperin does not stain teeth or irritate the gastrointestinal tract and is water soluble. Prescribe Copperin "A" for adults, Copperin "B" for children.

Liberal professional samples gladly sent on request

MYRON L. WALKER COMPANY, INC.
Mount Vernon, New York

COPPERIN

Seldom sick *but* never well

• Today, with our generously rationed American diet, there are few who develop frank vitamin deficiency syndromes

But there is a great host of people who do not enjoy buoyant good health because they fail to obtain enough of these all-important accessory food substances

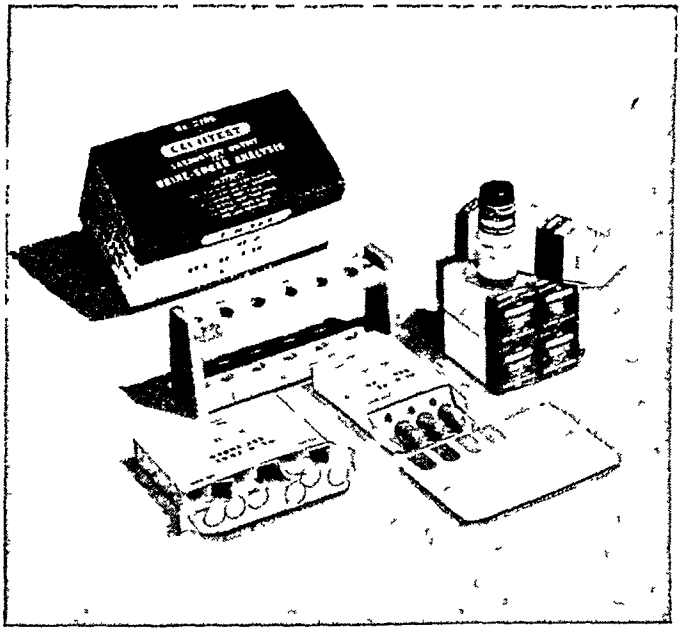
They are seldom sick but never well.

For this great group, additional vitamins are necessary

And what more convenient way is there to supply this need than to prescribe 'Avicap'

One 'Avicap' a day supplies the minimum daily requirements of the six vitamins known to be essential in human nutrition

Avicap Registered Trademark



'Avicap' Multi-vitamin Capsule

Each 'AVICAP' contains Vitamin A 5,000 U S P units; Vitamin D 500 U S P units; Vitamin B_1 .1 mgm ; Vitamin B_2 2 mgm ; Vitamin C 30 mgm ; Nicotinamide 10 mgm

BACTRATYCIN

TRADEMARK

Antibiotic Ointment

containing

TYROTHRICIN

BACTRATYCIN contains tyrothricin, one of the most effective known antibiotics. Tyrothricin consists of two fractions, gramicidin and tyrocidin.

By the nature of its composition, BACTRATYCIN presents tyrothricin in true solution affording faster antibacterial action, plus a desirable slight tissue penetration.

INDICATIONS: BACTRATYCIN is indicated for topical use in **ulcers... abscesses... pustular dermatitis... impetigo... stitch abscesses... infective dermatitis... and similar surface infections either caused or complicated by gram-positive organisms.**

BACTRATYCIN, because of its tyrothricin content, must not be used in freely bleeding wounds.

Available: Through leading pharmacies in jars containing 2 ounces.

Literature to physicians upon request.

Editorial

Limitations of Sulfonamide Therapy in Surgery

The futility of treating wounds by the topical application of sulfonamides seems to be proved beyond dispute. As long ago as 1941 Fleming, as quoted by Wakson, warned against placing too much faith in antiseptics belonging to the sulfonamide group "because their action is neutralized by chemicals, by pus, and by dead bacterial cells." The validity of his warning has been established by the investigations conducted by subcommittees of the Committee on Medical Research of the Office of Scientific Research and Development.

The result of this work has been published by Dr. Frank L. Meleney in a report which should be read by every surgeon.[1] It covers the work of nine units set up at the Akron City Hospital, the Charity Hospital in New Orleans, the Cincinnati General Hospital, the Cook County Hospital, in Chicago, the Detroit Receiving Hospital, the Henry Ford Hospital, in Detroit, the Johns Hopkins Hospital, in Baltimore, the Massachusetts General Hospital, in Boston, and Presbyterian Hospital, in New York. The results are based on 2,191 complete records of cases studied over a period of twenty-two months. Of the 2,191 cases there were 926 soft-part wounds, 674 compound fractures, and 591 burns. For statistical purposes the groups were divided on the basis of common factors which might favor or minimize the development of infection. These factors include the time elapsed between the occurrence of injury and the time of operation, the amount of gross contamination of the wound, and the extent of tissue damage.

Of the 926 cases of soft-part wounds 17.6 per cent were infected. All of the patients were, of course, given adequate surgical treatment according to accepted standards, but 322 received no sulfonamide while the remaining 604 were treated with sulfonamides, either systemically, locally, or both. The total sulfonamide group had 20.4 per cent of infections compared with 12.4 per cent in the group treated with no sulfonamide.

It is probable that a majority of surgeons use sulfanilamide in the peritoneal cavity and believe that the drug is of particular value both in treatment of infection and as

[1] Meleney, Frank L.: Surg., Gyneo. & Obst. 80: 263 (1945).

a preventive. It will come as a shock to them that this study reveals a higher percentage of infection in the drug-treated cases than in the controls. In the controls there were 8 cases involving the alimentary tract without an infection among them.

Many cross tabulations were made in this study under the direction of eminent biostatisticians, but they only confirm the results already described. Dr. Meleney says, "No matter how we look at these results, we cannot find any evidence to support the idea that the use of the sulfonamides has lowered the incidence of infection in the accidental soft-part wounds which have been covered in this study."

The study of compound fractures includes fourteen tables, each covering a separate phase of the subject. Space does not permit even a summary of results, but in general they correspond with those obtained in wounds of the soft tissues. The result in one tabulation is so important that it should be mentioned. It has to do with the question of primary closure of the wound in compound fractures. The lowest rate of serious infections is in the wounds which were completely closed, while in those partly closed or left open the rate is high. The importance of tension in wound closure was also emphasized. In 265 cases in which closure was done without tension, there were only 6 per cent of serious and 6 per cent of trivial infections, while those closed with tension had 16.4 per cent serious and 21 per cent trivial infections. The report states, "This relatively low incidence of serious infections in compound fractures closed with tension cannot be attributed to the sulfonamides, for in 34 such patients receiving both general and local sulfonamide, there were 9 serious and 3 trivial infections while in 26 control cases there were only 1 serious and 8 trivial infections."

There is a distinct danger that belief in the efficacy of the sulfonamides in the local treatment of wounds may result in the neglect of sound surgical principles. As Dr. Allen O. Whipple says in his Foreword, "It is finally the unanimous opinion of the committee that, as always, the carrying out of the sound surgical principles of preventing and treating shock, of hemostasis, of removing nonviable tissue and foreign bodies, of repairing the wound with minimum tissue tension, of maintaining maximum nutrition to the tissues, of immobilization of the wounded part—in other words, sound surgery, is the *sine qua non* of wound therapy."

The study of burns was equally comprehensive, with cross tabulations giving comparisons of drug-treated burns and controls within various subgroups including the major factors concerned with wound infection. In this group also the evidence indicated that the local use of sulfonamides as prophylactic agents was of no value. On the other hand, it is stated that the sulfonamides have apparently been useful in treating cases of infection by reducing its spread from the original site.

An interesting observation in the study of burns is that pressure dressings with vaseline, boric acid, saline, or zinc peroxide gave the lowest incidence of infection while those patients treated with tannic acid had 100 per cent infection.

The following quotations from the report summarize the more important conclusions:

"The use of the sulfonamides as employed in these cases either systemically alone or locally alone, or combined, has not materially reduced the incidence or the severity of local infections in the wounds or burns nor have they delayed the development of infection nor have they eliminated the pathogenic organisms from the wounds. It seems likely, however, that they have minimized the spread of the local infection into the general circulation and have therefore cut down the incidence of septicemia and death. This has been accomplished by systemic drug therapy when infection developed in the controls, as readily as when the drugs have been used either locally or generally as prophylactic agents and employing them only as therapeutic agents after infection has developed. Omitting the routine early use of these drugs would avoid a great waste of material and many toxic reactions. . . .

". . . .Our carefully analyzed figures show that when the local conditions favored infection, the controls on the whole did better than the drug-treated cases. These are precisely the conditions in which it was hoped that the drugs might be of value. This tends to lend weight to the belief that the presence of devitalized or damaged tissue in some way inhibits the bacteriostatic action of the sulfonamides. . . .

"The results of this study have surprised many people and are presented with the keen disappointment of all of those who have worked on the

problem, for all hoped that something would be found which would prevent infections in these wounds However, the facts must be faced, the problems which they present must be understood and an attempt must be made to solve them, because in war wounds, local infection, even if it does not result in death, causes prolonged hospitalization and either temporary or permanent disability or deformity, frequently with loss of limb Effort must be made in the following directions (1) to find out what interferes with the bacteriostatic action of sulfonamides in the wound or on the surface of a burn (2) to find some way to inactivate the inhibitors, (3) to find some form of sulfonamide which will not be inhibited in the wound, (4) to find some other agent which will eliminate the bacteria from the wound or nullify their action without injury to the wound itself"

It should be emphasized that this report does not disparage the *systemic* use of the sulfa drugs On the contrary, it emphasizes their efficacy in limiting the spread of infections and preventing septicemia

The Legislature Acts Wisely

The Legislature of the State of New York deserves the highest praise of the medical profession for its assistance in maintaining the standards of medical practice in this State by refusing to pass the chiropractic bill

In protecting the standards of medical practice, the Legislature has once again served the public well There should be only one standard under which medicine or any other activity having to do with the health of the people can possibly be practiced in this state, and that is the highest standard By refusing to degrade the present medical practice act in any particular, the Legislature has acted wisely

The practice of medicine in these enlightened times is based upon scientific knowledge gained by years of experimental investigation by our trained scientists using the most modern equipment which industry has been able to put at their disposal The great body of factual medical knowledge has increased enormously and is available through the medical profession to the public It is true that it takes some time to disseminate this scientific knowledge and to create public acceptance of new things Methods by which new knowledge is disseminated through the medium of the medical profession and brought to public acceptance are also constantly improving There is no reason why archaic practices or unscientific procedures should be allowed to persist or to be foisted upon the public

Many people take the attitude that in refusing to pass the chiropractic bill the legislators have done a favor *for the doctors*, protecting their economic interests or some equally irrelevant rot Whereas, what the legislators have done, acting on the advice of scientists and educators, is to protect *the public interest* by insisting that only *one* standard of medical practice shall exist in this State Any chiropractor or naturopath, or, for that matter, any individual can practice medicine if he qualifies himself by required study and examination *as the doctors do, in recognized institutions of learning* The legislators recognize this fact, and insist that anyone who proposes to occupy himself with the lives and health of the people of the State shall be properly qualified It may be argued that this forces chiropractors to practice illegally, that they cannot be licensed If they practice illegally, they do so knowingly, and the people of the State have the mechanism of the courts to deal with such a situation Thus the legislators also realize

It is to be hoped that the doctors, scientists, and educators will support the legislators to the fullest extent in their consistent and well-fought battle to maintain the highest standards of medical practice for the people of this State

Dr. Wadsworth Retires as Director of the State Laboratories

Dr Augustus B Wadsworth retired as Director of the Division of Laboratories and Research of the New York State Department of Health after thirty-one years of continuous service He developed this important function from very unfavorable and

primitive conditions into one of the outstanding activities of the State, bringing to the work a well-grounded background of clinical practice and teaching together with his previous accomplishments in fundamental research. This constituted a new standard for public health laboratories in a state, a fact which became widely recognized both here and abroad. From small beginnings the laboratory facilities in Albany grew until its staff numbered over four hundred persons and the annual cost well over a million dollars. This expansion of service to physicians is shown by the increase of diagnostic and sanitary examinations from about 20,000 in 1914 to over 1,190,000 in 1940. In addition, therapeutic and prophylactic preparations reached a total of over 660,000 packages. Many other services were furnished and a policy of decentralization with local autonomy was established, which constitutes a unique achievement in public-health activities.

Dr. Wadsworth deserves the gratitude of the people of the State and the praise of the medical profession for his accomplishments. His successful career in this chosen field shows the evidence of a disciplined, well-prepared, and competent mind, the type of mind which should set an example for future appointments by governmental authorities. We of the JOURNAL extend our felicitations and good wishes to Dr. Wadsworth and his associates in the Department.

Current Editorial Comment

Of This and That

Can "deceleration" in medical education now be commenced? The *New England Journal of Medicine*[1] discusses this question fairly and comprehensively, stating that the Army has altered its contracts with the schools of medicine in such a manner that *until further notice* it will supply only 28 instead of 55 per cent of the student body. This reduction of 27 per cent is accompanied by a return to an annual period for the matriculation of future incoming classes on the part of the schools themselves.

These factors, it is pointed out, are not mutually harmonious. The Army has reduced the number of its trainees but still calls for continuous accelerated training, and the medical schools have reduced the frequency of entering classes but are not yet in a position to return to a twelve-month basis of training. To avoid confusion, it is considered that the question must now be decided whether an immediate return to the prewar timing of the curriculum is desirable. Of advantage perhaps to the brilliant student, the three-year course severely handicaps the more stable, hard-working, slower students. Time is necessary to mature and season a student in the latter group in which are often found the solid attributes of character and personality that contribute to the making of the best physicians.

The medical graduates of 1948–1949 are now commencing their training. The program should be adjusted to the conditions that will probably exist at that time. We concur in this reasoning. The problem would be simpler if more could be forecast concerning the conditions at that future time. The underestimation by the armed forces of the number of nurses they now need and the consequent inequitable proposal to draft them at present being considered, may be an indication that such an underestimation could happen with respect to the number of physicians the services may need, according to changes in the tactical situation. The war is hardly over yet, and the demands of the putative peace remain to be estimated.

Deceleration is wholly to be desired from the point of view of scholarship and in the interest of more thorough training. It is encouraging to us that the possibility now exists for a return to annual matriculation for medical students.

[1] Dec. 14, 1944.

Announcement

In the interest of returning medical veterans the War Participation Committee would like to know of any physicians in the State who are willing to employ discharged veterans as temporary assistants. Please reply to the War Participation Committee, 292 Madison Avenue, New York 17, stating the number of assistants you can use, the nature of your practice, and the length of time you would like to have such assistants serve.

GASTRIC MUCOSAL ATROPHY AND CARCINOMA OF THE STOMACH

ARTHUR PURDY STOUT, M D , New York City

(From the Surgical Department of the Presbyterian Hospital and the Laboratory of Surgical Pathology, Columbia University)

THE relationship of chronic gastritis, especially what is usually called chronic atrophic gastritis, to carcinoma of the stomach has been the subject of several recent investigations from the pathologic aspect, with the result that a difference of opinion has arisen

Some years ago Konjetzny (1938)[1] in Germany and Hurst (1929)[2] in England came to the conclusion that chronic gastritis was a definite precancerous lesion Guiss and Stewart[3] have challenged this In 1943 they published the results of an elaborate pathologic statistical study of 293 stomachs of individuals of all ages and conditions including 73 with gastric cancer They came to the conclusion that "there is no evidence to suggest an etiologic relationship other than that chronic atrophic gastritis may be caused or intensified by the presence of carcinoma in the stomach" They noted that "atrophic gastritis is an exceedingly common condition with advancing age" Further, they remarked 'To assert on morphologic grounds that the origin of gastric cancer depends on the existence of gastric atrophy would require far more evidence It would at least require proof that early gastric cancer begins in, and can be directly traced to, an area of atrophy to the exclusion of other areas" They feel that this proof is lacking In 1944, Warren and Meissner,[4] in a similar fashion, examined the mucosa of 356 stomachs which were removed for gastric cancer or peptic ulcer Like Guiss and Stewart they divided the changes of chronic gastritis into exudative and epithelial and agreed that the purely inflammatory lesions had no significance as precancerous changes, but they felt that the epithelial changes could be compared to well-recognized premalignant changes elsewhere in the body They, therefore, assert that it may be assumed that some gastric cancers arise on the basis of these changes

These two opinions fairly represent the two opposing schools of thought Arrayed on the side of Warren and Meissner are Usland (1935),[5] Jenner (1939),[6] Judd (1942),[7] and Jankelson, McClure, and Freedberg (1943),[8] who believe there is some direct sequential relationship between chronic gastritis and cancer Among those who can find no evidence of a causal relationship between the two may be cited Gutmann, Bertrand, and Péristiany (1939)[9] and Maher and her associates (1943) [10]

In the laboratory of Surgical Pathology, Columbia University, we have accumulated a number of surgically resected stomach specimens which have all been treated in the same fashion by opening along the greater curvature, pinning out on a cork board, fixing in Bouin's fluid, and then taking ten or more sections from different areas according to a definite plan There were thus made available multiple sections from 150 stomachs, 50 with gastric carcinoma, 50 with gastric ulcer, and 50 without gastric ulcer or carcinoma which were removed because of duodenal ulcer It seemed worth while to study this material to see if any further information could be elicited which would be of value in deciding whether or not morphologic changes in the gastric mucosa can be regarded as precancerous

A perusal of the various studies of gastritis shows that the purely inflammatory changes, such as the development of lymphoid follicles and the diffuse infiltration of inflammatory cells in the mucosa, edema, and fibrosis have no demonstrable relationship with the development of carcinoma Most of them are commonly present to some degree in all resected stomachs For instance, lymphoid follicles were present in 148 of our 150 specimens, although their numbers varied greatly Therefore it seemed wise to concentrate upon the epithelial changes in the gastric mucosa Some of these are very difficult to evaluate For example, an increase in the thickness of the mucosa in various parts of the stomach is sometimes said to be due to hyperplasia of the glands and is one of the criteria of so-called hyperplastic gastritis (Schindler and Ortmayer, 1942) [11] I have never been able to convince myself that such hyperplasia actually occurs because there are so many sources of potential error, for example, any increase in the cell and fluid content of the substantia propria will increase the thickness of the mucosa and any deviation from the perpendicular in cutting will result in a tangential section which gives a false appearance of thickening After careful study of our own material and perusal of the published work of others, three histologic features were selected for special analysis These were (1) the transformation of the gastric mucosa into a mucosa of the intestinal type which is commonly called intestinal metaplasia (Fig 1), (2) a loss of the characteristic gastric glands with their chief and parietal cells in the fundic portion of

FIG. 1. Photomicrograph of atrophic gastric mucosa from the lesser curvature of the antrum showing marked intestinal metaplasia and cyst formation.

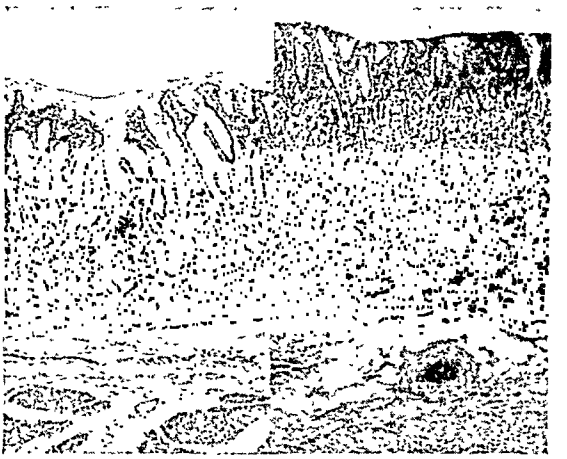

FIG. 2. Photomicrographs taken at the same magnification showing mucosa of the pyloric type at the left and of the fundus type at the right.

the stomach and their replacement by a mucosal pattern characteristic of the pylorus and antrum, which for convenience will be referred to as pylorization of the fundus (Fig. 2); and (3) the development of microscopic mucosal cysts (Fig. 1).

The first two features mentioned above are the most striking and important changes of gastric mucosal atrophy. The mucosa is occasionally thinned by these processes but usually it is not. Intestinal metaplasia is most commonly found affecting small patches of the pyloric and antral mucosae. Less often the fundus is also involved. It varies from the transformation of a single isolated gland (Fig. 3) to the involvement of almost the entire stomach mucosa. It is easily recognized, for the cell nuclei are much more deeply stained, the mucus secreted is easily and deeply stained with mucicarmine and other basic dyes, and Paneth cells, which are never found in normal gastric mucosa, appear. Pylorization of the fundus is also easily determined because of the striking difference between the appearance of fundic and pyloric mucosae. In the pylorus and antrum the pits extend deeply half way through the mucosa, and the underlying glands have exceedingly few chief and parietal cells, while the fundus mucosa has shallow pits and its glands are made up almost exclusively of chief and parietal cells. The pyloric type of mucosa normally covers the distal five or six centimeters of the stomach, ending very abruptly at its junction with the fundus mucosa. If it is found proximal to this, it is regarded as an abnormal and atrophic change. These two changes are both regressive ones in which highly specialized cells are replaced by simpler ones capable of secreting mucus. Since the vast majority and perhaps all gastric carcinomas are composed of cells capable of secreting mucus, it is reasonable to investigate them together

The third change in the epithelium is dilatation of the pits or glands with the formation of small cysts (Fig. 1). These are easy to recognize in sections but not so easy to evaluate. There seem to be two different reasons for their formation. They may result from simple obstruction of a pit or gland or from the process of gland regeneration following injury.

Because all cyst formation could not be definitely related to the first two changes, it seemed wisest to study it independently, and it will be discussed later in this paper.

Intestinal Metaplasia and Pylorization of the Fundus

Table 1 shows that these changes are present in half of the stomachs with duodenal ulcer, three-fifths of those with gastric ulcer, and 94 per cent of the stomachs with gastric cancer. Moreover, the difference is much accentuated by the fact that the degree of involvement tends to be much greater in the gastric carcinoma group. However, although the three groups are strictly comparable according to sex (duodenal ulcer—male 38, female 12; gastric ulcer—male 37, female 13; carcinoma—male 38, female 12) they are not so according to age, for there is an ascending progression in the mean ages of the three groups. Table 2 shows the distribution of these lesions according to age groups. Now it can be observed that there is a steady increase

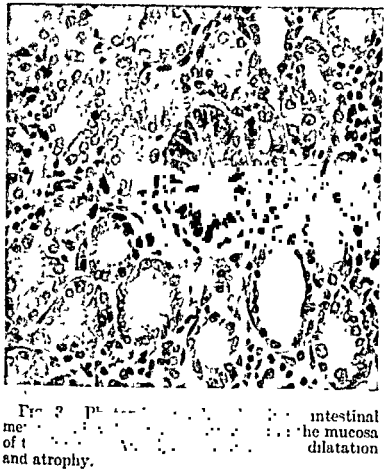

Fig. 2.—Pl... intestinal me... the mucosa of t... dilatation and atrophy.

in the incidence and size of area of mucosa involved from the third decade, when it first appeared, to the eighth decade, when every stomach showed a considerable degree of involvement. From this chart one must conclude what others have done before: that atrophic changes are found in the stomach with increasing frequency with advancing years until in old age possibly every stomach shows some evidence of mucosal atrophy.

In order to neutralize the age factor to the greatest possible degree, stomachs with and without cancer removed during the sixth decade of life were compared. The results are given in Table 3. This shows that the incidence and the degree of atrophy are considerably greater in stomachs with cancer than in those without cancer. If we move to the older age groups and

TABLE 1.—PERCENTAGE OF INTESTINAL METAPLASIA AND/OR PYLORIZATION OF THE FUNDUS IN 150 STOMACHS RESECTED FOR DUODENAL AND GASTRIC ULCER AND FOR CARCINOMA

	No Cases	Absent	Present	Slight	Medium	Marked	Mean Age (Years)
Duodenal ulcer	50	50	50	28	20	2	44 3 (17–69)
Gastric ulcer	50	38	62	12	30	20	49 6 (25–71)
Gastric carcinoma	50	6	94	16	14	64	56 3 (33–78)

make the same comparison in patients over 59 years of age there is a smaller difference between the numbers involved but still considerable difference in the degree of involvement (Table 4). So far it has been shown that the atrophic stomach is apparently a favorable site for the development of carcinoma, but it has not been shown that either intestinal metaplasia or pylorization of the fundus are changes which can lead directly to cancer formation. To do that one should be able to note either that the carcinoma always occurs in an area where these changes have occurred or one should be able to trace gradations between the altered epithelium and the cancer cells. Such gradations can be noted in many skin epitheliomas developing, for example, in radiated areas or in arsenical keratoses, and they can be found in the adenomatous polyps of the gastrointestinal tract, so that no hesitation is felt in describing these as precancerous lesions. It is impossible to state whether or not carcinomas originate in atrophic mucosal spots, for no one observes the beginning of a carcinoma. It can only be said that the environs of the carcinoma when it is removed frequently show no atrophic changes, although other parts of the same stomach may do so and in three of the 50 specimens no atrophy was found anywhere. Perhaps the most favorable type of carcinoma to study is the superficial spreading cancer, or

cancer *in situ*, for one frequently finds traces in this of mucosal glands intermingled with cancer cells. After long and attentive study it has never been possible for me to find convincing evidence of gradations of change from atrophic cell to cancer cell. When the tumor is well differentiated and forms glands, which is rather infrequent, one can always explain the juxtaposition of cancerous and noncancerous glands on the basis of invasion of the latter by the former.

Mucosal Cysts

Tables 5, 6, and 7 show an analysis of the stomachs based upon the presence or absence of mucosal cysts. These indicate that cystic dilatation of the glands is much more frequent in stomachs with cancer than in those without cancer and that this feature becomes increasingly more frequent with advancing age but is disproportionately greater in stomachs with carcinoma. When the individual cases are studied it is found that the solitary sporadic cysts occur usually without any demonstrable relationship with carcinoma, but that most of the stomachs with frequent mucosal cyst formation (Fig. 1) also have cancers and that the cysts sometimes are more numerous in the vicinity of the carcinoma. One gets the impression that there is a certain degree of cellular disturbance in the immediate vicinity of some carcinomas, one feature of which is the development of cysts. On rare occasions a cyst can be found which is lined in part by cancerous and in part by noncancerous cells. But even such a phenomenon cannot be regarded as proof of the development of carcinoma from a cyst, for it can with equal propriety be explained as an invasion of the cyst by carcinoma.

Discussion

This study confirms the findings of others that mucosal atrophy may appear as early as the third decade and is found with ever increasing frequency and extent in the succeeding decades of life. Moreover, in comparable groups of stomachs mucosal atrophy is found in a larger

TABLE 7.—Percentage of Cystic Dilatation of Mucosal Glands in Patients Over 49 Years of Age with and Without Gastric Carcinoma

number and tends to be more widespread in those with cancer than in those without cancer. But when one tries to find actual progression from altered mucosal glands, be they of the gastric or the intestinal type, cystic or not, distorted or regular, it is realized that it is impossible to tell, when there is juxtaposition of carcinoma and mucosal gland, whether the carcinoma is invading the gland or developing from its epithelial cells. Further, it can be stated that in occasional stomachs with carcinomas in them, multiple sections from various areas fail to show any epithelial changes at all in some while others show only minimal changes.

It would seem, therefore, that while atrophy of the gastric mucosal epithelium and cyst formation are present to a greater degree and in larger numbers in stomachs with carcinomas than in comparable stomachs without cancer, the exact relationship between these two conditions remains undetermined.

A SURGEON ON WAR AND PEACE

Col. Elliott C. Cutler, chief consultant in surgery, AUS, European [illegible] Professor of Sur[illegible] livered on May [illegible] bridge, England [illegible] ject "A Surgeon [illegible]" Cutler's lecture, in abridged form, has appeared as the leading article in the September 30 issue of the *Lancet*.

[illegible] vanced to explain this experience. Chief among these explanations rank an easier discipline in our army of today, leaving an avenue of escape open for the battle-weary soldier, inferior leadership by subaltern officers, and a loss of self-sufficiency and independence in a country where overpaternalism has softened the population.

In particular, Colonel Cutler emphasizes the military value of hate in carrying a war through to its successful conclusion; he points out that it is a military fault of the English and Americans that they are naturally peace-loving and have as yet [illegible] mitted against ourselves.

Future opportunities for Germany to fling herself at the throats of civilized mankind must be denied, and Colonel Cutler closes his lecture on the note that those who make the peace must this time be those who have been to war and know what it means. It is expressly stated that war must be waged in hate, and it is implied that hate must not be forgotten when the peace is made.

In the same issue of the *Lancet* is one of the sanest and most temperate editorials that it has been our fortune to read—an editorial that bespeaks the innate fair-mindedness of the British nation. We are reminded that this war is not between men and a different species, but between men and men, in whom all the human elements are mixed. True, our adversaries have been led into intolerable deeds by their psychologic immaturity, but "five years have not changed our opinion that a peace of understanding has more permanence than a peace of passion."

"The young men who now command our thoughts and bear our hopes," the editorial continues, "are often heroes but seldom fanatics; and for our part we should say that one of their greatest achievements with [illegible] I sow [illegible] tion, to help young Germans feel it an adequate purpose in life to rebuild out of the ruins the Germany of Kant and Goethe and Beethoven—to whom we might add Virchow, Koch, and Ehrlich, or others according to taste."—*New England J. Med., Jan. 4, 1945*

OBSERVATIONS ON THE USE OF A NEW MATERIAL FOR CHOLECYSTOGRAPHY (PRIODAX)

A Preliminary Report

Lois C. Collins, M.D., and Ross Golden, M.D., New York City

(From the Department of Radiology of the College of Physicians and Surgeons, Columbia University, and the Radiological Service of the Presbyterian Hospital, New York)

A NEW contrast medium for cholecystography has recently been introduced, and numerous articles describing its results have been published. The substance, beta-(4-hydroxy-3,5-diiodophenyl) alpha-phenyl-proprionic acid, was first produced by Dohrn and Diedrich,[1] who found this substance to fulfill most of the postulates of the ideal contrast medium for cholecystography. It was one of a series of approximately twenty-eight iodine-containing substances which they produced and tested. First used in Germany under the name of Biliselectan, reports from at least four different European clinics describing apparently satisfactory results have appeared in the German literature.[2–5] It is now produced under different trade names by at least two manufacturers in this country.

Since November, 1943, at least seven reports have appeared in the American literature. All have agreed that the substance was as satisfactory as, or more satisfactory than, tetraiodophenolphthalein for visualization of the gallbladder. There was some difference of opinion concerning the dosage, and also concerning the side effects of the substance.

Dannenberg,[6] in reporting a series of 143 cases, and Bryan and Pedersen,[7] reporting 845 cases, felt that 3 Gm. were satisfactory, and did not find repeat examinations necessary in any of their cases. Einsel and Einsel[8] were of the same opinion. Wasch,[9] Hefke,[10] and Paul, Pohle, and Benson[11] felt that 3 Gm. were usually sufficient but that in a certain number of instances the gallbladder was unsatisfactorily visualized and a second 3 Gm. dose was advisable. Marshall[12] used 6 Gm. in a series of 50 cases. The majority of reports stated that the side effects with the new drug seemed definitely less than with tetraiodophenolphthalein. Only one direct comparison between the two methods was reported. Paul, Pohle, and Benson examined 46 of their cases with both drugs and found little difference in the incidence of symptoms except the nausea. Nausea occurred in 28 per cent of the patients who had the new substance and in 45 per cent of those who had tetraiodophenolphthalein.

Chemistry and Pharmacology

The new substance has a simpler, smaller molecule than tetraiodophenolphthalein. Although each molecule of the former has only two iodine radicals as opposed to four in the latter, the percentage of iodine is almost as high. The new material contains 51.5 per cent iodine by weight, as opposed to 61.6 per cent in the phenolphthalein preparation. It is a white powder with a sharp taste, and is very slightly soluble in water or fruit juice. It can be administered in suspension, or swallowed in tablet form. The soluble form, the sodium salt, makes a too highly alkaline solution to be practical for intravenous use.

Junkmann[13] found that Biliselectan, given intravenously in 10 per cent solution, was less toxic to rats than tetraiodophenolphthalein used in the same way. The average fatal dose of the new drug was 0.39 Gm. per kilo of body weight, and of tetraiodophenolphthalein, 0.31 Gm. However, when given orally, the rats tolerated a larger dose of tetraiodophenolphthalein, presumably because it is less completely absorbed from the intestinal tract. Modell's[14] work with cats gave approximately the same results. The LD 50 when given intravenously was 150 mg. per kilo, but when given orally 1,000 mg. per kilo was tolerated. Transient albuminuria occurred when the larger doses were given over a period of days, but no significant histologic changes were demonstrable in the kidneys.

Physiology

The substance is absorbed from the small intestine rapidly and almost completely. The small size of the molecule is probably one of the most important factors in the rapidity of absorption. The substance is apparently carried through the portal vein to the liver, where it is excreted through the biliary radicals and concentrated in the gallbladder. The substance is eliminated from the body principally through the kidneys, from 61 to 83 per cent (Junkmann) appearing in the urine within seventy-two hours. Although it is uncertain whether a chemical change occurs during the process of excretion through the liver, the substance in the urine is, in large part, chemically unchanged.[13] Splitting off of the iodine does not occur and no cases of iodism have been reported.

Apparently the material, after expulsion from the gallbladder, must be reabsorbed from the

TABLE 1.—195 EXAMINATIONS

Dose	3 Gm		4 Gm		6 Gm

* In one case cholesterosis was found
† Gallbladder was normal in one case Patient was jaundiced at time of the examination

small intestine repeatedly, each time this happens a smaller amount passes through the gallbladder and the remainder is excreted through the kidneys, until most of it has been eliminated in the urine For this reason the gallbladder shadow can be seen on the second and third days If the shadow after the first dose is unsatisfactory, an immediate second dose has been suggested as a method of increasing the density in the gallbladder This was used by Wasch, Hefke, and Paul, Pohle, and Benson with a little improvement in the density of the shadows of the cases

Material

This report is concerned with 195 cases in which this new substance* has been used The dose and certain details in the method of administration have been varied during this period The first patients received 3 Gm suspended in water or fruit juices Later, two 3-Gm doses were given, one at 4 P M and the second at 8 P M Still later the material was furnished in the form of 0 5-Gm tablets, to be swallowed without suspension in fluid The first tablets were not coated and occasionally patients complained of burning in the back of the throat after taking them The present form is a coated 0 5-Gm tablet Beginning at 4 P M the patients are given two tablets every half hour until the desired dose has been taken

The patients have a fat-free supper at 6 30 or 7 00 P M, and the following morning are allowed orange juice, tea, or coffee with sugar but without cream, and dry toast if desired The first films are taken at 9 00 A M and the routine fat meal given as usual We have used 3-Gm, 4 Gm, and 6 Gm doses, the results of which will be discussed later

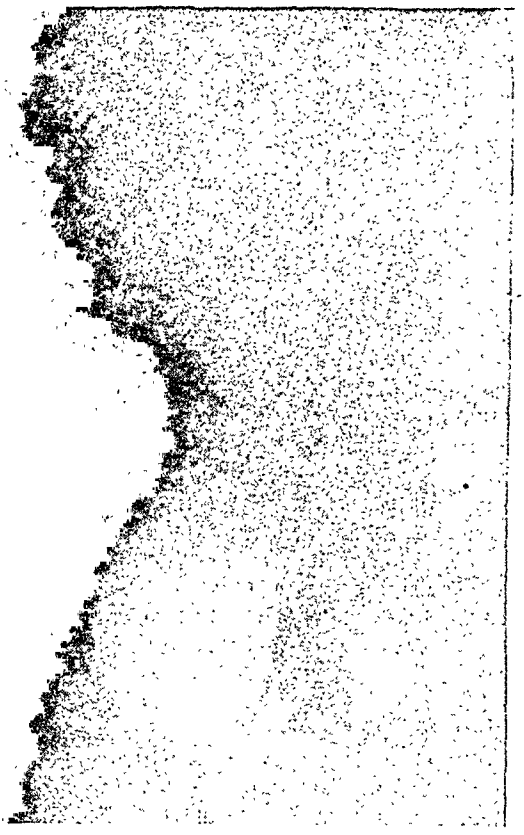
Table I shows the number of cases examined by each dosage method, and the number of cases interpreted as normal and abnormal in each group Three of the cases interpreted as normal were checked by operation, and the diagnosis

TABLE 2.—ANALYSIS ACCORDING TO DENSITY

Dose	3 Gm	4 Gm	6 Gm
Cases	38	22	64
Borderline Density	2 (5 %)	2 (7 %)	1 (2 %)
Fair Shadow	8 (21 %)	3 (14 %)	8 (13 %)
Good Shadow	28 (72 %)	17 (77 %)	55 (86 %)

Fair density and good density—unquestionably normal
Borderline density—questionable whether normal or not

found incorrect in one case This case proved to be cholesterosis In the group interpreted as pathologic, 22 cases were checked by operation and in all but one the diagnosis was confirmed The one patient in whom the gallbladder was found to be normal at operation had been jaundiced at the time of the examination



The cases that were interpreted as normal were divided according to the density of the shadows, as shown in Table 2 The shadows classified as having fair and good density were all of sufficient density that they would be called normal without hesitation The borderline density refers to a shadow that leaves doubt as to whether it is within normal limits It is interesting to note that the percentage of good shadows becomes slightly higher as the dose is increased The two patients who had borderline shadows with 3 Gm doses were re-examined with 6 Gm and in both cases the shadow was a little better on the second examination, putting them definitely in the normal group A third case examined by the 3 Gm dose, which showed a poor shadow, was re-examined with 6 Gm and showed no increase in the density of the shadow This was interpreted as pathologic

We have had the impression at this time that a 4-Gm dose is more likely to give a good shadow than a 3 Gm dose, and therefore the latter is probably the most satisfactory for routine use However, it will undoubtedly be necessary to give a second dose in a few cases that have shadows of borderline density

In 10 cases previous examinations with tetraiodophenolphthalein had been done In 8 of the cases the results with the new and the old substance were the same (Fig 1) In one case the patient had been jaundiced and showed no gall-

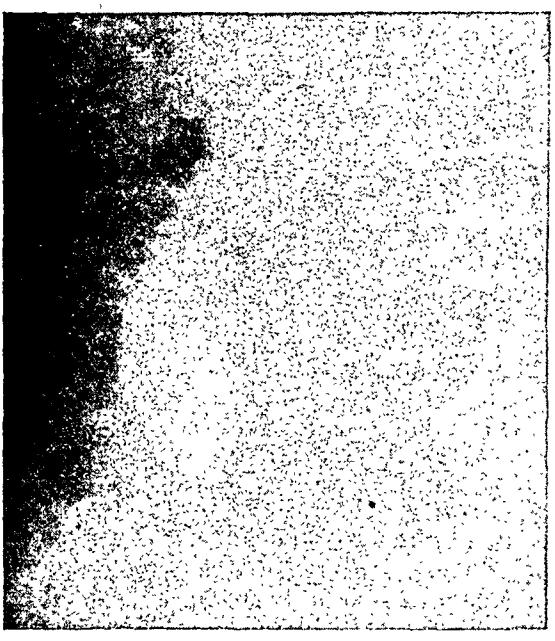


FIG. 1. Normal gallbladder. A and B—Films taken nineteen hours and twenty-one hours after the first of two 4-Gm. doses of tetraiodophenolphthalein. Opaque material is present in the hepatic flexure.

C and D—Same case examined six years later with 6 Gm. of the new substance. No opaque material is present in the hepatic flexure. The density in the gallbladder is similar to that of the previous examination.

bladder shadow at the time of the previous examination and showed a normally functioning gallbladder on the second examination. In the other case there had been no gallbladder shadow with the tetraiodophenolphthalein, and there was a faint shadow with the new substances. Both examinations were interpreted as indicating gallbladder pathology.

Paul, Pohle, and Benson examined 46 cases by both tetraiodophenolphthalein and the new drug. In 41 cases the results were the same. In 2 cases the shadow was a little better with tetraiodophenolphthalein, and in 3 cases a little better with the new substance.

The incidence of undesirable side effects has been a little higher in this series than in other series which have been reported. Our patients were questioned concerning the occurrence of any unusual symptoms, and specifically about the occurrence of nausea, vomiting, diarrhea, and cramps. Any loose movements were interpreted as diarrhea. No attempt was made to classify the symptoms according to severity. For purposes of comparison, 100 patients who were examined with tetraiodophenolphthalein were questioned in the same way. The routine with tetraiodophenolphthalein has been to give two 4-Gm. doses, having preceded each dose with 6 cc. tinct. opii camphorata. Paregoric has not been used with the new substance.

The incidence of these symptoms is shown in Table 3. There was surprisingly little difference in the occurrence of the symptoms, except for the nausea, which was only about half as frequent with the new drug. Vomiting and cramps occurred with about equal frequency with each drug. Diarrhea was a little more frequent with the new drug, the increase being principally in the larger dose groups. Two of the patients who were examined with both 3- and 6-Gm. doses had no diarrhea with 3 Gm., but had rather severe diarrhea after 6 Gm.

Burning on urination occurred in 4 per cent of the cases. It does not occur with tetraiodophenolphthalein, which is excreted through the colon. The percentage of symptom-free patients was the same with both drugs in this series.

The incidence of symptoms in general increased

as the dose was increased. The apparent discrepancy in the figures for the 4-Gm. series was not considered significant because the total number of cases in this series was relatively small.

The incidence of symptoms as reported in the literature has been tabulated in Table 4 with our figures for comparison.

Paul, Pohle, and Benson, who studied 80 cases with tetraiodophenolphthalein and 114 cases with the new drug, found no significant difference in the incidence of symptoms except for nausea; their figures resembled ours in that respect. However, the incidence of diarrhea with both drugs was lower in their series, as it was in all of the other reports. Since these are all subjective symptoms, it is easy to understand how a wide variation in the evaluation of symptoms may occur. Hefke, for instance, described diarrhea as two or more watery movements, whereas our figures include cases with only one loose movement.

The most striking advantage of the new drug is the absence of opaque material in the hepatic flexure (Fig. 1C and D). In no patient examined was it necessary to give an enema to remove the opaque material from the colon. With tetraiodophenolphthalein an enema is frequently necessary, and unfortunately, it is not always completely satisfactory to remove from the colon the portion of the opaque material which has not been absorbed. The new substance is present in the colon only in traces, if at all. This fact, in our experience, has not interfered with the visualization of the gallbladder.

A series of cases are now being studied with a view to determining whether the doses used for cholecystography are associated with objective evidence of a disturbance in the kidney function. At the present time only a few cases have been studied but none of them has shown a depression in phenolsulphonephthalein excretion nor have they shown albuminuria. In view of the observations in animals and in view of the burning on urination mentioned by some patients, further studies along this line are indicated.

Conclusions

1. Beta-(4-hydroxy-3,5-di-iodophenyl) alpha-phenyl-proprionic acid appears to be a satisfactory medium for cholecystography.

2. With 4- and 6-Gm. doses the shadows seem, on the average, to be slightly more dense than with the 3-Gm. dose, but in individual cases the 3-Gm. dose produces a dense shadow.

3. There is less nausea with the new drug than with tetraiodophenolphthalein, but otherwise there is no striking difference in the occurrence of symptoms with the two drugs. Burning on urination occurs only with the new substance.

4. Because of the absence of opaque material from the hepatic flexure, the new substance gives more satisfactory visualization of the gallbladder than tetraiodophenolphthalein, although the density with the two drugs is approximately the same.

5. A preliminary study of kidney function has shown no evidence of kidney damage following the doses described above.

HEAD-WOUND GAS MASK NOW IN PRODUCTION

A gas mask to protect head-wound patients from war gas has been developed by the Chemical Warfare Service at the request of the Medical Department, and is now in production, the War Department has announced.

The mask is the first such device especially designed to protect patients with bandaged heads, faces, or jaws. It consists of a silk-like plastic hood to which an air-purifying canister and an outlet valve are attached. A flexible window across the eyes provides clear vision. Air is drawn into the mask by the ordinary breathing of the wearer.

The mask is pulled over the head like a sack, and experiments at the Medical Research Laboratories have shown it to be comfortable to the wearer as well as efficient.

PRESBYCARDIA, OR AGING OF THE MYOCARDIUM

WILLIAM DOCK, M.D., Brooklyn, New York

(From the Department of Medicine, Long Island College of Medicine)

PHYSICIANS have long been misled by the saying that a man is as old as his arteries. As a matter of fact, the arteries have very little to do with the aspects of aging which alter our appearance and behavior as we grow older, and pure involutional processes in the arteries rarely are responsible for disease or death in the aged. Our scalps become bald, our faces wrinkled, our hairs gray in spite of the persistence of a rich blood supply to the skin. Neurones die and disappear from our cerebral cortex, our basal nuclei and cerebellum, and even from our spinal cords, in spite of an excellent blood supply and the complete absence of any vascular sclerosis.[1,2] Senile behavior, emotional or apathetic, with poor memory and judgment, is often erroneously spoken of as caused by "cerebral arteriosclerosis." It is usually due to disseminated cortical atrophy of the cerebrum.[3,4]

Men like Pasteur may suffer repeated strokes and yet have little cortical atrophy, remaining alert and highly competent into old age. Others become prematurely senile at 40 or 50, due to cortical atrophy, and show no arteriosclerosis. Parkinson's disease, senile intention tremor, and the decline of athletic prowess or creative ability may begin in the 30's and may become marked in people with no cerebral vascular disease. These changes are due to the loss of neurones, which in men and other mammals begins soon after maturity and continues at various rates in different individuals and in different areas. This trophic loss of neurones, like that of scalp hair or of hair pigment, has a familial pattern and pace, and is independent of the state of the arteries. The skin, hair, and brain determine how old we look and act, so that a man may truly be said to be as old as his ectoderm.

While arterial involution is rarely the basis of damage to the brain, it seems probable that in many people hypertension of the type classified as "benign" is due in part to the involution of the central nervous system. Transient rises in blood pressure are not rare in adolescence, but are seen in more individuals during the succeeding decades, occur more often, last longer, and eventually lead to an almost constant hypertension during activity, and even during sleep.

The increasing number of new cases of hypertension during the fifth, sixth, and seventh decades[5] cannot be accounted for either by renal vascular changes[6,7,8] or by known endocrine or emotional factors. Indeed, while many of the vascular and visceral disturbances which seem linked with emotional stress—peptic ulcer, migraine, and Raynaud's disease, for example—pass their highest frequency of onset and decrease during the later decades of life, this is the age when hypertension most often becomes fixed. Tics of voluntary muscles become more frequent with age, lacrimation often is more readily evoked by cold or by emotion, and the carotid sinus reflex may be more easily elicited in older people. Therefore, it is not unreasonable to suspect that the establishment of sustained hypertension often is due to changes in central inhibition and that such cases belong in the same etiologic category as the tics, tremors, and rigidity of senescence. There is impressive evidence that in people on the American dietary hypertension is a very important factor in determining the severity and localization of atherosclerosis.[6,7] Therefore, vascular disease, leading to disability and death, may be a sequel of one type of neural aging, and a result rather than the cause of decay of the central nervous system.

The changes in the arteries due to age—medial calcification and medial fibrosis—rarely cause any vascular dysfunction, while the familiar vascular accidents and diseases are due largely to intimal damage secondary to cholesterol deposits.

These deposits are rarely seen in people who have diets high in whole cereals, beans, and vegetable oils; they are common only in those who live on diets rich in animal fats but poor in animal viscera, and especially in those who eat much milk fat and egg yolk.[9,10] Such vascular lesions represent metabolic and nutritional disorders, not aging changes. Men in their 20's can have severe atherosclerosis of the coronaries, with no evidence of vascular aging, and thus they may die in the first flush of manhood.[11] No matter how young, a man is quite as vulnerable as his arteries.

While the normal aging or involutional processes in arteries play no significant role in the disorders of advancing years, aging of the heart muscle seems to be an important factor in causing congestive heart failure in middle age and later. This change is not associated with a specific histologic alteration in the muscle and therefore is not fully appreciated. Consequently, there have been various explanations of heart failure with advancing age. All were based on the tacit assumption that age itself had no appreciable

effect on myocardial function. This assumption must be fully considered.

There is no lack of gross and microscopic change in the aging myocardium. Muscle cells atrophy, disappear, and are replaced by adipose tissue or delicate fibrous strands. This is most marked in the auricles and the right ventricle, and in obese oldsters dying without heart failure. Old hearts also show tortuous dilated epicardial vessels and sclerosis of the annulus fibrosis and tips of papillary muscles, but these are seen commonly when there has been no functional evidence of heart trouble. Pigment granules accumulate near the nuclei of the muscle cells, and may give a chocolate color to the myocardium. Such pigment is most obvious and occupies the greatest proportion of the cellular content in atrophic hearts of very old persons who never had a sign of cardiac failure. Therefore, it is not likely that the relatively small amount of pigment found in hypertrophied old hearts has anything to do with their dilatation and failure. It was the lack of correlation of the visible effects of aging with predisposition to failure which led to the search for extraneous causes for the loss of myocardial efficiency with age. But since avitaminosis and some endocrine disorders cause failure of the heart with minimal histologic change, involution may act in an analogous fashion. There is no histologic change in the eye in presbyopia or in the hair follicles with white hair, so that functional aging of the heart need not involve anatomic lesions.

In mammals the weight and the capacity of the ventricles increase when the volume flow of blood rises, but the weight of the ventricle increases with no change in capacity when the arterial pressure goes up gradually because of an increase in resistance in the pulmonic or systemic circuit.[12] When the load is removed, the ventricle atrophies to its previous size. When there is an abrupt increase in cardiac work, hypertrophy is preceded by the dilatation necessary to permit increased ventricular effort (Starling's Law).

In many old people the heart atrophies. Presumably the normal decrease in basal metabolism and in physical activity reduces the mechanical load, and the efficiency of the muscle is so high that a small ventricle is adequate to meet these diminished burdens. When an aging person has hypertension or a valve lesion, atrophy does not occur, but, on the contrary, there is significant hypertrophy of the appropriate type and location. Eventually such hearts often fail, but on the other hand some people die at advanced ages with no evidence of myocardial failure and with only moderate cardiac hypertrophy in spite of long-standing hypertension or valve lesions dating to their youth. Such cases prove that hearts may continue to be efficient in spite of age and serious overloading. Had these people not had such cardiac handicaps they too would undoubtedly have had marked cardiac atrophy.

If the efficiency of the muscle is impaired, as it is by thiamine deficiency, dilatation and hypertrophy also occur,[13] for the heart responds to loss of efficiency in the same way that it does to an increase in mechanical load. Occasionally middle-aged people die with huge dilated hearts with no evidence that hypertension, valvular lesions, metabolic disorder, avitaminosis, or any known factor has contributed to heart failure.[14] Perhaps some of these cases represent precocious myocardial involution, analogous with the involution of the pigment production that produces white-haired men before 30, or the involutions of the nervous system (Pick's and Alzheimer's diseases) which lead to amentia in the 40's or 50's.

At the extremes of clinical experience are those whose hearts dilate and fail for no other reason than myocardial aging and involution, and those whose hearts, in spite of decades of severe embarrassment, remain efficient into extreme old age. Between these extremes lies the mass of the population. They may have cardiac hypertrophy, dilatation, and failure at various ages depending upon the severity of any chronic cardiac embarrassment, valvular, hypertensive, endocrine, or nutritional; upon intercurrent febrile illnesses; and upon the rate and severity of myocardial loss of efficiency due to age. Whatever the nature of this aging change, it is obviously associated with a slow recovery from contraction and is brought to light by rapid heart action of whatever cause. Even in youth paroxysmal tachycardia lasting for several days may lead to cardiac dilatation and congestive failure because of progressive failure of the recovery mechanism when diastole is brief and the coronary flow reduced by fall in blood pressure. In older patients less marked acceleration, even without change in coronary flow, can cause heart failure. Occasionally such failure is apparent in a few hours; more often, only after days of accelerated rate.

Aging of the myocardium resembles aging of the accommodative mechanism of the eyes. Neither is apparent from gross or even histologic study, but only from functional tests. Presbyopia is revealed by failure to identify near-by objects or small type in the same way that myocardial aging is revealed by failure of the heart to sustain such stresses as high cardiac output, high arterial pressure, acute febrile illness, or tachycardia. When failure begins systole is lengthened and the increase in systole-cycle ratio may parallel

the degree of failure. But there is no way to estimate myocardial efficiency without overloading the heart and then determining when dilatation and prolongation of systole begin.

Failure due to acute myocarditis may develop even in young people with diseases such as rheumatic fever, typhus, periarteritis, and trichinosis, or with progressive myocardial damage due to glycogen deposition, amyloidosis, sarcoidosis, or repeated and extensive infarction. Heart failure, even in youth, also occurs when valve leaflets are destroyed, when pulmonary arterial pressure rises to levels four or five times normal, or when uremia or avitaminosis affects the myocardium. It is a remarkable paradox that elevated arterial pressure or scarred valves which caused no difficulty even with a vigorous life at the age of 20 should be blamed for cardiac failure a few decades later, when, due to falling basal metabolism and decrease in physical activity, the physical work of the heart is much less. In the past such cases of heart failure have usually been accounted for by assuming a decrease in coronary blood flow, and the failure was ascribed to "arteriosclerotic heart disease."

It is now realized that diffuse arteriolar disease is extremely rare in the heart and voluntary muscles, and that arteriosclerosis of the heart is always synonymous with atheromatosis of the epicardial parts of the coronary arteries—that is, with coronary arteriosclerosis as this term is used in relation to angina pectoris and myocardial infarction. While congestive failure may occur as a sequel to these disorders, the relationship is not close. Particularly in younger men, heart failure due to coronary disease is rare. Of eighty soldiers, 20 to 36 years old, who died of coronary occlusion, not one had congestive failure of any significant duration.[11] Even in older patients, an initial myocardial infarct is followed by heart failure in less than one of ten survivors, and follows only after an interval free of symptoms, for months or years in many cases. There is no basis for diagnosing arteriosclerosis as a cause of heart failure when there has been no coronary narrowing or myocardial infarction. It would be just as reasonable to call cases of unexplained heart failure "thyrocardiacs" in spite of the absence of any evidence of Graves' disease. In hyperthyroidism heart failure is rare even in severe cases in adolescence or the early 20's, but it is common in senescence with relatively mild hyperthyroid states, sometimes not of long duration. The fact is that neither coronary disease nor Graves' disease is likely to cause heart failure, unless the myocardium has aged.

Nor is there direct proof that as hearts age and hypertrophy they "outgrow" their vascular beds. X-ray and perfusion studies prove that the large heart has a large vascular bed,[15] and that even in old hearts the vascular bed always grows and adapts itself to the need for blood after infarction or with hypertrophy. There is no evidence that myocardial ischemia is a cause of heart failure in the aging or aged, except when there is occlusion of the large coronary vessels in the epicardium. Angina pectoris is the symptom and fatty degeneration of the heart is the anatomic hallmark of myocardial ischemia. Both are absent in aging hearts that hypertrophy and fail, except in those patients with coronary occlusion or severe anemia. Hypertension, hyperthyroidism, valvular disease, or inadequate blood flow to the heart muscle must be recognized as merely aggravating factors, never inevitable causes of heart failure. The increasing frequency of failure with senescence is due not merely to the presence of one of these disorders, but to senescence of the myocardium.

If involution of the myocardium is accepted as the most probable basis for many instances of heart failure in senescence it can be postulated that such changes begin at various ages, and may, like gray hairs, be absent even at three score and ten. In many people these changes may begin, just as do presbyopia and gray hairs, in the 20's and 30's, and in most before 50. Only in this way can one explain why a febrile illness or hyperthyroidism so often causes auricular fibrillation and failure in people over 50, and so rarely in those under 30. All cardiologists have more or less consciously recognized the importance of age as a factor in heart failure, without stating how age affected the heart. This phenomenon might be more widely appreciated if there were a good Greek word—presbycardia—to indicate that age has altered the ability of the heart to meet its burdens even though there is no significant structural change.

In each adult with congestive failure one should decide how much of the difficulty is due to an abnormal mechanical burden, how much to myocardial inflammation, to endocrine or vitamin imbalance, or to coronary sclerosis, and how much to presbycardia. The mechanical load and the vitamin or endocrine disorders can readily be evaluated in most cases. By the response to rest, mercurial diuretics, and salt restriction one can estimate how much of the trouble was due to bodily activity and high salt intake. Finally, with digitalis one can determine how much of the myocardial defect is reversible. This drug, so valuable in many older cardiac patients, is useless in beri-beri hearts, and almost useless in tachycardia due to acute myocarditis or hyperthyroidism in young adults. The cardiac glucosides seem to be effective in failure induced by desoxycorticosterone[16] and even in mammalian hearts

isolated from the body.[17] They have no beneficial effect on coronary blood flow, so that their action on hypertrophied old hearts is not due to increasing coronary flow. In many cases of heart failure the effectiveness of digitalis, increasing with the age of the group under study, indicates that a partially reversible biochemical defect is the most important factor in the causation of their cardiac disability, for only a biochemical defect could be modified by chemical agents of the digitalis type.

Summary

Like presbyopia, presbycardia (myocardial senescence) is a functional change associated with minimal anatomic alteration, which may begin soon after maturity and may lead to loss of adaptation of the aging tissue to its more exacting burdens. This seems to underlie many cases of heart failure in adults. Like presbyopia, presbycardia is a disorder for which medicine can provide a fairly effective countermeasure —in this case the digitalis glucosides.

Simple involution of arteries, as contrasted with atherosclerosis, is unimportant as a cause of cardiac disability in senescence, and causes few serious functional changes in the brain and other vital organs.

Deterioration of the central nervous system of the aging person is usually due to trophic loss of neurones, not to cerebral arteriosclerosis. Many cases of benign arterial hypertension seem related to such a trophic change in the central nervous system. Increased vasomotor irritability[18] may then be likened to senile intention tremor, Parkinsonism, and other involutional disorders of specific neurone groups.

All involutional changes are likely to manifest themselves, at least in larval or transient forms, much sooner after maturity than is generally believed compatible with the term "senescent." These may be brought to light only because of extrinsic factors which impose unusual burdens on the affected tissues, or, like white hair, they may occur soon after maturity and with no evidence of extrinsic causation.

The presence of senile changes in one system should never be taken as evidence of general change. Men who become bald or white-haired before 30 may retain youthful nervous function until late in life, and those with visibly tortuous temporal arteries at 30 may have faultless cardiac and vasomotor function at 90.

TEACH THEM THIS ART

Hospitals are built and maintained primarily for the sick, but one of the other cardinal functions of the hospital is the training of interns and residents. This type of traditional cooperative education which is the greatest source of practical training and development of a young physician has been in the past the basis of many fine contacts between staff men, interns, and residents.

The medical schools are still doing a splendid job in spite of a decrease in personnel and the men who are being graduated now are just as capable and anxious to continue their academic interests as any of their predecessors. Their medical training has been cut to three years but they now go to school twelve months of the year. The only actual change has been to shorten rotating internship to 9 months.

With the present shortage of interns and with the hospitals filled with patients, there may be a tendency to forget that these young men are still looking for inspiration, for guidance, for a word of encouragement.

It is possible to make or break a spirit during these few short months in which we have agreed to impart to them what we have to offer in the art and science of medicine.

There is hardly time these days for an intern to do anything but take histories, do physicals, give intravenouses, and keep up his correspondence with the Surgeon General, but a little more effective interest in his immediate medical future by all of us is indicated.—*J. J. L., in Detroit Medical News, Jan. 22, 1945*

VESICOVAGINAL FISTULA AND ITS SURGICAL MANAGEMENT

VIRGIL S COUNSELLER, M D , Rochester, Minnesota

(From the Division of Surgery, Mayo Clinic)

VESICOVAGINAL fistula is a surgical entity that has developed as a complication subsequent to surgical procedures on the pelvic structures, difficult and complicated deliveries, radiation therapy for cancer of the cervix, or accidental trauma The greatest number of these fistulas which we have encountered in recent years fall in the first group, but there have been some from each class Generally speaking, the surgical problems involved in the treatment of vesicovaginal fistula require considerable thought urologic investigation, and a working knowledge of the various surgical procedures that are known and have proved to give the best results for different types of fistulas There is not just one operation or one method of approach that is applicable to all fistulas and for this reason vesicovaginal fistula seems to me to be an excellent subject for mutual discussion

I do not believe that in a meeting of this type there would be any value in presenting a review of a definite number of cases and showing the statistical data pertaining thereto However, I do desire to discuss certain phases of this subject which have improved my results and reduced my failures These apply both to the clinical and to the surgical management

Clinical Investigation

The diagnosis of urinary fistula is usually evident from the leakage, excoriation of the labia, inflammation of the vagina, and the odor, but to locate a small fistula may be extremely difficult Accurate information as to how the fistula occurred in the first place is most important For example, fistulas following total or supracervical hysterectomy are usually in the midline of the bladder, those subsequent to vaginal hysterectomy are usually in or near the ureteral meatus, and those following the excision of a urethral diverticulum, which, although not strictly vesicovaginal, should be included in this discussion, are located just in front of the internal sphincter and often seriously involve that structure The question has always been of interest to me why a urethrovaginal fistula located in the proximal portion of the urethra but which does not involve the internal sphincter should cause serious urinary incontinence, especially if the sphincter is the only mechanism of urinary continence, as many seem to think The answer to this question should explain satisfactorily why some operations for incontinence, which are applied to the incompetent sphincter, do not cure more patients than they do

Those fistulas that are not seen readily by means of cystoscopic examination are usually demonstrated, as you know, by filling the bladder with a colored solution and noting the point of discoloration in the vagina However, this method of demonstration may be faulty and very inaccurate With the patient in the examining position and with the cystoscope in place, a fistula near the sphincter or urethra will often not leak under these conditions In this situation a weighted speculum should be placed on the perineum and the entire vagina manipulated with long finger forceps to stretch or enlarge such a fistula

I recently had this experience again with one opening near the sphincter and, in addition, five other openings in the distal third of the urethra

A very careful cystoscopic examination is an essential prerequisite to a successful repair of the fistula One should observe the fistulous opening through the cystoscope, since its site is usually demarcated by a process that has the appearance of a diverticulum or a depression plus some granulations This appearance is caused by the vesical mucosa growing downward and uniting with the vaginal mucosa It is of considerable assistance to the surgeon if these fistulas are threaded at this time with black silk for identification and traction The fistula must also be located with respect to the sphincter, trigone, base, and either ureteral meatus, as the extent of involvement of the sphincter or ureteral meatus may alter the choice of operation considerably The character of the entire vesical mucosa with respect to deformity and infection should be observed A postoperative deformity of the bladder may conceal a second fistulous opening which might be overlooked easily and result in serious consequences

The factor of infection of the urinary tract and its relationship to recurrences of the fistula also has not been sufficiently stressed Fortunately, however, severe cystitis is not frequent, but when encrusted or interstitial cystitis is associated with the lesion it should receive priority of attention If the fistula is repaired in the presence of a badly inflamed mucosa, a recurrence of the fistula is almost a certainty, since repair of a

Read at the Annual Meeting of the Medical Society of the State of New York New York City May 10 1944

wound in this region is the same as in any other location. The infection penetrates through from the vesical side of the wound and not from the vaginal side, since the vaginal mucosa from its very nature can withstand a definite amount of infection without harm. The question of infection in the upper part of the urinary tract is equally important. It is not at all uncommon to find, in a case of vesicovaginal fistula which has occurred subsequent to a surgical procedure on the pelvic organs, that a ureter may have been injured and there follows associated infected hydronephrosis. A discharge of pus into the bladder from pyonephrosis following the repair of a fistula can be, and usually is, disastrous. A routine excretory urogram or catheterization of the ureters and pyelograms should always be a routine procedure before repair of the fistula is undertaken.

In the diagnosis of fistula following the use of radium for carcinoma of the uterine cervix, very careful search must be made to determine the presence or absence of remaining malignant tissue, for, if such tissue is present, repair of the fistula is hardly justified in view of the life expectancy.

Factors Influencing the Choice of Treatment

Spontaneous closure of some small fistulas, such as those that occur following delivery, is fairly common. It has been stated that closure follows conservative treatment in such instances and that the cause of the fistula is probably a combination of previous pelvic or urinary disease and trauma in the course of delivery, rather than delivery alone. My experience with such fistulas has been very limited. However, I have observed that quite similar results occurred following conservative treatment of postoperative fistulas, especially those associated with drainage of pelvic abscesses, in which the wall of the bladder becomes a portion of the wall of the abscess. The vesical wall may be injured at the time that drainage is instituted or it may be necrotic and slough through in the course of convalescence. My colleagues and I consider that a sound measure in such cases is to insert a retaining catheter to empty the bladder first, and to leave it in place for five to seven days, until this danger has passed.

It is true also that small fistulas which occur high in the dome of the bladder following other surgical procedures have been observed to close spontaneously if the bladder is kept continuously empty by a retaining catheter for a few days. Also, I should like to stress that if such fistulas do not close early it will be useless to continue conservative management. The cauterization of small fistulous tracts has never appealed to me very much as a good procedure. Nevertheless, I resort to it once in a while without much faith and on rare occasions I am surprised to see a successful closure from the cicatrix. Cauterization should be limited to the smallest fistula of the recurring type.

Time is a very important factor in the management of vesicovaginal fistulas. I have often said that to open the bladder accidentally during vaginal hysterectomy or vaginal plastic repair is not a serious accident provided immediate surgical repair is done. However, if the bladder is empty and the opening is not recognized, a fistula is sure to follow. Vesical tissue will heal just as promptly as any other fresh tissue but accurate approximation is required just as it is required in a section of the intestinal tract.

Immediate repair of postoperative fistulas is not advisable, since if the fistula is at once evident the patient is rarely in physical condition for further surgical procedures. Most fistulas make their appearance a few days subsequent to operation as a direct result of necrosis. Those that follow hysterectomy usually are caused by a suture passing through vesical mucosa and necrose through in from five to eight days. Some of them following delivery are a direct result of pressure necrosis and loss of blood supply. Obviously, tissues in such a state cannot be repaired with any assurance of success. It is, therefore, advisable to postpone surgical repair for six weeks to three months, in order that all edema and other evidences of inflammation may subside completely. Failure to observe this one rule is one of the greatest causes of recurrence of the fistula.

When multiple operations have been done in an attempt to close the fistula, sufficient time should elapse to permit regeneration of blood supply and the softening of scar tissue. This often is a period of months. Therefore, if recurrence follows what seems to be an excellent and satisfactory closure, it is best not to touch the fistula again for several weeks. Also, it is, I believe, a safe dictum that the percentage of successful closures decreases with each operation, so that the surgeon who is fortunate enough to have the first chance at closure will have the best advantage. In competent hands successful closure in primary cases averages 80 to 90 per cent.

Unfortunately, in a small percentage of cases the scar tissue and lack of adequate blood supply are so bad that further repair is impossible. In some cases the destruction of the vesical neck and urethra from trauma or radiation is so extensive that repair is inadvisable. When the bladder is incapable of retaining urine again, ureterosigmoid transplantation is the procedure of choice

if the rectal sphincter is competent Some congenital anomalies present this situation at the outset Two years ago I saw a woman of 20 years of age who had exstrophy of the bladder, partial prolapse of the uterus, and no anus, the rectum entering the vagina My first procedure was to construct a rectum and anus somewhat posterior to the normal location After one year, when this organ was functioning adequately for gas and feces and the patient could retain an enema for two hours, I transplanted the ureters to the sigmoid colon A good result was obtained I now am trying to devise some procedure to retain the uterus in its normal position, since her menstrual cycle and female organs are entirely normal

The Surgical Approach

I believe it to be most unwise for one to advocate the view that there is only one approach to any surgical lesion We know that vesicovaginal fistulas can be repaired by the vaginal, the transvesical, or the transperitoneal route There are advantages and disadvantages inherent in each method One should choose the route which gives the best functional results as well as a low mortality rate

The vaginal approach appeals to me for very definite reasons First of all, a vesicovaginal fistula opens into the vagina and one does not have to disturb any other organ to get at it The risk involved is practically nil The surgical procedure is simplified There is only one small vaginal incision to heal and this usually heals rapidly if it is approximated accurately Obstetricians are well aware of this fact

The position of the patient on the operating table is the cue to the accessibility of the fistula The Kraske position has many advantages In this position the patient is placed on her abdomen with the buttocks raised on a kidney elevator A Sims speculum is inserted in the vagina and held firmly against the perineum, a maneuver which raises the posterior vaginal wall and exposes the entire vagina and the anterior vaginal wall

The surgeon can then dissect directly down on the fistulous tract rather than through a dependent cavity as is necessary in the transvesical approach The ureters can be catheterized with ease if it is advisable to do so when a laceration has extended laterally to one of the ureteral orifices or if the single fistula adjoins or involves the meatus or intramural portion of the ureter The ramifications of the laceration can be identified more easily than by other routes A fistula may present itself as a single opening but the vesical wall often is thinned out in a groove or furrow in the direction of the injury and, if this thinned portion of the vesical wall is not visualized excised, and repaired a fistula frequently will recur in the line of repair Since mobilization of the portion of the bladder containing the fistula and complete excision of the scar tissue are very essential parts of the operative procedure there is all the more reason why the vaginal approach should offer the simplest and easiest way both for the patient and for the surgeon as well as offering better chances of cure and considerably less disability One must possess complete familiarity with pelvic anatomy, especially subvesical anatomy, if one elects the vaginal approach

It may be argued that a fistula situated high in the vagina, like that encountered following total abdominal hysterectomy, is inaccessible and fixed The opposite is usually the situation, because, if a fistula follows such a procedure, then the vaginal vault is often very inadequately supported as a result of the same technical factor which produces the fistula If the vaginal vault is fixed or immobile, I should advise opening the cul-de-sac, a very simple procedure, in order to note the proximity of the sigmoid colon In such cases I should also advise placing the index finger ventrad to the bladder and actually pulling the bladder into the vagina thereby rendering it quite accessible for any surgical procedure I wish to stress the advantages of this maneuver

Once in a while a rectovaginal fistula is situated just opposite a vesicovaginal fistula and may be of such size that feces will be deposited in the bladder Such an occurrence considerably complicates the problems involved The operation here must be well planned and foolproof The effect of a recurrence of the fistula on the mental attitude of the patient and of the surgeon is more than I care to experience as I grow older and, I hope, a little wiser Therefore, if a rectovaginal fistula is present and if the uterus has been removed, I believe that left inguinal colostomy is in order as a preliminary procedure Both vesical and vaginal infection will subside and the induration will disappear The fistula can then be approached as previously described with infinitely greater chance of success than if colostomy had not been performed

Fistulas that are located near the internal urethral sphincter or urethrovaginal fistulas require by virtue of their location, that the vaginal approach be used in their repair A type of urethrovaginal fistula that I have been especially interested in is the one which follows excision of a urethral diverticulum The orifice of this diverticulum usually is located just in front of the sphincter or within 1 5 cm of it, so that some incontinence accompanies this type of fistula The degree of incontinence depends a great deal on the

relationship of the fistula to the sphincter and, from an anatomic standpoint, on just how much the internal sphincter and the posterior third of the urethra are interrelated in controlling continence in any given case. This factor is not easy to determine, so that repair of the fistula must include not only the fistula but most of the urethra and the sphincter back to the midarea of the trigone. It might be inquired: Why does a fistula so often follow the excision of a seemingly innocent little urethral diverticulum? This question is answered, I believe, in one word: infection. A urethral diverticulum is symptomless until it incompletely empties itself and becomes a pocket of pus which constantly discharges into the urethra. To cleanse it of its infection is quite impossible and, therefore, the inner wall of the diverticulum becomes an intimate part of the wall of the urethra, from which it cannot be separated without injury. I should suggest that the diverticulum be excised completely except for that small area running under the urethra if it happens to be adherent, and that then the orifice of the diverticulum be closed with a few sutures and the entire urethra and sphincter repaired as previously stated. A more certain method of preventing a recurrence of the fistula is to excise the diverticulum and make no attempt to repair the defect in the urethra until all inflammation has subsided.

A fistula situated in or near the internal sphincter is always accompanied by sphincteral incontinence and the method of repair is exactly as previously described, but in addition, a little more emphasis is placed on approximation of the scarred sphincter.

I should like to mention a type of fistula in which the dorsal position is preferable to the Kraske position and, of course, this necessitates the vaginal approach. This type of fistula is one which follows delivery or plastic repair of cystocele and occurs with the uterus in its normal position. In the dorsal position the cervix can be used as a tractor and the fistula visualized, and the bladder can be separated more easily and accurately from the cervix than when the patient is in the Kraske position. If the cervix is lacerated also, or should the fistula be vesicocervical, a repair of the cervix is certainly more accurately performed when the patient is in the dorsal position than when she is in the Kraske position. In dealing with this type of fistula, one must look for transverse defects in the vesical wall and repair transversely. One is not interested in the cul-de-sac or vaginal vault.

I am sure that the transvesical approach is favored by many surgeons in preference to all other types. However, when this method is elected it must be predetermined that the repair will be entirely successful; otherwise, the patient will have not only a recurring vesicovaginal fistula but also considerable disability and perhaps a postoperative hernia, especially if the fistula was subsequent to abdominal hysterectomy. One type of fistula which should be handled adequately by the transvesical approach is one in which it becomes desirable to reimplant the ureter in the bladder and to repair the fistula simultaneously.

The transperitoneal approach is definitely indicated for some types of vesicovaginal fistula, although it entails a much higher risk than any other method. If there is pelvic cellulitis and if it is desirable to perform total abdominal hysterectomy and repair of sigmoidal fistula too, adequate protection against subsequent leakage of urine into the peritoneal cavity should be provided by means of gauze in the vagina in case of necrosis and recurrence, since patients do not do well with urine in the peritoneal cavity.

The method of surgical repair which seems to me to offer the most for a successful result has been referred to in previous communications[1] on this subject and will not be reviewed now.

There seems to be considerable disagreement regarding the type of suture material to be used. At one time I used silver wire and advocated its use, but I have discontinued its use because I have observed cases in which some of the segments finally appeared within the bladder. The patient sometimes presents them to one later and refers to her vesical distress and severe pain as the wire passed through the urethra. In some cases segments of silver wire have been removed through the cystoscope with immediate relief of vesical symptoms. As a result of such experiences, all the material that I use for repair of the vesical wall is absorbable material. The vaginal wall is approximated with interrupted cotton sutures. These sutures I do not remove until after six weeks. They sometimes come out by themselves but those remaining after the six weeks' period should be removed, since they become inflamed and are definitely painful.

Postoperative Care

The postoperative care as conducted by most of us is essentially the same. I would emphasize certain points. I believe that when the repair is completed sulfathiazole placed in the vaginal canal is useful. The vagina is packed lightly with plain or iodoform gauze to prevent any oozing of blood behind the vaginal wall. This gauze should be removed within fifty-six to seventy-two hours. A sponge or gauze pack

[1] Counseller, V. S.: J. Urol. 47: 711 (May) 1942.

remaining longer will tend to favor recurrence of the fistula The vagina should not be examined or inspected in any way while the patient is in the hospital nor should there be any treatment or cleansing douches I feel sure that one cannot improve healing by treatment and if there is leakage of urine again one cannot do or at least one should not do, anything about it at that time

Any examination by using even the smallest speculum invites disaster Even after three weeks I do no more than examine the suture line very carefully with one finger I would not think of putting in a speculum That is why the sutures are permitted to remain so long

The use of the Bradford frame is a distinct advance in the treatment of vesicovaginal fistula by virtue of the fact that the incision is not bathed constantly in urine and also that the patient can observe the urine dripping into the basin A plugged catheter can be a very serious complication and is likely to occur if the urine is infected

Discussion

Dr George Gray Ward, *New York City*—As Dr Counseller has stated the majority of cases of vesicovaginal fistula seen today are due to surgery or radiation therapy In the Woman's Hospital of New York in recent years cases are two and one-half times more frequent from these causes than from obstetric injury

Hysterectomy or radiation by those lacking operative skill and knowledge of gynecologic anatomy and technic are accountable for many fistulae in the vaginal vault These are usually small and difficult of access

I have found the Schuchardt incision, if properly made, a most valuable aid in obtaining accessibility in such cases, and I have stressed the importance of commencing the separation of the vagina and bladder in the lower vagina to establish the plane of cleavage where there is an absence of scar tissue The bladder can then be easily displaced downwards with a straight male sound passed through the urethra The technic of dissecting the pubocervical fascia from the vaginal mucosa and overlapping it gives additional security to the flap splitting operation

I have not encountered the difficulty Dr Counseller mentions with silver wire sutures If I use silver wire in the flap-splitting technic it is placed only in the vaginal flaps and is shotted

If the fistula is imbedded in scar tissue as the result of radiation or cauterization, it is important to dissect out this tissue, even if the fistula is enlarged thereby, as otherwise the lack of vascularity will be a cause of failure

The original Sims position is also very helpful in obtaining easy accessibility to the anterior vaginal wall for diagnosis and operation In searching for minute fistulae, remember to have the patient cough with the bladder distended with a colored fluid

In certain cases I have used the reversed Trendelenberg position and Boseman's posture (or Kraske) in closing large fistulae This posture allows a clear view of the operative field due to the distension of the vaginal walls and bladder, and bleeding is less troublesome as it runs into the bladder

When multiple attempts have resulted in failure with the flap-splitting technic, I have found the original Sims operation with silver wire sutures often successful

As Dr Counseller points out, some of the most difficult cases are those involving the internal vesical sphincter, or with complete or partial destruction of the urethra While the fistula can be closed and a new urethra can be constructed by employing the technic suggested by Farrar, control is absent because of the destruction of the muscle A self-retaining catheter should not be used in these cases A small, straight catheter tied in is less apt to prevent healing at the vesical neck It is often wise to secure drainage by a suprapubic cystotomy in urethral injuries

If the Kelly technic or the Kennedy technic is not successful, control may be obtained by the excellent operation devised by Aldridge in which strips of rectus fascia are brought down behind the symphysis and united around the urethra

Important points to remember before operating are that postpartum involution must be completed before attempting a repair, small fistulae sometimes close themselves if a retaining catheter is used promptly postpartum or postoperatively, and what is most important, as Dr Counseller states, infection of the entire urinary tract should be eliminated by appropriate medication or surgery Phosphatic deposits must be removed and their formation prevented by keeping the urine acid Also, after the operation it is important to keep the urine acid, as phosphatic calculi may ulcerate and reopen the fistula Sulfanilamide powder placed in the vagina is of definite value

Emmet carried on the pioneer work of Sims at the Woman's Hospital and had the most extensive experience with these cases of anyone of his time He reported some 270 cases with a cure rate of approximately 70 per cent In a recent series of mine I had a cure rate of 73 per cent

Probably the man who has had the greatest experience in our time is Dr N Mahfouz professor of gynecology in Cairo, Egypt, who is frequently quoted in the literature as Bey instead of Mahfouz The incidence of vesical fistula is very high in Egypt as a sequel of neglected labor In 1938 Mahfouz reported having operated upon over 400 cases with a cure rate of 95 per cent in his last 100 cases He uses spinal anesthesia, as it gives relaxation of the pelvic floor, he stresses the importance of inverting the edges of the denuded fistula, he uses catgut and silkworm gut, and warns against tying the sutures too tight, and he ties in a small straight catheter for drainage

In judging cure rates however, one must bear in mind that much depends on the type of case The postoperatively inaccessible fistulas in the vaginal vault, those that involve the urethrovesical junction

or destruction of the urethra, and those that follow radiation for carcinoma with formation of scar tissue are more difficult to cure than many large fistulas situated in the trigone of the bladder.

It should be remembered that each case is an individual problem and the type of technic must be selected or improvised to meet the conditions present.

"NATIONAL OPTICAL STORES"

This is but one of the names used by a chain of "optical stores" throughout the Middle West. In Indiana there are several such outfits in the larger communities. Sometime ago the *Journal* exposed this outfit, following a visit to their Indianapolis store, this in answer to a wire asking us to drop in for a conference relative to engaging our services in their Hammond store, which since has been closed.

From time to time we have commented on the fact that this outfit continues to solicit Indiana doctors, all well up in years, to take employment with them. Of late it would seem that they are having trouble in "manning" their establishments since an unusually large numbers of our members have received these bids, via post card.

One addressed to us, September 23, 1944, and signed by Anthony Sward, 1148 West Chicago Avenue, Chicago, indicated that we would have to leave town for this particular job. He said, "We can offer you a splendid remuneration. This is refraction work, *no experience necessary.*"

We at once answered the inquiry, asking for further information, although our previous Indianapolis interview had given us full information as to the racket. Under date of September 28, the letterhead being that of the National Optical Stores Company, Chicago, friend "Tony" wrote us quite a letter, which is given in full herewith:

"Dear Doctor Shanklin:

"Pursuant to your letter of September 25th.

"The proposition, as the card stated, is refraction work (refracting eyes). It is a permanent connection, and is very easy and interesting work. If you have not been doing this type of work recently, we are able to train you in a very short period of time.

"The minimum guarantee which we offer is sixty-five dollars ($65) per week. The branch offices that are available at the present time are South Bend, Muncie, Marion, and Evansville.

"This requires absolutely no selling in any shape or form on your part, and is really not in the nature of a proposition, but is a bona fide offer of a permanent connection with a company of many years' standing and reputation.

"Owing to the fact that we must have a doctor available, you will realize that we are doing the best we can to make arrangements as quickly as possible.

"If you have had no previous experience in refraction work please call me (collect) and I will make arrangements for you to train at one of our offices near you. While you are in training, we pay your expenses when you are away from home.

"Our bank reference is the National Security Bank of Chicago.

"We would esteem it a great favor if you wire or call me (collect) at the above address, as to your decision, immediately."

It will be noted that Tony suggests that training might be had in one of their stores. One such store is in a neighboring city, where the "opthalmologist" is a former member of our county medical society and who to our knowledge has had no previous training in this subject prior to his "enlistment" with this racket.

This thing has been going on for several years, right here in our own state. The reason that, as Tony says, "We must have a doctor available," is due to the Indiana Optometry Law, which put a stop to chain-store optometry in this state. However, by the clever subterfuge of employing a regularly licensed physician, they have been able, thus far, to evade the law. On the same date the card was mailed to us, September 23, it seems that Dr. A. B. Graham, now retired and formerly of Indianapolis, was sent a card, an exact duplicate, this being forwarded to him in El Paso, Texas. (It is evident that Tony is using an old directory, since Dr. Graham has not been listed at Indianapolis for some years.) Dr. Graham writes, "Why my name was drawn from the hat, as a possible gullible victim of this damnable racket, I do not know."

Folks, this is a racket, and a racket that can be scotched! How long shall we permit this outfit to evade the intent and purpose of the Medical Practice Act and the Optometry Law? Hundreds of the gullible answer the advertisement of these Indiana stores, pay their money in good faith, and what do they get? They get an "examination" by a doctor, a regularly licensed doctor; they are led to believe that these men are "eye doctors," which they are not. They are but doctors who have sold their medical birthright, probably because this racket offers more cash remuneration than they were able to make in regular practice.

We of Indiana have cleaned up some rather nasty messes about the state; we can clean this one up in short order if we but get to it. Further, it is entirely possible, under the existing medical laws to revoke the licenses of these medical offenders—a thing that should be done—NOW!—*J. Indiana M. A., Jan., 1945*

THE SURGICAL TREATMENT OF CHRONIC CONSTRICTIVE PERICARDITIS

GEORGE J HEUER, M D , and HAROLD J STEWART, M D , New York City

(From the Departments of Surgery and Medicine of the New York Hospital and Cornell University Medical College)

CHRONIC constrictive pericarditis is a disease characterized by a chronic fibrous thickening of the pericardium which is so contracted as to interfere with the normal diastolic filling of the heart The result of this interference with normal cardiac action are the signs and symptoms resembling heart failure Pick, in 1896, emphasized the common findings in this disease of involvement of the liver and ascites and, therefore, it is often called by his name

From a historic viewpoint, however, the condition was accurately described long before Pick's publication Galen, about A D 160, is said to have observed a scirrhous thickening of the pericardium in a cock and suggested that the same condition might occur in man and interfere with proper cardiac function Lower, however, in 1669, appears to have been the first to describe the disease in man He pointed out that in large pericardial effusions the mass of fluid "oppresses" the heart in that it compresses its walls and prevents them from dilating sufficiently to receive blood, that under these conditions the pulse becomes small and finally is suppressed, resulting in syncope and death He cites the history of a London housewife aged 30 years who over a period of years declined in health with dyspnea, precordial discomfort, weakness, and small intermittent pulse The only important postmortem finding was a thick, opaque, and even "callous" pericardium densely adherent to the heart In 1729, Lancisi added to the clinical picture of the disease by citing the case of a man aged 24 with small pulse, marked engorgement of the jugular veins, and swelling of the abdomen At autopsy a small heart surrounded by a thickened, adherent pericardium was found Morgagni, in 1761, reported 7 cases of the disease, in one of which at postmortem the heart was "so constricted and confined that it could not receive a proper quantity of blood to pass on" But this author also noted that adherent pericardium need not necessarily be associated with symptoms and signs, an observation which may have distracted the attention of the medical profession from the importance of this disease, for little mention is made of it for over one hundred years even by such well known clinicians as Corvisart, Laennec, and Skoda

During the first half of the nineteenth century two German physicians, Griesinger and Kussmaul, and two English physicians, Chevers and Wilks, made important observations upon the disease, but these, for some unknown reason, entirely escaped notice It remained for Pick, in 1896, to stimulate interest in a disease which for so many years had been singularly neglected He reported 3 cases and discussed in particular the differential diagnosis between constrictive pericarditis and primary cirrhosis of the liver The interest he aroused in this condition has continued to the present day

The idea that surgery might achieve results in a disease which has resisted the efforts of the physician is attributed to Weill, who in 1895 suggested that patients with it might be relieved by resection of the pericardium Délorme, an internist who seems to have had unusual surgical instincts and whose name is widely known in connection with the operation of decortication of the lung for chronic empyema, not only suggested but insisted between the years 1895 and 1898 that surgery be attempted in this disease His advice, however, was not immediately followed Henle, in 1907, first attempted the operation, and in 1913 Rehn and Sauerbruch performed resection of the pericardium for chronic constrictive pericarditis, the former successfully Schmieden followed their lead in 1918, and since that time interest in the diagnosis of the disease and knowledge regarding its surgical treatment gradually has become more general In this country, Churchill was the first to perform the operation, and he and White in Boston, Beck and his associates in Cleveland, and Burwell and Blalock in Nashville have shown particular interest in and made important contributions to our understanding of this disease

It is not our purpose to go deeply into the cause, pathology, clinical manifestations, and diagnosis of this disease But we are sure it frequently is overlooked and, therefore, some remarks regarding its salient features are, perhaps, warranted The cause of the thickened, contracted, adherent pericardium has been related to tuberculosis in 1 out of 18 proved cases in our experience, in 5 of 37 cases in White and Churchill's experience, and in 22 of 28 cases in Burwell and Blalock's experience Pneumonia, sepsis, a previous pericarditis with effusion, as in 5 of our

Read at the Annual Meeting of the Medical Society of the State of New York New York City May 9 1944

cases, all have apparently been causative factors; yet in most of the proved cases the antecedent cause of the condition has not been determined. The pathologic process in the wall of the pericardium gives rise to a variety of lesions. The pericardium is always thickened; but the thickening may be variable in different parts, being slight in some areas, marked in others. The thickened pericardium may be made up wholly of fibrous tissue or deposits of calcium may occur, giving rise to plaques, sheets, or a complete bony shell. It may be slightly adherent to the heart or so densely adherent and fused that a cleavage plane between the heart and its covering cannot be demonstrated. The contraction of the thickened pericardium may implicate the entire heart or chiefly the right ventricle or the great vessels at the base. It is the compression of the heart by its shrunken envelope that gives rise to the clinical manifestations of the disease.

These clinical manifestations commonly are dyspnea, increase in the size of the abdomen due to enlargement of the liver and ascites, and edema of the feet and ankles. Either may be the symptoms of onset, although dyspnea and enlargement of the abdomen are the most frequent. Of the physical signs a nontender, nonpulsating enlargement of the liver with ascites and engorgement of the jugular veins are the most important. The venous pressure is increased. The heart shadow may be small, average in size, but most frequently slightly or moderately enlarged. The cardiac rhythm is usually normal (13 cases) but there may be auricular fibrillation (5 cases). Abnormal cardiac sounds, such as murmurs, are absent in the majority of cases but there may be a slight or moderate systolic murmur. The blood and pulse pressures are low or may come within normal limits. The paradoxic pulse was present in all our cases. Fluoroscopic examination of the heart may show a diminution in cardiac motion and fixation of the heart in the mediastinum; the x-ray film may demonstrate a heart encased in a calcified pericardium. Electrocardiographic studies usually show abnormal records. The QR-S complexes have shown a low voltage in 17 patients and either a low voltage or inversion or flattening of the T-waves of the coronary type. The electrical axis shifts only slightly with change in the patient's position; the axis deviation was present to the right in 6 of our patients, to the left in 2, and normal in 10.

In the series of 18 cases here reported enlargement of the liver occurred in all cases; ascites in 15, edema of the extremities in 11, and pleural effusion in 8. Dyspnea on exertion or at rest was present in 17 and cyanosis in 14. Distention of the peripheral veins and an increase in venous pressure was present in all our patients. With these findings it is apparent that the diagnosis of chronic constrictive pericarditis should be considered in patients with the signs of congestive heart failure, in the absence of the common causes of this condition.

Certain studies of the circulation carried out upon 9 patients with chronic constrictive pericarditis by one of us (Harold J. Stewart) have added to our knowledge of the pathologic physiology of the disease. It has been found, in brief, that there is an increase in the arteriovenous oxygen difference, an elevation of the venous pressure, and a prolongation of the circulation time; a diminution of the cardiac output per minute, a decrease in the stroke volume, and a lowered value for the cardiac index (cardiac output in liters per square meter of body surface per minute). In seven of the 9 cases studied, these measurements of the circulation have been repeated after the operation of pericardiectomy; and in the cases cured or improved, the functional capacity of the heart increased. We have found, therefore, that these tests constitute a valuable aid, not only in the diagnosis but in estimating the improvement following operation.

In the differential diagnosis the disease is most commonly confused with mitral stenosis, cirrhosis of the liver, polyserositis, and nutritional or other edemas. Tricuspid disease and mediastinal tumors may occasionally be wrongly diagnosed. A widespread chronic pulmonary fibrosis in a young individual not subjected to operation but examined at autopsy was confused with the condition in our experience. From our own observations and those of others, the leading clues to a correct diagnosis are the insidious onset of dropsy, particularly in young persons, the preponderant liver enlargement and ascites, the increased prominence of the jugular veins with increased venous pressure, the normal or relatively normal heart in the presence of a non-nephritic dropsy, the low pulse and blood pressures and paradoxic pulse, the x-ray evidence of poor or absent cardiac pulsation and pericardial calcification, and the electrocardiographic findings of low voltage QR-S complexes and T-waves.

This, in the briefest outline, is the disease the surgical treatment of which is under consideration. We shall not speak of Brauer's operation of cardiolysis, a procedure designed to relieve the heart of its excessive work in moving the thoracic wall with each systolic contraction. This operation has limited indications in the disease which we are discussing because the chief cause of the difficulty is not the attachment of the pericardium to sternum and ribs but the constriction of the heart itself by its rigid, adherent covering. The operation we shall consider is the decortication of the heart by resection of the pericardium. It is

designed to relieve the constriction of the heart so as to permit a normal diastolic filling with a resultant normal contraction and an increased cardiac output.

A review of the literature and our own experience shows that the possibilities in this type of surgical procedure are sufficiently great to warrant its application in selected cases. All of the 18 patients with chronic constrictive pericarditis here considered have been subjected to the operation of pericardiectomy. All the patients have recovered from the operation. Seven patients were cured in the sense that their symptoms and signs disappeared and they were able to lead normal active lives; 3 patients, more recently subjected to operation, have so far recovered as to appear to be cured; 4 patients were markedly improved, 1 moderately improved, and 4 patients were unimproved by operation, of whom 3 have since died.

From the literature we have assembled 256 patients subjected to operation, with a primary mortality of 29 per cent. Of the fatalities, 25 patients died upon the operating table and 49 died during the immediate postoperative period. To have lost at once over one fourth of the entire number of patients subjected to operation suggests that preoperative treatment leading to a proper selection of cases and knowledge of and great attention to all the details in the operative procedure have influenced profoundly the results of surgery; and it is with these matters that we shall chiefly concern ourselves.

Preoperative Treatment

The preoperative medical treatment we have used is similar to that in the treatment of heart failure due to other causes. The patients are kept in bed and given a low salt diet (2.0 Gm. daily) and a limited amount of fluids (1,200 cc.). A high protein diet has been given because it was indicated in 4 patients because of the low value of their serum proteins and because, in others, it seems desirable to maintain the level of the serum proteins in order to draw fluids into the blood stream and make them available for excretion. Of the drugs used to mobilize fluids, mercupurin has been found to be the most satisfactory. It usually is given in 2.0 cc. doses intravenously at three-day intervals. To some patients ammonium chloride, 3.0 Gm. per day, was given at the same time to enhance the diuretic effect. Theocalcin, 1.5 Gm. three times a day, urea (50 cc. of 50 per cent solution three times a day) and aminophylline 0.1 Gm. three times a day all were tried but with less effect. Abdominal and thoracic paracenteses were resorted to when fluid could not be removed by other measures. Patients were not subjected to operation until fluids accumulated in the tissues and body cavities had been removed or reduced to the greatest possible extent even though this required months of rest in bed.

Anesthesia

Of the 18 patients subjected to 19 operations, 7 were anesthetized by the simple open-drop ether method, 11 with drop ether administered through an intratracheal tube (Magill) and 1 with an ethylene-oxygen-ether mixture. All the anesthesias were smooth, satisfactory, and without cyanosis. In 14 cases the pulse was rapid, ranging between 100 and 160, in the majority being 130 or over; in 5 there was not an increase in pulse rate. In the 14, the pulse was usually not only rapid but irregular in rhythm. On the other hand, the respiration remained regular, adequate, and unaccompanied by cyanosis. While our experience is as yet too limited to compare different methods of anesthesia in the operation of pericardiectomy, it can be said that ether has been highly satisfactory. In no case did we have the slightest anxiety regarding this part of the procedure. While we did not use intratracheal anesthesia in 7 of our cases and our patients failed to suffer any ill effects from the accidental opening of the pleura, we are inclined to think that intratracheal anesthesia is desirable. Our experience would indicate that in spite of the greatest care the left pleura, in particular, is likely to be opened in exposing the pericardium for resection, and that the opening might be sufficiently large to cause respiratory embarrassment.

Approach to and Exposure of the Heart

A greater part of the ventral surface of the heart may be exposed by an approach upon the left side of the thorax; and, therefore, at the primary operation a skin muscle flap is reflected upon this side. The position and extent of the flap may be determined by the position of the heart with reference to the overlying costal cartilages and ribs as determined by the x-ray film. We have found it desirable to expose the heart from its base to its apex, and therefore it may be necessary to resect inclusively the second to fifth, the third to sixth, or the second to sixth costal cartilages and segments of the corresponding ribs. The skin-muscle flap is formed by incisions which overlie, respectively, the uppermost and lowermost costal cartilages to be resected and which are connected by a vertical incision corresponding with the midsternal line. The major pectoral muscle is freed from the sternum and ribs and reflected laterally with the skin flap. The costal cartilages and segments of the corresponding ribs are resected. Thus far we have done a subperichondrial and subperiosteal

resection and have preserved the intercostal muscles, which are divided at the left border of the sternum and together with the perichondrium and periosteum are reflected as an additional flap. The dissection is then carried down to the pericardium along the left sternal border and the fat and connective tissue overlying it are carefully freed and stripped laterally, carrying with them the reflection of the left pleura. It is during the course of this maneuver that the left pleura may be torn and, therefore, it should be carried out slowly and carefully. The pericardium is freed to the left lateral border of the heart from the apex to the base, in the course of which the phrenic nerve may be brought into view. Having exposed the left pericardium, a similar procedure is carried out over the right side of the heart and to its right border. In doing so the heart is depressed so as to create a space between it and the sternum sufficient to allow the subsequent resection of the pericardium. In 17 of the 18 cases subjected to pericardiectomy it was possible to resect the pericardium over the right side of the heart without resecting any portion of the sternum; in one case the resection of the left half of the sternum seemed necessary in order to obtain sufficient exposure.

In only one case, thus far, have we performed a second operation upon the right side in order to free a greater part of the right heart. This patient, markedly improved but not entirely well five years after his primary operation, was subjected to a second operation and his right ventricle and auricle were completely freed. He seems to be well, for all symptoms and signs present before the second operation have since disappeared and his elevated venous pressure and delayed circulation time have returned to normal.

Resection of the Pericardium

It has been our practice after fully exposing the pericardium to incise it over the left ventricle and devote such time as may be necessary in establishing the most satisfactory cleavage plane between it and the heart muscle. In some cases a satisfactory cleavage plane is at once evident and the mobilization of the pericardium may be proceeded with at once. Again, there may appear to be complete fusion between pericardium and myocardium, making the dissection of the pericardium a time-consuming matter. In some cases the pericardium is thickened and fibrous but not calcified; in other cases it is almost a complete bony shell; in still others it is a fibrous membrane containing areas or plaques of calcification of various sizes and distribution. Calcified areas may be present over the right ventricle but not over the left, may occur chiefly about the apex and diaphragmatic border of the heart, or may surround the great vessels at the base. They may be easily separated from the heart muscle or may extend into and involve the heart muscle. It is evident from these considerations that the resection of the pericardium may not be too difficult, or it may be extremely difficult and dangerous.

It has seemed best to us to dissect the pericardium off of the left ventricle first because there is less likelihood of tearing into the left than the right ventricle in starting the mobilization of the pericardium and less danger of overdilatation of the left than the right side of the heart. The mobilization is carried laterally so as to free the apex and left border of the heart, upward to the base of the heart, and downward to the diaphragm. A region where particular care is necessary is the interventricular groove containing the descending branch of the left coronary artery. It is here that adhesions between pericardium and myocardium may be particularly dense and it is possible, as in one case in our experience, that a part of the artery may be dissected out of its bed with the pericardium, the division of which might seriously interfere with the heart. Having safely crossed the interventricular groove, the mobilization is carried out over the right side of the heart; to the right, if possible, to the right auricular ventricular groove, upward to the base of the heart, and downward to the diaphragm. It has seemed easiest to us to resect the pericardium in fragments; but we have always carried the line of separation between pericardium and myocardium well ahead of the cut edge of the pericardium in order to maintain a flap which we could bring against and suture to the heart muscle if the latter were inadvertently torn. We have also at times abandoned the attempt to separate a plaque of calcification or a particularly adherent piece of pericardium from the heart, thinking it better to leave it as a patch on the muscle than to risk injury to the heart muscle in attempting to remove it.

How much of the pericardium it is necessary to remove in order to achieve satisfactory results is difficult to state. We have removed as completely as possible the pericardium over the left and right ventricle; but in only one recent case have we attempted to remove the adherent pericardium over the auricles. An effort has been made to free the apex; and if possible the dissection is carried well down on the diaphragmatic portion of the pericardium. Only one attempt has been made to go beyond the right auricular-ventricular groove and we have not attempted to free extensively the great vessels at the base.

Not only may the decortication of the heart be, of itself, a tedious and dangerous procedure, but it is made more so because of the necessity of operating upon an organ in constant motion, and

one very sensitive to external stimuli. In 13 of the 18 patients subjected to operation, the heart-beat, as counted at the wrist, varied between 100 and 160 and in all cases was over 130 during the greater period of the operation. In some cases there were periods of paroxysmal tachycardia; in others ventricular fibrillation (EKG), in still others such complete loss of rhythm that the cardiac action could be described only as complete arrhythmia. Periods of transient stoppage of the heart occurred not infrequently, and in the majority of cases the dilatation of the right ventricle and its herniation through the pericardial defect added to the difficulties of the procedure. The manipulations necessary in the mobilization and removal of the pericardium certainly play a role in the irregularity of cardiac action. All the circumstances tend to urge the surgeon to hurry and finish the operation, but I am convinced that it is a tendency to be resisted. It has seemed to us wise to pause periodically in the course of the operation in order to allow the heart to regain a more normal rhythm and function.

That great care in the operative procedure is of importance in the success of the surgical treatment of chronic constrictive pericarditis is evident from a survey of the literature. As previously noted, of the 256 cases which we have assembled, 74, or 29 per cent of the entire number, died upon the operating table or during the postoperative period. A study of such data regarding the causes of death as are available shows that injury to the heart during operation, wound or other complications, and acute cardiac failure accounted for a high percentage of the deaths. There appears to be little doubt that care in avoiding injury to the heart, gentle manipulation of the heart, and meticulous attention to detail in operative technic are important factorsin lowering the mortality.

Closure

In the 18 patients whom we have subjected to operation, bleeding has been controlled as perfectly as possible and closure of the large wound has been with silk and without drainage. In 17 cases healing of the wound has been *per primam;* in one case a hematoma developed in the lower part of the wound, followed by a localized superficial infection which did not jeopardize the wound as a whole. In this case there also occurred a moderate-sized left hemothorax—complications resulting from imperfect hemostasis. In the closure of the wound we have retained all the layers reflected, first suturing the intercostal muscle and posterior perichondrium at the sternal border, then the major pectoral muscle and finally the subcutaneous layer and skin. Schmiden not only resects completely the bony thoracic wall but excises the major pectoral muscle, using only the skin and subcutaneous tissues to cover the heart. Churchill resects the bony thoracic wall but retains the pectoral muscle. Both surgeons think a mobile thoracic wall over the decorticated heart is desirable. Our experience thus far in cases followed over eight years indicates that the reformation of a rigid thoracic wall is not incompatible with satisfactory results.

Postoperative Treatment

Following operation 13 of the 18 patients had a surprisingly smooth and satisfactory postoperative course and their convalescence was practically uninterrupted. In 6 the immediate postoperative course was complicated by pulmonary or intrathoracic complications such as pneumonia, pneumothorax, and serosanguineous effusions. These 6 patients were ill after operation but at no time dangerously ill. In 4 of the 6 patients one or more aspirations of the chest were performed for pneumothorax or pleural effusion. The oxygen tent was used postoperatively following 10 of the 19 operations either because of a mild cyanosis or because the pleura had been opened during operation. At some period during convalescence some accumulation of fluid in the chest, either a simple or a serosanguineous effusion, was noted in 14 instances, for which aspiration was performed in 6 cases. Some degree of fever occurred after 17 of the 19 operations. Because of signs suggesting parenchymal involvement of the lung, the sulfa drugs were used in 3 patients and penicillin in 1. Fluids were given by clysis after operation in 14 patients, not given in 4. In one patient only a small blood transfusion of 500 cc. was given.

We have avoided intravenous fluids because of the fear of embarrassing the newly released heart by too rapidly increasing the blood volume. In general the diet and salt and fluid intake prescribed before operation were continued for a time after operation. Diuretics were used after operation in 14 patients and not required in 5. The position in bed was according to the comfort of the patient. A slight elevation of the patient seemed the most comfortable.

Improvement in the signs and symptoms of the disease has, in our experience, varied considerably. In 7 patients improvement was evident at once or before the expiration of a month; improvement in 1 did not become pronounced until after the lapse of two or three months, in 4 not until after six to ten months and in 1 not until after one year. In 2 improvement was gradual, in 4 improvement failed to occur. We have learned not to be discouraged if improvement after operation is not evident at once and rapid.

Results to Date

As previously noted, 18 patients have been subjected to 19 operations without a postoperative fatality. Of these:

(*a*). Seven patients are classified by us as cured over periods varying from one and a half to eight and a half years, of whom 6 have been followed more than three years and 3 more than seven years. One of these patients, after being completely cured for three and a half years, died from an unrelated acute generalized peritonitis.

(*b*). Three patients more recently operated upon have shown such improvement in their symptoms and signs as to warrant the expectation of a cure. Since they have been followed less than one year, they have not been classified as cured.

(*c*). Four patients are markedly improved over periods of from three to six and one half years. One of these patients died six and one half years after operation from pneumonia.

(*d*). One patient is moderately improved and is living six years after operation.

(*e*). Four patients were not improved by the operation. Of these 1 is living seven years after operation and 3 have died. One patient died one year after operation from recurrent pulmonary infarction, and 2 died eleven months and seven months, respectively, after operation from a progression of the disease. In the last two it became fairly evident on their return visits that the operation had failed in its purpose. To have cured or markedly improved 14 of 18 patients subjected to operation (77 per cent) is evidence that surgery has contributed importantly to the therapeutics of a disease which commonly causes death.

THE EVOLUTION OF THE ASEPTIC PRINCIPLE IN SURGERY

Ideas seldom spring full-fledged from the mind of man. What he does, what he thinks, what he is depend upon a multiplicity of factors over which he has no control. For example, minds as great as William Harvey's were produced in the fourth century B.C., but the circulation of the blood was not discovered until the seventeenth century A.D. The second century conceived minds which surpassed even that of the great Vesalius; yet human anatomy was not a fact until the sixteenth century. Progress is seldom constant. A chart of medical progress would resemble nothing so much as an economic graph with its valleys of depression and peaks of prosperity. A great discovery waits upon propitious social, technical, and cultural factors, upon the accumulation of pertinent but often isolated facts, and finally upon genius to forge the final link and "make" the discovery.

The principle of asepsis, more than any other one factor, has made possible the miracles of modern surgery. Yet few realize that the idea grew slowly through the centuries [illegible] boosts along the way—often [illegible] part of the contributor—from microscopists, physicists, bacteriologists, obstetricians, and laymen, as well as physicians and surgeons, before it culminated in the antiseptic principle of Lister which quickly evolved into our present concept of asepsis.

Wounds and their complications have concerned man from the earliest times. The ancient Greeks sutured wounds and used simple wine and astringent dressings, with apparently few wound infections. Galen also had good results in treating the wounds of the gladiators by suture and simple dressings. The later copyists of Galen, however, distorted his true meaning and extolled the value of suppuration —"laudable pus"—in wound healing. This abominable concept of wound therapy, which demanded that every wound discharge pus before healing, became so firmly entrenched in the middle ages that it was not completely dislodged until the nineteenth century.

One of the first breaches in the solid front of the advocates of "laudable pus" was made by Theodoric, Bishop of Cervia, one of the [illegible] all time. In 1266 he co[illegible], later printed in the surgical anthology at Venice in 1498, in which he advocated the simple, expectant, dry treatment of wounds: "It is not necessary as Roger and Roland have written, and as many of their disciples teach, and as all modern surgeons profess, that pus should be generated in all wounds. No error can be greater than this. Such a practice is indeed to hinder nature, to prolong the disease, and to prevent the conglutination and consolidation of the wound." Theodoric thus anticipated our modern aseptic treatment of wounds by more than six centuries. His teaching was given little credence, however, after Guy de Chauliac, the most eminent authority on surgery in the fourteenth and fifteenth centuries, repudiated his doctrine and again advocated "laudable pus."

Paracelsus, the physician, surgeon, alchemist, and mystic of the early sixteenth century, was another precursor of asepsis. He taught that nature and not officious meddling heals wounds. Although others, including Villanova in the fourteenth century and Fallopius, Wuertz, and Duchene in the sixteenth century, recognized the deleterious effect of air on wounds, no real progress was made toward a rational therapy of wounds until some light was thrown on the cause of infections. One of the early contributors to this field was the microscopist, Antonj van Leeuwenhoek.—*J. C. Trent in Thumbnail Sketches of Eminent Physicians, North Carolina M. J., Jan., 1945*

A GENERAL RESUME OF THE HEMATOLOGIC DISORDERS

ELLERY G ALLEN, M D , Syracuse, New York

A PROFESSIONAL colleague, discussing an unfortunate case of leukemia, recently inquired how I ever became interested in so morbid a phase of internal medicine as hematology. He was of the opinion that hematology is a more depressing field than cardiology and compared favorably with neurosurgery in the matter of mortality My original interest in this subject I told him, came because of the inspiration of certain teachers An interest in laboratory procedures developed early in my student days and the later association with capable and cultured clinicians, who kindly encouraged me in my interests, are the main reasons, I believe, why I have developed an enthusiasm for this subject In addition, I suggested that, although invariably fatal hematologic disorders are frequently seen, the majority of patients presenting abnormalities of the blood-forming organs can be greatly relieved or improved, if not completely restored to a state of normal health

I have selected some of the more practical aspects of the problems as we have seen them in dealing with patients in the hospital wards, dispensary, and in private practice These subjects will be discussed in the following sequence

A The erythrocytes
  1 Normal values
  2 Anemia
  3 Polycythemia
B The leukocytes
  1 Normal values
  2 Leukopenia
  3 Leukemia
C The hemorrhagic diseases

The Erythocytes

Normal Values —In postnatal life the erythrocytes originate from the endothelial lining of the bone marrow sinusoids Although it has been generally held that the average red blood count for a woman is 4,500,000 and 5,000,000 for a man it is known that these figures have been handed down to us as the result of three blood counts Vierdort performed in 1852 It can be stated that healthy women present erythrocyte counts varying between 3,800,000 and 5,500,000, with an average of approximately 4,800,000 and that the counts of men may vary between 4,600,000 and 6,500,000, with an average of approximately 5,400,000 The hemoglobin values for both men and women can safely be said to be 3 Gm per million

Thus a female patient may have a hemoglobin value as low as 11 4 Gm (76 per cent) and a man may exhibit a reading as high as 19 5 Gm (130 per cent), without either's having a definitely abnormal level For practical purposes, a hemoglobinometer reading in grams is preferable to one reading in per cent, since various hemoglobinometers have different standards as representing 100 per cent, and I am convinced that nothing has more confused the matter of color-index estimations than this fact

The hematocrit is a valuable instrument for estimating the volume of packed red cells, the volume index, and the mean corpuscular volume of the average individual erythrocyte, and should be employed in all cases of anemia Calculation of the color index gives us an impression as to the hemoglobin content of the average cell, whereas the volume-index estimations indicate their average size Thus anemias may be classified as hyperchromic, normochromic, and hypochromic, on the basis of the color-index studies, and macrocytic, normocytic, and microcytic, on the basis of volume-index calculations Of the two, the volume studies, as obtained by the red count and hematocrit reading, are probably preferable to the color index figures, since it is possible to more accurately read a hematocrit level than the color in the hemoglobinometer

Anemia —An individual is said to be anemic when the amount of circulating hemoglobin has been reduced below his normal level Although at one time we were prone to regard anemias as "primary" and "secondary," chiefly because it seemed necessary to separate pernicious anemia from other types, we now know that all anemias are "secondary" and that the terms should be abandoned From the laboratory standpoint, anemias are classified on the basis of color or volume-index studies Practical clinical classification, based on cause, demands that one consider whether the anemia is caused by increased blood loss, increased blood destruction, defective blood formation, or any combination of the three The anemias caused by blood loss are common and are likely to be of the hypochromic or microcytic type The hemolytic anemias, caused by increased blood destruction, may exhibit any type of color or volume index, whereas the anemias caused by decreased blood formation are likely to be hyperchromic and macrocytic, although such factors as inadequate dietary iron,

Read before the Cortland County Medical Society, March 17, 1944

infection, increased hemolysis, and blood loss may considerably alter this picture.

In any case of anemia, the physician should ask himself: Is the anemia caused by blood loss, is there evidence of increased blood destruction, and are any factors present that could depress the marrow function? Obviously, one must subject the patient to a thorough study in order to decide this matter and unless this be done in every case, one cannot have any rational basis for intelligent treatment. A thorough history and physical examination should include attention to the possibility of inadequate diet, infection, abnormal loss of blood, hemorrhagic phenomena, toxic drugs and chemicals, disease of the gastrointestinal tract, hepatic disorders, jaundice, enlarged lymph glands and spleen, a history of exposure to x-ray or radium, and diseases affecting the bone marrow itself. Complete laboratory studies, including x-rays of the gastrointestinal tract, gastric analysis, studies of the stools and urine for blood, examinations for evidence of increased hemolysis, and sternal marrow biopsy, may be necessary in the cases in which the cause is not obvious, and even when all this has been done, a rare case may defy causative diagnosis.

The successful treatment of anemia depends on our ability to remove the cause, and any antianemic therapy is merely treating a symptom unless this is possible. One must insist on the removal of agents or physical conditions known to depress the marrow function, increase hemolysis, or cause bleeding, if this be possible. Adequate diet, control of infections, and hemorrhage must receive close attention. The anemia of primary thrombopenic purpura and congenital hemolytic icterus are best treated by splenectomy. Liver extract is specific for pernicious anemia and aids greatly in the management of some of the anemias secondary to deficiency states, especially those in which hyperchromic blood is present. Iron is valuable in most of the hypochromic anemias, but I am not convinced that liver extract or the addition of copper is of distinct value in this variety. Transfusions of blood are usually not indicated in types of anemia known to respond to specific therapy, although it may be necessary occasionally to employ this valuable procedure when the hemoglobin level approximates 4.5 Gm. (30 per cent) to prevent circulatory collapse, to control hemorrhage, or to tide the anemic patient over until a definite diagnosis can be made.

Our experience with pernicious anemia has permitted us to draw several conclusions. In about ten years, at the University Hospital and the Syracuse Free Dispensary Hematology Clinic, my associates and I administered approximately ten thousand injections of liver extract intramuscularly. From our observations, we conclude that liver extract caused clinical remission in every uncomplicated case. The average case in relapse received twenty to thirty units of liver extract on the first day of treatment and no more for a week, if a satisfactory reticulocyte response followed. Subsequent dosage averaged ten units weekly until the hemoglobin and red-cell levels were normal. In occasional cases, the addition of iron was found to be of benefit when the red-cell level had reached approximately 3,500,000, especially if the color index had fallen below 1.0. Following remission, the patients received ten units once in two to four weeks. Occasionally a case required more frequent injections and a rare patient was controlled by one injection of ten units every six weeks. Those patients exhibiting objective neurologic signs have been treated with ten units once a week, irrespective of their normal blood levels, and no patient has failed to improve, at least symptomatically. No patient with objective neural signs has recovered completely, although a few have been noted to have gained improvement in vibratory sensation and reflexes. Two patients with partial loss of vision caused by optic neuritis have recovered almost completely. A rare patient with multiple peripheral neuritis was thought to recover, although it was felt that the addition of parenteral thiamine may have been of distinct aid in hastening recovery.

It is important to realize that patients with pernicious anemia may also have other physical defects requiring urgent attention. We have seen patients who also had the complication of vascular disease, infections, gastric malignancy, chronic nephritis with nitrogen retention, and myxedema. Thus, if one is not constantly aware of such possibilities, therapeutic efforts may prove unavailing.

The hemolytic anemias, caused by increased blood destruction, include those caused by toxic agents, such as sulfonamide drugs, lead, the inhalation of arseniuretted hydrogen, phenyl hydrazine, benzedrine, potassium chlorate, phosphorus, benzol and its derivatives, and snake venom. Hodgkin's disease and infections, such as malaria and severe sepsis, may be causative agents. The rare, acute hemolytic anemia of Lederer, usually associated with an infectious process, may respond satisfactorily to blood transfusions. The hemolytic anemia of Cooley, seen chiefly in children of Mediterranean stock, does not respond to any type of treatment, nor do satisfactory results follow therapy for sickle-cell anemia. Studies of erythroblastosis fetalis, shown to be caused by immunization of an Rh negative mother by an Rh positive fetus with the production of agglutinins, which causes hemolysis of the fetal blood cells, have added distinctly to our

knowledge of this occasional serious disorder. Hemolytic anemia of the newborn may be fatal, or may respond well to intramuscular injections of blood serum or frequent small transfusions.

Congenital hemolytic icterus is characterized by varying degrees of anemia, jaundice, and bouts of fever, and is diagnosed on the basis of family history, increased fragility of the erythrocytes, and the presence of spherical microcytes in the peripheral blood. Splenectomy is the treatment of choice, although we have seen at least 3 patients who appeared to improve temporarily following repeated intramuscular injections of liver extract.

Polycythemia.—Polycythemia vera is a rare disease, but constitutes a serious problem, from the point of both diagnosis and treatment. Many patients have been diagnosed as having and have been treated for polycythemia who did not have the disease. This unfortunate error has largely resulted from lack of appreciation that many normal people have red-cell and hemoglobin levels considerably above the average. I agree with Kracke that "red cells should number at least seven million before a diagnosis can be established with certainty." Naegli has recorded an unusual case in which the red count was 20,000,000, but, in my experience, I have seen no case with a red count exceeding 10,500,000. My own observations lead me to believe that venesection and preferably frequent removals of small amounts of blood is the treatment of choice, although most patients will be expected not to survive more than six to eight years after diagnosis has been established.

The Leukocytes

Normal Values.—Ordinarily we consider the leukocyte count to number between five and ten thousand. Rarely do healthy adults reveal figures below 5,000, but it can be definitely stated that not infrequently one finds white blood counts in the neighborhood of 12,000, in the absence of demonstrable disease, and this fact is of great importance to those considering possible surgery. It is my impression that the history, clinical signs, differential white count, and degree of "left shift" are of far more importance than the total count. By way of example, it is well known that severe infections may be associated with profound leukopenia and the so-called "leukemoid blood picture," sometimes confused with acute leukemia.

Leukopenia.—The most striking depression of the white blood count is seen in the condition termed "agranulocytosis." One of our fatal cases exhibited only 150 cells and no polymorphonuclears could be found in the stained smears. Women are more prone to the disease than men, it is generally agreed, and diagnosis is usually not difficult. The white blood counts are usually less than 1,500 and the polymorphonuclears below 10 per cent. The total number of lymphocytes is decreased and anemia and purpura are rarely found, this latter in contrast to the cases of leukopenic leukemia, occasionally misdiagnosed as agranulocytosis. If the total white blood count is repeatedly above 2,500, one can justifiably question the diagnosis of agranulocytosis.

As to the cause of agranulocytosis, it has been amply demonstrated that drugs containing the benzene ring, notably amidopyrine have been responsible in certain sensitive individuals. Since the sulfonamide drugs have been employed, numerous cases of this disorder have been reported, although it is remarkable, considering their widespread use, how infrequently serious bone-marrow depression occurs.

As to treatment, the main points are to discontinue drugs known to depress marrow function, remove foci of infection, if possible, and to administer pentose nucleotide and liver extract in full dosage, and, possibly, to use repeated transfusions. Recently, some reports have been published in which patients have been treated with sulfonamide drugs, but more experience with this method will necessarily have to be gained before it can be accepted as a safe procedure.

Leukemia.—Leukemia remains one of the most serious problems confronting the physician. Most patients with blood counts in excess of 50,000 are leukemic, although reports of patients with infectious mononucleosis and blood counts in the neighborhood of 50,000 have been published. Rarely a case of infection may present an unusually high leukocyte count, and we have seen an adult patient with a kidney abscess whose total white count was 70,000 and a child with extensive osteomyelitis of the skull who exhibited a count of 90,000 cells. It is important to realize that many patients with leukemia exhibit leukopenia, and our experience has shown that numerous cases of this disease occur in which the white count may be below 4,000, rarely below 3,000.

The cases in patients with greatly elevated white counts are not difficult to diagnose, when one bears in mind the usual splenomegaly, adenopathy, anemia, "blast cells," and quite occasional secondary thrombopenic purpura. The diagnosis of leukemia is occasionally extremely difficult, particularly when the total white count is low, when "blasts" are not found in the peripheral blood, when splenomegaly and adenopathy are not in evidence, and the anemia is of the hyperchromic type. Failure of liver therapy is sometimes followed by bone-marrow

biopsy, at which time the evidence of leukemia may frequently be demonstrated.

The treatment of leukemia is mainly symptomatic and is, on the whole, quite unsatisfactory. X-rays, radium, radioactive phosphorus, transfusions, and antianemic drugs may appear to be of temporary value in some of the chronic cases, but all treatment eventually fails and any treatment in the acute cases, except for the temporary effect of transfusions, has been, in my experience, of no definite benefit.

The Hemorrhagic Diseases

From a practical standpoint, the hemorrhagic diseases one encounters are principally hemophilia, thrombopenic purpura, nonthrombopenic purpura, hemorrhagic disease of the newborn, familial purpura (nonthrombopenic), and the severe bleeding occasionally seen in polycythemia. Laboratory studies of value differentiating these conditions are too well known to merit detailed discussion, although it may be emphasized that the bleeding time, as ordinarily performed, is notoriously unreliable. Tests for clotting time must be performed, using venous blood, otherwise the results are entirely unsatisfactory. Clot retraction time is an important test, for failure of the clot to retract is a characteristic finding in the thrombopenic purpuras. The tourniquet test should be performed by placing the blood pressure cuff at a pressure of about 90 mm. and noting the number of purpuric spots in a measured area after four minutes.

As to diagnosis of the hemorrhagic states, thrombopenic purpura, either idiopathic or secondary, is identified on the basis of lowered platelet count, increased bleeding time, normal or slightly prolonged clotting time, failure of the clot to retract, and a positive tourniquet test. The nonthrombopenic purpuras may or may not show a positive tourniquet test, although a considerable proportion give this evidence of increased capillary permeability. Hemorrhagic disease of the newborn and excessive bleeding associated with vitamin K deficiency are characterized by prolonged clotting and prothrombin time. Nonthrombopenic familial purpura, occurring in both sexes, and polycythemic bleeding are found to have a prolonged bleeding time; in the first instance, a probable inherited nervous mechanism prevents normal capillary contraction after puncture, and in the second case, failure of the capillaries to contract because of subintimal adventitial sclerosis is the likely explanation. The characteristic findings in hemophilia are a family history, the usual clinical features, and a prolonged clotting time.

The treatment of the hemorrhagic states is only partially satisfactory. The simple nonthrombopenic purpuras usually respond to treatment if the cause for the increased capillary permeability can be removed. Removal of infections, administration of vitamin C in appropriate cases, and elimination of allergens are but examples. Idiopathic thrombopenic purpura is best treated by transfusions of fresh whole blood and splenectomy. There is no certain satisfactory treatment of secondary thrombopenic purpura, since many cases are leukemic or the bone marrow is so badly damaged for one reason or another that transfusions offer only temporary benefit. Hemophilia can usually be temporarily controlled by the transfusion of fresh whole blood or the administration of plasma, either fresh or dried. The administration of plasma several days old has been found to be ineffective. The vitamin K deficiencies, characterized by delayed prothrombin and coagulation times, are usually corrected by the administration of vitamin K preparations, provided the liver is not badly damaged. The bleeding of polycythemia and nonthrombopenic familial purpura can only be arrested by local pressure, although transfusions are of aid in combating shock and anemia.

In conclusion, may I mention a few of the general impressions I have gained in observing some of the hematologic disorders? The diagnosis of all these conditions requires painstaking clinical study and detailed and repeated laboratory observations. Even with all the data at hand, it is occasionally impossible to make a correct diagnosis, and treatment, although often successful in certain ailments, is frequently disappointing in others. The problems of leukemia and bone-marrow depressions of unknown cause offer the greatest challenge to our investigators, but it can confidently be hoped that time and effort will give us a suitable answer in these obscure states, as has been the case in pernicious anemia, some of the purpuras, erythroblastosis fetalis, and in the bleeding now recognizable as that due to vitamin K deficiency.

EXAMINATIONS IN OTOLARYNGOLOGY

The American Board of Otolaryngology will conduct examinations at the Waldorf-Astoria, New York, June 5-8, and at the Palmer House, Chicago, October 3-6.

CONFERENCES ON THERAPY

Psychologic Aspects of the Treatment of Pain

From the Department of Pharmacology and Medicine, Cornell University Medical College and the New York Hospital, July 15, 1943

Dr H G Wolff Physicians have long known that people vary a great deal in their reactions and attitudes to painful experiences This has confused many and has led to a variety of investigations and interpretations Attempts have been made to classify people on the basis of whether they were more or less "sensitive" by eliciting pain with pressure on the styloid process More recently Hollander devised a little gadget consisting of a lemon-skin grater, under a blood pressure cuff The latter is inflated and when the subject complains of pain, a reading is made on the manometer It is claimed that the more "sensitive" persons complain at a lower pressure and the less "sensitive" at a higher pressure Wilder has made much of this test in the classification of patients and in the use of drugs

We felt that the issue was being confused and I shall now explain our reasons for thinking so It has been found that the pain threshold is uniform from individual to individual Tom, Dick, and Harry, all ages, all races, if they are alert and attentive exhibit the same pain threshold, i e, the intensity of stimulation at which pain is first felt under fixed circumstances is uniform But persons vary greatly in their reaction toward pain and this is what is being estimated by the various devices that I mentioned This has practical significance In a patient about 50 years of age discomfort over the precordium may become a very serious matter if he has heard about coronary occlusion among his friends It may, therefore, require a great deal of medicament to overcome that discomfort in him On the other hand, the same individual, if thirty years younger, might have the same degree of discomfort and require no medicament whatever and very little attention It is not the pain itself which causes a violent reaction but the implications of the pain That also holds for other varieties of painful experience

We all know that perception of pain can be dissociated from reaction to pain, and there are many common examples For instance, in the excitement of games one does not bother about one's injuries In sexual excitement or in religious excitement injury is likely to be ignored Among religious enthusiasts pain certainly does not cause the reaction that it does in one who is a passive observer or in one who has no such convictions that suffering is an asset A person giving himself pain for scientific purposes may also have a detached attitude An individual coming into the accident room in a drunken condition may be very badly banged up and show none of the effects of it until the next day when he is sore and bruised all over At the time of alcoholism he is indifferent, although he is aware of the injury A woman who is very eager to have children may be having as much pain in childbirth as one who does not want them, but the reactions of the two women may be very different A person with pain who has confidence in his doctor may have little reaction A patient with pain and no confidence in his doctor may have a severe reaction These are common experiences with which we are all familiar and which illustrate the difference between perception and reaction

Some drugs are especially useful in managing this reaction aspect of pain, and the most effective are the opiates and alcohol

An example of a simple biologic reaction to pain is sweating which can be readily measured by determining changes in skin conductivity By this means we can study the factors which influence reactions to a painful stimulus In subjects taking 30 cc of 95 per cent alcohol, the effect on the pain threshold is relatively uniform and predictable However, the effect on the reaction threshold, that is, the point at which a given stimulus causes a change in skin resistance, varies anywhere from 40 to 800 per cent elevation in different individuals and in the same individual on different days Morphine and alcohol have an enormous effect on the reaction threshold

There are many factors which influence threshold and have a bearing on the management of pain Distraction is one of the most important factors Reading aloud an engrossing adventure story to an interested group of persons can raise the pain threshold 10 or 15 per cent Autosuggestion raises the pain threshold more in some than in others In the test of repeating five to nine digits forward and backward the individual who is interested in and preoccupied with doing well has his pain threshold appreciably raised, while others not interested are less influenced

Hypnosis may have a large effect. A loud clanging bell may raise the pain threshold almost as much as aspirin.

There is another important situation in which distraction can raise the pain threshold: A physician's manner of entering the room, taking a history, and chatting with the patient may cause the individual to have less pain at the time. That is a common experience. The effect of suggestion has been studied in a series of experiments in this laboratory. A nonsuggestible person, with experience in sensory examinations and psychologic testing, was given 0.3 Gm. acetylsalicylic acid and the usual elevation of the pain threshold was observed. On subsequent days he was given placebos, once with no suggestion, and once with mild suggestion, being told it was an analgesic of some value. No elevation of the pain threshold occurred. Then he was given a placebo and told it was a very remarkable analgesic and that we expected striking things to happen. Again there was no increase in threshold. Now contrast that with the experiment in the second subject. This was a young woman, a kindly, interested, zealous, and helpful person in the laboratory. She was given 0.3 Gm. of acetylsalicylic acid and the usual elevation of the pain threshold occurred. On another day she was given a placebo and realizing how well she had done before, she reported an elevation of the pain threshold without any acetylsalicylic acid. Then she was humiliated by being told she had made an error and must be careful about reporting her observations. A few days later she was given 0.3 Gm. of acetylsalicylic acid with no effect. She was very cautious now. Suggestion, obviously, was operating throughout all this experiment. Two weeks later, after returning from vacation, she had regained confidence and approached the experiment in a more detached way. She was given 0.3 Gm. acetylsalicylic acid with good effect, and thereafter on subsequent days was given placebos with no effect. Thus she had learned something about herself and was no longer allowing suggestion to play too much part in her observations.

Such experiments with suggestion have many implications. Sterile hypos act very much in the same way. It is often stated by the house officer that the pain in a particular case was a pretense because the patient was helped by sterile hypos. Nothing could be more false. Pain may be very appreciably influenced by sterile hypos, since no procedure is more suggestive for the relief of pain.

In addition to distraction and suggestion, there is a third psychologic factor, namely, confidence, conviction, or belief, which is of importance in the management of pain. We have made an experiment illustrating the interplay between physician and patient. The patient was given a placebo, which, the doctor declared, had value, but the patient was not convinced. This had little effect on the pain threshold. On another day when the enthusiasm of the doctor gave her conviction that she had been given an agent of considerable analgesic force, a threshold-raising effect equal to that of aspirin was produced. In other words, when the patient has belief that the doctor's medication is useful, it will have more effect even though it is a placebo, than when there is no such confidence. The opposite would also be true. If the doctor felt that a pill, which was declared to be good by one doctor, was not good and said, "I don't believe in it but take it anyway," it is obvious that such a lack of conviction might easily work to overcome the effect of a reasonably good analgesic.

All this has a bearing also on experience with new drugs. Doctors are flooded by folders with descriptions of new agents which will do all sorts of things and they try them out with a belief that they will, and soon they are reporting a high percentage of improvements. You readily can see how wrong they may be under those circumstances.

However, confidence, conviction, and belief in the physician, combined with the physician's own enthusiasm, will have a great deal to do with the effectiveness of an agent in the management of pain. This is true both when the agent has no value and when it does have a value. It is only proper to conclude this by pointing out why "quacks" may be effective physicians in the management of pain. You see why people flock to religious sects promising to heal the sick and give relief from pain. They are often helped appreciably and they are thankful for that help. "Shrines" have been giving people help since the beginning of time.

A physician who is capable of giving the conviction that he knows what he is about, and that the patient is being well cared for, is contributing a great deal toward helping him. Under such circumstances the physician's reassurance may take the place of morphine or any other agent that is capable of modifying the reactions to pain. He may also modify the perception of pain through suggestion, distraction, and confidence.

Dr. Rennie, will you make some comments at this point?

DR. THOMAS A. C. RENNIE: I find this extremely interesting experimental corroboration of information known to many of us through our experience and observation on patients. I suppose no single situation in a student's life brings out what has been said more aptly than that of venipuncture and the varying reaction of individ-

ual patients to the amount of pain involved in taking a blood sample

In discussing the topic of pain, I think one important factor that might be included in your formulation would be the great cultural differences that exist Thus, in the primitive tribe pain is part of the initiation experience Here pain is obviously handled very differently from the manner of modern civilization The English put a premium on restraint in expressing emotion They are less likely to complain of pain than the more voluble Latin-type individual In psychiatry one encounters the hysteric characteristics more distinctly in the Jewish race than in some other races In treating such individuals the social background must be considered

You have discussed individual differences in the reaction to pain I would be interested in knowing to what extent family patterns modify individual response to pain In very early life a child can be trained to take pain well or trained to take it poorly, and the attitude of the parent to the very first experience with pain must contribute a great deal to the conditioning of the subsequent response to pain So, in early childhood development, family attitudes would be of extreme importance

There is another aspect of pain which I find interesting, and that is the duality between pain and pleasure Undoubtedly there are a lot of individuals who get a great deal of pleasure out of pain, and pain becomes a necessary kind of suffering in order to fulfill certain urges within themselves Quite recently I listened to a patient, who was under the influence of a depressant drug, tell me of the exquisite joy of having a child without anesthetic and she stated that any mother who had not gone through that experience will never know what motherhood means This became an ecstatic experience a transported physical sensation arising from the sheer pain of childbirth I saw an individual recently who said that she liked to go to the dentist because she loved the exquisite sensation of the drill There is that curious duality which exists between pleasure and pain

DR WOLFF And it is linked with the sex experience

DR RENNIE Yes I think the other aspect which should be emphasized is the role of the degree of anxiety and general insecurity which the person is experiencing Obviously, under such circumstances he is more aware of the pain experience and makes more of it Hence, the attitude which has been discussed by Dr Wolff is so very important

There is a final point which I would like to bring out Pain may have a curious value as a distracting element Thus, for example, I have seen a patient in protracted depression, who recovered completely from this state following the distraction caused by severe pain that lasted several days as the result of the fracture of a leg

Pain is a complicated subject, but much has been done to elucidate the psychology involved

DR WOLFF Do you want to add something, Dr Binger?

DR CARL A BINGER There are several things which occurred to me while Dr Wolff was speaking I think the source of the pain has a strong influence on the reaction to it Not long ago I saw a young Englishman who had been through the "blitz" and never went into a shelter He did not show the slightest fear He was somewhat undernourished and pale from inadequate diet When I pricked his finger for a blood count he nearly keeled over That was a particular kind of trauma which he could not tolerate though he was obviously a man of great courage

I think there are specific kinds of pain experiences which have a specific meaning to certain neurotic individuals Fear of the dentist may be outstanding in some people I just saw a young man who although he belonged in a society whose members go to the dentist for prophylactic treatment twice a year, had never been near a dentist because of fear

In veterinary medicine it was empirically discovered that the pain threshold may be raised by administering another strong stimulus simultaneously When a veterinarian wants to open an abscess he puts a twist on the horse's lip As he is about to incise the abscess, the twist is tightened and this distracts from the sensation of the incising

The observations which the psychologist, Prof Gardiner Murphy, is now making seem to me to have a bearing on this subject, although in an entirely different field He is interested in measuring what he calls autistic phenomena He is concerned with the mechanisms which influence and govern judgment One experiment is to put the subject in a dark room and show him a light The subject is then told that the light is moving upward, and he is asked to estimate how far it moves upward Or he may be told the light is moving in a circle and he is to estimate the radius of the circle Each particular individual who is exposed to this experimental situation will have a certain kind of quantitative answer It then turns out that the light is fixed in a bracket and actually is not moving at all, and yet because of some inner mechanism of our own we interpret this light as moving according to our own judgment This observation has a bearing on Dr Wolff's experiments

In order to test what kind of influences modify judgment, Professor Murphy has various devices

For example, he puts a man, innocent of the experimental procedure, in with a group of men who know about it, and invariably his judgment will gradually come to coincide with the opinion of the others. Another type of experiment involves giving the subject two objects to balance and he is asked to describe which one of the two is the heavier. When he gives the right answer he is handed a penny and if he gives the wrong answer the penny is taken away. After a while he will favor the side on which he is rewarded. So our judgments of perception, through some internal mechanism, are influenced by such factors as public opinion and reward or punishment.

DR. WOLFF: Dr. Gold, you certainly have had a lot of experience in assaying the effect of agents which are supposedly useful in the management of pain in patients with coronary artery disease. Have you anything to say about that?

DR. HARRY GOLD: I should like first to comment on your interesting allusion to the differences in the response to a pain in the chest on the part of a 20- and a 50-year-old man. The younger one makes light of it and carries on with little or no medication; the older man's reaction is more serious and requires abundant medication, because he is likely to be more concerned with the serious implications.

Failure to bear this in mind may lead to error in diagnosis. I recently encountered two young women under the age of 40 with thoracic pain on exertion, one of whom had diabetes. Their capacity for walking without pain was markedly impaired but their account of their pain was made with such glow and cheer and was so completely dissociated from the usual reaction of anxiety and apprehension accompanying this symptom in older people that the diagnosis was held in doubt for some time. Electrocardiograms, exercise tests, and response to nitrites proved coronary disease beyond question. But because of their unusual reaction to the pain, an error in diagnosis was escaped by a very small margin.

The literature on the effects of drugs on the pain of coronary artery disease often leaves one in great doubt as to whether the relief is psychologic or actually due to the drug. I might cite one or two illustrations. It is stated that digitalis increases the pain in patients with angina of effort, and there have been several papers in which pain has been studied before and after treatment with digitalis. A few years ago we studied a large group of ambulant patients with angina of effort to whom we gave large doses of digitalis over periods of weeks, alternating with placebo over similar periods of time. When we examined the records, which consisted of the judgments of the patients as to whether the pain was more or less in the period during which the drug was taken, we obtained figures of this kind: 15 per cent of the patients that received digitalis had more pain and 30 per cent had less pain; and for the placebo 15 per cent had more pain and 13 per cent had less pain. The use of xanthines for the control of pain in angina pectoris is another example. No sooner does one publish a paper stating that the xanthines given by mouth relieve coronary pain in about 80 per cent of cases, when another reports that they are of no value in most cases. We also subjected that question to a similar type of study and found that with theobromine the pain diminished in 22 per cent, while with sugar of milk in 25 per cent. In these experiments we applied a blind test. A real blind test is one in which the eyes of both patient and doctor are blinded, that is, the patient does not know what he is getting and the doctor does not know what he is giving. I don't believe it is generally recognized how important it is that the doctor who dispenses the medicine should not know what he is giving in a study of this kind, if he expects to derive an unbiased answer.

In the March 8, 1941 issue of the *Journal of the American Medical Association* a paper was published in which the author took issue with the view that the oral xanthines are of no help to patients with coronary artery pain. He also used a placebo, and this is what he had to say in conclusion about the business of keeping everybody in the dark when one tests a drug that is supposed to relieve pain: "In this connection should be mentioned the psychologic attitude of the clinician toward the drug in question. It is just as unfair in seeking a patient's evaluation of a drug to lead him to expect poor results as to lead him to anticipate good ones. I attempted to be as noncommittal as possible, but discerning patients may well have seen my enthusiasm for these particular xanthine drugs." There it is. The author seemed to recognize the psychologic factor. He attempted to deal with it by giving patients sugar of milk as a placebo and then lost the whole point in that he knew what he was giving at the time and communicated his enthusiasm for the xanthine to the patients.

I cite these as illustrations of how very careful one has to be in judging the effects of analgesics, because it is lack of this care that, I think, is responsible for the situation we discussed in a previous conference on the treatment of rheumatoid arthritis, when we listed thirty different drugs used for the control of the pain of rheumatoid arthritis, most of them in their turn falling by the wayside although they were introduced in the beginning with a great deal of enthusiasm.

DR. WOLFF: One type of pain which has psychologic implications and which we have not touched upon is the pain experienced by patients

with peptic ulcer during periods of anxiety, conflict, or stress Associated with the emotional state are certain bodily changes which in themselves give rise to sensations of pain Thus hyperacidity, hypermotility, and engorged vascular mucosa near a lesion may become painful when the acidity is increased or when the stomach changes its motility This is an open discussion and you are all participants

DR MCKEEN CATTELL At the risk of some repetition, I would like to emphasize the importance of your data in relation to the formulation of the mechanism of the action of analgesic agents

The fact that the effect of analgesic drugs is related to their influence on the reaction pattern to the pain, and further, that this is modified by psychologic factors, has been clearly shown by the discussion today It seems to me that we are not far wrong in assuming that the increase in threshold to pain following the use of a drug is due to the effect on the mental state, and I think, therefore, that a large component of morphine action, for example, is its influence on mood and on the ability of the patient to concentrate The tendency to concentrate on the pain is no longer present after the administration of morphine, and thereby the factor which makes the pain unbearable is removed I feel that if any one of us at this moment started to spend perhaps thirty seconds intently considering his position on these seats, he will find his position unbearable On the other hand, distraction such as comes from listening to an entertaining talk would permit us to sit in comfort for quite a length of time

DR WOLFF Thirty seconds would imply a low threshold Dr Barr, do you feel that frank suggestion has a legitimate role in the management of pain? What ought to be our attitude about such matters?

DR DAVID P BARR Certainly, suggestion is a most effective remedy I have been led to believe, however, that it is not a dependable measure for long continued use Not only does it tend to lose its efficacy because the mechanism by which it is applied is not perfect enough, but also it represents undesirable dependence of one individual upon another If perchance the other individual is lost, the therapeutic value of the procedure has also been lost I would be interested to hear more expert opinion from the psychiatrists

DR WOLFF Would you like to answer that, Dr Renne?

DR RENNIE I suppose the epitome of what one can achieve under suggestion is illustrated by hypnosis There is no question but what dramatic things can be done under hypnosis One can change the blood sugar and the blood pressure One can create pain and abolish pain I have never actually seen any deliveries under hypnosis but many have been reported in which the patient had very little pain experience I have seen hypnosis used in other conditions of intractable pain with considerable success and so I feel strongly that suggestion is a factor of very great importance It can, of course, miscarry unless used intelligently and advisedly

DR GOLD The place of placebos in the treatment of pain also needs to be better defined I remember some time ago, when discussing the matter of placebos with a group of students, a member of the staff who was there, heard me speak of sugar of milk as a placebo, and said "We use yeast tablets as a placebo because they also carry some vitamins" There is no objection to yeast tablets, but there is to the notion that a placebo as a therapeutic measure cannot stand on its own merits without the support of some vitamin There is a general feeling that in prescribing placebos we indulge in a kind of frivolity. The placebo is a legitimate form of therapy and ought to be pursued more diligently than it is, especially as a frequent substitute for a sedative

DR EPHRAIM SHORR I wonder whether we should not extend the concepts concerning pain to other sensations as well I find myself, for example, at this moment uncertain as to when I ought to let a homosexual male, who is having an enormous increase in energy as the result of saline injections, know that he has been able to get along without medication That is one instance Our experiences with the menopausal syndrome bring out clearly wide individual differences in the pattern of reaction to the menopausal state We base the treatment on these psychologic differences So it is with fatigue of so many of our psychasthenic individuals, who find themselves exhausted in the morning or after a sedentary day in the office, and who are capable of quite vigorous activity Suggestion may distract them from the awareness of the sensations, as alluded to by Dr Cattell Thus I think the ideas concerning pain which have been discussed may be extended to the treatment of a variety of discomforts

DR WOLFF Dr Binger, you had a question?

DR BINGER Not a question but something I wanted to say in relation to what Dr Gold said I think it is a pretty well-known experience that therapeutic procedures work better if the doctor himself believes in them That is the reason why quacks have an advantage over the rest of us, because they believe unqualifiedly in their art and are not trained scientifically to be skeptical as we are We cannot often administer a drug with as much conviction as one who has no skepticism

I do not think that this is an argument for not being skeptical, but skepticism certainly influences our therapeutics, and it also influences our judgment about suggestion and placebo. Some of us cannot give placebos with any conviction and in that case, I am sure, they will not do any good.

DR. GOLD: I think it is wise not to link the use of the placebo to the idea of the doctor's faith in his medicine. It is, of course, a fact that if the doctor has conviction concerning the value of the medicine and conveys it to the patient, the medicine is likely to be more effective than otherwise. But the placebo has no more need of this reinforcement than does digitalis in connection with a case of heart failure. The chief beneficiaries of blind faith on the part of the doctor are the medicines of uncertain pharmacologic actions. They acquire a reputation for merits which they do not deserve. There is nothing uncertain about the rule of a placebo. It has no pharmacologic actions. The placebo is merely a chemical agent used as a psychotherapeutic device. Its use is based on the proposition that some patients bear their troubles with less discomfort and, in some, organic symptoms are relieved by the taking of a "medicine" two or three times a day. That this is a fact was shown by the studies to which I have referred. The taking of a placebo brought about at least temporary amelioration of pain in about 25 per cent of patients with angina pectoris. Some patients leaned on it heavily. The effect was, of course, psychologic. The patients must have thought that we believed it was for their benefit from the fact that we prescribed it. You will recall, however, that we were trying to compare a dose of theobromine with a dose of a blank for their effects upon pain, and we did not know at the time which we were giving. We had to take every precaution, therefore, to avoid conveying to the patient our own notion of their value. We were in no position to influence even subconsciously the patient's judgment. The taking of the placebo had to carry its own weight without embellishment on the part of the prescriber. If we view the role of the placebo in this way, we need encounter no difficulties from the standpoint of scientific skepticism. The doctor needs only to decide which patient is likely to benefit from the psychologic effect of taking a "medicine." He needs to have no faith in the "medicine" other than to recognize the fact that taking a "medicine" does in some patients produce a wholesome psychologic effect. I believe that the placebo is most applicable to short-term treatments, and should never be allowed to take the place of long-range measures for psychologic adjustment.

DR. HARRY RICHARDSON: I wonder if ether deserves consideration. What is the difference in the state of the patient who has had morphine and the patient under ether?

DR. WOLFF: The scope of this discussion has been an arbitrary one. We are talking about analgesics, that is, about agents which produce degrees of comfort and relief of pain without disturbing too much awareness and consciousness, but ether is an agent which makes the patient comfortable only when consciousness is seriously disturbed. Certainly, ether is capable of raising the pain threshold just as alcohol is, except that ether is less compatible with consciousness.

DR. GOLD: I should like to ask a question which has a bearing on what Dr. Cattell said. How dependable do you think the threshold-raising power is as a final test of the analgesic power of a drug? The maximum threshold-raising effect of aspirin is about 30 or 40 per cent.

Are we safe in assuming that that ceiling effect does not represent the whole analgesic experience?

DR. WOLFF: Certainly! Aspirin, of course, has other effects. It has a slight effect on the mood in creating a feeling of contentment and detachment. It also induces relaxation and a feeling of sleepiness. All analgesic agents do that to a greater or lesser degree. Morphine, in comparison to aspirin, induces a change in mood and elevation of the pain threshold to a much greater extent. It induces a feeling of contentment, freedom from anxiety, and indifference to discomfort, pain, and anguish, and it also raises the pain threshold at least twice as high as does aspirin.

Therefore, would you not say, Dr. Gold, that the over-all action in pain can never be expressed in terms of threshold raising alone?

DR. GOLD: That is what I should say. Even though 0.3 Gm. of aspirin produces a ceiling effect on the pain threshold, a larger dose, such as 0.6 or 0.9 Gm. of aspirin, might exert a greater influence on the reaction to pain, and, therefore, a greater over-all analgesic action.

DR. WOLFF: Possibly some individuals get more sleepy with larger doses although the analgesia may not be much greater. The patient may somehow be able to slumber through his discomfort.

DR. CATTELL: Defining analgesia in terms of the threshold-raising effect is doubtless correct, but from the practical standpoint the question arises as to whether in the management of pain the over-all effect of drugs is not what should be considered.

I am inclined to doubt that it would be safe to judge relative analgesic efficacy on the basis of the threshold-raising effect alone.

Summary

DR. HARRY GOLD: The discussions in the conference this afternoon explored the composition, mechanisms, and relationships involved in the pain experience. Pain involves not only a physical perception but a psychologic reaction. Experiments indicate that under standard conditions the stimulus necessary to evoke pain is fairly constant for the same person at different times and for different people, but that the psychologic reactions to pain show wide differences. Several examples of the dissociation of these two phenomena, perception and reaction, were presented, such as the lack of pain from physical injuries in the excitement of games, and in sexual and religious experiences. Dr. Wolff has made use of the threshold for sweating as a simple device for measuring the reaction to pain. Attention was called to causes of differences in reaction to pain, namely, the implication of the pain, cultural and family patterns as exemplified by the emotional restraint of the English and turbulence of the Latin, and the conditioning of children by the family's reaction to early painful experience. It was indicated that specific pains have special meaning to some individuals as shown by fainting from venipuncture or fear of the dentist by individuals able to tolerate other pain with little disturbance. By accurate measure of the pain threshold Dr. Wolff has brought support to the common experiences that distraction, suggestion, confidence, and conviction alter the perception of pain.

We need to understand these matters as a basis for successful therapy of pain, and as a basis for proper interpretation of clinical experiences in the control of pain. It is agreed that suggestion has a proper place in the treatment of pain, epitomized in the use of hypnosis. Confidence in the physician and enthusiasm increase the efficacy of analgesic agents. By the same token, drugs without inherent merit often acquire a reputation for actions they do not possess.

There is a place for the therapeutic use of the placebo in the control of pain at the psychologic level. Analgesic drugs act to relieve pain in part by raising the threshold to the perception of pain, as appears to be the chief action of aspirin and other agents of that series. The analgesic power of these agents is much more limited than that of agents like morphine, codeine, and, to some extent, alcohol, which, in addition to raising the threshold, exert a marked effect in altering the reaction to pain, through change in the mood and the ability to concentrate on the painful experience.

PENICILLIN MORE WIDELY DISTRIBUTED

...roves, it has been ...vilian distribution ...f the Chemicals ... P. ... Board told the Penicillin Producers Industry Advisory Committee at a recent meeting, WPB reported on February 8.

A 20 per cent increase in monthly quotas of penicillin for more than 2,700 depot hospitals has been in effect since February 1, WPB said. Allocations for January, 1945 totaled 35,200,000,000 units (352,000 vials) as compared with 12,200,000,000 units allocated in May, 1944. Several tentative programs for the more widespread distribution of penicillin as soon as the supply situation warrants were presented to the committee for its consideration. Production in December, 1944 was 278,000,000,000 units (2,780,000 vials), while the January, ... requirements for penicillin will tend to decrease in a few months as stocks are built up, military representatives reported.

The committee discussed means of increasing the available supply of amyl acetate, used in the production of penicillin.

Use of amyl acetate is also required in the manufacture of protective coatings to meet military specifications. WPB suggested that other solvents be developed to be used in place of amyl acetate, in order to reduce the over-all consumption of the chemical, and that industry make a survey of its present recovery systems to ascertain if amyl acetate is being efficiently recovered. To the extent possible, production methods should be improved so that the output of penicillin ... use o... Sh... Adm... the committee was told. These shipments have been made only to those areas in which penicillin control committees have been established, and detailed monthly reports are required from each committee.

He also complained of chronic sinusitis which occasionally became severe, and he had some bleeding from the right nostril which he attributed to his sinusitis. The patient was told that he had Bright's disease two years before admission, ascribed to a quinsy sore throat three years before.

Significant in the systemic review were: dyspnea on very slight exertion (electrocardiogram report was negative), no cough or chest pain, no palpitation, 4 plus ankle edema for two months, very poor appetite; the patient was on a salt-free diet and on a meat-free diet for a year up until three months before admission. There was no nocturia at the time of admission, no gross hematuria, but red blood cells were reported on microscopy. In the last two months before admission, oliguria was noted but the volume was not measured.

Physical examination revealed a very thin white man, very pale, with a moderately enlarged abdomen. The patient appeared chronically ill, slightly dyspneic, and had a strongly uriniferous breath. Positive findings were: one temporal vessel markedly sclerotic, without palpable pulsation. Examination of the eyes revealed very pale conjunctivae; fundoscopy showed very pale eyegrounds —the blood column and retinal vessels appeared so transparent that underlying structures shone through. Arterial reflexes were increased, and there was compression of the veins at arterial crossings; no hemorrhages or exudates were seen. The nose was full of bloody crusts, but the sinuses were clear. The ears were normal. The teeth were poor, mucosa very pale, and small tonsillar tags were present without inflammation. There were some firm submaxillary glands; the neck veins were engorged, and pulsation was marked. Heart: P.M.I. was somewhat to the left of the M.C.L. The right border was 1 cm. to the right of the sternum. There was a blowing systolic murmur at the apex, heard also in the aortic area. There were no thrills. The blood pressure was 138/92; the pulse was 80; the sinus rhythm was regular. There were moist rales at both bases but no evidence of fluid. Examination of the abdomen showed the liver to be down four fingerbreadths and tender to deep palpation, but the edge was not well felt because of the abdominal distention. There was shifting dullness with slight bulging of the flanks. No other masses were palpable. There was 2 plus pitting edema of the feet, but no pretibial edema. The impression was of chronic nephritis, although it was not clear whether the edema was caused by kidney or heart dysfunction. The patient was apparently in congestive failure in addition to his nephritis.

Laboratory workup showed hemoglobin 24 per cent, 1,200,000 red cells, and 9,000 leukocytes, but the differential was so confusing that the diagnosis was deferred until better slides were obtained. Apparently the low viscosity of the blood affected the uniformity of the smear. The urea nitrogen was 112, creatinine 11, uric acid 15, sugar 80, CO_2 combining power 14.7. Total protein was 8.83, with albumin 3.92 and globulin 4.91. Albumin-globulin ratio was 79 per cent. Blood calcium was 9, inorganic phosphorus 8.3. Phosphatase was 3.7 Bodansky units. Total cholesterol was 64.

Urinalyses during the stay showed negative, trace, and positive evidence of albuminuria. Specific gravity was 1.010. There were occasional epithelial cells, 1 or 2 pus cells, 1 or 2 red cells, but no casts seen. Because of the confusing blood smear which showed a number of atypical leukocytes and some large blast-type cells, blood studies were carefully repeated, and blood findings were: 13,300 white blood cells, 36 per cent neutrophiles, 32 per cent lymphoctytes, 12 per cent monocytes, 15 per cent plasma cells, 2 per cent monoblasts, 3 per cent eosinophiles. There were many normoblasts and erythroblasts present. A sternal bone-marrow puncture showed marked infiltration of the marrow by plasma cells, many of which were atypical or dividing. This then suggested, in view of the increased globulin in the serum and the marrow findings, the possibility of a myeloma.

X-rays of the skull, leg, arm, and thorax revealed no recognizable change. There was no Bence-Jones protein in the urine, but despite this, some felt that the diagnosis should be plasma-cell myeloma of the bone marrow with myeloma of the kidneys.

Three 500 cc. transfusions were given with a final red count of 1,500,000 and 30 per cent hemoglobin. Two subsequent blood chemistry examinations showed urea 125 and urea nitrogen 87 (the latter was done on the day the patient died). The CO_2 combining powers for the third and sixth days both were 16.6. Venous pressure was 27 cm. of saline solution, and circulation time was twenty-five seconds with decholin. The temperature was between 97 and 98 F.; the pulse was about 82 for most of the stay. On the seventh day the patient, having become progressively dyspneic and gradually comatose, developed a fever of 103 F. and expired in a convulsion. He had been given vitamin C, vitamin B_1, had had 22 grains of digitalis, had been on a Carrel diet, and received 10 cc. of calcium gluconate solution intravenously each day. Frequent small infusions of 2 per cent glucose were given, averaging 2 liters intake. The maximum output for any day was 410 cc.

Comment

Myeloma of the kidney has been described by Perla and Hunter[1] as presenting a picture of large amounts of albumin in the urine; Bence-Jones albumose in 65 per cent of the cases showing kidney lesions, a low specific gravity, a low concentrating power, a rise in nonprotein nitrogen, a severe secondary anemia, and an edema usually caused by cardiac failure. The kidneys are pale, usually contracted, with a narrow cortex. The surface is smooth except where arteriosclerosis is marked, but there is severe tubular destruction in the cortex and medulla, which are extensively replaced by connective tissue, interstitial lymphocytic infiltration, casts in the intact, dilated, convoluted tubules of the cortex, and calcification of an occasional tubule in the medulla. However, the glomeruli are for the most part anatomically intact, but show slight hyalinization in some cases. Perla and Hunter described this as a picture of severe chronic nephrosis with evidence of secondary inflammation and fibrosis on contraction of the kidney. Bell,[2] in a survey of a large number of cases, concludes that the picture is not quite this typical, and the term nephrosis is probably confusing. In almost every instance in which autopsy was performed, arteriosclerosis of varying degree was noted, but most of the investigators attributed this to the fact that the patients were usually 50 years of age or over. Metastases to the kidneys were mentioned as pos-

sible in very malignant types of tumor, but none were described

The clinical diagnosis in this case, however, was chronic nephritis, and the general opinion was that the myeloma was incidental However, a limited autopsy was secured, revealing the true nature of the Bright's disease in this case

The autopsy was limited to an incision in the abdomen for removal of the kidneys and small specimens of liver and heart valves

The body was that of a well developed, fairly well nourished white man The hair on the head was dark The eyes were gray-blue, the pupil round, equal, and in mid dilatation Rigor mortis was almost complete Both lower extremities revealed a moderate degree of edema

On opening the abdomen, it was seen that the panniculus measured up to 2 cm in thickness, the musculature was well developed There was a large amount of dark straw colored fluid present in the abdominal cavity

The liver was very large, its surface finely granular, dark brownish red in color On section, it showed a characteristic "nutmeg" appearance

The spleen was also enlarged to about one and a half times its normal size The capsule was smooth but thick It cut with increased resistance The cut surface was dark red in color, and no pulp could be scraped with the back of the knife

The kidneys were diminished in size The capsule of each stripped fairly easily, leaving a fine, pale grayish pink surface On section, the cortex seemed diminished in thickness, its markings obscured The vessels stood out prominently The calyces and pelves were slightly dilated and contained much grumous material and many small stones, the largest measuring 0 8 cm in diameter These stones were soft and friable, gray-brown in color, their surfaces smooth

The heart was large and flabby The right auricle was enlarged and filled with much clotted blood Its endocardial lining was smooth and intact The tricuspid ostium admitted three fingers with ease, the tricuspid valve leaflets were thin and delicate The right ventricle was somewhat dilated but not hypertrophied The pulmonic valve was competent, its cusps natural

The left auricle was dilated, its endocardium smooth and glistening The mitral ostium was of average diameter, the leaflets thin and delicate, the chordae tendineae neither shortened, fused, nor thickened The left ventricle was dilated, the myocardium of average thickness The aortic valve was competent, its cusps showing slight atherosclerotic changes in the depth of the sinus of Valsalva The myocardium was very soft and friable, dark reddish brown in color The coronary ostia were widely patent There was a moderate degree of thickening and sclerosis of the coronary arteries noted, but nowhere was the lumen obliterated or markedly narrowed

The lungs, on palpation, were very voluminous and appeared congested The pleural cavities contained no free fluid

Inspection of the gastrointestinal tract revealed no gross abnormalities The hilar and abdominal lymph nodes did not appear enlarged

On microscopic examination the liver and spleen showed extensive infiltration with plasma cells while the kidneys showed the typical picture of myeloma kidney described above

HYPHOLIN, NEW FORM OF PENICILLIN, IS A SUCCESS

The discovery of a new drug, hypholin, made from penicillium notatum, the mold that produces penicillin, was reported January 30 in the Medical Press and Circular of London, England The drug contains, in addition to penicillin bodies, the living hyphae (filaments) of the mold

Hypholin has resulted from extensive investigations by research workers following animal and human trials with earlier preparations of this type, known as vivicillin Hypholin differs from the latter in possessing a much higher penicillin potency and in being produced from a more complex culture medium

Many types of clinical conditions over several

[illegible] laimed are in [illegible] pneumonia, [illegible] staphylococcal [illegible]

It is hoped by its originators that the new drug will open up the bottleneck caused by inadequate supplies for general use of penicillin, now reserved for the services and a few desperately ill civilian cases Wider [illegible] and gargles is f and doctors r license by the Ministry of Health The material in a suitable form is already available to the veterinary profession for treating farm and domestic animals

Early in 1944 the discovery of vivicillin was prematurely announced, and misleading reports in the press brought discredit on the investigations, it is said Since then much work has been done in research laboratories and hospital wards toward the improvement of the original preparations Particular attention has been given to increasing the purity and potency This work has resulted in hypholin, which shows a potency equivalent to two to three thousand units of penicillin per hundred It has been possible to administer large doses of penicillin bodies through enteral routes without fear of toxic reactions —*N Y Times, Jan 31, 1945*

Additional Annual Reports

To the 1945 House of Delegates
Medical Society of the State of New York

Report of the Board of Trustees

To the House of Delegates; Gentlemen:

Immediately upon the adjournment of the 1944 meeting of the House of Delegates, the members of the Board of Trustees met and organized under the chairmanship of the senior member. The new member, Dr. Albert A. Gartner, from Buffalo, together with Drs. William H. Ross and George W. Kosmak, was assigned to the Committee on Investments. Dr. Thomas M. Brennan retained his position on the Special Committee on Publication. Dr. George W. Kosmak has continued as chairman of the Special Committee on Office Management and Administration.

These two very important committees, originally set up by action of the House of Delegates, are practically identical in membership and meet conjointly. This arrangement insures the attendance and active participation in all deliberations of two of the Trustees. Furthermore, by establishing a harmonious understanding and complete cooperation, a smooth and efficient administration of the Society business has been secured. That this plan has worked out successfully was conclusively proved during the year, when, owing to the untimely death of Dr. Peter Irving, the Council and official family were confronted in rapid succession by a series of situations emergent in nature and pressing for immediate solution. The Council Committee on Reorganization had at their disposal the accumulated data and experience of these special committees.

In referring to the death of Dr. Peter Irving, the Board of Trustees feels impelled to emphasize the great loss the Society has sustained in his passing. He was, as we all know, a hard-working, conscientious, loyal, and devoted servant. The tremendous growth and expansion of Society activities during his incumbency in office made his official life very arduous. He did not falter; neither did he flinch; but, on the contrary, with surprising energy and enthusiasm he took upon himself the ever-increasing burdens. It was not until his work was done that those who were close to him came to a realization of the full magnitude of the services he rendered in behalf of our membership.

Early in the year the Trustees accepted with genuine regret the resignation of Dr. Joseph Lawrence as Executive Officer of the Society, following twenty years of fruitful service in its behalf. Dr. Lawrence has accepted the invitation of the Trustees of the American Medical Association to organize and direct its new office in Washington, D.C. After looking over the field of available applicants, the Council selected Dr. Robert R. Hannon to succeed Dr. Lawrence. Following personal conferences with Dr. Hannon, a satisfactory contract was drawn up and executed.

The Trustees were concerned about the Bureau of Workmen's Compensation. Following prolonged negotiations a contract was entered into with Dr. David Kaliski, who had been selected by the Council to be the full-time director of the Bureau of Workmen's Compensation.

Noting the action of the House of Delegates in regard to the establishment of a Bureau of Insurance, the Council lost no time in exploring the field and interviewing prospective candidates. Mr. George P. Farrell was agreed upon and his name sent to the Board of Trustees with his personal biography and credentials. A contract was entered into with Mr. Farrell and signed.

Drs. Kaliski and Hannon and Mr. Farrell fully understand—and it is so stated in the individual contracts—that they are in fact responsible to and under the direction of the Council and a Council-appointed committee. They are to carry out the policies established by the Council and conduct the work of their respective Bureaus under the direction of the Council or appropriate Council Committee.

The members of the Board of Trustees have been mindful of the duties, obligations, and responsibilities placed upon them by the Constitution and By-laws. At the same time they have endeavored to cooperate fully and promptly implement and expedite the various programs initiated by the Council or House of Delegates. To this end all necessary information, advice, and counsel are sought through personal consultation, group conferences, and expert consultation.

It has become increasingly evident that the Society has outgrown its quarters on Madison Avenue in New York City. The growth of activities, the establishment of new Bureaus, the housing of personnel—all present problems of much-needed additional space, and a demand for attention. The Trustees are preparing to meet this situation so that when the Council finally acts the demands will be adequately met and the expense of making the change kept at a minimum.

The Council has advocated the study of establishing a pension system for employees of the Society. Preliminary work in this direction has already been done; considerable factual data have been compiled, all of which will be made available to the new committee appointed by the President of the Society. The committee, consisting of three Trustees, is charged with the duty of exploring this subject further, to the end that, if found feasible, some plan might be prepared and presented to the Council and House of Delegates. The appointment of Dr. Ross as chairman of the committee, including Dr. Kosmak as one of the members, gives the assurance that whatever recommendation comes from the committee will be based on thorough study, mature deliberation, and sound judgment.

The financial world has been confronted and challenged by an array of unprecedented situations precipitated by strains on national and international economy incident to the present global conflict. The financial status of any organization is not entirely free from possible adverse effect. Realizing this

situation, the Trustees have been particularly concerned with the management of the invested funds of the Society. The Chase National Bank, as in the past, has continued its service of rendering regular reports containing valuable information and expert advice concerning the invested funds of the Society and the handling of the same. The reports of the Treasurer, the auditors' report, and the report of the Publication Committee reflect the sound financial situation in which the Society finds itself. In view of the completeness and clarity of these reports it is sufficient to call attention to but a few items.

The operating expenses are well within operating income. The membership dues amounted to $119,934, an increase of $3,927 over the previous year. Remission of dues for members in service amounted to $47,210. The income from the 1944 Annual Meeting was in excess of $8,661 over the previous year. This amount was earmarked to defray costs of future meetings. In spite of carefully planned economy, administrative expenses have increased over the previous year by $4,563.41. The Public Relations Bureau costs increased $5,975.58 The most conspicuous item is the balance on the favorable side from the JOURNAL management, over $30,000 net. The attention of the members is particularly directed to the Treasurer's Report on this matter.

The investment fund shows an increase of $10,500 in excess of the previous year. Some holdings have been sold at a small profit; the market value of others has improved to the extent of $10,500. The Society holds United States War Savings Bonds in the amount of $91,000 and United States Treasury Bonds in the amount of $65,000. The stocks held are diversified and show appreciation amounting to $7,336.

In their efforts to conserve Society resources, the T[illegible] interested advice and sound recommendations, the Trustees are particularly indebted.

Respectfully submitted,

GEORGE W. KOSMAK, M.D.

3. [illegible]ittee on Mal-
4. [illegible]

PART I

1. Directive by the House of Delegates.—At the 1944 meeting of the House of Delegates of the Medical Society of the State of New York, held in New York City, the House directed the Council Committee on Malpractice Defense and Insurance to make a complete survey of the entire malpractice insurance situation in this state and bring in its recommendations to the Council, and furthermore, [illegible] by letter of the [illegible], the Committee [illegible] insur[illegible] of the [illegible]tion in 1921.

At the outset the Committee was of the opinion that the only question involved in the directive was one of rates; that is, whether we could obtain from a reliable insurance company lower rates for the Group Plan than those we now have. It quickly became evident, however, that a more important element was involved; [illegible] lying any consideratio[illegible] ervation of the control [illegible] the elements of the Group Plan which in turn govern not [illegible] also [illegible] fense [illegible] elements are of vital concern to every member of the Society and rates alone are of secondary importance. No rates can be acceptable for the Group Plan, regardless of any temporary saving they offer, if they [illegible] both now and in the future.

2. Basic Requirements for the Group Plan.—Early in its study the Committee felt the need of a [illegible] the Group Plan. These requirements or principles had been well established but they had never been brought together and recorded. After analyzing each element involved, the Committee adopted the following as the minimum basic requirements for the Group Plan:

(*a*) The company shall establish to the satisfaction of the Society that it desires without reservation to enter into a joint undertaking with the Society to study the problems of malpractice defense and insurance in New York State and to provide protection to members of the Society desiring it under a group plan which will place and retain in the hands of the Society maximum control over the vital elements of the enterprise.

(*b*) The plan shall be a group plan of insurance.

(*c*) The company shall issue to the Society as trustee for the members a master policy which will set forth all of the terms and conditions of the insurance. The policy contract shall be amended from time to time to meet the needs of modern practice of medicine by agreement between the Society and the company, and no amendments shall be made in the contract except with the approval of the Society. Members shall be insured under the terms of the master policy by individual certificates issued to them and each certificate shall have printed on the back thereof a copy of all terms and conditions of the master policy as amended.

(*d*) The company shall issue a certificate of insurance to any member in good standing of the Society who applies for it (unless otherwise directed by the Society) at rates approved by the Society.

(*e*) The company shall not issue malpractice insurance to any physician or surgeon in the State of New York except to members in good standing of the Society and to members of the Homeopathic Medical Society of the State of New York.

(*f*) All suits and claims against members insured under the master policy shall be defended exclusively by the legal counsel for the Society and the cost of such defense shall be charged to the loss experience of the Society.

(*g*) The members insured under the master policy shall constitute a self-rating group and the rates charged under the master policy shall be computed annually upon the actual loss and loss expense incurred, plus proper and agreed ratios for operating expenses and profit. There shall be no loadings in the rates for salaries, allowances, commissions, claim expense, dividends, or profit, except those contained in the predetermined and allowable expense and profit ratios, and no change shall be made in those ratios except with the approval of the Society.

(*h*) The company shall furnish the Society, upon an approved form, analyzed loss vouchers approved by the legal counsel for the Society covering all expenditures for losses and loss expenses incurred and no charge for closed suits and claims shall be included in the loss experience under the master policy unless covered by such a voucher.

(*i*) No estimated reserves for outstanding or anticipated suits and claims shall be included in the loss experience under the master policy except those approved by the legal and indemnity representatives of the Society.

(*j*) The company shall recognize the indemnity representative of the Society as the sole representative of the Society and the broker of record for all members insured under the master policy. On behalf of the Society he shall have full charge of all underwriting operations, cost accounting, and rate computations, and report directly to the Chairman of the Committee on Malpractice Defense and Insurance.

The present Group Plan and the carrying agreement with the Yorkshire Indemnity Company meet all these requirements.

3. **Report on American Policyholders Insurance Company of Boston.**—The directive of the House of Delegates resulted from the active solicitation of members of the Society and representations made to them by agents of the American Policyholders Insurance Company of Boston. This was brought to the attention of the House by the delegates from Bronx County who urged that this company, being at present the leading competitor of the Group Plan, be given a hearing. As the Committee's inquiries indicated that this was the only company alleged to be interested in the Group Plan, representatives of that company were invited to meet with the Committee. Mr. Douglas R. Holmes, the local New York City manager, had been designated by that company to discuss this subject with the Society and two conferences were held with him. In addition to the members of the Committee, the second conference was also attended by the president and other officials of the Society. Prior to the meetings, the Group Plan and its requirements were explained rather fully to Mr. Holmes. He was advised as to the purpose of the meetings far enough in advance to give him ample time in which to prepare for them and, at both conferences, he was given every opportunity and urged to present any proposals which his company had to offer to the Society. He was also urged by letter to have present at the second conference an executive officer of his company who had authority to reach decisions with the Society and to commit his company to the Society, but no such officer was present.

Mr. Holmes' proposals consisted only of an offer to the Society as a whole of the policy and rates which his company had been offering to doctors in New York as individuals. Upon questioning, he stated that the company would be willing to adopt a group form of insurance and somewhat reluctantly he agreed that all members would be eligible for protection unless his company was able to convince the Society to the contrary in certain cases. He would not, however, commit his company to any of the other requirements for the Group Plan, particularly those through which the Society controls the legal defense, cost accounting, and rate projections. The Committee was unsuccessful in its attempt to establish contact with any responsible officer of the company or to secure from such an officer, in writing or otherwise, anything which would in any way commit the company to the Society or even confirm the statements made by Mr. Holmes to the Committee. For these reasons the Committee is convinced that this company is not interested in the Group Plan or the malpractice insurance business of the Society unless it can be secured on a basis which would permit it to be handled purely as a company enterprise, the Society being excluded from any measure of control over the vital elements of its administration and management.

A few weeks after this conclusion was reached, it was announced in the public press that, as respects a major part of its business in New York State, this company would discontinue paying dividends to policyholders as of March 1 of this year; that, as of that date, it had canceled all of its agency contracts and brokerage connections; and that thereafter it would not write any of its principal lines of insurance in this state. It is also reported that the company is planning to close its New York City office, which is believed to be the only one it has in this state.

The true development of malpractice insurance takes many years to mature. This is not a business

that can be handled on a year-to-year basis and, for that reason, the Group Plan must be in the hands of

this state under a widely advertised plan of policyholders' participation has served to strengthen the

pal lines of insurance in this state appears to be a

malpractice insurance business of the Society if that, too, proved to be unprofitable. The exposure of our business to the prospect of being abandoned some day in a similar manner cannot be tolerated by the Society.

In the circumstances, the Committee cannot recommend that the American Policyholders Insurance Company be considered as the carrier of the Group Plan. Furthermore, the Committee is of the opinion that no temporary saving in rates would justify any member of the Society in going outside the Group Plan to buy his malpractice insurance as an individual.

Any report on the Group Plan would be incomplete if it did not include a favorable reference to the Yorkshire Indemnity Company and its officers. Mr. Alan O. Robinson, the vice-president and general manager of the company, and Mr. Horace Crowell, assistant secretary and manager of the

for which the Group Plan was organized and have bent every effort to help carry them into effect. They have met every obligation fully and promptly and have granted every request made of them by the Society.

The Group Plan is unique in that, in its operations, it is, in

company and

success upon

and the good

The Society can be proud of the fact that, throughout the life of the Group Plan, it has met all of its obligations to the company and can consider itself fortunate to have the Group Plan in the hands of a company whose officials have so scrupulously lived up to both the spirit and letter of the terms of the carrying agreement under which it is operated.

PART II

1. **Current Operations of the Group Plan.**—The detailed tabulation of the cost of operating the Group Plan for the nine years ending December 31, 1944, has been received and studied by the Committee

2. **Reduction in Rates.**—The downward trend of loss costs noted at the end of 1943 has been confirmed and, as the rates are predicated on those costs, it is possible to reduce the rate for minimum limits of $5,000-$15,000 to $28, effective May 1, 1945. As this proportionately reduces the rates for all higher limits, a new rate schedule has been prepared and approved. On and after May 1 all new and renewal policies will be issued at the new rates.

The 70 per cent reduction for members serving in the armed forces will apply to the new rates.

The Committee desires to point out that the reduction in rates will permit members to increase the amount of insurance they are now carrying without additional cost, and it is recommended that they do so.

Since 1924, protection on account of x-ray therapy has been excluded from the policy and a substantial surcharge has been made for that specialty. Due to the successful efforts made by the x-ray therapists to reduce the cost of their own losses, the surcharge for their protection has been reduced from time to time until last year it was only one fifth of the original charge required in 1924. A study of the costs this year indicates that the losses growing out of x-ray therapy have finally been reduced to the general average of other branches of medical practice in this state, and it is now possible to eliminate the extra charge for that specialty. The Committee believes that the x-ray therapists of the Medical Society of the State of New York are the first to bring their losses down to this level because additional premiums running as high as 100 per cent of the base rate are still being demanded by insurance companies in all other parts of the country.

The exclusion of x-ray therapy will be retained in the policy contract as at present, but protection on account of it will be granted to qualified members by endorsement, without additional charge.

As directly bearing on the question of rates, it is of sufficient interest to quote here two paragraphs of a letter from the secretary of a prominent insurance carrier with broad experience in the field of malpractice insurance:

"The doctors of a given state through their society are to a very large degree in a position to control the rate for their state. In those states where the doctors have recognized this situation and approached it from the standpoint of minimizing their losses through proper cooperation among themselves and resisting unjust claims, a very favorable rate has resulted. As you know, we have been very successful in a number of states in working with the officials and committees of the State Society along these lines. In these cases the doctors were not constantly haggling with us over the question of rates, with the idea of trying always to get the lowest possible figure, but, on the other hand, they spent their time and efforts in cooperating and in the defense of unjust claims, with the result that the losses were materially reduced and consequently their rates were reduced correspondingly.

"In our best judgment, unless and until the officials of a State Medical Society realize that rates

angle, they are never going to get other than a

which for the

ure upon the

3. **Amendment of the Policy Contract.**—Since the members insured in the Group Plan constitute a self-rating group, the Society has always felt that the costs of the group as a whole should not be augmented by losses caused by substitutes for insured members, unless such substitutes were members of the Society and individually insured. Experience has shown, however, that this restriction frequently works a hardship that may be out of proportion to the loss costs involved, because the services of a sub-

stitute usually are required only in an emergency when there seldom is time in which to find a doctor available who is an insured member of the Society. For this reason, the policy contract has been amended as of May 1, 1945, to extend protection on account of the acts of *any* licensed and qualified physician or surgeon while acting as a substitute for an assured in an emergency when the assured is prevented from acting for himself.

The intent of this amendment is to apply to emergencies of the moment and not to those which call a member away from his practice for a day or two, nor to those arrangements whereby a member has his emergency calls taken with some regularity by a substitute. In such circumstances, it is presumed that the member himself or someone in his office will have ample time in which to arrange for the services of a substitute who is a member of the Society and individually insured in the Group Plan.

The policy, as heretofore, will continue to protect the assured on account of the acts of *anyone* in the care of a patient previously seen and diagnosed by the assured.

These changes in rates and the policy contract have been made in accordance with the agreements covering the operation of the Group Plan and should make participation in it increasingly attractive to all members.

There are several other proposals before the Committee for consideration which will require considerable more investigation and study before they can be reported to the Council.

PART III

1. Review of Purposes for Which the Group Plan Was Organized.—A majority of the members of the Medical Society of the State of New York today have come into the practice of medicine since 1921, when the Group Plan of malpractice insurance and defense was organized. It was a well-established institution when many of them joined the Society and, therefore, it is perhaps natural that they should take it for granted and feel no personal responsibility for supporting and maintaining it. It is, however, one of the most important activities of the Society and it is essential that all members understand the significance of this undertaking.

Contrary to the belief of many, the Group Plan was not evolved or inspired by an insurance company nor has it ever been controlled by any company beyond the terms of the carrying agreement under which it is operated. It should be said, however, that, in the beginning, the Aetna Life Insurance Company rendered valuable assistance in helping to work out many of the details of operation. The plan was conceived and all of the essential details were worked out by the Society and its advisers to accomplish the following:

(*a*) Combine the facilities of organized medicine with those of a strong insurance company in a united front to meet and combat the rapidly increasing growth of unjust suits and claims against medical men in this state.

(*b*) Improve the quality of legal defense furnished insured members of the Society and preserve the principles of defense established by the Society.

(*c*) Provide a satisfactory form of policy contract for members of the Society who wanted to be insured.

(*d*) Provide sound insurance to members at rates based solely upon their own losses plus minimum charges for operating expenses and profit or handling charge for the company, and make such insurance available to all members of the Society.

(*e*) Assist the Society in maintaining free legal defense for uninsured members.

(*f*) Establish, through the appointment of an indemnity representative of the Society, an insurance department that would be responsible to the Society for supervising and managing all the details of operation, thus guaranteeing that the purposes for which the Group Plan was organized would be fully carried out.

After a careful study of the entire undertaking, the Committee is satisfied that all of those aims have been achieved and that the Group Plan is stronger today than at any time in its history. How well it has succeeded in the matter of cost may be judged by the fact that, although it began operations in difficult times when the prevailing rate for a minimum policy of $5,000-$15,000 limits was $45, the average cost of such a policy in the Group Plan over twenty-four years has been only $72.75. Today the rate is $28. Two years hence it may be higher or lower but, whatever it is, the members will have the satisfaction of knowing that they are paying only for their own losses plus minimum charges for expenses and profit approved by the Society.

2. The Indemnity Representative of the Society.—For the same reasons that many members have not understood the purposes and significance of the Group Plan, they have not understood the position and function of our indemnity representative. Again, contrary to the belief of many members, Mr. Wanvig is not associated with, nor is he the representative of any insurance company and has not been such since he came to the Society in 1921. He was appointed by the House of Delegates as the indemnity representative of the Society and he has no other duty or activity. The success of the Group Plan has been due in a large measure to his competent management of its affairs.

3. Reorganization of the Committee on Malpractice Defense and Insurance.—It has previously been said that the Group Plan is one of the most important activities of the Society. In addition it is, in itself, a large business. For some years after its organization the indemnity representative reported directly to the Executive Committee, as no special insurance committee has been appointed. Later, a committee of one was designated to be the connecting link between the office of the indemnity representative and the Executive Committee. This was enlarged to a committee of three and developed into the present Council's Committee on Malpractice Defense and Insurance. This has proved to be generally satisfactory but, from time to time, the entire membership of the Committee changes and, when that occurs, each new member is obliged to educate himself in all the intricate details of the makeup and operation of the Group Plan. This is a long and sometimes rather difficult task for medical men who have had no previous experience with such matters, and yet it has to be done before any competent decisions can be made.

The need for having some permanent member on the Committee has long been felt and recommendations to that effect have been made by previous committees. The recommendations have not been approved, however, because, as presented, they might have deprived the President of his right to appoint the chairman of one of his committees. That may be a valid objection, but it still does not provide for the Society the continuity of contact with the Group Plan, the need for which becomes increasingly apparent as the active members in the

[Continued on page 1020]

The potentiation of the central action of phenobarbital by the belladonna alkaloids (Friedberg, Arch. f. exp. P. & P. CLX, 276) renders possible attainment of desired effects with relatively small doses, thus avoiding "hang over" and other unpleasant side-actions. In contrast to galenical preparations of belladonna, such as the tincture, Belbarb *has always the same proportion of the alkaloids.*

Indications: Neuroses, migraine, functional digestive and circulatory disturbances, vomiting of pregnancy, menopausal disturbances, hypertension, etc.

Formula: Each tablet contains ¼ grain phenobarbital and the three chief alkaloids, equivalent approximately to 8 minims of tincture of belladonna.

Belbarb No. 2 has the same alkaloidal content but ½ grain phenobarbital per tablet.

CHARLES C. HASKELL & CO., INC., RICHMOND, VIRGINIA

[Continued from page 1018]

Society grow further away, in point of time, from personal knowledge of the causes which brought the Group Plan into being and the ideals which govern its operation. This enterprise has now been in existence twenty-four years and, so long as it continues to accomplish the purposes for which it was organized, there is every reason that it should be continued indefinitely and certainly past the years of active participation in Society affairs of those whose foresight sponsored it and whose support has brought it thus far along the road of service to the Society. This long view of the matter requires a continuity of contact with our insurance affairs which is not possible in our present setup.

To provide supervision of these insurance matters by members of the Society who are thoroughly and continuously familiar with all of the details of the Group Plan and, at the same time, to meet the objections raised to previous proposals, the Committee recommends the following:

(*a*) That a board on malpractice insurance and defense consisting of five members be created to replace the present Council Committee on Malpractice Defense and Insurance.

(*b*) That the members of the board be appointed for one, two, three, four, and five years, respectively, and that each year the incoming president appoint a new five-year member.

(*c*) That the Secretary, Treasurer, Indemnity Representative, and Legal Counsel be ex officio members of the board.

(*d*) That the board meet at the call of its chairman and have duties similar to those of a board of directors of a corporation; that it receive the reports of and advise with the indemnity and legal representatives and reports its findings and recommendations to the Council.

(*e*) That the recent chairmen of the Committee on Malpractice Defense and Insurance who are now active in Society affairs be requested to serve on the first board appointed.

The indemnity and legal representatives of the Society concur in this recommendation.

4. **Adherence to the Group Plan.**—Each year the Committee draws attention to the suits and claims filed during the previous year against uninsured members and the House of Delegates requests the county societies to bring the need of insurance protection to the attention of their members. Nevertheless, each year brings the usual quota of suits against members who, because they believed they did not need insurance, or for other reasons, failed to secure protection under the Group Plan and each of them must now face the possibility of substantial loss which must be paid for from his own pocket. There are, at the present time, 160 such cases pending in the office of the legal counsel.

The Committee is of the opinion that no member of the Society can afford to practice his profession without malpractice insurance in the Group Plan, but it has never been the policy of the representatives of the Society to urge such insurance upon a member who, after considering the matter carefully, concluded that he did not need or could not afford it. However, the situation is quite different in the case of members who have indicated their desire to be protected by buying their insurance as individuals outside the Group Plan. Probably many of them have not understood that their reasons for such action could not outweigh in importance, both to themselves and the rest of the Society, their adherence to and support of the united effort that the Group Plan stands for in this state. This point of view can best be presented to such doctors by fellow members of their own county societies whose advice they would value.

The Committee recommends, therefore, that the Society request the county societies to appoint special committees or direct their committees on medical economics to bring this aspect of the matter to the attention of the members of their counties; that it be discussed at appropriate county society meetings; and that publicity be given to the campaign in county society publications. Much has already been done and the indemnity representative, by mail and by personal visits, will continue to bring the Group Plan to the attention of all members not insured in it. However, maximum results will not be obtained until members in each community who believe in the Group Plan actively use their best influence to increase the participations in it. That is the surest way to preserve unity and to stabilize and lower rates.

The Group Plan was organized solely for the benefit of the members. It is operated by the Society and its representatives exclusively for the benefit of the members. It has accomplished every purpose for which it was organized and, for these reasons, it deserves the loyal support of every member of the Society.

Reasonable TREATMENT OF HYPERTENSION

Successful management of high blood pressure calls for a regimen which is adjusted to individual requirements. Physical activity is generally curtailed and overwork is avoided. In certain circumstances special diets are prescribed and the use of stimulants is restricted.

These measures are often supplemented with the administration of Theominal. This combined vasodilator and sedative aids in reducing blood pressure to a more normal level. As a consequence hypertensive symptoms are relieved and the risk of complications is reduced.

DOSAGE: The customary dose of Theominal is 1 tablet two or three times daily; when improvement sets in the dose may be reduced. Each tablet contains theobromine 5 grains and Luminal* ½ grain.

*Luminal (trademark), Winthrop Chemical Company, Inc., brand of phenobarbital.

Over-the-Counter Sale of Sulfonamide Drugs

Report of the Subcommittee of the Committee on Public Health Relations of the New York Academy of Medicine

SECTION 118 of the Sanitary Code of the City of New York prohibits the sale of sulfonamide drugs, whether for internal or external use, without a prescription. Two groups of sulfonamide preparations are excepted, namely, sulfonamide nose drops containing not more than 2.5 per cent of sulfa drugs and adhesive bandages containing sulfathiazole. (The usual concentration of the drug in these bandages is 6 to 12 mg. of sulfathiazole per inch of bandage.) These two exceptions have been allowed because (1) the Federal Food and Drug Administration permits the over-the-counter sale of these products, provided that they bear proper precautionary labels and directions for use, and (2) at the time this ruling was made there was no actual proof that the external use of the sulfa drugs in small concentrations had caused any harm.

For advertising reasons sulfa drugs are now being added to various kinds of salves, tape bandages, shaving creams, and similar products which are sold under well-established proprietary names. Of late, one of the drug concerns applied to the Health Department for permission to sell without prescription a suspension containing 5 per cent of sulfathiazole. In view of this and in view of the fact that more and more reports appear in the literature to the effect that topical application of the sulfa drugs can arouse a hypersensitivity resembling an allergic phenomenon, the Commissioner of Health submitted to the Committee the question of what action the Board of Health should take in this regard.

After looking into the matter carefully, your Subcommittee has come to the conclusion that clinical experience bears out the fact that a small percentage of people become sensitized to the sulfonamide drugs, that a severe systemic reaction may be produced in these persons when the drugs are administered a second time, and that a minute amount of the sulfonamide drugs applied to the unbroken skin or to the mucous membranes can and does sensitize an individual even more quickly and with greater certainty than when such drugs are administered by mouth.

Because such sensitization is often dangerous and prevents the use of the sulfonamide drugs in treatment of conditions in which they are particularly indicated, because over-the-counter sale of preparations containing sulfonamides will expose many persons to the danger of sensitization, and because the wide use of the sulfonamide drugs in ineffective concentrations may result in an increase in organisms resistant to the sulfonamides, your Subcommittee recommends that, until such time as clinical evidence may justify a contrary course of action, Section 118 of the Sanitary Code of the City of New York be so amended as to eliminate all exceptions from the clause which prohibits the over-the-counter sale of sulfonamide preparations.

The Subcommittee wishes to suggest the desirability of making this recommendation known to the general public. The Subcommittee likewise considers it desirable to issue a statement on the part of the Committee on Public Health Relations to the general profession warning against the unnecessary use of sulfonamide preparations for the treatment of minor conditions.

Respectfully submitted,
GEORGE MILLER MACKEE, M.D., *Chairman*
McKEEN CATTELL, M.D.
RUSSELL L. CECIL, M.D
ROBERT A. COOKE, M.D.

SCIENTIFIC HELP SEEN FOR PSYCHONEUROTICS

New methods designed to reduce the number of psychoneurotics will be developed as a result of draft board findings, Col. Samuel I. Kopetzky, chief medical officer of Selective Service in New York City, predicted in an address before sixty members of the Advertising Women of New York at the Hotel Belmont-Plaza.

A veteran of three wars, Colonel Kopetzky told how typhoid fever was conquered after the Spanish-American War and how technics in treatment of wounded after World War I had ultimately led to the discovery of the sulfa drugs.

Public consciousness had not been fully roused on psychoneurotics until a national appraisal of Selective Service rejections approximated their number at 30 per cent of 4,000,000 rejected.

Colonel Kopetzky observed that "this deviation from the behavior pattern manifests itself at the early age of 5 or 6 years. Certain symptoms, such as confused sentences, are noted in kindergarten children." To find whether teachers may be at fault in their methods of handling such children or whether it can be attributed solely to family background and environment, Colonel Kopetzky is studying 1,000 cases, 500 of which have been obtained through the Child Guidance Institute. The other 500, Colonel Kopetzky explained, are cases of persons revealing psychoneurotic tendencies but who were not under institutional supervision Findings will be forwarded within the next few months, Colonel Kopetzky said, to the National Committee of Physical Fitness and Health.—*N.Y. Postgraduate Medical Education

Programs arranged by the Council Committee on Public Health and Education of the Medical Society of the State of New York are published in this Section of the JOURNAL. *The members of the committee are Oliver W. H. Mitchell, M.D., Chairman (428 Greenwood Place, Syracuse); George Baehr, M.D., and Charles D. Post, M.D.*

Chemung County Teaching Day

GENERAL medicine is the subject of the teaching day that was held on May 2 for the Chemung County Medical Society at the Mark Twain Hotel, Elmira.

The program of the day was as follows. At 4:00 P.M. Dr. A. Wilbur Duryee, associate clinical professor of medicine, Columbia University College of Physicians and Surgeons, discussed "Peripheral Vascular Diseases." Following Dr. Duryee's talk at 5:00 P.M. Dr. Edward F. Hartung, assistant clinical professor of medicine, Columbia University College of Physicians and Surgeons, discussed "Newer Aspects in the Treatment of Arthritis."

After a dinner at 6:30 P.M. the program resumed at 8:00 P.M. with Dr. Leslie A. Osborn, assistant professor of psychiatry, University of Buffalo School of Medicine, lecturing on "The Recognition and Management of Psychiatric Problems in General Practice."

The teaching day has been arranged by the Council Committee on Public Health and Education of the Medical Society of the State of New York.

Résumé of Hematologic Disorders

"A GENERAL Résumé of Hematologic Disorders Including the Anemias" was given by Dr. Ellery G. Allen, associate professor of clinical medicine and assistant professor of clinical pathology, Syracuse University College of Medicine, at a meeting of the Oneida County Medical Society on April 10 at the Hotel Utica, in Utica.

The instruction was presented by the Council Committee on Public Health and Education of the Medical Society of the State of New York.

On May 10 Dr. Allen will present the same subject to the Seneca County Medical Society. The meeting will take place at the Armitage Tea Room, Seneca Falls, at 2:00 P.M.

Cardiac Instruction in Jefferson County

MANAGEMENT of acute cardiovascular emergencies was the subject of the talk by Dr. Clarence de la Chapelle, professor of clinical medicine, New York University College of Medicine, when he spoke to members of the Jefferson County Medical Society on April 12 at the Black River Valley Club, Watertown.

This postgraduate instruction was arranged by the Council Committee on Public Health and Education of the State Medical Society.

Steuben County Lecture on Penicillin

PENICILLIN therapy was explained by Dr. Frederick T. Schnatz, assistant professor of medicine, University of Buffalo School of Medicine, at a meeting of the Steuben County Medical Society on April 12 at the Baron Steuben Hotel, in Corning.

Dr. Schnatz's postgraduate instruction was presented cooperatively by the Medical Society of the State of New York and the State Health Department.

Pregnancy and the Rh Factor

PREGNANCY and the Rh factor were discussed by two members of the faculty of the Syracuse University College of Medicine at a meeting of the Madison County Medical Society, held on April 11 at the Hotel Oneida, Oneida.

This postgraduate instruction, presented by the Council Committee on Public Health and Education of the Medical Society of the State of New York, and the New York State Department of Health, was given by Dr. Raymond J. Pieri, professor of clinical obstetrics, and Dr. Robert C. Schwartz, instructor, clinical pediatrics, Syracuse.

Lecture on Rheumatic Fever

"RHEUMATIC Fever—Rheumatic Heart Disease" was discussed by Dr. J. G. Fred Hiss, professor of clinical medicine, Syracuse University College of Medicine.

The occasion was a meeting of the Broome County Medical Society, held on April 10 at the Binghamton City Hospital, Binghamton.

Dr. Hiss's instruction was presented through the cooperation of the Medical Society of the State of New York and the State Department of Health.

STOP THE URGE TO SCRATCH... ELIMINATE THE ITCHING... WITH ENZO-CAL

Prompt control of itching, which means less danger of infection from scratching, — the "aid-to-healing" and protective action of semi-colloidal calamine and zinc oxide — the mild anesthetic action of benzocaine — these all combine to make Enzo-Cal the professional favorite among antipruritics.

It's the favorite with patients, too, because it's a pleasing, greaseless vanishing cream — so clean and convenient to use.

In pruritus ani, pruritus vulvae, intertrigo, eczema, diaper-rash, poison-ivy dermatitis, and skin excoriations specify Enzo-Cal.

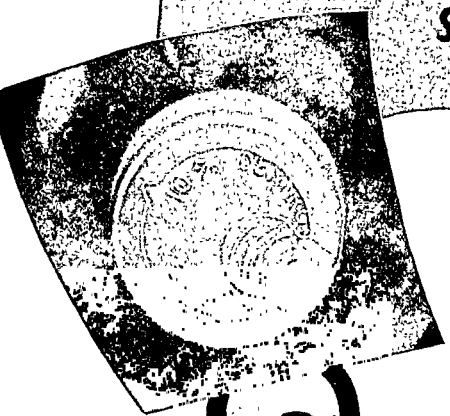
GAMMA GLOBULIN DISTRIBUTED FREE IN NEW YORK CITY

Free distribution by the New York City Health Department of a newly developed measles preventive, gamma globulin, began on February 29. The new preparation, useful also for modification of measles, will be distributed by the department to residents of the city through their physicians and hospitals. It has been made available to the Health Department by the American Red Cross. The concentrated solution contains the antibody globulins. It has been developed as a by-product from pooled normal human plasma in the Red Cross blood collection program, Dr. Stebbins said.

Gamma globulin has proved effective in protecting children recently exposed to measles and will be supplied through physicians regardless of the patients' ability to pay, according to the commissioner.

"On the basis of studies made by the Health Department," he said, "it has been found that a single dose of gamma globulin, administered within eight days after exposure, will protect most children from developing measles for about three weeks. If a child is re-exposed after that period the dose may be repeated. The small percentage of injected children who do develop measles usually have mild cases which clear up quickly. Unsatisfactory reactions to the preparation are extremely rare."

Dr. Stebbins explained that gamma globulin was not being made available for administration to all children exposed to measles, but only to those who had not previously had measles and who had become exposed to the disease at some time during the previous eight days and who were in the following categories: all children under 5 years old, all children exposed in the wards of a hospital or institution to cases of measles, and all persons over 5 who were suffering from any disease in which the occurrence of measles might present a definite hazard.



"It is important that these individuals be protected," said the commissioner, "since measles is most dangerous in children under 5, especially under 3, and may be a cause of death in very young children and in children who are suffering from certain other diseases. Obviously it is made available to hospitalized and institutionalized children to minimize the spread of the disease."

Gamma globulin will be available at the department's five district health centers which distribute other biologicals, at the five borough offices of the Health Department, and at the Bureau of Laboratories. In addition, the globulin will be supplied on demand to the four hundred drug stores in the city designated as consignment stations of the Department of Health.—*N.Y. Times, Feb. 26, 1945*

Necrology

George Louis Bartruff, M.D., of Brooklyn, died on March 11 at the age of 77. He had practiced medicine in the Bushwick section of Brooklyn for the past fifty years. He was graduated in 1893 from Bellevue Medical College.

Louis Fischer, M.D., of New York City, a specialist in children's diseases, died on April 9 at his home at the age of 80. He received his medical degree in 1884, and did postgraduate work in Berlin. Dr. Fischer was one of the first to use diphtheria antitoxin in the United States. He was an attending physician at Willard Parker, Riverside, and Sydenham hospitals. He was formerly a lecturer on the diseases of children at the New York Post-Graduate Hospital and also physician in charge of the Infantorium of the Heckscher Foundation.

John M. Flannery, M.D., of Buffalo, died on March 14 at the age of 65. He was graduated from the University of Buffalo School of Medicine in 1905. He was a member of the Erie County and state medical societies, and of the A.M.A.

Merton L. Ford, M.D., of Oneonta, died on March 10 *in Huntington Memorial Hospital, Pasadena,* California, where he had been a patient since February due to a fractured hip. He was 84 years old. Dr. Ford received his medical degree from New York University-Bellevue Medical College in 1886.

Thomas B. Fowler, M.D., of Springville, one of Erie County's oldest practicing physicians, died on April 3 at the age of 89. Dr. Fowler was graduated from Ohio Medical College in 1880.

Elias B. Guile, M.D., of Utica, a surgeon in central New York for a half century, died on March 29, at the age of 78, in Memorial Hospital, of which he had been a member of the staff for many years. Born in Copenhagen in 1866, Dr. Guile was educated at the Cazenovia Seminary and was graduated from the Homeopathic College, Cleveland, in 1888.

James T. Hardy, M.D., of Malverne, died on March 9 in Nassau Hospital at the age of 69. Dr. Hardy was a graduate of the New York Homeopathic Institute, class of 1900, and interned at Flower Hospital, Manhattan. He interrupted his education to serve in the Spanish-American War as a captain, and organized the Army Medical Facility at Chattanooga, Tennessee, during that war. He also later organized the fund-raising campaign for the building of Mary Immaculate Hospital, Jamaica. He was consulting physician and surgeon of the Bushwick, Lutheran, and Wade hospitals in Brooklyn, a member of the Kings County and state medical societies, and of the A.M.A.

Ivison D. Hoage, M.D., *of New York City, died* on January 23 at the age of 69. Dr. Hoage graduated from Long Island College of Medicine in 1903.

Megar Zackary Kara, M.D., of New York City, died on February 10 at the age of 56. Dr. Kara received his medical degree from the University of Istanbul in 1914, and was associate ophthalmologist at Stuyvesant Polyclinic Hospital.

Charles Franklin Kivlin, M.D., of Troy, surgeon and staff member of St. Peter's Hospital, Albany, died on March 21 of a heart ailment at the age of 69. Dr. Kivlin was a graduate of Albany Medical College, class of 1898. In addition to his practice in Troy, he was surgical consultant to the Hoosick Falls Medical Center, surgeon-in-chief and consultant to the St. Joseph's Maternity Hospital and St. Joseph's Infant Home, Troy, former surgeon-in-charge of the U.S. Employee's Compensation Commission for Troy, former physician to the Rensselaer County Welfare Home, and former medical adviser to the late Gov. Martin Glynn.

Francis J. Lawler, M.D., of Carthage, died on March 23 at the age of 53 from lymphatic leukemia. Dr. Lawler was the third member of his family to follow the medical profession. He was graduated from Albany Medical College in 1916, and interned at Glens Falls Hospital. During World War I he served in the Medical Reserve Corps as a first lieutenant, was later advanced to a captaincy and served for a year in an evacuation hospital. In 1940 he was appointed health officer of the Consolidated Health Board of Carthage and West Carthage, and at the start of World War II he organized and headed the Civilian Defense medical unit of Carthage, and taught Red Cross training classes. He was a member of the Jefferson County society and of the State Medical Society, and of the A. M. A.

Floyd Palmer, M.D., of Glens Falls, died at his home on March 28 at the age of 71. Dr. Palmer *received his medical degree from New York Uni*versity-Bellevue Medical College in 1899. He had been a practicing physician in Glens Falls since 1904, and was coroner of Warren County. Before going to Glens Falls he was on the staff of Mattewan State Hospital in Beacon. He was a member of the medical societies of Warren County and New York State, and of the American Medical Association.

Edward Augustine Quinlan, Sr., M.D., of Port Chester, died on March 22 at his home after a long illness. He was 69 years old. Dr. Quinlan came to Port Chester in 1898, following his graduation from Albany Medical College, and was in practice there forty-seven years. He was a member of the staff of the Ladies' Hospital, which later became the United Hospital of Port Chester, and at one time was in charge of the United Hospital Nurses' Training School.

Issac Reitzfeld, M.D., of Far Rockaway, Long Island, died on April 8 at St. Joseph's Hospital of Far Rockaway. He was 61 years old. Born in this city, Dr. Reitzfeld was graduated from New York University-Bellevue Hospital Medical College in 1904, and interned at Bellevue. He devoted himself to the study of orthopedics and traumatic surgery, until his enlistment in the Army Medical Corps in 1917. At the time of his death he was director of orthopedics at St. Joseph's Hospital and a consultant in orthopedic surgery at the Rockaway Beach Hospital, the Long Beach Hospital, and the Bronx Maternity Hospital. He was a member of *the Nassau County society and the Medical Society* of the State of New York, and of the A.M.A.

David J. Sibener, M.D., of Brooklyn, died on January 6 at the age of 43. Dr. Sibener was graduated from the Long Island College of Medicine in 1926. He was assistant ophthalmologist at the Israel-Zion Hospital and the Kings County Hospital. He was a member of the Kings County and state medical societies, and of the A.M.A.

Howard B. Swan, M.D., of Chestertown, died at his home on March 6 at the age of 52. A graduate of Albany Medical College, class of 1916, Dr. Swan practiced at Chestertown from 1919 until 1936, when he retired because of ill health. He served several terms as coroner of Warren County, and was a member of the medical societies of Warren County and the State of New York, and the A.M.A.

THE SOVIET ACADEMY OF MEDICINE

The establishment of the Soviet Academy of Medicine in the midst of war is a story of scientific growth. Professor N. I [illegible] his article "The All-U[nion] mental Medicine and [illegible] latest issue of the *Ame[rican Review of Soviet Medi]cine*, describes the full organization of the Moscow and Leningrad Institutes with their numerous departments and laboratories.

The author gives an interesting account of the resourcefulness of the Institute's several thousand scientific workers after the outbreak of the war; how they continued their research investigations in some fields; how they solved some of the more immediate war problems of public-health protection, and how they often worked in the army hospitals [illegible] into a number of independent research institutes," writes Professor Propper-Grashchenkov. "The Academy of Medicine will be composed of twenty-[illegible] [illegible] *American Re-*[illegible] Use of Carbon Dioxide at Lowered Barometric Pressures" by V. M. Garasenko, who states that "Our chief problem here is not just to increase the hemoglobin oxygen saturation in the lung capillaries, but also to facilitate the dissociation of oxygen from hemoglobin in the tissue capillaries." Professor V. Strelkov deals [illegible] "The Function of the Eye in Aviation." The purpose of these latter experiments was to increase the efficiency of the pilots. [illegible] [illegible] treatment of [illegible] [illegible] estigations [illegible]

Woman's Auxiliary

To the Medical Society of the State of New York

County News

Nassau County. The regular monthly meeting of the Woman's Auxiliary to the Nassau County Medical Society was held on March 27 at 8:30 P.M. in the Nassau Hospital Auditorium in Mineola.

Mrs. Louis A. VanKleeck, president, conducted a short business meeting and then turned the meeting over to Mrs. Nathaniel Robin, president-elect, who introduced the guests for the evening, the Victory Players of the American Theatre Wing. They presented a play entitled "More Than Just Love," which dealt with the adjustment problems of the returning serviceman and his family and offered counsel for both.

Mrs. Eugenie Chapel later introduced the players and Henry Viscarty, their commentator. He described his work in army hospitals, particularly at the Walter Reed Hospital, Washington, D.C., where the problems of the patient are those of a man returning to civilian life after amputation of one or more limbs. Mr. Viscarty stressed the importance of the correct attitude on the part of the families.

Mrs. Helen M. Bullwinkle, county chairman of home nursing for the Red Cross, described the new simplified course of six lessons being offered in all communities.

Dr. Patricia Steen, of Hempstead, also spoke on the subject of adjustment for the serviceman on his return.

Refreshments were served by Mrs. John L. Neubert and her hospitality committee.

The next regular meeting was held April 18, in conjunction with the Nassau County Mental Hygiene Society at 8 P.M. at Hempstead High School. The theme was "The Returning Veteran." The main speakers were Mrs. Ethel Gensberg, assistant director of the Veterans Service Center in New York City, and Dr. Matthew Brody, psychiatrist of the Sperry Gyroscope Company. Mrs. Fred C. Hewlett, who is connected with parent-education work, and is now with the American Society for Research in Psychosomatic Medicine, was the program chairman.

Queens County. Plans for a luncheon and bridge at LaGuardia Field, May 9, under the auspices of the Queens County Auxiliary, were recently announced by Mrs. Meyeron Coe, of Queens Village, president.

Mrs. Herman Enselberg, of Astoria, is entertainment chairman, heading the planning committee for the affair. She will be assisted by Miss Lucy Lanza, also of Astoria, who is cochairman of entertainment.

District representatives in charge of ticket sales are: Jamaica: Mrs. John Scannell; Queens Village: Mrs. Sylvester Catalanello; Richmond Hill: Mrs. William Flanagan; Forest Hills: Mrs. Miller Sanders; Ridgewood: Mrs. Henry Eichacker; Flushing: Mrs. J. Gibson Hill; Jackson Heights: Mrs. William Blaso; Long Island City: Mrs. Patrick De Canio.

Schenectady County. Mrs. Luther H. Kice, of Garden City, a member of the national legislation committee of the Auxiliary to the American Medical Association, spoke on "What Is New Among the Auxiliaries to the American Medical Association" at the luncheon meeting of the auxiliary to the Schenectady County Medical Society which was held in March at the Mohawk Golf Club.

The meeting was arranged by the legislation committee of the Schenectady County Auxiliary, which includes Mrs. F. Leslie Sullivan, chairman, assisted by Mrs. James Blake, Mrs. Charles Rourke, Mrs. Alfred Grussner, Mrs. Frank Furlong, Mrs. Carl Runge, and Mrs. Herman Galster.

Among the honored guests were Mrs. Edward A. Griffin, of Brooklyn, and the presidents of neighboring county auxiliaries, Mrs. R. R. Wytral, of Montgomery County, Mrs. James Bucci, of Albany County, Mrs. John Noonan, of Rensselaer County, and Mrs. I. T. Bullard, of Saratoga County.

Also present as guests of the auxiliary were Dr. D. Glen Smith, president of the Schenectady County Medical Society, and Dr. Alfred Grussner, chairman of the advisory committee.

PLASMA AND TISSUE PROTEINS APPEAR INTERCHANGEABLE

Plasma and tissue proteins should no longer be considered as distinct entities. Evidence cited editorially in the Winter, 1945, issue of the *Journal of Parenteral Therapy* strongly suggests that there is a continuous and rapid interchange—or traffic—between them.

Under certain conditions of inadequate or restricted protein intake, 1 Gm. of plasma protein (albumin) is lost for every 25 to 30 Gm. of tissue protein. The same ratio holds true when the attempt is made to replace plasma protein and tissue protein by restoring an adequate protein intake. In patients with serious protein depletion, owing primarily to malnutrition, it is highly impractical to make use of human plasma or serum transfusion.—*Minn. Med., Dec., 1944*

From Our Members in Service

France, 8 March, 1945

To the Editor:

As you surmised from the change of address, I have been transferred from the Station Hospital. That was my original assignment in the Army and lasted only three months. I was then placed on temporary duty with an observation squadron, on antisubmarine patrol off the southeast coast, during which period I accumulated a good bit of flying time.

I was fortunate enough then to obtain an assignment to the School of Aviation Medicine in Texas. After completing the course, I was assigned as squadron surgeon to a fighter squadron on the East Coast. After three months with this squadron I was promoted to a captain and assigned as group surgeon to a newly activated fighter group.

It was a wonderful experience to watch the fighter group grow and develop from a clumsy, colicky infant to a young, strong, and confident though inexperienced warrior. Just prior to our shipment overseas I was promoted to a majority.

The group quickly gained experience in combat and justified its confidence throughout its more than a year of combat operations. Shortly after arriving in the theater of operations I received the wings of a flight surgeon.

Shortly after D-day we arrived in Normandy and had the unique experience of operating from an airfield under enemy shellfire and bombing. This, however, was more of an annoyance than a real threat. It cost the enemy more than it did us.

We then followed the armies across France to our present location. My airbase aid station is located in a French farm house, and my office in the attached cow barn. Amazing how comfortable one can be under primitive conditions. I sometimes feel sorry for the poor folks back at home, worrying about coal, butter, meat rationing, etc. Well, that is life for you. Of course, we do have a few inconveniences such as mud, no tub baths, and nonflushing sanitary conveniences, plus an occasional definitely unfriendly gesture on the part of the Jerries. Such people . . . . but, of course, you couldn't expect anything better since they have associated with such nasty people, like Schickelgruber, Goering, and Goebbels.

Seriously, however, we all feel that our pilots are the best pilots in the best group in the best command in the best air force supporting the best army of the best nation in the world. How is that for morale?

STANLEY F. OGORZALY

INTERN TRAINING

Two major problems which face medicine in the postwar period are concerned with postgraduate medical training for the returning physician veterans and the training of interns. Among the former there will be many who desire to complete hospital training, particularly in the specialties, and with others the main interest will center in refresher courses in fields which of necessity have been neglected during the war. As far as these two groups are concerned it is obvious that the medical schools and the associated teaching hospitals can offer but relatively limited aid and that for the most part the burden of any definite program must rest upon the medical profession itself. Hospital training as we now know it must be carefully surveyed with a view to greatly increasing its usefulness, and those who are in positions of its responsibility must become aware of their obligations and opportunities.

In our own State, hospitals have for many years offered intern training but for some time previous to the war it was quite evident that for many hospitals there existed a real shortage of well-qualified applicants for such training. That this shortage has not become one of major significance during the war is largely due to the excellent functioning of the State Office of Procurement and Assignment.

It seems unquestionable that if in the future we are to maintain an adequate and useful intern training program in Connecticut the effort must be a carefully coordinated one and one in which this type of postgraduate training will be attractive to graduating students of good medical schools. The suggestion has been made that a permanent committee consisting of representatives of hospital administration and members of the profession could serve as a useful body to consider these problems and other pertinent hospital and professional relation ships.

Dr. E. M. MacEwen, president of the Association of American Medical Colleges, speaking of the internship, said recently, "Few, if any, of us are satisfied with the educational program offered graduates in many fully approved hospitals. The internship must be a part of the physician's preliminary education, not primarily a hospital service. Educational requirements should be added to the present service standards required for approval. So far as I know, no responsible group has ever formulated such a program.

Even our best hospitals are so definitely centered on the training of specialists that the intern year differs little from the senior year except for freedom from formal class work. We hear on all sides the demand for more general practitioners—if this demand is to be satisfied, we must develop a number of two-year rotating internships with a teaching and service program keyed to the needs of this type of practice." It is certain that most hospitals will welcome a carefully considered program for future intern training and it is hoped that in our own State the time will not be long before something constructive can be offered to those who are now responsible for this important aspect of medical education.—*Conn. State M. J., Jan., 1945*

Internal Medicine. Its Theory and Practice. In Contributions by American Authors. Edited by John H. Musser, M.D. Fourth edition, revised. Quarto of 1,518 pages, illustrated. Philadelphia, Lea & Febiger, 1945. Cloth, $10.

X-Ray Examination of the Stomach. A Description of the Roentgenologic Anatomy, Physiology, and Pathology of the Esophagus, Stomach, and Duodenum. By Frederic E. Templeton, M.D. Octavo of 516 pages, illustrated. Chicago, University of Chicago Press, 1944. Cloth, $10.

REVIEWED

The Wounded Get Back. By Albert Q. Maisel. Octavo of 230 pages. New York, Harcourt, Brace and Co., 1943, 1944. Cloth, $2.50.

This interesting and instructive description of what happened to the sick and wounded in the South Pacific area of combat action was written by a layman after five months' experience as an accredited representative of the Navy's Medical Department. There is a gracious foreword by Ross T. McIntire, the Surgeon General of the Navy. The lay reader will find ample thrills in many of the pages of this book and medicos will be justified in a feeling of satisfaction and pride in having participated in a job, not always easy, but always mighty important.

JOSEPH RAPHAEL

On the Influence of Trades, Professions, and Occupations in the United States, in the Production of Disease. By Benjamin W. McCready, M.D. (1837). Introd. by Genevieve Miller. Duodecimo of 128 pages. Baltimore, Johns Hopkins Press, 1943. Cloth, $1.75.

Genevieve Miller deserves our gratitude for having resurrected this important early American medical book and for her introductory essay.

This study was originally published as a prize essay in the *Transactions of the Medical Society of the State of New York*, 1837, and was written by the gifted Benjamin McCready. McCready was only twenty-three at the time, but had already given promise of the distinguished career as physician and humanitarian which was to follow.

It is unfortunate that the essay was published in so obscure a journal, because it was an excellent study of industrial medicine which can be read with profit by all workers in the field today. Wider recognition might have brought reforms which were to wait for a century.

MILTON PLOTZ

Physiology of the Nervous System. By John Farquhar Fulton. Second edition. Octavo of 614 pages, illustrated. New York, Oxford University Press, 1943. Cloth, $9.00.

The second edition of Professor Fulton's *Physiology of the Nervous System* gives a good account of all the relevant literature up to 1943. Of necessity some sections are curtailed; for example, the chapter on the receptors, although giving a description of their histology, does not give enough detail of their physiology. The section on reflexes is complete. The importance of the hypothalamus is stressed.

The invitation to specialists to revise certain chapters adds to the value of the book; for instance, the chapters on the autonomic nervous system and on conditioned reflexes.

Chemical mediation of nerve impulses at the synapses by acetylcholine receives adequate treatment. A large amount of evidence is adduced in its favor.

An extensive bibliography is included at the end of the book.

N. B. DREYER

Vitamins and Hormones. Advances in Research and Applications. Vol. I. Edited by Robert S. Harris and Kenneth V. Thimann. Octavo of 452 pages. New York, Academic Press, 1943. Cloth, $6.50.

Many books have been written on the subject of vitamins and hormones; in the reviewer's opinion

none have derived more from basic authoritative source than the present compilers. The book is a series of monographs by outstanding authorities. For example, Best and Lucas have written an excellent treatise on choline metabolism and its ramifications. No metabolist could afford not to read this monograph, which goes very thoroughly into the biochemistry of choline and its relatives.

Jolliffe and Most have appraised nutritional states from all angles. Loofbourow has covered identification and assay through spectrophotometry, colorimetry, and spectroscopy. The relationship of vitamins and amino acids is covered by Mitchell. Intermediary metabolism of the sex steroids is discussed by Pincus and Pearlman. In addition, George Wald, Roger Williams, Richard Hall, George Minot, Maurice Strauss, T. Reichstein, and Shoppee have written excellent treatises on their respective subjects.

For the internist who desires to go directly to the source this book is unsurpassed.

GEORGE E ANDERSON

Behind the Universe. A Doctor's Religion. By Louis Berman, M D. Octavo of 303 pages New York, Harper & Brothers, 1943. Cloth, $2.75.

This is the sixth book published by the well-known physician who has shown considerable interest in biology, chemistry, heredity, and endocrinology. The present volume is his opinion of what lies behind the world of surface experience. He attempts to correlate and synthesize religion with science, and to integrate the relationship of the individual to his species and to the cosmic forces of the universe.

The book will afford much food for thought and reflection. It may not be easy reading, but will prove valuable and interesting to those who are philosophically minded.

IRVING J. SANDS

Practic [illegible]
ick C. Ko [illegible]
revised. [illegible]
more, Wi [illegible]

This manual presents the more important qualitative and quantitative chemical aspects of cell constituents, of cell activities, and of the composi- [illegible] are tests for carbohydrates, fats, and proteins, as well as estimations of amino acids and cholesterol in the blood. There are chapters on estimation of pH by colorimetric and electrometric methods, [illegible] and intestinal of vitamins, pyridoxine, and of such hormones as adrenalin, androgens, and estrogens, are given.

E. H. NIDISH

The Medical Clinics of North America. Mayo Clinic Number. July, 1944. Octavo. Philadelphia, W. B. Saunders Co., 1944. Published bimonthly (six numbers a year). Cloth, $16 net; paper, $12 net.

The Mayo Clinic issue of the *Medical Clinics of North America* includes a symposium on chemotherapy. Most of this material, while instructive, has been covered elsewhere. About half this volume, however, is devoted to a series of clinics on other subjects, almost all excellent, among which the papers by Rushton on sleep paralysis and that by Montgomery on moles are outstanding.

MILTON PLOTZ

Gynecological and Obstetrical Urology. By Houston S. Everett, M.D. Octavo of 517 pages, illustrated. Baltimore, Williams & Wilkins Co., 1944. Cloth, $6.00.

This is a textbook on urology of interest to the [illegible] tion with the great urologic group there, Everett is peculiarly well fitted for his task. The gynecologist will be delighted with the full chapter on direct cystoscopy with the Kelly cystoscope, the first time this technic has been readily available.

CHARLES A. GORDON

A Textbook of Pathology. Pathologic Anatomy in Its Relation to the Causes, Pathogenesis, and Clinical Manifestations of Disease. By Robert Allan Moore. Octavo of 1,338 pages, illustrated. Philadelphia, W. B. Saunders Co., 1944. Cloth, $10.

This textbook is another addition to the excellent group of textbooks of pathology that have been published in recent years. The arrangement of the book is different and, in the reviewer's opinion, a step in the right direction. It groups the various diseases, wherever possible, under the causes of the diseases or under the physiologic derangements rather than under anatomic types. When the causes are unknown the disease is listed under the organs or systems involved.

The paper is good and the type is clear. The illustrations are plentiful, well chosen, and com- [illegible] information on the subject.

The book should be of value not only to students of medicine but also to general practitioners.

DAVID M. GRAYZEL

Neurology of the Eye, Ear, Nose, and Throat. By E. A. Spiegel, M.D., and I. Sommer, M.D. Octavo of 667 pages, illustrated. New York, Grune & Stratton, 1944. Cloth, $7.50.

This book deals with the anatomy, physiology, and pathologic disturbances of the neural mechanisms related to the eye, ear, nose, and throat. It is the result of a series of postgraduate lectures given over the last twenty-five years in the University of Vienna, Temple University, and in other medical centers in this country. Formerly these lectures were published in a volume called *Oto-Ophthalmo-Neurologie.*

The present volume covers not only the basic principles discussed in the first European edition but the experiences of at least a decade of work in this country as well.

The [illegible] present [illegible] raphy [illegible] twenty references to books and articles on special phases of the subject. It is an excellent book and one that should have a great appeal to neurologists,

otologists, laryngologists, and ophthalmologists. It is highly recommended.

IRVING J. SANDS

The Diseases of the Endocrine Glands. By Hermann Zondek. Fourth (second English) edition. Translated by Carl Prausnitz Giles, M.D. Octavo of 496 pages, illustrated. Baltimore, Williams & Wilkins Co., 1944. Cloth, $11.

Zondek's *Diseases of the Endocrine Glands*, in its original German version, published in 1926, was one of the outstanding books on the subject. It was so far ahead of its time that it did not receive the full recognition which it truly deserved. The recent second English translation is augmented by numerous additions to keep up with the rapid progress of modern endocrinology, a task almost too difficult to accomplish. Inevitably, the unity of the original work had to suffer in the course of the patching-up process. One can only desire that Dr. Zondek will find time and opportunity to write an entirely new book on the subject, as excellent as the early edition. Notwithstanding these critical comments, the new edition is still one of the most valuable treatises on endocrinology, especially for the clinician whose interest centers upon diagnosis and treatment rather than on minor details of theoretic significance.

MAX A. GOLDZIEHER

Simplified Diabetic Management. By Joseph T. Beardwood, Jr., M.D., and Herbert T. Kelly, M.D. Fourth edition. Duodecimo of 172 pages, illustrated. Philadelphia, J. B. Lippincott Co., 1944. Cloth, $1.50.

The fourth edition of this manual brings the latest material on diabetic treatment up to date for the layman.

In this edition, as in those past, the authors sponsor a food unit scheme called the "line-ration scheme." According to this line-ration scheme, Unit A represents 5 Gm. of carbohydrates and 1 Gm. of protein, equal to 24 calories. Unit B contains 5 Gm. of protein and 10 Gm. of fat, equal to 110 calories. The author gives a list of the foods and the various unit combinations.

These mathematic calculations are introduced to the diabetic in the effort of simplification; unfortunately, it only tends to confuse the patient. Even very intelligent patients like simplicity in figures. Equations may be good for students, but how many graduates use them or care to use them? If charts or schemes had any popularity there would be very few patients left in clinics. Experience shows that once a diet sheet is given with a simple list of foods and their percentages for the patient's own choice, within a short time the patient is off the diet.

This book might have a greater appeal if the "line-ration" scheme were omitted.

MORRIS ANT

Operations of General Surgery. By Thomas G. Orr, M.D. Quarto of 723 pages, illustrated. Philadelphia, W. B. Saunders Co., 1944. Cloth, $10.

This is an excellent textbook which describes most of the standard procedures used in the various fields of surgery. The operative procedures are well explained, and the illustrations are unusually good. The book will be of great value to the experienced surgeon who needs reference to operations which he does only occasionally, and to the beginner in surgery, who will do well to familiarize himself with most of the procedures described.

EDWARD P. DUNN

The Radiology of Bones and Joints. By James F. Brailsford, M.D. Third edition. Octavo of 440 pages, illustrated. Baltimore, Williams & Wilkins Co., 1944. Cloth, $12.

The third edition of this book follows its predecessor by ten years. It has been brought up to date and, as formerly, is a generalized study of the x-ray appearance of the skeleto-articular systems. There is some difficulty in following the exhibits, which often are removed from the text, but for those interested in radiology it is a rather complete compendium of the subject with an excellent bibliography.

It is of value as a textbook and a ready reference to the orthopedist as well as to the roentgenologist. For those in industrial practice, it should also prove of assistance.

MILTON G. WASCH

Artificial Pneumothorax in Pulmonary Tuberculosis. Including Its Relationship to the Broader Aspects of Collapse Therapy. By T. N. Rafferty, M.D. Octavo of 192 pages, illustrated. New York, Grune & Stratton, 1944. Cloth, $4.00.

In this book Dr. Rafferty has presented us with an interesting if not controversial discussion of the present-day status of artificial pneumothorax as employed in pulmonary tuberculosis.

His thesis appears to be that pneumothorax proves to be effective in only about fifty per cent of the cases in which it is tried, and that even when effective it is likely to be productive of such complications (spontaneous pneumothorax, empyema, etc.) as to render its employment of doubtful value. In short, one gains the impression that the author presents more of an indictment than an endorsement of the measure. This attitude may be partly explained on the ground that Dr. Rafferty approaches his subject from the viewpoint of a trained surgeon rather than from that of a student who has devoted himself to many years of study and contemplation of the broader subject of tuberculosis. The book serves an excellent purpose, however, in stimulating thought on the subject and bringing about a reorientation of the viewpoint of all of us interested in the treatment of pulmonary tuberculosis.

FOSTER MURRAY

The South African Frog (*Xenopus Laevis*) in Pregnancy Diagnosis. A Research Bulletin. By Abner I. Weisman, M.D., and Christopher W. Coates. Octavo of 134 pages, illustrated. New York, New York Biologic Research Foundation, 1944.

In this little volume the authors give all the information available on the South African frog, *Xenopus Laevis*, and an extensive bibliography. This covers not only the frog's value in pregnancy diagnosis, but also its discovery, history, anatomy, physiology, and the methods of breeding and housing it. Accuracy of pregnancy diagnosis is emphasized, particularly in the more obscure cases of ectopic pregnancy and in situations in which time is of great importance.

To attempt by sheer force to evacuate a constipated bowel may jeopardize the already precarious condition of hypertensive cardiac, tubercular and other patients on bed rest.

Prophylaxis or sensible physiologic therapy of constipation can do much to advance the well-being of such patients. This may be deftly accomplished with 'AGAROL'* Emulsion, which, by replacement of moisture and mucin-like lubricating factors, and by effecting gentle stimulation of peristalsis aids in reestablishing the mechanism of normal evacuation. *Trademark Reg. NO. 7 OF A SERIES • • • "PREMARIN" THERAPY AT THE MENOPAUSE

The Time Element

Oral therapy with a potent natural estrogen such as "Premarin" makes possible a substantial saving in time for both physician and patient. In the experience of many clinicians, the number of office visits may be kept at a minimum when "Premarin" is employed—yet this can be accomplished at no sacrifice of therapeutic effectiveness or of the patient's well-being.

This clinically-proved *natural* estrogen is exceptionally well tolerated. Unpleasant side effects are rarely noted; in fact, most clinicians have reported that patients experienced a general sense of well-being in addition to relief of the symptoms.

Combat Team

They're armed with tourniquets and plasma instead of guns and grenades. • They're the combat team of medical science—the medical officer and the aid men—and they're fighting men, through and through. • It isn't a showy fighting job—just hard, dangerous work that goes on even when the guns are quiet. So often, rest for the men of medicine is limited to a few moments of relaxation with a friendly cigarette. More than likely it's a Camel cigarette; for Camels, with their mildness and full, round flavor, are such a big favorite with fighting men in *all* the services.

TRIPLE ATTACK ON SMOOTH MUSCLE SPASM

TRASENTINE*-PHENOBARBITAL attacks spasm of the abdominal and pelvic viscera in three ways:

- **Direct local action on smooth muscle**

- **Indirect action by blocking motor impulses to spastic muscle**

- **Central nervous sedation . . . potentiating TRASENTINE'S spasmolytic power**

Clinically effective, TRASENTINE-PHENOBARBITAL has found widespread acceptance for the relief of spasm in the gastro-intestinal, biliary, and genito-urinary tracts. It is particularly effective in individuals suffering from hyperexcitability of the autonomic nervous system.

"FROM A CLINICAL POINT OF VIEW...

"it must be assumed that every patient with chronic infection is anemic."[1]

● For treating hypochromic anemias, Hemo-genin combines the advantages of Fergon (Ferrous Gluconate Stearns) with the nutritional values of vitamin B complex plus liver concentrate. Because Fergon is rarely associated with gastro-intestinal distress, Hemo-genin may be administered before meals to enhance iron absorption.

Hemo-genin

Fergon Plus B Complex

FOR HYPOCHROMIC ANEMIAS REQUIRING IRON AND B COMPLEX

Frederick Stearns & Company
Division
DETROIT 31, MICHIGAN

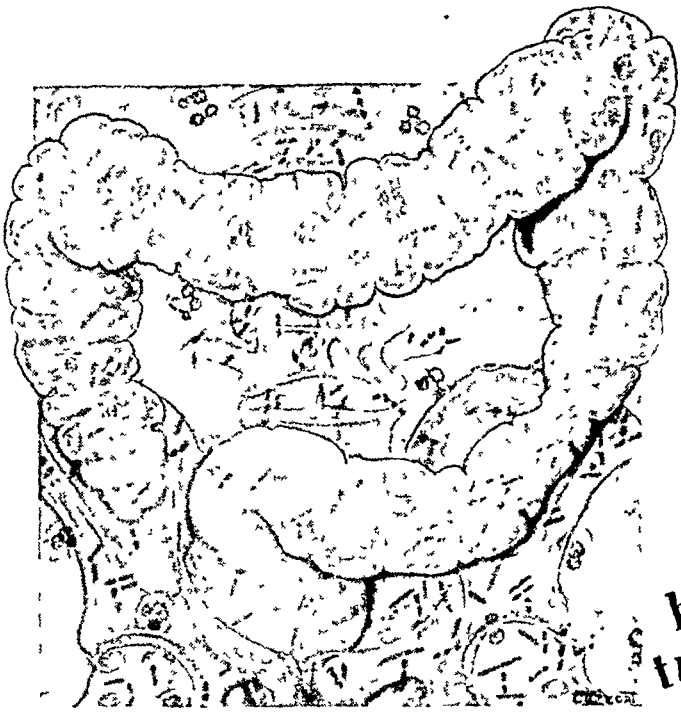
NEW YORK KANSAS CITY SAN FRANCISCO WINDSOR, ONTARIO SYDNEY, AUSTRALIA AUCKLAND, NEW ZEALAND

FACTS ABOUT HEMO-GENIN

COMPOSITION: Fergon (Ferrous Gluconate Stearns), synthetic vitamin B complex factors and liver concentrate. Six capsules daily supply 12 gr. ferrous gluconate and the daily requirement of B vitamins.

NON IRRITATING to gastro intestinal mucosa because low degree of ionization makes it virtually non astringent. May be administered before meals to facilitate maximum absorption.

GREATER iron utilization shown by clinical comparison of ferrous gluconate with other iron salts.†



† Clin. Investigation 16 547, 1937

INDICATED in hypochromic anemias requiring iron and vitamin B complex. Especially valuable when patients do not tolerate other forms of iron.

DOSAGE: Two capsules three times daily, before or after meals.

SUPPLIED in bottles of 100 and 500 capsules.

The LONG LANE

has a turning

IN THE treatment of constipation and intestinal disorders involving bacterial action, the physiological turning point to normal intestinal function may be initiated with NEO-CULTOL.*

NEO-CULTOL is a suspension of a viable culture of *Lactobacillus acidophilus* in a highly purified, tasteless mineral oil jelly agreeably flavored with chocolate.

Implantation of acidophilus bacilli, readily achieved with NEO-CULTOL, inhibits putrefactive processes, intestinal fermentation and related disorders which may be due to bacterial activity.

NEO-CULTOL promotes natural peristalsis without causing habituation or the disagreeable symptoms of the cathartic habit.

*The name Neo-Cultol is a registered trademark of The Arlington Chemical Company.

How Long is a good night's sleep?

Four? Eight? Sixteen hours? Eight hours most closely approximate the requirements for normal physiological recuperation. Ipral functions within this range. Given one hour before retiring, Ipral will carry the patient through a full night's sleep, unlike the shorter-acting hypnotics whose effects wear off quickly. Ipral will then permit the patient to wake up in the morning generally calm and refreshed; free from the lassitude of longer-acting hypnotics. Ipral Calcium (calcium ethylisopropyl barbiturate Squibb) in 2-grain unidentifiable tablets.

THE SYNERGISTICALLY ENHANCED EFFECT OF

SMOOTH MUSCLE RELAXATION AND CENTRAL NERVOUS SEDATION

IN G.I. DISORDERS OF SPASTIC ORIGIN

Both neurogenic and myogenic tonus of the entire gastrointestinal tract have been found to respond to the spasmolytic effect of DONNATAL'S ingredients

Atropine by interrupting myovagal connections, will relieve spasticity of the upper portion of the alimentary canal thereby relaxing pylorospasm and tending to re-establish the normal type of gastric secretion Scopolamine is noted for its sedation of the intestinal structures and its consequent value in spastic constipation and irritated colon A relaxing influence similar to that of atropine (though more marked) is exerted by hyoscyamine—upon smooth muscle of the G I tract, gallbladder and ureter, providing relief in gastric and hepatobiliary colic and in sphincter spasm

Phenobarbital helps control the psychogenetic factor —so important in spastic pathologies—by sedation of the central nervous system supported in certain cases by the central action of scopolamine

Donnatal is available in bottles of 100 tablets each tablet containing the formula illustrated above

DONNATAL *affords all the advantages of natural belladonna alkaloids—*

YET IT IS SIGNIFICANTLY NON-TOXIC;

DONNATAL *provides for the sedation so frequently required—*

YET IT IS ENTIRELY NON-NARCOTIC;

AND

DONNATAL *has marked pharmacologic potency—*

Indicated —

THOUGH SURGERY MAY BE NEEDED

Biliary tract surgery, though a true etiologic approach to the motivating disease, cannot immediately restore impaired liver function and bile flow. In fact, the impact of anesthesia and surgical manipulation may temporarily aggravate the existing hepatobiliary symptoms. Hence it appears imperative that further functional impairment be prevented and that the liver be assisted toward speedy resumption of secretory activity.

Decholin (chemically pure dehydrocholic acid) is of proven efficacy as a valuable aid before and after biliary tract surgery. Its specific hydrocholeretic action produces a copious flow of thin liver bile which is secreted under increased pressure and thus proves effective in physiologic drainage of the hepatobiliary pathways. Decholin is contraindicated only in complete obstruction of the common or the hepatic bile ducts.

SUPPLIED

Decholin in 3¼ grs. tablets. Boxes of 25, 100, 500 and 1000, and Decholin sodium in ampuls (3, 5, 10 cc).

Riedel - de Haen, Inc. • New York 13, N. Y.

REG U.S. PAT OFF

PACE-MAKER OF BILE ACID THERAPY

TREATING THE ARTHRITIC

Each capsule contains:

Vitamin D (Irradiated Ergosterol)	50,000 U S P Units
Vitamin A	5,000 U S P. Units
Ascorbic Acid	50 mg
Thiamine Hydrochloride	2 mg
Riboflavin	1 mg
Pyridoxine Hydrochloride	0 1 mg
Calcium Pantothenate	0 333 mg
Niacinamide	10 mg
Mixed Natural Tocopherols	3 4 mg

NOT MERELY THE ARTHRITIS

Darthronol is an outgrowth of the newer knowledge of arthritis, the recognition of the multiphasic systemic nature of the disease. It is designed to combat not merely the articular involvement but the almost invariably encountered systemic disturbances—anorexia, loss of weight, anemia, affections of the gastrointestinal and hepatobiliary tracts, impaired carbohydrate metabolism, etc. For this purpose Darthronol combines, in a single capsule, massive dosage of vitamin D_2 and adequate potencies of the other eight vitamins concerned with the functional capacity of numerous organs and the integrity of vital processes affected in arthritis. An added advantage is found in that the amounts of each vitamin in the Darthronol capsule are automatically increased in a constant ratio, when severity of the disease demands more intensive therapy with vitamin D_2.

J. B. ROERIG & COMPANY

536 Lake Shore Drive • Chicago 11, Illinois

The second edition of the brochure "Systemic Therapy in the Arthritides" is now available. Physicians are invited to send for a copy.

. . . FOR THE "LET-DOWN" FEELING

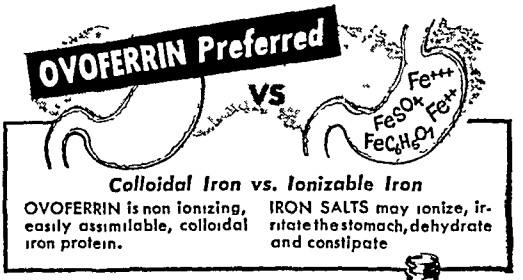
THAT OFTEN COMES WITH YEARS

FREQUENTLY the lassitude and "let-down" feeling of the elderly patient is attributable in some measure to simple hypochromic anemia.

In these cases, physicians find Ovoferrin a hematinic of value . . . combating the anemia, helping to raise the hemoglobin level, without the undesirable side-effects to which elderly patients are sensitive. No digestive disturbances, no constipation. Ovoferrin is pleasant to take, palatable, odorless. Stimulates appetite. Doesn't stain teeth or injure tooth enamel.

Non-ionizing, Ovoferrin enters the gastro-intestinal tract as a fully hydrated oxide in colloid state. Provides needed iron protein in readily absorbable and assimilable colloidal form.

A valuable hematinic in nutritional anemias, in convalescence, in debility states, in pregnancy, in adolescence.



Available at drugstores in 11 oz. bottles. Dosage: One tablespoonful in water at mealtime and at bedtime.

HOW OVOFERRIN ACTS IN THE BODY

in the mouth... Pleasant and palatable, Ovoferrin is almost tasteless. Doesn't stain teeth or destroy tooth enamel.

in the stomach... Ovoferrin is stable, non-irritating. Non-ionizable, its colloidal structure remains practically unchanged by gastric juices. Passes on ready for further assimilation.

in the intestine... Entering here in colloidal form, Ovoferrin iron is readily absorbed, utilized. A stable hydrous oxide that has neither dehydrating nor astringent action. No distressing side-effects, no constipation.

Colloidal Iron vs. Ionizable Iron

OVOFERRIN is non ionizing, easily assimilable, colloidal iron protein.

IRON SALTS may ionize, irritate the stomach, dehydrate and constipate

OVOFERRIN

COLLOIDAL ASSIMILABLE IRON

MADE BY A. C. BARNES CO., NEW BRUNSWICK, N. J.

"Ovoferrin" is a registered trademark, the property of A. C. Barnes Co.

"The curative effect of vitamin D on rickets in infants is one of the most constant phenomena in pediatric practice"

Baldwin, H et al, Am Jl Dis Child, 59, March 1940

provides a new effectiveness, a great convenience and an appreciable economy in the administration of antirachitic vitamin D

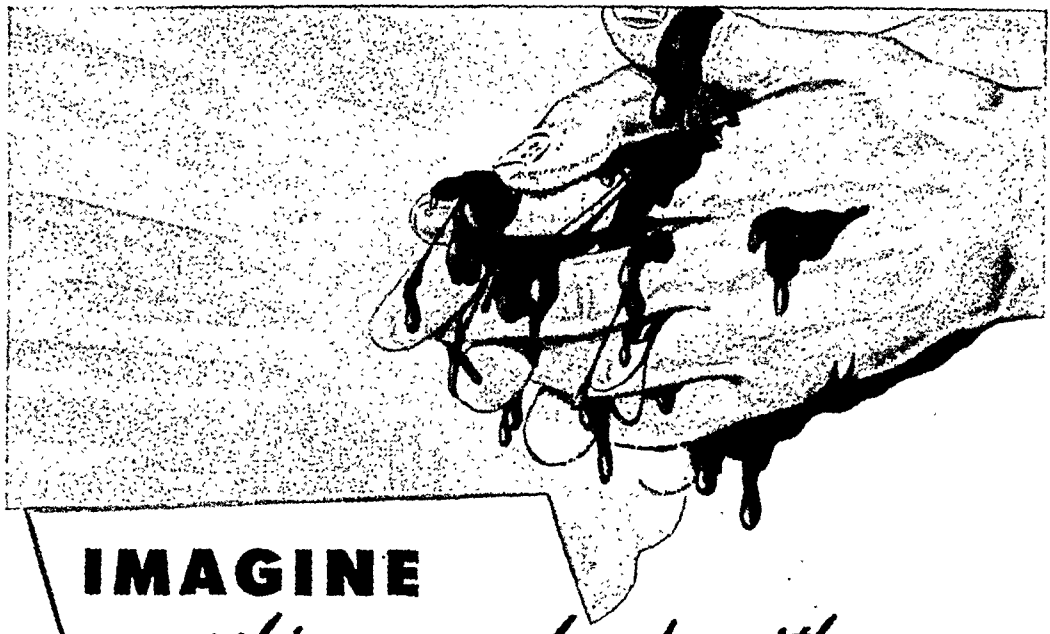
Infron Pediatric is electrically activated vaporized ergosterol (Whittier Process), highly purified and specially adapted for pediatric use

Infron Pediatric is of such high potency that

One capsule is sufficient dosage for one month

Infron Pediatric is non-toxic and clinically effective, as shown by the published work of Wolf, Rambar, Hardy and Fishbein

Infron Pediatric is readily miscible with the feeding formula, milk, fruit juice or water—can also be spread on cereal



Supplied in packages of 6 capsules, sufficient dosage for 6 months

Available at prescription pharmacies Ethically promoted

NUTRITION RESEARCH LABORATORIES • CHICAGO

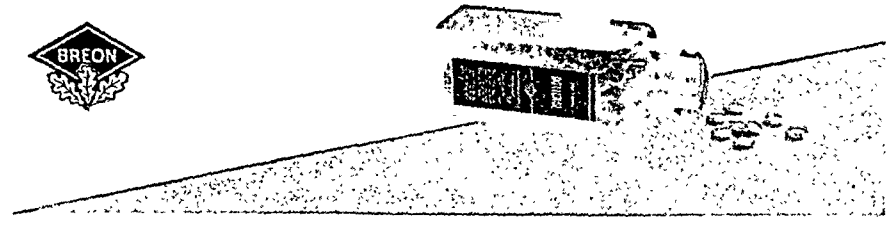
IMAGINE

washing your hands with

MOLASSES!

If water were as thick as molasses our hands would almost never get washed. Hydrocholeresis, the modern word in gallbladder therapy, makes the difference between molasses, thick—and water, thin, human bile. Hydrocholeresis is often the answer to proper bile flow. In Doxychol-Breon, the marked hydrocholeretic agent, dehydrocholic acid, is combined with desoxycholic acid to provide thin bile stimulation. Dehydrocholic acid more than doubles the volume of fluid bile from the liver. Desoxycholic acid chiefly assists in the emulsification of fats and the absorption of fat-soluble vitamins by the small intestine. These two salient bile acids now available in one convenient tablet form, Doxychol-Breon, are supplied in bottles of 100, 500 and 1000 tablets.



Doxychol Tablets are composed of dehydrocholic acid 3 grains and desoxycholic acid 1 grain.

BREON

PROLONGED BRONCHODILATATION plus RELAXING SEDATION IN *bronchial asthma*

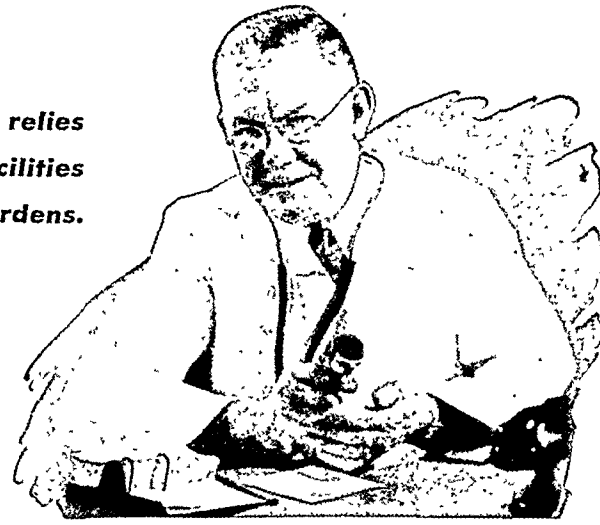
In utilizing the synergistic actions of Calpurate, ephedrine and phenobarbital—EPURAL becomes a potent bronchodilator and sedative, significantly free from untoward central and cardiac side-effects.

For symptomatic treatment of bronchial asthma, hay fever and allergic coryza, EPURAL offers the therapeutic advantage of providing *prolonged bronchodilatation*, and effecting *safe sedation*, which serves to counteract the natural tendency of ephedrine (when used alone) to stimulate the central nervous system.

While EPURAL may be safely administered over protracted periods, with freedom from gastric disturbances, it should be used with caution in hyperthyroidism, diabetes mellitus, and severe cardio-renal disease.

FORMULA: Calpurate (calcium theobromine—calcium gluconate) . 4 gr.
Ephedrine sulfate . . . . . ¼ gr.
Phenobarbital . . . . . ¼ gr.

In bottles of 100, 500 and 1,000 tablets.



EPURAL

For Safe, Symptomatic Relief of Allergic Respiratory Conditions

THE MALTBIE CHEMICAL COMPANY, NEWARK, NEW JERSEY

"An extra hand of proven skill"

. . says the practitioner who relies upon the Spa's superb facilities for relief from wartime burdens.

SARATOGA SPA extends to the harassed physician a helping hand of proven skill to lighten his wartime load.

Serving as an old friend in time of need, it provides the facilities for continuing the treatment of patients suffering from such conditions as cardiac, vascular or rheumatic disorders of a chronic nature.

It is a restorative haven in a troubled world for your patient, and a time-tested adjuvant to which you can turn with full confidence.

For professional publications of The Spa, and physician's sample carton of the bottled waters, with their analyses, please write W. S. McClellan, M.D., Medical Director, Saratoga Spa 155 Saratoga Springs, N. Y.

SARATOGA SPA

THE EMPIRE STATE'S CONTRIBUTION TO THE MEDICAL PROFESSION

More effective

ANALGESIC CHEMOTHERAPY

for *Acute and Chronic* BACTERIAL EAR INFECTIONS

White's OTOMIDE

A new, more effective method of topical chemotherapy, for prevention and treatment of common bacterial infections—*BOTH acute and chronic*—of the middle ear and external auditory canal.

FORMULA·

Carbamide (urea)	10%
Sulfanilamide	5%
Chlorobutanol	3%
Glycerin	q.s.

White's Otomide is a stable solution of urea (carbamide) and sulfanilamide in glycerin. The glycerin employed in this product has been especially processed to assure high specific gravity. Chlorobutanol, a recognized local anesthetic agent *that is therapeutically compatible with sulfonamides* is included in the formula for its analgesic and antipruritic properties.

Combining the essential requisites of a most serviceable type of "ear drop" medication, Otomide provides:

1. **Effective bacteriostasis, even in the presence of pus;**
2. **Gratifying local analgesia;**
3. **Prompt remission of foul odor and cessation of discharge in purulent otorrhea.**

Detailed literature available to physicians on request.

White's OTOMIDE
is available in dropper bottles
of one-half fluid ounce (15 cc.)—
on prescription only.

WHITE LABORATORIES, INC., Pharmaceutical Manufacturers
Newark 2, New Jersey.

WHEN YOU NEED A GOOD SUPPORT FOR REDUCIBLE HERNIA—may we suggest the advantages of "custom-made" Protection, designed to meet the described needs of each particular case? Physicians, who know from experience, can tell you that Rice "custom-made" Supports for reducible HERNIA are truly different and that our methods are dependable. With dozens of different styles, shapes and types of pads at our disposal and with a full realization of our responsibility to those who put their faith in us —we respectfully offer our services for your approval. Descriptive literature and measurement charts on request.

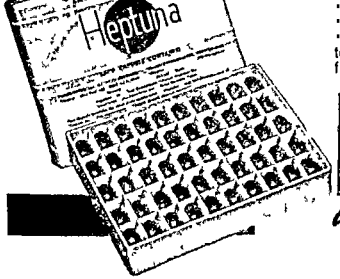
ANEMIAS



FOR LITERATURE WRITE DEPT. N

Anemia remains an important factor in retarding convalescence. The blood-destructive influence of infectious processes frequently leads to anemia. In addition, the enforced inactivity and the resulting impairment of appetite and digestive functions contribute toward the development of nutritional deficiencies.

Heptuna has been found a valuable aid in speeding recovery from infectious and other debilitating diseases. It contains, in addition to an adequate amount of highly available, readily utilized iron, adequate amounts of the fat-soluble vitamins A and D, and the B complex vitamins (partly derived from liver concentrate and yeast). These vitamins not only aid in optimal iron utilization, but also improve the appetite and lessen fatigability.

REFLEX HEADACHE

Headaches of reflex origin are a puzzling and troublesome problem. Their origin may be from the eyes, the nasopharynx, the vascular system, the gastro-intestinal tract or may be quite obscure.

Symptomatic relief, however, can be successful before the true cause of the difficulty has been determined.

For such helpful therapy, 'Tabloid' 'Empirin' Compound is a time-tested, efficacious agent. Its acetophenetidin and acetylsalicylic acid work synergistically for headache relief. Its caffeine combats depression.

Acetophenetidin . .	gr. 2½ (0.162 gm.)
Caffeine	gr. ½ (0.032 gm.)
Acetylsalicylic Acid .	gr. 3½ (0.227 gm.)

Rx Pediforme FOOTWEAR

for MATERIAL DIFFERENCE

Supple—but tough! *Supple* to yield where shoes would otherwise pinch; *tough* to stand up where shoes would otherwise lose shape and weaken in the support they should provide. That's the "material difference" in Pediforme footwear.

Like the strength of the proverbial chain—a shoe is only as strong as it's weakest stitch. While some restrictions have been placed on the manufacturing of shoes—there is no ban on quality or workmanship. Doctors can still rely on Pediforme's strict observance of what the medical profession expects of the footwear they prescribe. And *that's* the "material difference", too!

HOLLISTER-STIER *Superior* EXTRACTS

TO PROVIDE RELIEF FROM THE DISTRESS OF RHUS DERMATITIS

Extensive clinical experience of over 25 years has shown that even severe attacks of rhus dermatitis will, most often, yield completely to treatment with potent extracts of the oleoresins of Poison Oak and Ivy, as supplied by Hollister-Stier. Employing only absolute alcohol as a solvent, Hollister-Stier Extracts retain their potency over prolonged periods, and they may be administered without pain or discomfort since they are diluted when used (with solvent contained in other package). Although five doses are provided with each set, many cases require only two or three injections, and, of particular interest to busy physicans, Hollister-Stier Poison Oak-Ivy Extracts *eliminate* the necessity of *differentiating diagonostically* between oak or ivy dermatitis.

Won't you accept, with our compliments, one complete set for trial use in your practice? The coupon is for your convenience (Also available: Prophylactic Treatments of Ivy or Oak, or both, and similar Seasonal Treatments in average or double-strength dosage)

HOLLISTER-STIER LABORATORIES N-2
WILKINSBURG, PA.

Gentlemen:

You may send me, *without cost or obligation*, one set of Hollister-Stier Poison Oak-Ivy Seasonal Treatment for trial use (regular price $2.00).

Tar

WITH A NEW THERAPEUTIC EFFICACY IN A "*Cosmetic*" NON-IRRITANT FORM

TARBONIS, differing from other tar preparations, presents a new liquor carbonis detergens, produced by a process distinctly its own, which results in considerably higher contents of phenol and cresol derivatives, of sulfur compounds and unsaturated hydrocarbons—the ingredients to which the therapeutic efficacy of tar is credited. This unique liquor carbonis detergens is incorporated in a special vanishing-type cream.

Freedom from irritant properties makes TARBONIS safe for use on the tender skin of infants and children. It is greaseless, free from all tarry odor, does not discolor skin or fabrics, and requires no removal before reapplication. TARBONIS is the preparation of choice whenever tar is indicated—infantile eczema, psoriasis, dermatitis venenata, seborrheic and other dermatoses, certain tinea infestations, pruriginous intertrigo, etc.

• • •

Physicians are invited to send for a clinical test sample of TARBONIS, and for a copy of the comprehensive, illustrated brochure on tar therapy.

REMEMBER *You are sharing with them!*

● It's a new experience for Americans to have to share anything with anybody, in this great land of plenty. A new experience, too, for other Americans to be fighting for their lives and our future in far-away lands across the seas. No sacrifice is too great for us to make for them.

One sacrifice all of us can make is to take temporary shortages of our favorite foods with cheerfulness and gratitude to our heroes across the seas.

To those for whom the morning glass of Kemp's Sun-Rayed Tomato Juice has become almost a rite—we say, have patience. Remember you are sharing with our armed forces. They deserve the best—and get it when they quench their thirst with this tomato juice that is never thin or watery. Meantime, keep recommending Kemp's Sun-Rayed. Many grocers still have a small supply of the limited amount available for civilian use this year.

SOPRONOL *Inhibits* FUNGOUS INFECTIONS

MONILIA albicans

EPIDERMOPHYTON inguinale

MICROSPORUM audouini

TRICHOPHYTON purpureum

. . . As demonstrated by clinical investigation in a leading United States hospital

In tests on a large number of hospital patients, Sopronol was found to exert an *inhibitory* rather than a destructive action on the fungus. The advantages of this method are obvious. Sopronol, taken readily into the fungous organism, prevents its development and spread. Hence the infection is quickly brought to an end, but without the customary skin irritation caused by poisonous by-products resulting from strong fungicides in contact with the mold. The chemical basis of Sopronol is sodium propionate.

ALL SUPERFICIAL MYCOSES (RINGWORM)

Prescribe Sopronol for: Tinea Pedis, Tinea Cruris, Tinea Capitis, Tinea Glabrosa, due to "the dermatophytes"—Trichophyton, Epidermophyton, Microsporum, Monilia (Candida) and pathogenic aspergillae infections. Sopronol is non-irritating, non-keratolytic, non-toxic.

Available in alcoholic solution, powder and water soluble ointment bases

MYCOLOID LABORATORIES, INC., Little Falls, New Jersey N 2

Take Advantage

OF

VITAMIN "B" SOLUBLE (WALKER)

IN ALCOHOLISM THERAPY

Vitamin B holds a well-recognized place in the treatment of alcoholism. Alcoholic polyneuropathy is said by Jolliffe[1] to be unquestionably due to vitamin B_1 deficiency. Romano[2] states that both vitamins B_1 and B_2 have definite value in this condition. It is also believed that the addition of nicotinamide hastens recovery of the patient. (Spies, Sydenstricker, Jolliffe).

Vitamin "B" Soluble (Walker) supplies all the factors of the B complex, plus additional fortification of various constituents. Each capsule contains 3 grains brewers yeast concentrate, 1 mgm. Thiamin HCL, 1 mgm. Riboflavin, 5 mgm. Nicotinamide, 30 mgm. Ascorbic Acid. The dosage potency is regulated by the physician according to severity of the symptoms.

The generous use of Vitamin "B" Soluble (Walker) preceding and following indulgence in alcohol, does much to prevent symptoms of depression and nervous irritability that so commonly occur. In bottles of 30 and 100 capsules.

Liberal samples gladly sent on request

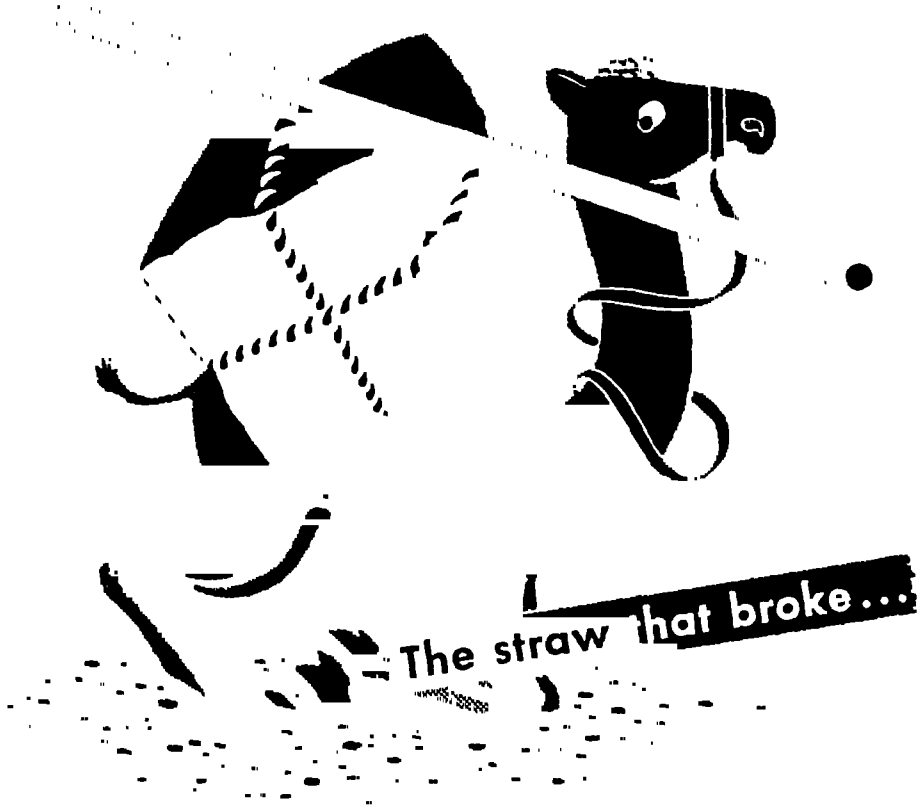
ORETON

FOR THE TAUT, FRAYED NERVES OF

PREMENSTRUAL TENSION

The emotional and physical distress suffered by approximately 40% of women during the five days preceding menstruation often yields dramatically to mild androgenic therapy.[1]

Although the etiological factors involved in premenstrual tension have not been fully established, many reports would seem to indicate that an increased secretion of estrogen by the ovaries during this period may be a responsible factor. Androgens, as antagonists of estrogens, appear to neutralize the effect of this excess secretion and alleviate, if not completely eliminate, the symptoms of the condition



The androgens of choice for therapy in premenstrual tension are *ORETON Ampules for intramuscular injection and* ORETON-M Tablets for oral administration.

VOLUME 45 MAY 15, 1945 NUMBER 10

Editorial

Your Assistance is Imperative

Every physician, at one time or another, must choose between the putative weal of his patient and the furtherance of the public interest. Especially is this true when the communicable diseases are concerned.

The control of venereal disease, for instance, must include, to be effective, the identification and treatment of persons who have been in sexual contact with persons with known cases of communicable venereal disease and thus have received or transmitted their infections. No physician would disagree with this point of view.

The great burden of venereal disease therapy rests upon the individual physician, especially in large areas of rural populations. The responsibility for venereal disease control, however, rests in the state and local health departments. These are confronted with a problem which requires for its solution a greater degree of assistance from the practicing physician than merely early and proper therapy.

In the delicate task of securing information concerning sexual contacts of patients with venereal disease of recent acquisition, the physician who embodies the patient's hope for cure holds an advantage which no other person can attain. Especially at the moment when diagnosis has been made, before treatment is begun, information may be secured, not only concerning the presumed source of infection, but in respect to the sometimes large number to whom the disease may have been transmitted. We are informed that "as a rule, he (the physician) has cooperated splendidly with health-department personnel who have requested his assistance in the questioning of his private cases, either by securing the names of the contacts himself, or by approval of such questioning by health-department personnel. It sometimes happens, however, that such cooperation is not forthcoming, and that the physician takes it upon himself to forbid an approach to his patient to discover the names of the contacts, or, contrary to Regulation 2 of Chapter II of the Sanitary Code, may refuse to reveal the full name and address of the patient previously reported only by the initials and date of birth."

As one health officer writes: "Though I recognize that such refusals to cooperate are usually dictated by the physician's solici-

tude for the marital felicity of his patients, I feel that this is one of the situations in which the privacy of the individual is of less importance than the general good. To be specific, one can be quite certain that for every diagnosed case of venereal disease there is at least one other person infected with the disease who may be at large, unaware of his infection, spreading the virus which he bears among still other sexual contacts. Yet the denial of public interest in this matter places the health officer in an unfortunate quandary: to neglect his prescribed duty of checking the spread of communicable disease within the population which he serves, or to appear to disregard the wishes of a colleague."

The situation is one equally difficult for the doctor of public health and the doctor of medicine. Both are concerned primarily with the health and the best interests of the patient, the early diagnosis of his disease, early and competent therapy, and then with the public weal which demands the revelation of the source of the infection.

We submit that the number of physicians whose attitude is as described in the foregoing quotation is small, for the identification of additional cases is to the interest of the patient, and the physician, as well as to the community. The physicians of New York State have long enjoyed an enviable record for cooperation in all proper fields of public health activity. It is unthinkable that the location of venereal disease contacts should not be considered one of these.

Foresight

Great credit is due to the Commissioner of Health of the City of New York, Dr. Ernest L. Stebbins, and to his associates, Dr. Howard B. Shukoff, Dr. Whalen D. Sutliff, and Dr. Harold Brown in the planning and development of the Tropical Disease Diagnostic Service.

Anticipating the public-health problems which may result from the introduction of exotic diseases by servicemen and travelers from the tropics into this area, the Commissioner has prepared to meet them:

"To facilitate the recognition of cases of tropical disease, the Department has established the Tropical Disease Diagnostic Service which provides both laboratory and clinical facilities and has the advice and assistance of the specialists on the tropical disease staff of the Delamar Institute of Public Health, Columbia University. To study the incidence and to be on the alert for the spread of these diseases, the Department has appointed, in the Bureau of Preventable Diseases, an epidemiologist with special training and experience in tropical diseases.

"New York City is one of the focal points of world-wide travel and as such will at all times have imported cases of tropical disease. For their spread most of these diseases require specific intermediate hosts and other special environmental conditions which are not found in this area. The most common tropical diseases seen in New York City are amebiasis, malaria, and filariasis.[1]

"Recognizing the need for special laboratory facilities the Department offers to the profession services for the identification of parasitic infection. Dr. W. D. Sutliff, assistant director of the Bureau of Laboratories, is in charge of the laboratory work. In order to cope with any future increase in the demand for this type of diagnostic work, he has trained a group of fifteen department technicians in parasitology. A similar course for the training of hospital technicians will be offered early in 1945. For diseases of the tropics which are nonparasitic, such as bacillary dysentery or yaws, the general laboratory facilities of the Department are available for cultures, serology, darkfield examination, and the like.

"The Tropical Disease Diagnostic Service also provides consultation by physicians trained in this specialty. Physicians, hospitals, and laboratories may secure advice concerning diagnosis, treatment, and prevention of tropical diseases, as well as methods of submitting specimens. Epidemiologic aspects of the work are under the direction of Dr. H. B. Shukoff of the Bureau of Preventable Diseases.

While the location of this Service at 600 West 168th Street, New York City, is of special benefit and convenience to the physician of the metropolitan area, we see no

[1] Quarterly Bulletin, Department of Health, New York City, Dec., 1944.

reason why its facilities and assistance could not be available to physicians of the entire State. One expects the greatest concentration of possible cases of exotic disease in the large metropolitan areas, but they will occur elsewhere, also.

It is likely, therefore, that the Tropical Disease Diagnostic Service will prove to be of benefit to many throughout the State. Improved transportation facilities, an inevitable result of the war, will materially assist and broaden the Service's usefulness.

Health Teaching in the Schools

After many years of study, a *Syllabus in Health Teaching* has been prepared and issued for use in the public high schools of the State, under the direction of the Division of Health and Physical Education of the University of the State of New York.

In the preparation of the content of this syllabus, many agencies and people cooperated, as the foreword sets forth, among them the Subcommittee on Child Welfare of the Council Committee on Public Health and Education of the Medical Society of the State of New York. It marks a really notable advance in its approach to the difficult subject of health teaching, a contribution to this field of which the State may well be proud.

Wartime needs and the weaknesses revealed as a result of war have helped to shape its content. The units of study were prepared by a state health-teaching committee under the direction of the Division of Health and Physical Education. The bulletin has been reviewed by the representatives of several organizations, departments of state and local school systems, whose constructive suggestions have played an important part in its preparation.

The major consideration in preparing each unit was to select the goals and learning activities most likely to result in improved health practices and health status of high-school youth. At the junior high-school level, special emphasis is placed on hygiene, while basic physiology and anatomy have received greater stress in the units of study for the senior high school.

The syllabus is distributed to the schools as a practical aid to administrators and health teachers for immediate use in establishing local health teaching programs. It is contemplated that a further edition based on its use during the coming year will become fully effective, under the leadership of qualified health teachers and health coordinators, by September 1, 1945.

While this bulletin is concerned with the function of the schools in teaching health, it is important to show, although briefly, that two other areas are important parts of the school health education program. One of these areas is called school health service. This comprises expert services in the health-examining of children, appraising their strengths and weaknesses, securing treatment of remediable defects and protection against certain communicable diseases, and giving health guidance to individual pupils. The effort in this area is to secure the treatment of handicaps, to protect against the hazards of infection, and to educate young persons through experience in preventive health measures and in the proper care of disease and defect.

The other area of health education is healthful school-living, a term that includes the hygiene of the school plant—lighting, heating, ventilation, seating, cleanliness; the school nutrition program; pupil-teacher relationships in developing and maintaining healthful reactions in matters of discipline. individual differences, success and failure punishment, and pressure for accomplishment; and conditions of the school organization that may affect health, such as arrangement and conduct of work, recreation, rest and recess periods, home study, and daily health inspections.

It is obvious that the third area of health education, health teaching, has rich relationships with the first and second. It is equally clear that in the development of health education in any one or all of these areas the administrator of the school has the central responsibility.

This bulletin is designed to present the

material for the basic course work in health required by the Regents. Some health teaching is now going on in connection with courses in biology, home economics, general science, and other subject areas. There is need for coordination, however, to avoid wasteful duplication of instruction, but the health field is so rich in materials that such duplication can be avoided readily. It is expected, therefore, in addition to the basic health teaching, that all teachers of courses containing health implications will continue to contribute to the health understandings of their pupils.

Thus, in the language of the syllabus itself, its objectives are set forth. To anyone who has had the privilege of observing the countless hours of conference and discussion necessary to bring forth this work, its publication will mark not the end but the beginning of real progress in this extraordinarily difficult field of the educator's art.

Physicians of this State who, through their State Society, have contributed materially to the content of the syllabus will observe with interest the future status of health teaching and guidance in the schools. It is one thing to write a syllabus. To put the content into actual practice is quite another.

Considering the mechanics by which this has to be accomplished, the training of teachers, modification of the ideal to fit the practical limitations of curricular possibilities, the thousand details of background, instruction, modalities, personalities, it would be unfair to expect too much too soon. But the objective is excellent, and the prospect of reasonably uniform health teaching in the State seemingly assured.

Current Editorial Comment

Of This and That

Bulletin 7[1] of the Council on Medical Service and Public Relations of the A.M.A. refers to *H.R. 284* by Mr. Randolph, of West Virginia, which is a bill to provide for health programs for government employees. It has been referred to the House Committee on Civil Service.

This bill provides medical facilities for all Federal employees. There is already established some facility of this kind for certain departments, but Mr. Randolph would like to see it extended to cover all Federal employees. The services are to be established only upon recommendation by the Civil Service Commission after consulting with the Public Health Service and are to be limited to: (1) treatments of minor illnesses and dental conditions, except in cases of emergency; (2) pre-employment and other examinations; (3) referral of employees to private physicians and dentists; (4) education and preventive programs relating to health, including alleviating of health hazards in the working environment.

Also: *H.R. 327*, by Mrs. Rogers, Massachusetts, a bill to provide for the establishment of a permanent nurse corps in the Veterans Administration referred to the Committee on World War Veterans' legislation, provides for the establishment in the Veterans Administration of a permanent Nurse Corps, to be known as the Veterans Administration Nurse Corps, and hereinafter referred to as the Nurse Corps. The officers of the corps shall consist of one Superintendent of Nurses, with the rank of colonel, to be appointed by the President, and 16,000 officers.

Such a permanent nurse corps in the Veterans Administration would seem to be desirable in our opinion. Dr. Joseph Lawrence, in reporting these bills in the Seventy-Ninth Congress, adds, with his usual good common sense, "If you are particularly interested in any bill and especially if your congressman is the author of any, write to him for a copy, designating it by its number.

"Your congressman will appreciate the interest you show and it is a good public relations act to begin your correspondence with your congressman before you need write him to oppose other congressmen's bills."

[1] Jan. 25, 1945.

The New President, Edward Rutherford Cunniffe, M.D.

Dr. Edward Rutherford Cunniffe was born in Port Jervis, New York, where he prepared for college and was graduated from Cornell University Medical College with the class of 1903. He served his period of intern training at Fordham

Hospital, New York City, and almost immediately was appointed to the attending staff of the hospital, where he has served as assistant visiting surgeon, associate visiting surgeon, and attending surgeon, and has been director of the Second Surgical Division for the past twenty years. During a great part of this period he was associated with Fordham University Medical School, teaching physiologic psychology, then physiology, soon transferring to the surgical department as an instructor, assistant professor, and he held the rank of clinical professor of surgery when the school closed.

He is a member of the Bronx County Medical Society, Bronx Medical Association, Bronx Surgical Society, New York Surgical Society, American College of Surgeons, and the American Medical Association. He has held the office of President of the Bronx County Medical Society, Bronx Surgical Society, and First District Branch Society. He has been a member for many years of the Medical Society of the State of New York and American Medical Association's House of Delegates. He has been for the past nine years a member of the Judicial Council of the American Medical Association and is now chairman of that Council. He served for some time as Trustee of the Medical Society of the State of New York, resigning from that position last year.

His hospital appointments at present are Director of Surgery, Second Division, Fordham Hospital, visiting surgeon at Union Hospital, Consulting Surgeon, Morrisania Hospital, all of New York City, Consulting Surgeon at Holy Name Hospital, Teaneck, New Jersey, consulting surgeon at St. Joseph's Hospital, Yonkers, New York, and consulting surgeon at St. Francis Hospital, Port Jervis, New York.

Dr. Cunniffe has participated actively in the work of the State Society for many years. He is familiar with its problems and is well qualified to undertake the onerous task which he is about to assume as its President.

THIOURACIL IN HYPERTHYROIDISM

A Survey of One Year's Experience

MARTIN G VORHAUS, M D , and HAROLD H ROTHENDLER, M D , New York City

(From the Hospital for Joint Diseases)

THE clinical evaluation of a new drug in the treatment of disease must be determined by the largest possible experience in its use This requires the cooperation of all the groups engaged in research so that the conditions for investigation in a definite clinical entity may be as varied and diverse as possible

The experimental evidence that the administration of thiouracil in hyperthyroidism is followed by a reduction in the basal metabolic rate appears well established This is frequently followed by a reduction in tachycardia, a decrease in tremor and sweating, a gain in weight and a general feeling of better health These observations have been reported by several competent clinicians and constitute a valid reason for continued clinical study

The first problem confronting the clinician is the precise determination of the diseased state under survey Hyperthyroidism comprises a large group of clinical states not only varied in the intensity and character of their clinical manifestations but differing in their causative and pathologic concepts The classic syndrome of Grave's disease is well recognized, yet numerous variants have been reported and corroborated Thus, hyperthyroidism with or without goiter, and goiter with or without hyperthyroidism are known to exist The same is true of exophthalmos Still more perplexing is the existence of hyperthyroidism with normal or increased cholesterol figures and/or a normal metabolic rate

It therefore becomes apparent to the internist that there is no single clinical or laboratory testimony which alone can be used to measure the success of this new drug in the treatment of hyperthyroidism An accurate estimation can only be determined in relation to the entire clinical picture—namely, to health and the maintenance of health in large number of patients

The second step in this critique of thiouracil relates to its method of use Evidence is accumulating that it is definitely superior to iodine in the preoperative preparation of the toxic hyperthyroid patient The thiouracil-treated patient has a smoother operative course and a milder postoperative reaction Its effect in the reduction of postoperative recurrences is still to be studied and evaluated In addition to its preoperative value, its merit as a purely therapeutic agent cannot yet be determined The clinician is well aware of spontaneous regressions of hyperthyroid states To what extent thiouracil may increase the number of these cases requires much more time to ascertain The duration of thiouracil therapy, the amount of the daily dosage, and the intervals between courses of treatment are now being investigated

A third point to be considered is the toxicity of thiouracil It is already clear that some individuals are sensitive to small amounts and others insensitive to relatively large amounts of thiouracil The type and intensity of thiouracil reactions must be tabulated and analyzed statistically so that the factor of safety of this drug can be judged accurately Hyperthyroid states are so frequent and widespread that the release of this drug for general use will undoubtedly be followed by a great demand for it all over the world

With a frank recognition of these problems, we are presenting our clinical observations on the use of thiouracil in hyperthyroidism—its value, its limitations, and its dangers

Procedure

The cases in our series were taken from clinics as well as from private practice Any patient whose signs and symptoms justified the clinical impression of hyperthyroidism was included in this series This method of study was motivated by our conviction that our experiences with the drug would be typical of the experiences of other clinicians after the publication of the first few papers and the release of thiouracil for general use It was felt that a more accurate clinical evaluation of the advantages, limitations, and undesirable results of this new drug could be obtained by this type of case selection rather than by a deliberate selection of those patients whom the drug might be expected to benefit

We have analyzed our experiences in detail, as we feel that only by the careful compilation of similar results of all workers in this field can a definite concept in regard to the use of thiouracil in hyperthyroidism be evolved

This preliminary report is based upon our experiences with 25 patients who have been under treatment sufficiently long to permit some clinical observations

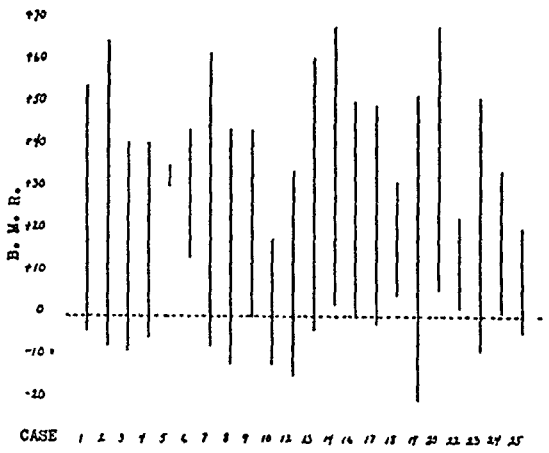

FIG. 1. B.M.R. responses of 22 patients treated with thiouracil, showing pre-treatment level and response to maximal thiouracil effect.

As a result of thiouracil therapy* 22 patients showed varying degrees of improvement in their hyperthyroid state, while 3 patients were classified as therapeutic failures. Of these 22 cases (88 per cent) surgery has been performed on 4, and advised for a fifth. If thiouracil therapy is to be evaluated as a medical regimen in hyperthyroidism, then these 5 surgical cases should be classified as medical failures. Statistically speaking, then, of 25 cases treated, 17, or 68 per cent, were improved by thiouracil and 8, or 32 per cent, were unimproved.

Of the 22 cases showing any improvement, 18 (83 per cent) were female and 4 (17 per cent) were male. Their ages ranged from 15 to 61 years with 85 per cent in the 31 to 50 age group.

Analysis of Signs and Symptoms of 22 Cases (88 Per Cent) Improved

Goiter.—Prior to treatment, 6 cases were without goiter, while 16 had palpable goiters. Of these 16, the size of the goiter increased perceptibly in 4 cases; in 5 there was a definite diminution; and in 7 there was no apparent change.

Exophthalmos.—Seven of these 22 patients had no clinical exophthalmos. Of the remaining 15, 4 patients showed no change. In 9, however, there was complete disappearance, and in 2 a clear-cut reduction of the previously noted exophthalmos.

Tachycardia.—All of these 22 patients had a marked tachycardia which was sharply reduced in 9 per cent, and returned to normal in 91 per cent of this group.

Sweating.—Excessive sweating was present in 20 cases. It returned to normal in 17 cases, was noticeably less in 2, and unchanged in one case.

Tremor.—Tremor of the hands was present in 21 cases. It disappeared in 20 cases and remained unchanged in one case.

Changes in Body Weight.—Prior to therapy there was an average weight loss of 18 pounds in 15 patients. Two of the patients were gaining weight (one a young girl of 15, the other a diabetic), four had a constant weight, and the weight factor in one patient could not be evaluated because she was pregnant.

Following therapy, 19 of these 22 patients showed an average weight gain of 12 pounds; one patient showed no change in weight; and two others (one an obese diabetic) lost weight.

Basal Metabolism Rates.—Prior to therapy, all patients had elevated basal metabolic rates, ranging from +21 to +68, with an average of +45. Following improvement, all cases (100 per cent) showed a reduction in rates to an average of −1 (see Fig. 1).

Analysis of Thiouracil Dosage

Thiouracil was the only medication used in the course of this study except for small doses of phenobarbital (0.015 Gm.) in a few cases in the early days of treatment. No patient was asked to give up work or to take additional rest periods. On the contrary, all patients were urged to continue their usual routine of life. No special diets were advised nor was any attempt made to encourage increased food intake. We felt that only in this manner could clinical response and gain in weight be accurately interpreted as a therapeutic result, rather than as evidence of the patient's effort to cooperate.

The initial daily dose of thiouracil ranged from 0.2 Gm. to 0.8 Gm., given in divided doses two or three times daily. This initial dose (an average of 0.4 Gm. daily) was continued until clinical improvement, as evidenced by a drop in the metabolic rate and a modification of the preexisting symptoms of hyperthyroidism, was noted. This initial period of treatment varied from nine to sixty-one days, with an average duration of twenty-eight days. The earliest subjective manifestations of improvement were general reduction in body tension and nervousness, and were commented on by the patients themselves.

The period of therapy up to this first clear-cut clinical evidence of improvement was called the initial period; in the subsequent, or maintenance period, the dose of thiouracil was radically reduced. Doses ranged from 0.2 Gm. to 0.6 Gm. daily with an average of 0.2 Gm. daily, or one half the average dosage for the initial period.

All of our cases were closely followed during

* The thiouracil used in this study has been generously furnished by Dr. B. W. Carey, of the Lederle Laboratories, Inc., Pearl River, New York.

this maintenance period. The average period of observation for these patients at the time of this report (September, 1944) is one hundred and seventy-three days; one case has been under observation for four hundred and four days.

Evaluation of Thiouracil Therapy in 22 Improved Cases

For purposes of clinical evaluation we have divided our cases into the three following groups:

1. Complete disappearance of hyperthyroidism
   - A. After cessation of therapy
   - B. While on maintenance dose
2. Marked reduction of manifestations of hyperthyroidism
3. Slight reduction of manifestations of hyperthyroidism

In Group 1A we have five patients (cases 4, 7, 10, 19, 23) who have remained asymptomatic after medication was stopped. These cases had ranged in their B.M.R. from +23 to +62 before treatment, and ultimately reached a level of from −7 to −20. At the time of writing they had been without thiouracil from forty-nine to two hundred and ten days; they are all leading normal lives, free of any signs or symptoms of hyperthyroidism. This clinical response required a total intake of thiouracil ranging from 9 to 57 Gm. in from sixty-eight to one hundred and eighty-one days. Statistically this gives an average intake of 24.1 Gm. in one hundred and thirty-nine days, or a daily average intake of 0.2 Gm.

In Group 1B we have three patients (cases 1, 9, 16) who have become asymptomatic while on small maintenance doses of thiouracil.

Case 1.—The patient has taken 85.2 Gm. in four hundred and four days. For the past ten months she has been on a maintenance dose of 0.1 Gm. daily and is asymptomatic. This patient is diabetic, and since improvement in her hyperthyroid state her insulin requirement has been cut in half. Her congestive failure has improved sufficiently so that diuretics are no longer necessary.

Case 9.—The patient is a young woman who has made a gratifying response to an extremely small dose of thiouracil. She has taken 18.8 Gm. in two hundred and forty-four days, or a daily average of 0.07 Gm. For the past three months, on a maintenance dose of 0.1 Gm. once a week, she was asymptomatic. At that time her B.M.R. was +5, and medication was stopped.

Case 16.—A woman has been under observation for fourteen months. She has taken a total of 100.3 Gm. of thiouracil in three hundred and fifty-seven days, and has been able to be without medication for a continuous period of three months. Now, on a maintenance dose of 0.1 Gm. daily, she is free of hyperthyroidism with a B.M.R. of +4. (See A. F.)

In Group 2 we have placed those patients (cases 2, 6, 8, 12, 17, 18, 22, 24, 25) whose manifestations of hyperthyroidism have been markedly reduced. Some of these patients have been able to stop medication for as long as five months; it is possible that eventually some of them may be reclassified into the asymptomatic group. At this time, however, although the metabolic rates of the patients in Group 2 are all within normal range, the patients still manifest some residual hyperthyroid symptoms, such as slight tachycardia, occasional minimal sweating, or tremor.

Case 12.—He has been a known hyperthyroid and diabetic for twelve years. He has taken a total of 37.4 Gm. of thiouracil in one hundred and fifty-three days, or a daily average of 0.2 Gm. The period of observation of this patient has extended well over a year, during which time he was without medication for four months, then resumed a daily dose of 0.2 Gm. when his symptoms recurred. With the abatement of his symptoms, he was taken off medication for three weeks, and then took 0.1 Gm. every other day for six weeks. Since then (three months at the present time) he has had no medication, his diabetes is under better control, he feels well, and his last B.M.R. was −3.

Case 2.—The patient has gained 18 pounds in the five-month period of observation. She has taken a total of 42.9 Gm. in one hundred and seventy-one days, or a daily average of 0.25 Gm. Now on a maintenance dose of 0.3 Gm. daily, her last B.M.R. was +5.

Case 17.—A woman has taken a total of 43.7 Gm. in two hundred and fourteen days, or a daily average of 0.2 Gm. She has been on a maintenance dose of 0.2 Gm. daily for the past four months, and has gained 7 pounds; her last B.M.R. was +2.

Case 8.—The patient, diabetic, had originally lost 50 pounds. On a total of 11 Gm. in seventy-six days, or a daily average of 0.14 Gm., he has regained 12 pounds, and his blood sugar has dropped from 180 to 116 mg. On a maintenance dose of 0.1 Gm. daily for the past three weeks, his last B.M.R. was +12.

Case 6.—A woman had undergone a hemilobectomy fourteen months previously. She took a total of 23.1 Gm. in ninety-one days, or a daily average of 0.25 Gm. She was asymptomatic when last seen, with a B.M.R. of +14. She was told to continue taking 0.2 Gm. daily, but has not returned for a check-up.

Case 22.—A young girl 15 years of age has had 59 Gm. in two hundred and forty-five days, or a daily average of 0.2 Gm. Asymptomatic for the past four months, she has gained 11 pounds; on a maintenance dose of 0.3 Gm. daily for the past three weeks, her last B.M.R. was +7.

Case 18.—The patient is diabetic. She has taken 42.3 Gm. in eighty-eight days, or a daily average of 0 5 Gm.

When she was last seen she was on a maintenance

dose of 0.6 Gm. daily. At that time her diabetes was under better control, and her B.M.R. was +5.

Case 24.—This man has taken 69.3 Gm. in one hundred and twenty days, or a daily average of 0.5 Gm. He has gained 33 pounds, and on a maintenance dose of 0.3 Gm. daily, his last B.M.R. was +1.

Case 25.—A woman had had a second-stage thyroidectomy one year previously, and had taken iodine until two months before thiouracil medication was begun. After taking a total of 9.4 Gm. of thiouracil in ninety-eight days, a daily average of 0.1 Gm., she had gained 4 pounds, and was asymptomatic except for a slight residual exophthalmos. When last seen she was on a maintenance dose of 0.1 Gm. daily, and her last B.M.R. was +10.

In Group 3 have been placed five patients (3, 5, 13, 14, 20) whose clinical response to thiouracil alone was deemed minimal, and for whom surgical intervention was ultimately recommended.

Case 5.—A woman had a large, hard, nodular goiter with hyperthyroidism and auricular fibrillation. On thiouracil she gained 6 pounds, and her auricular fibrillation disappeared. After eight weeks of this regimen, in which time she took a total of 28 Gm. of thiouracil, or a daily average of 0.5 Gm., she was sufficiently improved to be permitted to undergo a hysterectomy for multiple fibroids. The fibrillations returned on the third day postoperatively, but subsided in four days on a daily thiouracil intake of 0.3 Gm. After four more months of continuous medication, on an average daily intake of 0.2 Gm., she had gained 7 pounds and was free of fibrillation, although her metabolic rate had fallen at no time to below +30. Thyroidectomy was advised and was performed by Dr. L. Druckerman at Mt. Sinai Hospital. The thiouracil was stopped nine days postoperatively. Four weeks later the patient was asymptomatic, with a metabolic rate of −3.

Case 14.—The patient had had enlargement of the thyroid gland for over thirty years. When first seen, she was experiencing frequent transient attacks of auricular fibrillation, which disappeared after eight days of thiouracil medication, 0.3 Gm. daily. However, it took a total of 300 Gm. in the next eighty-eight days to reduce her B.M.R. from its original level of +68 to +12. In spite of the lowered metabolic rate, it was necessary to increase the daily dose to 0.6 Gm. daily for the next three months in order to control her other symptoms of hyperthyroidism, although her fibrillation did not recur. On this regimen she gained 27 pounds. Thyroidectomy was advised at that time and was performed by Dr. D. Casten at the Hospital for Joint Diseases. Two days postoperatively there was a transient return of fibrillation for one day, but otherwise convalescence was uneventful. Her postoperative B.M.R. was +8, thiouracil has been discontinued, and the patient feels well.

Case 3.—The patient was a young woman, 21 years of age, whose metabolic rate dropped from +41 to ±0 after fifty-six days of thiouracil medication, totaling 12.6 Gm. or a daily average of 0.2 Gm. Discontinuation of medication for two months (because of her marriage) resulted in a recurrence of her hyperthyroid symptoms and an elevated rate of +39. A resumption of thiouracil, 17.5 Gm., in the next sixty-three days, effected a good clinical response. Because of her youth and her apparent need for continuous medication, a thyroidectomy was performed by Dr. Berg at the Hospital for Joint Diseases. She made a good recovery, thiouracil was stopped, and her postoperative B.M.R. was −13.

Case 13.—A young woman took 38.1 Gm. in ninety-one days, or a daily average of 0.4 Gm. She showed considerable clinical improvement, with a gain of 18 pounds, and a marked reduction in her pretreatment B.M.R. of +61. However, her goiter continued to grow in size (the circumference of her neck increased 2¼ inches), and surgery was consequently recommended, and performed by Dr. M. Bodenheimer at the Hospital for Joint Diseases. *This patient received iodine for one day* postoperatively through an inadvertence. Thiouracil was discontinued seven days postoperatively, when her B.M.R. was −4, *and the patient is now well and has resumed her normal routine of life.*

Case 20.—The patient had had a left hemithyroidectomy twelve years previously. Because of enlargment of the right lobe with hyperthyroidism and a B.M.R. of +68, thiouracil therapy was instituted. Her response was slow; three months of continuous medication amounting to 43.1 Gm. of thiouracil in one hundred and forty-six days, or daily average of 0.3 Gm., was needed before the basal metabolism rate fell to normal. On continued therapy of 0.2 Gm. daily the B.M.R. rose to +12 and later to +27. At the same time, the right lobe of the thyroid had enlarged considerably, producing choking sensations. Operation was advised, but refused, and the patient did not return for further check-up.

Effect of Thiouracil Therapy in Associated States

Auricular Fibrillation.—Auricular fibrillation in long-standing hyperthyroidism is a well-known clinical finding. It is the frequent experience of internists that such fibrillation usually persists even after thyroidectomy. At times it is resistant to treatment and occasionally represents the only clinical residue of pre-existent hyperthyroidism.

We have had the unique opportunity of observing the disappearance of auricular fibrillation in three cases of long-standing hyperthyroidism coincidental with thiouracil therapy.

The first of these, Case 5, has been described in detail among the patients who were operated upon. Her fibrillations were confirmed by electrocardiogram, and in twenty-eight days, after a total intake of 19.6 Gm., or a daily average of 0.7 Gm., her rate had dropped from an apex rate of 136 to a regular sinus rhythm of 70. After six months of

medication, during which time a hysterectomy for multiple fibroids was performed, she underwent a successful and uneventful thyroidectomy, with no return of her fibrillation.

Case 16.—A 61-year-old woman has been grouped under 1B, as she has become completely asymptomatic on a small maintenance dose of 0.1 Gm. daily. When first seen, she had a B.M.R. of +51, and was fibrillating at the rate of 120. She was started on a daily dose of 0.8 Gm. After four weeks of medication, she was hospitalized for a cerebral embolism and facial palsy. She was digitalized (3 Gm. daily for ten days only) and the thiouracil was continued. At that time the heart returned to regular sinus rhythm, with a rate of 84, and the basal dropped to +9. This patient has been followed for over a year in the clinic, with no recurrence of fibrillation, and with complete disappearance of her hyperthyroid symptoms on the present maintenance dose of 0.1 Gm. daily.

Case 14.—This patient has already been described in detail under the cases operated upon. Her original fibrillating rate was 180, but she returned to regular sinus rhythm after eight days of thiouracil therapy. She had a transient return of her fibrillation for one day, two days after thyroidectomy. Three weeks later she had made a complete recovery, with a B.M.R. of +8 and a regular sinus rhythm of 76.

Diabetes.—Four of our patients had diabetes mellitus associated with their hyperthyroid conditions. Prior to the onset of thiouracil therapy the diabetic state of these four patients was controlled with difficulty by diet in two instances (Cases 12 and 18); in the other two cases (Cases 1 and 8) insulin was needed. Since these patients have exhibited the characteristic thiouracil response, a modification of their diabetic state seems to have taken place. Dietetic control has been more readily established, and of the two cases requiring insulin, Case 8 no longer needs it, while Case 1 has had her insulin requirement cut in half.

This experience with thiouracil therapy parallels the well-annotated observations of patients with hyperthyroidism complicated by diabetes in whom thyroidectomy was performed.

Pregnancy.—We have had the opportunity of observing a patient who started her thiouracil therapy in the third month of her pregnancy. She was maintained on thiouracil until the day of delivery, and showed the characteristic clinical and subjective response to the drug. She was delivered of healthy twin boys. Thiouracil was discontinued from the day of delivery for seven consecutive days. A maintenance dose of 0.1 Gm. every other day was resumed and continued for one month. At that time she was asymptomatic, and thiouracil was discontinued. As far as we know, this is the second report of the administration of thiouracil during pregnancy.

Failure of Thiouracil Therapy

As stated earlier in the paper, 22 of the 25 patients showed some degree of favorable response to thiouracil. However, we have classified five of these as therapeutic failures from the medical point of view since four of them eventuated in surgery and the fifth required surgical intervention. The three patients detailed below were considered failures in thiouracil therapy because of undesirable complications. Their reactions to therapy were considered of sufficient clinical significance to justify cessation of the drug.

Case 2.—The patient was a woman 42 years old, with known rheumatic heart disease, who had lost 15 pounds in a six-month period. The thyroid gland was slightly enlarged, the B.M.R. +37, R.S.R. 96, but tremor, sweating, and exophthalmos were absent. After forty-two days of continuous medication (0.6 Gm. daily), a total intake of 25.2 Gm. of thiouracil, her gland was smaller, her metabolic rate had dropped to +26, but her hemoglobin, which had been 90 per cent before therapy was started, had fallen to 69 per cent. Thiouracil was discontinued, and iron therapy begun. At the end of two months, with a loss of 4 pounds, her basal metabolism rate had risen to +49, but her hemoglobin was 88 per cent. Two months later, or four months after the cessation of thiouracil therapy, she had gained one pound, was free of tachycardia, tremor, sweating, and exophthalmos, her thyroid was not enlarged, and her metabolic rate had fallen to −2.

This case demonstrates the development of anemia coincidental with thiouracil administration. With the cessation of thiouracil and the institution of iron therapy, the blood returned to normal and the B.M.R. rose. Subsequently there was a spontaneous return to normal of the metabolic rate. The absence of tachycardia, tremor, and exophthalmos represents a marked variant of the usual clinical picture of hyperthyroidism. Regardless of the validity of the clinical impression, it seems justifiable to classify this case as showing one undesirable effect of thiouracil.

Case 15.—The patient was a known hyperthyroid, who had responded favorably to iodine medication five and two years previously. When first seen, she was again taking iodine. Her physical findings, nine days after the cessation of iodine therapy, were a moderately enlarged thyroid gland, a fine tremor of the hands, no exophthalmos, R.S.R. of 160, and a B.M.R. of +53. Thiouracil (0.4 Gm. daily) was started. After twelve days of continuous medication her temperature rose to 101.5 F. Thiouracil was stopped, but the temperature rose to 105.5 F., with a moderate leukopenia (4,700 W.B.C.). Two similar febrile episodes occurred a few hours after [illegible] Gm. to 0.4 Gm. of [illegible] few hours each time. The white blood count ranged from 4,300 to 5,700. This patient also developed transient paroxysms of auricular fibrillation with her B.M.R.

at +58, 52, and 54. Because she was considered a poor operative risk, x-ray therapy was started.

This patient was checked on three occasions, and each time temperature elevation followed the administration of very small doses of thiouracil. Slight leukopenia was also noted. This case represents thermal and leukopenic reactions to the drug and probably belongs in the group of drug idiosyncrasies.

Case 21.—A 43-year-old man had had a coronary occlusion eleven months before. Following recovery he had symptoms of precordial angina and hyperthyroidism. His thyroid was not enlarged, and he had regular sinus rhythm; he had a slight tremor, moderate exophthalmos, and a metabolic rate of +29. Thiouracil, 0.3 Gm. daily, was started. After seven days of medication, he complained of pain in the right shoulder, numbness of the fingers, and weakness of the right hand. Medication was stopped; the pain in the shoulder subsided gradually. Due to lack of cooperation on the part of the patient, thiouracil therapy could not be repeated.

This case would seem to represent an idiosyncratic reaction, since in seven days of therapy, with a total intake of 2 Gm., a neuritic syndrome developed.

These three cases, representing 12 per cent of the total series, demonstrate undesirable reactions to thiouracil, of which two developed with very small total intake of the drug (Case 21 with a total intake of 2 Gm.; Case 15 with an initial total intake of 4.8 Gm., and subsequently with 0.1 Gm. and 0.4 Gm.). The third patient seemed to tolerate the drug well through the initial stages, but at the end of seven weeks (total intake of 25.2 Gm,) she developed moderate anemia.

There are several references in the literature specifying undesirable effects of thiourea and thiouracil. Of these there have been five deaths.[1–5] A survey of these published reports indicates the same two types of reaction we have observed, namely, an early idiosyncratic reaction to small amounts of the drug, or a tolerance in the initial stage, but a later or "cumulative" effect of the drug.

In our small series the unfavorable reactions represent 12 per cent of the total. There is no way, at the moment, of determining what percentage of unfavorable reactions the published reports represent. At the present time we know of no way of predicting which cases will react unfavorably. We emphatically urge careful clinical observation of all cases receiving thiouracil. A suggestion has been made recently of the coadministration of folic acid, which may modify unfavorable thiouracil reactions.

In our observations we encountered other untoward effects of thiouracil, not sufficiently severe to justify cessation of therapy, but worthy of mention here. Case 2, after she had taken 0.3 Gm. of thiouracil daily for three days, developed a flushing of her face and forearms, accompanied by itching. With cessation of therapy for two days, the skin reaction subsided. Medication was resumed in the same dosage, with a slight recurrence of the flushing and minimal itching. The drug was continued, and the skin reaction subsided, disappearing completely fifteen days after it had first developed. This same patient developed a moderate secondary anemia while on thiouracil therapy, which responded to iron medication, while continuing the thiouracil. Case 7, the pregnant woman, also developed slight anemia in the eighth month of her pregnancy which required no medication. Case 12 developed hypochromic anemia which quickly responded to oral liver therapy. His thiouracil treatment was discontinued at that time because the B.M.R. was well within normal limits.

Summary

In the past year we have observed the effect of thiouracil in 25 cases of hyperthyroidism. In three of these patients the drug was discontinued because of undesirable reactions; neuritic, febrile, anemic, and leukopenic complications were noted. In the remaining 22 cases beneficial modifications of the clinical state, ranging from slight to marked, were observed. In five patients the response to thiouracil therapy alone was deemed clinically insufficient to justify long-term administration. Operation was advised for these five patients, four of whom have already successfully undergone thyroidectomy.

In the remaining seventeen there has been moderate to marked improvement in the hyperthyroid state. Five patients have remained asymptomatic for from two to four months after discontinuance of the drug. In one patient thiouracil was administered during the last six months of her pregnancy without any apparent ill effect on the offspring. Four patients with diabetes and hyperthyroidism showed favorable modification of their diabetes as their hyperthyroid state responded to thiouracil. Three patients with auricular fibrillation returned to normal sinus rhythm following thiouracil medication.

In our opinion, the administration of thiouracil carries with it an unpredictable danger of unfavorable or toxic reactions. Deaths have been reported with thiouracil or related drugs. We believe that this drug should not be released for general use because of the probable occurrence of these reactions.

The drug for the optimal medical management of hyperthyroidism would seem to be a chemical compound retaining all the beneficial effects of thiouracil noted above, but free of the undesirable and dangerous reactions observed by us and

others. Other thiourea derivatives or modifications are already being studied. Until such time as a more satisfactory drug is reported, we wish to re-emphasize the experimental nature of thiouracil administration and the need for the utmost caution in its use.

Appreciation is expressed for the technical assistance of Mildred Lefkowitz, B.A.

OPPORTUNITY!

The fate of the voluntary nonprofit hospitals is inextricably bound up with that of medicine; problems of either are problems of both; separate and unrelated consideration of those problems cannot produce correct solutions; therefore, hospitals and doctors must act in concert if care of the sick is to be conducted in a humane way and further progress is to be made in medical education and research.

To the doctor is entrusted the solemn duty of protecting, preserving, and restoring health, but the fruits of the knowledge, skill, and experience of the

war against sickness, injury, and disease; they must work together.

It is in the light of these premises that the Medical Society of the State of New York and the Hospital

Important matters have already engaged the attention of the Joint Committee. Steps have been taken to solve a problem that has long perplexed both groups. For some reason the professional status of the specialties of roentgenology, pathology,

lengthy discussion the Joint Committee has agreed on amendments to the Workmen's Compensation Law and the Education Law that seem to meet the requirements of both groups. They will be sponsored jointly. The hospitals are giving full support to the Medical Society in opposition to the chiropractic bill. Here, then, is strong evidence of the need of a Joint Committee and its value to both organizations.

A good beginning has been made, but much more remains to be done. For one thing, the Joint Committee must be given the loyal and whole-hearted support of the parent bodies.

Today the war-torn world knows well the tragic consequences of the evil policy of "divide and rule."

this pernicious doctrine. Outside groups are now invading the field of health, but instead of meeting them by determined and coordinated action, medicine and the hospitals passively go their separate ways.

Who among us will knowingly contribute to the continuation of such a policy? Who is willing to accept the responsibility for prolonging a condition that may have a far-reaching and deleterious effect on public health?

The efforts of the Joint Committee must not be allowed to fail. Opportunity knocks loudly—let the doors be thrown open wide to admit good will, understanding, unity, and cooperation, by the hospitals and the medical profession. This is the true way to advance the cause of good health, the free practice of medicine, and the development of the voluntary nonprofit hospital system. Now is the time to benefit by the wisdom of the old adage, "in union there is strength"—tomorrow may be too late.

Doctors and hospitals, close ranks! With mutual respect, confidence, and determination, let us go forward together to bring health in full measure to the people of New York.—*John F. McCormack, President, Hosp. Assn. of New York State, in Hospital Forum, March, 1945*

DR. LYMAN GUY BARTON, SENIOR

Mrs. Marjorie L. Porter, Plattsburg, N.Y.

During the past century and a half northern New York has been served by men outstanding in several professional fields. In the medical field the name of Barton has long been honored, since it was in 1839 that the first Lyman Barton started practicing in Willsboro, to be succeeded by his son and grandson, all of whom have gained enviable reputations.

Lyman Barton was born in Hebron, in Washington County, New York, September 20, 1812, the son of Simon and Olive Cary Barton. He studied medicine with his uncle, Dr. Ira Barton, of Waterford, Pennsylvania, and was graduated from the medical department of Dartmouth College in 1838. In 1839 he settled at Willsboro, and the following year, December 31, 1840, married Minerva Aiken, a daughter of Maj. Abraham Aiken, Sr., who came to Willsboro from Dutchess County in 1784. Mrs. Barton's maternal grandfather, Job Boynton, came to Burlington, Vermont, from Massachusetts in 1780 on snowshoes, and his daughter, Elizabeth, Mrs. Barton's mother, was the first child born in Burlington. Job Boynton was one of the pioneer boat builders and operators on Lake Champlain, long before the advent of steamboats on the lake. The seven children of Dr. and Mrs. Lyman Barton were Elizabeth, Abbie, Ellen, Susannah, Sarah, Cora, and Lyman Guy.

In 1869 the University of Vermont conferred upon the first Dr. Lyman Barton the honorary degree of Master of Arts. He was a permanent member of the old Medical Society of the State of New York, and was one of the founders of the Medical Association of the State of New York in 1884. He was admitted as a member of the Essex County Medical Society in 1839 and was its president in 1861 and 1862, and again from 1865 to 1867. He was recognized as one of the ablest and most progressive members of his profession in the state. He was one of the first surgeons in the United States to successfully perform the difficult and then almost unknown operation of ovariotomy, which was noted in leading medical journals of this country and Europe. He died at Willsboro October 20, 1899.

Various papers and case records of Dr. Barton's partially reveal his personality, including his personal philosophy of life. Daybooks kept by him as early as 1841 list many of his patients, together with his extremely modest fees. At one time he recorded a ride up the mountain to call on Benjamin Boardman, at which time a blue pill was the prescribed dose, and the entire charge was thirty-eight cents. A meeting at the Phoenix Hotel in Willsboro, on January 8, 1842, netted Dr. Barton fifty cents; examination of Miss Baker, fifty cents; visiting D. Delance's and Charles Towner's school one day, seventy-five cents; and apportioning school money one-half day, 38 cents. Patients often paid their fees with merchandise, such as a plough, or with services, such as horseshoeing. Many of his patients' names are carried by descendants of Willsboro pioneers; a few well-known ones are Thomas Hoffnagle, Charles Morhous, Charles Stower, Daniel Fairchild, Horace Parkill, Levi Higby, Andrew Buckminster, Ira Manley, Timothy Frisbie, and others.

His case records include those pertaining to bilious pneumonia, gunshot wound, old age, cerebrospinal meningitis, diphtheria, apoplexy, and consumption. In September, 1866, Dr. Barton was called upon to give his testimony at an inquest pertaining to the death of a Mrs. McGregor, and this testimony he recorded in full. He was appointed at times to serve as guardian for children and kept an accurate accounting of the estates he handled. He was the attending physician of Rev. Cyrus Comstock, an early Congregational minister at Lewis, Essex County, who invented the Comstock buckboard and died at an advanced age after falling from his own buckboard in the vicinity of Willsboro Point.

These are only indications of the strenuous life led by the first Dr. Barton in this section of the Adirondacks. His valuable work was carried on by his son, Dr. Lyman Guy Barton, Sr., who was born on July 1, 1866, in the Town of Willsboro.

The second Dr. Barton received his early education in the public schools, in Troy Conference Academy, Poultney, Vermont, Ives Seminary, Antwerp, New York, and in the Granville Military Academy at North Granville, New York, from which he was graduated in 1883. He obtained a state scholarship and entered Cornell University the same year, taking the course in mechanical engineering. After three years at Cornell, at the urgent request of his father, he gave up the engineering course, and began the study of medicine at Dartmouth College, Hanover, New Hampshire. He later entered Bellevue Hospital Medical College, and graduated in 1891.

On June 18, 1885, Kittie Cornelia Wilcox, of Ithaca, became Dr. Barton's bride. Their

three children are Lyman G. Barton, Jr., A.M., M.D., F.A.C.S., Philip B. Barton, B.S., M.D., and Mrs. F. C. Dossert, artist, and at one time a designer of handmade jewelry for Tiffany's, New York City.

In a brief autobiography, Dr. Barton tells something of the members of the Bellevue faculty and his work there, and remarks that the lectures were good, special emphasis having been given to teaching everything considered important and necessary to be known before starting medical practice. At the end of the course there were no graduation exercises. Each student who passed the final examination was notified to that effect, and handed a diploma.

Following graduation from Bellevue Dr. Barton returned to Willsboro, hoping to be associated with his father in general practice. However, his father retired at once and gave both patients and equipment to his son. The elder Dr. Barton was then 82 years old and had been in practice for fifty-two years, the only physician in several surrounding towns, and the only one responsible for emergency surgical operations.

At that time the nearest hospital to Willsboro in New York State was over a hundred miles away; there was no laboratory in the county, no trained nurse, no telephones, no electric lights, or even electric power. Except for the D. and H. Railroad along the eastern side of Essex and Clinton counties, transportation was by horse-drawn vehicle. Several towns had no drugstore, and in the few existing ones only the so-called galenicals and patent medicines were dispensed. Also, with few exceptions, the physicians in the various towns were middle-aged or elderly, and all dispensed their own remedies. Supplies such as sterile catgut, surgical gauze, ready-made bandages, and plaster-of-Paris bandages were not obtainable. Cheesecloth was the substitute for gauze. All operations were performed in private homes and were done on kitchen tables.

When Dr. Lyman Barton began practicing in Willsboro he found that, in accordance with the custom of the time, his father measured powdered drugs on the tip of his penknife, having attained a high degree of accuracy in the act. The young doctor, however, felt that nothing should be left to chance in the procedure so, aided by his mechanical training, he soon invented a tiny scale for the purpose, constructing it so that it could be enclosed in the case of an old-style watch.

This small scale was the beginning of a long series of devices originated by Dr. Barton for the benefit of the medical profession and its patients—men, women, and children who may never know to whom they owe their debt of gratitude.

One of Dr. Barton's first designs was for a portable metal table with tilting top to obtain the desired position for abdominal operations. Until this time there were no operating tables made with tilting tops, and when Dr. E. D. Ferguson, surgeon at the Samaritan Hospital, Troy, New York, and Professor Bingham, of the University of Vermont, saw Dr. Barton's improved table, each wished to have one made by the Willsboro mechanic who was doing the work. A firm in Brooklyn, manufacturing hospital furniture, was given the privilege of making and selling the table, also.

The first major operation performed by Dr. Barton was done within a few weeks after he began practice. A man fell between two loaded coal cars on the railroad and had both legs crushed midway between the knees and ankles, so that a double amputation was required. The usual mortality in such operations at that time was 50 per cent, all the modern methods of treating shock, except morphia for the relief of pain, being nonexistent. Dr. Barton's patient was a healthy young Swede who fortunately recovered.

In 1891 appendicitis was not recognized as a disease entity except in some of the large cities. Cases of appendicitis terminated in one of three ways: spontaneous recovery, death of the patient from general peritonitis, called "inflammation of the bowels," or development of a walled-off abscess. Dr. Barton performed the first appendectomy in that part of New York State.

The surgical equipment given to Dr. Barton by his father was what was known as a general operating set, quite inadequate for many operations.

This equipment was increased by purchase and by the invention of other instruments by the young doctor. Essex boasted an expert blacksmith who could forge anything, a real instrument manufacturer. The blacksmith forged a complete set of retractors which Dr. Barton finished, polished by hand, and then had nickel-plated.

In 1891 and for years afterward, physicians were rarely engaged to attend patients during confinement, it being assumed that a doctor could be obtained if necessary, so that many deliveries occurred with no other attendants than relatives or neighbors. The administration of anesthetics was strenuously objected to, so that forceps deliveries were rare. It was due to Dr. Barton's experience with this type of case that he originated the Barton forceps, although he did not put the idea into effect until later. It was this instrument that made him famous all over the world, since it decreased infant mortality

in what is called "high transverse arrests" from 20 to less than 1 per cent.

The practice of medicine and surgery under the conditions described was carried on by Dr. Barton over a period of twenty-three years. During these years, in all surgical operations in the towns of Essex and Clinton counties, Dr. Barton as the attending physician administered the anesthetic and, except in one instance, Mrs. Barton was the sole assistant.

When the Champlain Valley Hospital was opened in Plattsburgh in 1910, Dr. Barton was asked to accept an appointment to the surgical staff with a three-month service each year. He accepted, and during the next two years commuted daily for three months between Willsboro and Plattsburgh, making many extra trips. He then moved to Plattsburgh and remained in practice there until his death.

In 1917 Dr. W. S. Buck, the radiographer at the Champlain Valley Hospital, went into the Army, and asked Dr. Barton to substitute for him in the x-ray department during his absence. Dr. Barton became so interested in the work that he kept up with the advances made in x-ray science and was asked to take charge of the x-ray department at the Physicians Hospital. He held this position for the remainder of his life, in addition to serving on the staffs of both hospitals.

As a result of the interest he had in mechanics, supplemented by the training received at Cornell, Dr. Barton was able to devise instruments and appliances for personal use and for the hospitals, both in Plattsburgh and elsewhere. These were as follows: an ether dropper, the salient feature of which was the use of a needle-valve by which the drop rate could be regulated to obtain the desired air-ether rate for any depth of anesthesia; a folding all-metal Balkan frame made of gas pipe by the hospital mechanics in the hospital shop to replace the old wood frame; the Barton obstetric forcep; a modified Kirschner clamp for use with Kirschner wire in the treatment of fractures of the long bones; a hand-operated drill with telescoping attachment for placing the Kirschner wire; a Rongeur bone forcep with multiple-lever construction, increasing the cutting power seven times; a Liston bone forcep with multiple-lever construction; a rib shear with multiple lever construction for single-rib resecting of all ribs including the first for thoracotomy; a self-retaining vaginal retractor; a uterine dilator; a fracture frame for the reduction and immobilization of beveled, spiral, and comminuted fractures of both bones of the leg; a drill guide for drilling an osteoplastic skull-bone flap at 45 degrees for suturing with rustless steel alloy wire; a forcep for twisting the wire at a desired tension; a skull tong for the treatment of fracture dislocations of the cervical spine by traction suspension. Some of the instruments were made in America and some in Germany, and were illustrated in manufacturers' catalogues.

Dr. Lyman Guy Barton, Sr., died in Plattsburg on November 21, 1944, five weeks after the death of his wife. Both are buried in the family plot in the Willsboro cemetery. An editorial in the *Plattsburg Press-Republican* at the time of Dr. Barton's death well expresses the loss felt by his friends and associates:

"Not only has Clinton County but all humanity suffered a distinct loss in the death of Dr. Lyman Guy Barton, Senior, whose barque of life drifted into that great unknown sea at his home in this city early yesterday morning. That his loss is keenly felt and deeply deplored was shown by the expressions of regret that were heard on every hand when the sad intelligence was conveyed. For more than half a century Dr. Barton had been active in the practice of that most unselfish of all professions, medicine, and not only that, but had he chosen to take his talents to the market places of the world, his name would have stood higher and on a different worldly plane among those whose lives have been dedicated to the benefit of humanity.

"The great career of usefulness that was Dr. Barton's has not ended in death, for he has passed on gifts of his inventive genius that will be used for all time for the benefit of mankind. His object in living was not to lay up stores of riches for himself, but to enrich the world with the priceless funds of knowledge which will go down through the generations. Behind his brusque but gentle manner and kindly speech he possessed a persuasiveness and forcefulness that fitted him for the accomplishment of great things —how great, time alone shall prove.

"Dr. Barton was a man for whom naught but good could be said. He has left this world a richer place because he was such an integral part of it."

CARLYLE ON HEALTH

The healthy know not their health, but only the sick.—*Thomas Carlyle, in Tuberculosis Clip Sheet, Dec. 1945*

CONGENITAL MALFORMATIONS AND BIRTH INJURIES AMONG THE CHILDREN BORN IN NEW YORK STATE, OUTSIDE OF NEW YORK CITY, IN 1940–1942

J. V. DePorte, Ph.D., and Elizabeth Parkhurst, S.M., Albany, New York

(Director and Senior Statistician, Division of Vital Statistics, New York State Department of Health.)

THE adage coupling child-bearing with child-burying epitomizes the experience of centuries and was not generally questioned until the development and application of what have come to be considered elementary measures, such as the pasteurization of milk, the protection of water supplies, and immunization against diphtheria, demonstrated the preventability of a great number of deaths in infancy.

Only a generation ago the natural increment of our population was decimated annually, one out of every ten babies born in the original Registration Area[1] dying from congenital insufficiency, disease, or accident before reaching the first year of life. Now the mortality in the same area has dropped to about one in every twenty-nine births. These figures are evidence of the remarkable progress which has made the American record one of the most favorable in the world. Theoretically, infant mortality has an irreducible minimum, but that further improvement is attainable, even in terms of our present medical knowledge, is demonstrated by the fact that in 1938, the latest prewar year, the infant mortality rates in Australia, the Netherlands, New Zealand, Sweden, and Switzerland were lower than in continental United States.

Most of the reduction in the infant mortality in this country has occurred among babies who weathered the first month of life. In New York State, for example, the neonatal mortality (under one month) was 41 per 1,000 in 1915 and 23 in 1942, a decrease of 44 per cent, while the mortality between one month and one year dropped from 57 to 9, or 84 per cent. Putting it in another way, in 1915, of every 100 babies who died before reaching the first year, 42 were under one month of age; by 1942, this proportion had risen to 72 per cent. It was, therefore, logical for individuals and organizations who were concerned with child and maternal welfare to direct their attention toward the causes of neonatal mortality, and especially congenital malformations and birth injuries. In this connection, it is of interest to quote from a statement by an eminent pediatrician, the late Dr. Henry L. K. Shaw:

"Our knowledge of the frequency and character of congenital malformations is very meager and inaccurate and is obtained mainly from death certificates and hospital records. The statistics so derived relate only to malformations which are associated with deaths in the first few weeks of life. For example, babies born with harelip or cleft palate do not die from the malformations and we have no reliable or definite knowledge of the frequency of these conditions. Congenital heart disease is, perhaps, more common than is generally accepted, but we have no reliable data from a large number of births.

"Obstetricians and pediatricians are concerned with problems of neonatal mortality and morbidity. Statistical study of all cases of malformation, both of those who live and those who die, would give us definite knowledge of the frequency, location, and character of such conditions. A study of birth injuries to babies born, not only in hospitals but in homes, might point out ways and means to avoid such accidents and materially decrease the present high neonatal mortality."[2]

To make possible a continuous study of congenital malformations and birth injuries, the New York State Department of Health placed on the reverse of the birth certificate the questions: Did baby have any: (1) Congenital malformation? . . . Describe. (2) Birth injury? . . . Describe.

The physician in attendance at the birth is asked to answer these supplementary questions with the understanding that they do not constitute part of the official certificate, will under no circumstances appear in certifications or transcripts issued by the Department, and that the information supplied will be considered confidential. It is gratifying to find that answers are entered on more than 90 per cent of the certificates, the proportion being equally high in urban and in rural places.

The purpose of this paper is to summarize briefly the data for infants born in 1940–1942. In this three-year period the Department received 300,795 certificates of live births, answers to the supplementary questions being given on 273,604 certificates.

[1] The area included the District of Columbia, New York, and nine other states in which the registration of births was at least 90 per cent complete.

TABLE 1.—MALFORMATIONS AND BIRTH INJURIES RECORDED ON THE BIRTH CERTIFICATES OF CHILDREN BORN IN NEW YORK STATE, OUTSIDE OF NEW YORK CITY, IN 1940–1942

Children with congenital malformations or birth injuries	5,385
Children with congenital malformations	3,180*
Congenital malformations, total	3,635
Spina bifida	460
Hydrocephalus	152
Meningocele and encephalocele	68
Anencephalus	93
Other malformations of the central nervous system	39
Malformations of the heart	142
Other malformations of the cardiovascular system	4
Malformations of the digestive system	125
Malformations of the genitourinary system	52
Monstrosity	11
Hernia	54
Abdominal evisceration	40
Malformations of the head	6
Malformations of the eye	25
Malformations of the ear	23
Malformations of the nose	7
Malformations of the jaw	4
Achondroplastic dwarf	12
Osteogenesis imperfecta	5
Scoliosis and other spinal deformities	5
Torticollis	9
Congenital dislocation of the hip	4
Clubfoot	584
Other foot deformities	109
Deformed leg or knee	34
Deformed or underdeveloped hand or arm	82
Hand, foot, arm, or leg missing	29
Adactylism, polydactylism, syndactylism	278
Harelip, cleft palate	336
Congenital tumors	77
Hemangioma and nevi	79
Developmental defects of the external genitalia	264
Defects of the superficial tissues	130
Tonguetie	99
Cyanosis, cause unknown	39
Others and unspecified	155
Children with birth injuries	2,246†
Cerebral hemorrhage	370
Other head injuries (except forceps marks)	223
Fractures	169
Injury to the brachial plexus	128
Facial paralysis	297
Hematoma	113
Forceps marks, abrasions, contusions	721
Asphyxia	99
Others and unspecified	126

* 41 children also had a birth injury.
† 41 children also had a congenital malformation.

TABLE 2.—MALFORMATIONS AND INJURIES AS CAUSES OF NEONATAL MORTALITY AND AS RECORDED ON BIRTH CERTIFICATES

Cause of Death	Deaths Under 1 Month	Question on Corresponding Birth Certificate Answered	Child Had Malformation or Birth Injury	Child Had no Malformation or Birth Injury
All causes	7,638	6,818	1,376	5,442
Congenital malformations	1,209	1,103	666	437
Hydrocephalus	164	158	153	5
Spina bifida	159	151	145	6
Anencephalus	83	78	78	..
Other malformations of the central nervous system	47	41	36	5
Malformations of the heart	468	416	117	299
Other malformations of the cardiovascular system	5	5	2	3
Malformations of the digestive system	198	177	79	98
Malformations of the genitourinary system	20	19	10	9
Other malformations	65	58	46	12
Injury at birth	1,718	1,566	477	1,089
Intracranial or spinal hemorrhage	621	575	288	287
Other intracranial or spinal injuries	58	55	28	27
Other injuries at birth	1,039	936	161	775
Other diseases peculiar to the first year of life	4,073	3,588	194	3,394
All other causes	638	561	39	522

Table 1 shows the number of children on whose birth certificates appeared a statement of a malformation or a birth injury. Children with both a malformation and a birth injury, of whom there were 41, were counted under each heading. In a considerable number of cases more than one malformation was reported by the attending physician. This explains the difference between the number of children with malformations (3,180) and the number of distinct cases of malformation (3,635).

Of all the children who were born in the three-year period, 7,638 did not survive the first month. To measure the completeness of reporting and the recognition of the specified conditions at birth, the causes of death of these children were compared with the statements on the corresponding birth certificates. Answers to the question on malformation and birth injury were found on 6,818 of these certificates, *but were affirmative on only 1,376.* A comparison of these affirmative statements with the causes to which the deaths of these children were ascribed, arranged in International List order, appears in Table 2.

According to the death records, 1,209 children under one month died from a congenital malformation, and yet the question on malformations was answered in the negative on 36.1 per cent of the corresponding birth certificates. Failure

TABLE 3.—CONGENITAL MALFORMATIONS AND BIRTH INJURIES AS A FACTOR IN INFANT MORTALITY

	Deaths per 1,000 Live Births		Deaths 1 Month to 1 Year per 1,000 Children Surviving 1 Month of Age
	Under 1 Year	Under 1 Month	
All children born in 1940–1942	37	25	12
Children with no mention of congenital malformation or injury on birth certificate	32	21	12
Children with a statement of congenital malformation entered on birth certificate	356	280	106
Children with a statement of birth injury entered on birth certificate	232	223	12

TABLE 4.—REPORTS TO BUREAU OF MEDICAL REHABILITATION OF ORTHOPEDIC MALFORMATIONS AND BIRTH INJURIES AMONG CHILDREN WHO SURVIVED THE FIRST YEAR OF LIFE

	Number of Children Not Known to Have Died During the First Year of Life	Reported to Bureau of Medical Rehabilitation	
		Number	Per Cent
Total	1,206	243	20
Spina bifida and club foot	19	3	16
Spina bifida only	73	16	22
Club foot only	393	107	27
Harelip, cleft palate	254	76	30
Adactylism, polydactylism, syndactylism	214	10	5
Foot deformities other than club foot	64	8	13
Deformed or undeveloped hand or arm	41	4	10
Erb's palsy	88	14	16
Congenital dislocation of shoulder, elbow, knee, ankle	6	. .	. .
Hand, foot, leg, arm missing	16	2	13
Spastic paralysis	9

to recognize the condition at birth was proportionately greatest for malformations of the heart, the question on the birth certificate in regard to malformations being answered in the negative in 64 per cent of the birth certificates of the children whose deaths were ascribed to it. On the other hand, practically all cases of anencephalus, hydrocephalus, and spina bifida from which the children died were recognized and entered on their birth certificates.

The deaths of 1,718 children under one month of age were ascribed to birth injury, but on 63.4 per cent of the corresponding birth certificates the question in regard to injury was answered in the negative. The percentage of negative answers was 46.2 for intracranial or spinal hemorrhage, 46.6 for other intracranial or spinal injuries, and 74.6 per cent for all other types of injury.

On the other hand, 233 children with a malformation or injury recorded at birth died from a different cause: 194 from "other diseases peculiar to the first year of life," and 39 from "all other causes."

Further examination of the infant death certificates showed that, of the 3,180 children who were born in 1940–1942 with a congenital malformation, 1,132 died before reaching the first birthday, 79 per cent of the deaths occurring within the first month. Of the 2,246 children with a birth injury, 521 died within the first year, 96 per cent of the deaths occurring within the first month.

Table 3 shows the mortality under one year among all children who were born in upstate New York in 1940–1942, and among those with or without a congenital malformation or birth injury reported on the birth certificate.*

Thus, during the first month of life the mortality among children with a reported congenital malformation was thirteen times and among those with a birth injury eleven times that among children reported to have neither a malformation nor a birth injury. For the rest of the first year, children with a congenital malformation were still at a great disadvantage, the mortality among them being nine times as great as among children without a malformation or injury. The higher risk for children with a birth injury was concentrated in the first month; after the first month the death rate among them was the

* Although some of the children who were born in upstate New York may have died elsewhere before reaching the first year of life, the number could not possibly be large enough to affect the death rate appreciably.

same as among children without malformation or injury.

The Bureau of Medical Rehabilitation of the New York State Department of Health reviewed the statements on the birth certificates and segregated those which it considered as orthopedic.* A number of conditions which might become orthopedic, but which were too indefinite as described or might clear up more or less spontaneously, were excluded. Among these are lacerations or bruises, facial paralysis, and cerebral hemorrhage, which might or might not result in spasticity. Fractures were considered nonorthopedic and surgical—in other words, as acute cases which should be taken care of within a definite period of time. Growths also were excluded because of the uncertainty as to whether they might or might not result in orthpedic conditions.

This separation into orthopedic and nonorthopedic conditions does not necessarily differentiate between conditions which require orthopedic care and those which do not. The main reason for such a separation in this paper is to make possible a comparison between the statements on the birth certificates and the information obtained by the Bureau of Medical Rehabilitation from clinic and nursing services, schools, applications for State aid, and questionnaires sent at intervals to hospitals treating orthopedic cases.

Children with orthopedic malformations or birth injuries whose mothers were residents of upstate New York numbered 1,784; of these, 399, or 224 per 1,000, died within the first month and an additional 179, or 129 per 1,000 survivors, died before the end of the first year.

The Bureau of Medical Rehabilitation had reports on only 24 of the 578 children who died within the first year. Of the 1,206 children who were not known to have died, only 243, or 20 per cent, were reported to the Bureau. Their distribution according to type is shown in Table 4.

Among the indicated types of malformations or injuries with a frequency of ten or more, the reporting ranged from 0 for the deformed or underdeveloped leg, ankle, and knee to 30 per cent for harelip and cleft palate.

On the other hand, the Bureau had reports on 233 children with orthopedic defects which were not mentioned on the birth certificates: on 52 certificates the question on malformation or birth injury was not answered; on 170 the infant was stated to have no malformation or birth injury. The remaining 11 specified nonorthopedic defects. The distribution of the 233 cases according to type is shown in Table 5.

Summary

In 1940–1942 congenital malformations were reported on 3,180, and birth injuries on 2,246 of the birth certificates filed in the State of New York, outside of New York City. That many cases of malformation or injury were not recognized at birth or not reported by the attending physician is demonstrated by a comparison of the causes of death of children under one month with the statements on the corresponding birth certificates, and likewise by a comparison with the Crippled Children's Register. On this basis a minimum estimate of malformations would be twice and birth injuries four times the reported figures. The actual numbers are undoubtedly higher because of the unreported conditions which may disable or incapacitate the child but rarely, if ever, cause his death.

Congenital malformation multiplies by at least 13 the risk of a child dying in the first month of life and by 9 at one to eleven months. Birth injury raises the risk of death elevenfold during the first month, but has no effect on the mortality one to eleven months.

Public and private agencies had knowledge of 243, or only 20 per cent, of the 1,206 children with congenital malformations or birth injuries of an orthopedic nature who were not known to have died during the first year of life.

* Grateful acknowledgment is made to Miss Elizabeth Brezee, Assistant Statistician, for reviewing statements of malformation and injury on the birth certificates and classifying them into orthopedic and nonorthopedic conditions in accordance with the definitions and procedure of the Crippled Children's Register of the State.

"FERTILITY DIFFERENTIAL"

If you're interested, Census has a new and modest little document on the subject. Runs 265 pages. Weighs about a pound. And you can find out such tidbits as that "smoothed figures" in one of the tables "were computed by fifth difference osculatory interpolation"—and that women migrating from urban to rural areas are somewhat more fertile than women migrating from rural to urban areas. Report has something to do with the sociologic phase of the "war effort" probably—but Washington wags suggest it's Spring!—*Washington Closeup; March, 1945*

CLAMS

Harold Ickes (Interior) has taken over the mud in which the famous Ipswich (Massachusetts) steamers grow (for a bird sanctuary)—and the Essex County area is in an uproar. Biggest losers seem to be the hundreds of clam diggers now out of jobs—the thousands of steamed clam eaters at shore dinner joints along New England's coast (Ipswich clams were tops)—and one poor chap who seems to have been cut off from his privy by the rather arbitrary line which government surveyors cut through his property.—*Washington Closeup, March, 1945*

REHABILITATION OF DISCHARGED SOLDIERS

B. Liber, M.D., Dr.P.H., F.A.P.A., New York City

(Director, the Mental Hygiene Clinic, New York Polyclinic Medical School and Hospital)

THE Rehabilitation Plan in New York City was started by the War Department in July, 1943, at the Selective Service Headquarters and was discontinued on April 1, 1944, when it was incorporated into a larger agency, the Veterans' Service Center.

The original plan consisted of social workers and volunteer physicians and was connected with the United States Employment Office. In its present form the doctors work in about the same way.

Men who are inadequate for military duty and who have been discharged are questioned and examined by physicians, who decide whether the candidates for jobs are able to work, and if so what kind of work they are capable of doing. Diagnoses are made and recommendations are offered regarding the most suitable temporary or permanent occupation or training course. Often the exserviceman points out his own desire, and the doctor expresses his opinion whether the candidate's health condition permits him to follow his wish.

The military discharge paper never indicates the trouble from which the man has suffered while in the service and the reason for his discharge, except by symbols known to members of the medical corps only. He may have spent several months in a military hospital and may have been treated there successfully or unsuccessfully.

Service medical records may probably be obtained, if the above mentioned center could afford the time to wait for them, which it usually cannot.

In the first phases of conscription the discharge slip carried by the man bore the diagnosis naming the man's disease, physical or mental, which was unfair, as it often made it impossible for him to find employment.

The present method, consisting of not mentioning any disorder, is a forward step as far as the exserviceman's interest is concerned, but it makes the task of the rehabilitation physician more difficult. However, the examiner may learn of the condition from other sources—from the man himself, if he is intelligent enough, or from a letter from one of his officers to his family or to his civilian doctor, or again, from some certificate "to whom it may concern," recommending the dismissed soldier and saying approximately that, although so-and-so had to be discharged, he always performed his duties willingly, his conduct was fine, and he will be useful in civilian life.

When a diagnosis is mentioned or the exserviceman learns it, it is usually "psychoneurosis." This seems to be the favorite or most acceptable one to Army doctors.

The majority, almost the totality, of the discharged men have not had an opportunity to be sent abroad.

The largest number of cases are physical, and many have been caused by injuries or illnesses acquired in childhood or adolescence and have become more evident as a result of camp requirements or activities. Indeed, the rehabilitation office is swamped with those discharged men who doubtless were ill before entering the armed forces. One feels that the number of rejections or discharges could almost be halved if no errors had been committed at the induction end, which is an impossibility. Lately, since I have been working as an examiner at the induction center also, I can blame no one. Considering the brief time unavoidably allotted to the examiners in general, and especially to the neuropsychiatric interview, the work is magnificent.

Only about 10 per cent of the cause for discharge is mental, and it chiefly represents borderline disturbances or situations which are transitions between mental health and mental disease, and in which preventive work might have achieved a beneficial effect. The neuroses, of course, are prevalent and they are followed by the various forms and shades of schizophrenia. Then come the manic-depressive cases, which are more rarely encountered. The forementioned is merely an estimation, viewed from the position of a rehabilitation worker and not from the standpoint of the medico-military man, and perhaps not fully agreeing with official statistical figures as they exist.

I have not seen any mental defectives among the discharged men so far, probably because they are more easily detected and eliminated at the induction or preinduction examination, and therefore failed to enter the military services in large numbers.

A good many men who are not strictly employable, and who still suffer from disabling defects or ailments, clamor for jobs and implore the examiner to disregard their physical or mental condition. This is, of course, due to their economic circumstances and to the lack of security within their families.

Presented at the annual (centennial) meeting of the American Psychiatric Association, May, 1944, Philadelphia.

If I were asked how many are being rehabilitated, I would have to reply that it depends on the meaning of rehabilitation. If employability is the criterion—and that is the principal purpose of the Veteran's Service Center—I can safely state that the great majority have been returned to industry, although but few of those afflicted with illness of any kind have been cured.

The examples cited in this paper represent a sort of cross section of the mental conditions which have come to the attention of this examiner within the first eight months of the rehabilitation work.

Case Reports

Case 1.—Perhaps the simplest case was that of the boy who complained for years of a vague pain sometimes in one shoulder, sometimes in the other, although he performed his duty as a shipping clerk correctly. At least, his work was satisfactory both to himself and to his employer. When asked about his health, he had told the inducting physicians about his trouble, but they disregarded it, perhaps rightly so. However, his military unit tried for eight months to make a soldier out of him—unsuccessfully. There was no convincing somatic disorder. There were neurotic elements which colored the subjective feelings or complaints and which the Army called "psychoneurosis." But they did not interfere in the least with this man's resumption of his old civilian job.

Case 2.—A man who, on an unusual occasion, had a spell of what was called "nervousness" and tachycardia, was discharged. The latter symptom was not present at our examination and the impression was one of full adequacy. Notwithstanding his possible failure at camp duties and judging from our angle only, he apparently could still serve Uncle Sam, which he too desired. At any rate, he could be very useful on the home front, where he was kept.

Case 3.—A man complained of rectal or anal pain. Nothing abnormal was found by the military physicians, and at our service the findings were also completely negative. He talked loud, trying to convince us that there was a disease, and he claimed that the Army doctor had called it a "nervous rectum." We sent him to a clinic where psychotherapy was tried with some success, at least temporarily. Several weeks later his condition was still comparatively good, and he accepted the suggestion to find employment.

Case 4.—A young man, although always working and never missing a day prior to his induction, said that ever since he could remember he had been "nervous," often upset, and he woke up at night with a feeling that something in him was "jumping." Sometimes he was dizzy and "everything in his body was sick." There were other familiar complaints. In childhood he could not get along with his schoolmates or with the members of his family. At a later age the only place where he felt comfortable was his shop because there, due to the nature of his job, he happened to be more or less isolated from the other workers. He called his condition "emotional unbalance," and claimed that his Army doctor told him that he was psychoneurotic. As he didn't care to serve, he described his symptoms to the preinduction examining physician as elaborately as he knew how, which did not interfere with his being accepted. But he admitted that his description, though true, was too well rehearsed to be trusted. Later, however, the Army discharged him.

Case 5.—A man of 37 felt ill and entirely disabled during his military service, although the only so-called abnormality found was a systolic blood pressure of 100. He knew about it and it scared him. He may have been a genuine neurotic, but neither his past history, speech, nor behavior revealed it. The fact is that in civilian life he was as normal as the average person. He asked us for a job, obtained it, and worked satisfactorily from all points of view.

Case 6.—Another man hesitated in his speech and was slow in answering. He had been unable to follow orders or to do what was assigned to him. After some months in the hospital he was finally discharged. He had had the same mental disturbance before induction, but there was only his affirmation, as his behavior had been apparently normal. In civilian life, however, although not very sociable, he had been sufficiently adjusted and now, after his discharge, he could easily be sent back to work.

Case 7.—On the other hand, a man who, according to the official letters addressed to his wife, was suffering from paranoid dementia praecox, as diagnosed by a board of experts, denied this contention after his discharge and applied at our service for employment. Of course, he was referred to the proper institution for observation and, if necessary, for therapy, and, willy-nilly, he accepted our advice.

Case 8.—A boy of 21 functioned normally in every respect except that he was a somnambulist. No harm had ever resulted from that disorder, and he had failed to mention it to the inducting officers, perhaps intentionally. While that defect will not interfere with his ordinary life and no real rehabilitation effort was needed in this case, it was correctly regarded as a nuisance by the Army physician.

Case 9.—A patient suffering from a light form of manic-depressive psychosis, being primarily depressed, with a feeling of futility and self-depreciation, spent ten months in an Army psychiatric hospital before being discharged. He was exactly as disordered mentally as prior to his induction. But, during the recruiting process, as he was neither enthusiastic to join nor strongly disinclined from serving, he made no effort either way. Now, back in his old environment, while from time to time disabled, as a whole he managed to be semiadjusted and gainfully employed.

Case 10.—Next is a man whose defect, probably enhanced in the service, became evident after a few weeks among his comrades in camp. He was discharged because of his quarrelsomeness. He claimed that, while in his school years he frequently got into trouble, this did not happen at a later age, in civilian life, probably because his oc-

cupation consisted of responsible work in an office, and was more or less secluded

Case 11—One man was discharged because of spells of petit mal, so was another who claimed to have had fits since he was hit on the head in 1934 while boxing, which became worse after a 'sunstroke" in camp Both made a good adjustment in civilian life, being able to work as before induction, in spite of their slight attacks

Case 12—A boy in whom no demonstrable ear or other organic disorder could be detected was discharged because of tinnitus But, after a relatively long service, he had some difficulty in becoming rehabilitated or adapted to nonmilitary surroundings

As a rule men with irregular sexual feelings or neuroses shun military service and do everything possible to escape it, because they know they can get into trouble there Nor does the Army want them, but sometimes they are caught in the net

Case 13—One homosexual, seized in the act in the vicinity of a camp, had a trial, was jailed, and was later dishonorably discharged This, of course, did not interfere with his return to a civilian occupation although he had to find a new firm Nothing daunted, he carried on his habitual intimate life—as would be expected

Case 14—Another, accused of the same sexual offense, was treated more generously He was pardoned and honorably discharged His misdeed was called a malady, 'psychoneurosis," which seems to cover many mental defects and faults of behavior Nor did he have any difficulty in readjustment He rehabilitated himself both to the job we found for him and to his old routine

Case 15—One man was discharged for bronchial asthma after a short period in the Army, but he told the rehabilitation examiner that the Army had overlooked his most important disorder the fact that he "trusted nobody," and that he found it difficult to work in a shop because he was afraid of his fellow-workers Of course, he had never had any friends and never played He was sent to an appropriate clinic

Case 16—A boy of 19, who had finished high school before induction, had been discharged because he became "nervous" after having spent forty-five days at sea without seeing land He was sometimes 'depressed," sometimes "irritable," but primarily moody and brooding He lost his appetite and much weight He was discharged, but he regretted it, because of a complete change of his feeling and behavior as soon as he set his foot on terra firma Indeed, no trace of the described mental state was noticeable, and he soon went to work at his old trade

Case 17—One man, who had been well prior to recruitment, became ill a few days before he had to present himself to his camp and was taken to a city hospital He vomited his food several times and later he had hematemesis and black stools Transferred to the Army hospital at Camp Dix, he stayed there a few weeks and was then discharged He had no opportunity even to put on a uniform He was entirely well when he came to the rehabilitation office He confessed that he hated to think of serving in the first place because he had just got married, and loved his wife dearly Was this the cause of his authentic, acute, though apparently temporary organic illness, for which no real diagnosis was ever made? Did his mind contribute anything to his symptoms or to the cause of his sickness? Was it all mental? Or was his mental state only a coincidence?

Case 18—We cannot express the same doubts about another man with a definite stomach ulcer who had been treated for it for a long time, but had not been cured He failed to attract the inducting examiner's attention to it because he did not want to be rejected He became ill in the Army camp and, after considerable treatment in a military hospital, was discharged He came to us with the request that he be re-employed, but his condition was such that we could not recommend it He was referred to a hospital instead Further investigation showed that under ordinary circumstance he was "all right," as he had said, and that each attack came as a consequence of some strong emotional occurrence.

Incidentally, in our center we meet many men who have been discharged due to duodenal or stomach ulcers, and we have all read lately about the increasingly large number of such cases among servicemen There may be a good deal of truth in the appealing theory that this disease has much to do with the mental and emotional state of the soldiers But may it be permitted to a psychiatrist to suggest that the change in the eating habits and the amount of food—particularly the heavy protein alimentation—may have their share either in the causative or contributory—or in both—factors of this illness?

Case 19—In camp during service a serviceman fell down from a window and hurt his head No great physical trauma resulted, but from that event dated his mental abnormality, which was designated by the name "psychoneurosis" in the Army, and which should be more correctly called nosophrenia—that is, a mental state preoccupied with illness This caused him to be discharged As soon as he came back to civilian life he readjusted himself and this center recommended him for a job

Case 20—Another boy, who apparently had always been well, became "nervous" and "mentally affected," because one of his friends was killed in the camp by a truck It seems that this other man, very tired on a hot summer afternoon, lay down and fell asleep in front of the truck, in its shade At 2 00 A M the vehicle, driven away in line of duty, went over his body and killed him—an extremely rare and unprecedented accident From that day on our exserviceman was nervous and depressed He was sufficiently ill to be interned in a military psychopathic hospital, where he stayed several months Then he was discharged Once out of

the Army, he recovered completely and was ready for a job.

Case 21.—The following case, the only one not taken from the rehabilitation center, is probably typical of many thousands. A man of 22 was a private who, after insulting and threatening his sergeant, had been dishonorably discharged. He seemed mentally normal and, despite our temptation to do so, the incriminating incident apparently could not be explained by any chronic disturbance or inherent tendency to a mental disorder. He had enlisted and served for two years. After leaving he regretted his conduct and the entire incident. He lived with his parents who were poor workers, and, although he did not want to be their parasite, as he put it, and although in the past, from the age of 16, he had always earned what he needed, now he could not muster the courage to go out and find a job. He felt bewildered, he said, as if he had received a real blow on his head and could not recover from it. Somehow he did not belong. He was a stranger. Anybody had the right to ask him what he was doing among civilians. True, this may indicate a schizoid trend that may have become more pronounced as a result of circumstances, but, from all our data, it had never manifested itself previously in a visible manner at all.

This is a state of mind encountered at present, in wartime, in many other—even honorably—discharged men under 25 and also among those rejected at induction. What has happened inside them? Except in the very practical individuals who think of nothing but their business and are glad to be back among their people, these boys are ashamed and perhaps also afraid. They, who ordinarily were sociable persons, suffer from a deep feeling of inferiority, of inadequacy, a lack of adjustment, a lack of sociability, partly because they are changed, but largely because the social background and the public opinion are different. Another important factor may be that these exservicemen had been too long under the influence of a modified environment and under superior protection to quickly bounce back into their old place in civilian society and readjust themselves there to greater personal responsibilities. At any rate, they are certainly in distress and in need of help and encouragement. The great majority are curable.

At our rehabilitation service, so far, we have seen but few men returned after participation in action on the various fronts. Each time they came they expressed a desire to go back to the battle areas.

Case 22.—One 20-year-old Jewish boy from New York's lower East Side, whose ship was torpedoed in the Mediterranean and who sustained a number of shrapnel wounds and a bad burn, was still limping with the aid of a cane, but was unhappy to be discharged. He had not seen a real battle. He had only spent ten days on a raft, together with thirty other men, until they were rescued. But now, not being allowed to return to the danger zone, he wanted an opportunity to learn a trade.

Case 23.—Another boy, 23, of Irish extraction and born and raised on the West Coast, had lived a year in New Guinea and was loud in his protests and angry at the authorities for his discharge. He did not care to admit that he had become quite ill in the tropical regions, and that he was not cured yet. All his pals were still there. He had not done a thing for his country. Could the examiner not help him to be reaccepted?

There are, by the way, patriotic and pseudo-patriotic reasons why men are eager to serve at any cost and why they will go out of their way to achieve their aim. This is not the place to go into that. I have made this matter the subject for another study. The mental state of such individuals may be normal or abnormal. But their insistence or enthusiasm does not correspond to the attitude of the ordinary serviceman, especially those over the age of 25—for that matter, not even to that of the average person in his family. The usual comment is simply this: "We don't like it, but when called, we must go and we might as well finish the job."

55 West 95th Street

MEDICAL MEN HONORED FOR CONTRIBUTION TO SAFE CHILDBIRTH

Two medical men, from diverse fields, have been honored by the Planned Parenthood Federation of America for their part in making childbirth more healthful, safe, and secure for American mothers.

Two $500 cash awards of the Albert and Mary Lasker Foundation were presented to Dr. John MacLeod, of the department of anatomy, Cornell University Medical College, and to Dr. Felix J. Underwood, executive officer of the Mississippi State Board of Health, at the Federation's twenty-fourth annual meeting dinner in the Waldorf-Astoria, New York, on January 24.

Dr. Richard Pierson, one of New York's leading obstetricians and chairman of the Federation's Medical Committee, presented the cash prizes, with a plaque and scroll, to the two men.

The award was given to Dr. MacLeod for his scientific research in the motility of human sperm cells—which should prove valuable, after further study, in the correction of infertility and the control of fertility in human beings. Dr. Underwood was cited for his state's expanded maternal health program, which includes planned parenthood as an integral part of its public-health service.

AN OUTBREAK OF EARLY SYPHILIS IN WESTERN NEW YORK STATE

BERWYN F MATTISON, M D , M P H ,* Kingston, New York, and
EARLE H HARRIS, M D , M P.H , Geneva, New York

(District Health Officer, Kingston, New York, and Assistant District Health Officer, Geneva, New York)

SINCE the early days of the present war reported cases of early syphilis have been increasing, especially among the "teen agers" and young adults Sometimes the value of intensive contact investigation of these cases, especially when no lesions are discovered, has been questioned The small outbreak to be described is an example of how productive such investigations may occasionally be when all agencies involved cooperate wholeheartedly

In December, 1942, two young men sought medical advice from private physicians because of genital lesions One was working in the city of Rochester and, after a diagnosis of syphilis was made by a positive darkfield examination, was reported immediately to the Rochester Health Department and in turn, as his residence was outside its jurisdiction, to the district state health office The other, in a rural area some 50 miles away, was similarly diagnosed and reported to another district state health office

These two patients, together with a friend of the first patient who subsequently sought care for a similar lesion, were interviewed regarding sexual contacts which had occurred during the sixty days prior to the onset of their symptoms as well as those which had occurred subsequent to onset of symptoms Altogether they named four contacts, one of whom had been previously known as promiscuous When she was interrogated, information leading to the identification of four others was secured All of these eleven persons were brought under medical supervision and nine were found to be infected, i e , seven in addition to the two original patients

Meanwhile, an apparently unrelated investigation was being carried on by the Rochester Health Department Thus followed the discovery of two other early cases through pre-employment serologic tests in a large industrial plant A total of seven recent contacts was discovered here, one of whom led back to the group which had been found earlier

These contacts were again outside the city, and the information was turned over promptly to the district state health office By interviewing this second group a final total of twenty five persons was named, of whom all but two were located and brought under a doctor's care (see fig 1) The results of their medical check-ups are given in Table 1 Only four of the twenty-three located had not been infected, and of the 19 cases discovered only one was not a recent infection All diagnosed cases were immediately placed under treatment and later followed regularly to prevent delinquency

TABLE 1.—RESULTS OF MEDICAL EXAMINATION

All Named Contacts	Total 25	Male 14	Female 11
Infected with early syphilis	18	9	9
Infected with late syphilis	1	1	0
Not infected	4	2	2
Not located	2	2	0

It is of particular interest to consider the way in which these patients came to be examined at the time a diagnosis was made Table 2 reveals that only about two thirds were prompted to see a doctor because of symptoms (11), while one third sought care after the urging of the epidemiologist (6), and two were picked up through routine industrial examinations

TABLE 2.—REASONS FOR EXAMINATION LEADING TO A DIAGNOSIS OF SYPHILIS

All Causes	Total 19	Male 10	Female 9
Symptoms	11	8	3
Contact investigation	6	2	4
Routine	2	0	2

This emphasizes again that not all patients with early syphilis will note their symptoms and that even patients with recognizable symptoms may not seek medical advice because of them For, although 9 of the 10 male patients had either genital or skin lesions (the tenth case was of over a year's duration), only 5 of the 9 women had any such history None of the latter had recognized genital lesions, merely secondary rashes And 8 of the 19 might have failed to see a physician at all had it not been for the contact investigations and the routine pre-employment examinations

Discussion

Our present concept of the maintenance and spread of syphilitic infection is one of small, interconnected epidemics, usually involving one or more promiscuous persons who serve as focal points The need for investigation and control of these more flagrant cases is obvious However, it is not always so apparent why similar

* Assistant District Health Officer Rochester New York at the time the investigation was reported

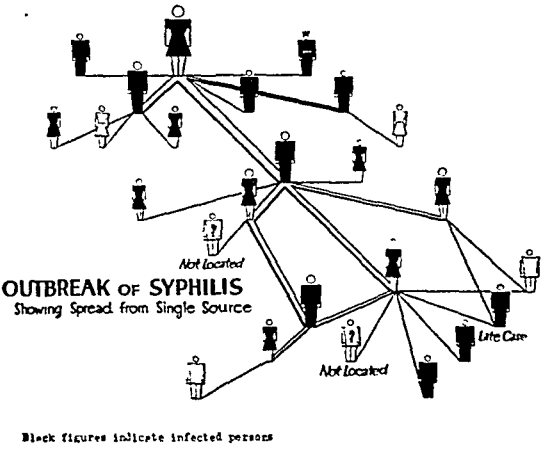

FIG. 1

investigation should be carried out on the isolated patient, known not to be promiscuous, who is being treated in the doctor's office or clinic.

In this latter instance an interrogation of the patient regarding his probable source of infection and subsequent contacts may prove much more important than the rather meager information at first implies. For, like a small piece of a jigsaw puzzle which gives the key to placing several other larger pieces, the naming of one other infected person may lead directly to the location of several.

Assembling the complete picture of a localized outbreak such as the one here reported is necessarily dependent on prompt and accurate reporting by the private physician. It is not always easy to determine the stage of disease in the absence of current genital or skin lesions, yet on this point must depend our estimate of the degree of infectiousness and the approximate date of infection. A careful history regarding genital and oral sores, rashes, and dates of sexual contact will frequently help. In the absence of any such history, a previous negative blood test (premarital, prenatal, employment, induction, routine hospital, etc.) within a year or two preceding a positive test may provide the necessary clue.

The diagnosis of congenital syphilis in the adult simply because there is no history of a recognized lesion or because the patient denies sexual relations on his first interview is extremely hazardous. Unless characteristic stigmata are discovered or a definite history of parental infection is secured, we probably should assume that the disease is acquired. Not only contact investigation but treatment regulation must be based on the correct diagnosis of the type of infection.

The private physician, industrial physician, local and state health departments must all work together to secure the best results for community and individual patient. Prompt, accurate reporting of cases and intensive epidemiologic investigation can be expected to get more infectious cases under treatment earlier, thereby decreasing the hazard to the community as well as improving the future outlook of patients who might otherwise have come under treatment later or not at all.

SNACK CARTS—A NEW IDEA IN SCHOOL FEEDING

The school feeding program in the City of Vanport, Oregon, is believed to be a factor in speeding production in this shipbuilding community. Children of workers are well-fed and well-cared for, enabling labor to stay on the job regularly over long periods of time.

Describing the program in *Nutrition News*, Miss Elsie Maxwell states that in Vanport, where she directs child feeding in the city schools, parents are away from homes for many hours a day or sleep at unusual hours. Houses are crowded, and cooking, refrigeration, and storage facilities are very limited.

These irregularities throw a heavy responsibility on the schools to provide rest, food, study, and play for unusually long hours as well as night care and meals for children of night workers. Several schools open at 6 A.M. and serve a hot breakfast to children. Light morning lunches, balanced noonday lunches, and afternoon snacks are served in all schools.

Each day beginning at 2:15 P.M., snack carts filled with fresh nutritious sandwiches, fruits, ice-cream bars, milk, and fruit juices, go into the school rooms. All items are priced five cents and children are permitted to buy whatever they choose. The majority select one item, many buy two, and a few rely on snack-cart offerings for a complete afternoon lunch.

Although there are no statistical data to prove the value of this feature, according to Miss Maxwell the abundant vitality and outward appearances of good health and growth of the children have led to the assumption that much is derived from it in terms of nutrition. It has reduced after-school loafing at nearby pop and hot-dog stands and drug stores, and the small margin of profit has helped to balance the budget which is somewhat out of line with that for the usual school lunches. Finally, there is the satisfaction of knowing that no child goes home hungry for lack of nutritious food.—*Health News, Jan. 29, 1945*

METALS OF MEDICAL IMPORTANCE USED IN THE AVIATION INDUSTRY

W D Schmidt, M D , Smithtown Branch, New York

(*Plant Physician Republic Aviation Corporation, Farmingdale, New York*)

AVIATION industry does not offer anything new in industrial hazards but, rather, a new combination of hazards which, due to the tremendous development of this industry during the last year, have become of importance to the general practitioner, who heretofore had no particular opportunity to take an interest in occupational diseases

Such terms as "dural poisoning ' are being used today, and unfortunately so, by physicians in general practice all over the country wherever planes are being built There is no such disease as "dural poisoning " and still this diagnosis is being made by nonindustrial physicians every day To me, the explanation for this is as follows the private practitioner has too little opportunity to familiarize himself with hazardous conditions in industry, and the information given to him through the channel of medical journals about industrial poisons does not arouse enough of his interest because it fails to show the practical importance of such poisons

Airplane manufacturing generally is assumed to be a metal industry, although it is less generally known that it also employs a great number of nonmetallic substances, such as plastics, fabrics, synthetic rubber, organic solvents, and many others Metal however, does play a predominant part, and therefore an attempt will be made to familiarize the general practitioner with the more important metals used in this industry, some of which may be of toxicologic importance

Up to very recently, only lead was recognized generally as a cause of occupational disease There is no doubt about the fact that lead is the most important of all toxic metals, although a considerable number of other metals are steadily gaining in importance as causes of industrial pathology

The ever increasing use of alloys has somewhat confused the picture and has made it difficult at times to attribute certain pathologies to one definite constituent Very often the toxic effects of one metal overlap the pathology caused by another metal constituent of the alloy, and possibly one metal potentiates the action of the other

Another complicating fact is that the same metal may, according to the physical or chemical state it is in, behave quite differently It appears that most metals are quite innocuous in the solid phase but are much more toxic in the gaseous phase, which would explain the fact that they cause systemic effects, mainly via the respiratory tract

When alloys are heated, those constituents with the higher vapor pressure may reach a greater concentration in the surrounding air than those with the lower one, even though their percentage in the alloy may be so small as to make them appear insignificant from the toxicologic standpoint as compared with the main constituent of the alloy

The salts of the metals, again, behave quite differently from the pure metals, which should not be astonishing inasmuch as they are really new substances with chemical characteristics of their own, which have nothing in common with either the acid radical or the metal ion entering into the formation of their molecules, just as table salt has the properties of neither chlorine nor sodium For this reason, I believe that the universally accepted method of testing for skin allergy for a certain metal by patch testing with a solution of one of its salts, for example, for nickel with nickel sulfate, has no scientific basis

Last the recognition of metal poisoning may be quite difficult inasmuch as most metal-fume poisonings manifest themselves with symptomatologies similar to common nonindustrial diseases

The following is a list of the metals and alloys most commonly used, giving their approximate composition

1	Stainless steel	18 per cent chromium 8 per cent nickel 73 per cent iron and less than 1 per cent carbon
2	Chrome molybdenum steel	Chromium molybdenum iron carbon percentages not known
3	Alloy 24-S	4 5 per cent copper 0 6 per cent manganese 1 5 per cent magnesium 93 4 per cent aluminum This alloy also called Alclad is covered on both surfaces with a layer
4	Alloy 2 S	
5	Alloy 5%-S	5 per cent magnesium 0.25 per cent chromium 97 5 per cent aluminum
6	Lead	Lead with a mixture of zinc Also as lead chromate
7	Kirksite	Zinc (mainly), aluminum copper magnesium
8	Cerrobend	Low melting point alloy containing 13 per cent antimony 87 per cent lead This is now being used in place of matrix an alloy which also contained cadmium

9.	Solder	60 per cent lead, 40 per cent tin
10.	Brazing wires	Principal components, copper and zinc
11.	Cadmium	Pure, as electrode in cadmium-plating and on cadmium-plated parts
12.	Chromium	As component of stainless steel and alloy 52-S, also as chromates, bichromates, and chromic acid. Sometimes as constituent of welding rods
13.	Magnesium	Pure and as component of alloys
14.	Zinc	As zinc chromate, and as constituent of kirksite, brass, brazing wires
15.	Copper	Zinc
16.	Brass	Alloy of copper and zinc

Pathology Caused by Metal Contact

The manifestation of clinical significance is contact dermatitis. Various metals have been reported as causes of contact dermatitis. Mercury, nickel, silver, antimony, zinc dust, and brass dust are accepted causal agents. Recently there has also been reported a "bronze-itch" due to magnesium-aluminum alloy.

Among the above-mentioned agents the following are being used in the aviation industry: nickel, as a constituent of stainless steel; zinc, as a constituent of "kirksite" and brass; brass; and magnesium-aluminum alloy, which may be either alloy 24-S (alclad) or alloy 52-S (dural), or "kirksite," all of which contain magnesium and aluminum.

We cannot help but feel, however, that these metals have, if any at all, only little significance as causative factors, since we had the opportunity to see hundreds of patients with dermatitis in this industry and were unable to find one who would show a positive reaction to the metal he was exposed to when patch-tested. One patient was found to be allergic to nickel sulfate but failed to give a positive reaction to metallic nickel or stainless steel. They will, however, have to be considered as potential causes of occupational dermatitis. A diagnosis of occupational dermatitis from any of them should only be made if patch tests with the suspected metal are positive and reproduce the typical lesion of the dermatitis from which the patient is suffering.

As far as the so-called "dural poisoning" is concerned, we were never able to arrive at such a diagnosis and in each case so diagnosed by the family physician we obtained negative patch tests with dural. Such dermatitis is usually caused by a great number of nonmetallic substances, both on and off the job, which may be, in some cases, zinc chromate used as pigment in spray paint, or so-called "fish oil," used as protective covering of metal sheets, or toluol, xylol, carbon tetrachloride used as cleaning and degreasing agents, etc.

The physician should ascertain the following diagnostic facts before making the diagnosis of occupational dermatitis:

Requisites: 1. The lesions appear at the point of maximum exposure and remain limited to the skin surface exposed.

2. There is actual exposure to the antigen at the time of the first appearance of the lesions.

3. Removal from the place of exposure should improve the condition and renewed contact should make it worse.

4. Patch test performed with the suspected agent should be positive and reproduce the typical lesion at the site of the test.

The following is a list of the more common substances used in the aviation industry capable of causing dermatitis:

1.	Chromates	Zinc chromate (in paint and sealing compound for gas tanks); dichromates (in chromate dip and sealing compound); chromic acid (in anodizing tank and chrome plating)
2.	Solvents	Toluol (paint, "wash-thinner," rubber cement, "bluing," etc.); xylol (in toluol *substitute, same as toluol);* naphtha (in toluol substitute, thinner for paint, in "Safety-Kleen" used in magnaflux, and in "wash-thi[illegible] "bakelite seaming [illegible] (in magnaflux and [illegible] and butyl acetate (in thinner for paint, dope, and lacquer); methyl-ethyl ketone (in thinner for paint); carbon tetrachloride; and trichloroethylene (in cleaning and degreasing operations)
3.	Oils	"Fish oil" (on dural sheets); cutting oils and oil emulsions (on machine operations); hydraulic oil; lubricating oil and grease
4.	Fumes	Nitrates and nitrous gases (welding and heat treat); fluorides and hydrofluoric acid fumes ("flux" in welding); cyanide and hydrocyanic acid fumes (cyanide heat treat and cadmium plating); chromic acid fumes (in "anodizing" and chrome plating)
5.	Acids	Hydrofluoric acid (flux in spot welding); chromic acid ("anodizing" and chrome plating); hydrochloric acid; nitric and sulfuric acids; acid fumes, as mentioned under fumes
6.	Metals	Zinc (in kirksite); nickel (in stainless steel); magnesium; dural (?)
7.	Resins	Plastics of all sorts; bakelite (in bakelite seaming compound and in paint); resins, other synthetics (in paint)
8.	Soaps	Cleansing soaps, particularly liquid soap and boraxo; oakite and wyndotte for degreasing; kelite, for degreasing; protective creams, if containing soap

For practical purposes, it is advisable to skin-test regularly unless the history gives a lead to some specific substance, with the following substances rather than with the individual component:

1. Paint, wet (primer and camouflage paint)
2. Paint, dry (primer and camouflage paint)
3. Dural, small square of metal, plain
4. Dural, small square of metal, covered with "fish oil"
5. Cutting oil
6. Oil emulsion
7. Wash-thinner
8. Carbon tetrachloride
9. Liquid soap

Different from contact dermatitis is the type

of pathology caused when metal penetrates into or under the skin, that is, when it causes a laceration or when retained in the tissues as foreign body or when metal dust is deposited into the depth of an accidental wound, in which case we would not deal with a plain allergic reaction of the skin but rather with a complex reaction due to trauma, possible bacterial contamination, foreign body reaction, chemical interaction between the metal and the tissue fluids, and possibly also an allergic factor The typical example of this type of pathology, and so far the only one known, is the reaction due to intracutaneous or subcutaneous penetration and retention of magnesium whereby a severe local inflammation is caused which shows a tendency to spread very much like a bacterial infection and which, sometimes, will go over into a chronic type of indurative inflammation with occasional acute flare-ups

This reaction has been reported quite often of late and goes under the name of "false gas gangrene" and is thought to be due to a chemical reaction between the metallic magnesium and the tissue fluids, with resulting liberation of gaseous hydrogen which will collect under the skin or mucous membrane in the form of gas bubbles

Judging from the chemical nature of magnesium, the occurrence of such pathology should not amaze us It would seem more amazing if other metals than magnesium such as aluminum, cadmium, and chromium, which occupy positions in the electromotive series of the metals very close to magnesium and which share its chemical instability, its tendency to replace hydrogen from its combinations and to form salts should not cause similar pathologic reactions No such occurrence has been reported yet, however

I also feel that there may be such a disease as "scratch dermatitis," i e , an allergic reaction of the skin due to introduction of an allergen which of course, may also be metal, into the skin by means of one or multiple scratches, in which the diagnostic patch test would not be conclusive It may be advisable to combine a scratch test with a patch test in cases when workers claim that their dermatitis started with metal scratches which became irritated and spread from there and in which the simple patch test is negative Such a "scratch-patch test" may throw an entirely different light on the existing pathology and certainly re-enacts more closely the actual conditions under which the contact with the allergen occurred

Chromates

Metallic chromium in its solid phase has probably very little toxicologic importance, although it might seem logical to assume that in some rare cases it could become the cause of a skin allergy, i e , dermatitis, similar to nickel dermatitis While chromium itself is inert, its salts, the so-called chromates, as well as dichromates and chromic acid, have an important position among those substances used in the aviation industry which are capable of causing serious pathology of skin and mucous membranes Chromium is used in four forms

1 Chromic acid, as electrolyte in "anodizing" and chrome plating

2 Zinc chromate and lead chromate as pigment in paints and as chromate dust on painted parts

3 Dichromates in the so-called "chromate dip" (treatment of cadmium bolts) and as component of "sealing compound" applied to gas tanks

4 Component of alloys, such as stainless steel (18 per cent chromium), chrome-molybdenum steel, and aluminum alloy 25-S (25 per cent chromium) Occasional constituent of welding rods

The ill effects of chromium appear to be limited to certain local reactions, except for the rare occurrence of fever and nephritis which have in some cases been blamed on chromium There also appears to be some controversy about causal relationship between lung cancer and chromium exposure Two main reactions occur

1 "Chrome-holes," which are slowly developing ulcers of skin and mucous membrane, with their site of predilection the exposed surfaces of hands, forearms, and face and the nasal mucosa (perforated septum without syphilis)

2 Allergic reactions dermatitis, asthma

If, in anodizing and chrome plating, the handling of parts is done by mechanical means and if the electrolytic tanks are adequately exhausted, the danger from contact with chromic acid should be minimal Nevertheless, workers do get chromic acid on their skin Since the ulcers develop slowly and often quite painlessly, the workers are convinced that the substance is harmless, and when the skin lesions occur, they are not, as a rule, blamed on the acid If fumes should escape from the electrolytic tank, in spite of the exhaust, the workers will complain about frequent nose-bleeds and they may develop ulcers of the nasal septum

Dermatitis is the most frequent pathology and can be quite disabling Considering the extent of exposure to the chromates and dichromates in the aviation industry, it seems amazing that the frequency is not greater than it actually is The explanation is probably this The majority of the workers have been working with these substances only for a short time and will become sensitized to the chromates only after prolonged

exposure, i.e., after three to six months or more. Therefore, more and more cases will have to be expected to occur in the near future. A contributory factor in the causation of dermatitis from zinc chromate and lead chromate is the defatting action of the solvents used in paint sprays.

As protective measures, this industry is using adequate exhausts and protective creams and clothing.

It also advises the use of plain vaseline in the nostrils of the workers exposed to chromic acid fumes and generally encourages greater personal hygiene, which is one of the most important factors in the prevention of dermatitis from the chromates.

Patients who have been found to be allergic to the chromates should not be exposed to this agent in the future unless properly protected. If the manifestation of the allergy was asthma, they should not be permitted to return to this exposure at all.

Systemic Metal Poisoning

The route of absorption of almost all metals is the respiratory tract, while the skin and the gastrointestinal tract play a negligible role as ports of entry.

In order to be absorbed through the respiratory tract, the metal has to be in the gaseous phase, i.e., in the form of a vapor. Poisoning may be acute or chronic. The typical representative of the acute form is the so-called zinc-fume fever, also called "brass-founders' chills," which is caused by zinc fumes, while the prototype of the chronic form is lead poisoning.

Metal-fume diseases have in common the characteristics of simulating nonindustrial diseases, such as a respiratory infection, in acuteness and lack of permanent changes. Lead poisoning and other chronic metal diseases, of course, are an exception to this rule. The fact that they show symptomatologies similar to those of common illnesses often makes it difficult to suspect and diagnose them, particularly if they occur during an epidemic of illnesses such as, for example, during a grippe epidemic.

Zinc.—Zinc is being used in the aviation industry in the following forms:

1. Zinc chromate, as pigment in the "primer," i.e., in the paint shop and wherever painting or paint spraying is done as well as in the processing of painted metal, in powder form.

2. As a constituent of kirksite, i.e., in the foundry where kirksite is melted and poured, in the grinding room where kirksite dies are ground and polished, and on the drop hammers where the dies are installed and used.

3. As constituent of brass, i.e., where brass pipes are worked upon.

4. As constituent of brazing wires, i.e., wherever brazing is done.

5. In electroplating where metals are plated with zinc as well as wherever zinc-plated metal is being cut or welded upon, as, e.g., if welding is done on galvanized pipe.

Zinc Fume Fever.—The symptoms are acute intoxication of short duration, i.e., twenty-four hours, rarely longer, and without permanent aftereffects or lasting disability. The symptomatology is as follows: severe chills, fever up to 102 F., irritation of the respiratory tract, causing dryness of the throat and a dry cough, nausea, headaches, and aches and pains in arms and legs.

This may be, and probably very often is, confused with a grippal attack, from which it can be differentiated, however, by the marked leukocytosis associated with this disease. This hazard is very actual in the foundry wherever brazing is done and wherever welding is done on galvanized material. Zinc dust, such as will be found in the foundry polishing room, may cause an aspecific irritation of the upper respiratory tract but will not cause systemic pathology.

Recently, there has been reported one case of unquestionable zinc allergy (dermatitis), confirmed by positive skin test, but this is probably a rare occurrence. If zinc is able, however, to cause dermatitis, it may also be capable of bringing on an allergic reaction on the mucous membrane of the upper respiratory tract, and I therefore believe that this zinc dust may become in some cases the cause, or at least an aggravating factor, of bronchial asthma.

Magnesium.—In the aviation industry a considerable amount of magnesium is being processed, both as plain metallic magnesium and as a component of such alloys as aluminum alloy 25-S (dural), alloy 24-S (alclad), and kirksite. Its toxic possibilities are four:

1. Pathology caused by retention of magnesium as a foreign body in and under the skin and mucous membrane, described above

2. Pathology caused by contamination of accidental injuries with magnesium dust, described above

3. Magnesium-fume fever, an analogue to zinc-fume fever. This is caused by exposure to molten magnesium and operations where magnesium oxide is formed. As a rule, magnesium is not poured in factories which only assemble planes and, therefore, it is not a hazard in the aviation industry except for one operation, i.e., magnesium welding. Since, however, the welding of magnesium is dangerous from the fire-hazard standpoint, it is usually done by only a limited number of very experienced welders and, therefore, the possibility for the development of

this disease is limited to a very small number of workers

Kirksite, of course, is being poured in this industry The magnesium content of this alloy is very small, however, in comparison to its zinc content The magnesium content of dural, which is 2 5 per cent, makes welding on this alloy harmless, at least from this angle

4 There have been reports suggesting magnesium as cause of abdominal cramps due to gastro-enteritis and of loss of weight and appetite

Cadmium —Solid cadmium also probably has very little toxicologic importance Its fumes, on the contrary, are extremely toxic

Cadmium-plated parts are examined for defects with the help of a magnetic device, the so-called "magnaflux," and when found defective, these parts have to be rewelded Such repair should be made only after "stripping" the cadmium from the parts by such methods as "sand blasting" or by a better method, dipping into hydrochloric acid In the hurry of high geared production, this stripping is often not done The rewelding is done on the still cadmium-coated parts, with resulting formation of heavy clouds of cadmium fumes which have a severe toxic effect when inhaled by the worker Such effects may be so severe as to cause sudden death, or if less so, may cause such symptoms as excruciating retrosternal pain, distressing cough, dryness of the throat, nausea, and vomiting I have had the opportunity to observe this symptomatology twice

The pathology which cadmium is capable of producing is reported to be the following edema and congestion of the lungs, hemorrhages into the lungs, chronic interstitial pneumonitis, damage to kidneys, spleen, and pancreas

Metal Fumes in Welding

Three types of welding methods are being used in this industry, namely, spot welding, gas welding and arc welding

1 Spot welding is of small toxicologic importance, since it produces a minimum of fumes and since, as a rule, no flux is employed in this operation It is done with the aid of a machine, employing high pressure and a current of high amperage

2 Arc welding is the fusion of two metals in the heat produced by an electric arc between the welding rod on one side and the metal to be welded on the other side This arc is created by a current of high voltage "Fluxes" are used in this operation for the prevention of oxidization of the metal surfaces and may be employed in any of the following three forms

(a) Application of the flux to the metal to be welded in paste form
(b) Dipping of the "rod" into a container with flux before use
(c) Coated "rods" In these, the flux has been applied to the rod before its purchase In arc welding, this is the prevalent method, while (*a*) and (*b*) are more commonly employed in gas welding

Prime function of the flux, in whatever form it may be used, is to provide a gaseous shield about the arc and the "weld" in order to prevent oxidization, and also to form a protective "slag" to cover the new weld Fluxes used in aluminum welding are mainly fluorides, while the coating of the welding rods may be any, or a combination of several, of the following substances silicon and titanium dioxide, aluminum, calcium, and magnesium oxides, iron, manganese, and calcium fluorides, and barium and calcium carbonates

Besides these inorganic compounds, any of the following substances may be used to bind the flux to the rod asphalt, rubber, resin, varnish, casein cellulose, and ethyl and sodium silicates

The welding rods themselves are mostly ferrous However, to make up deficiencies in the rod, in relation to the metal to be welded, substances such as manganese, chromium, and lead may also enter into the coating It is evident that all these substances are producers of fumes, some of which are highly toxic

Potential sources of injury from arc welding

(*a*) Generation of metal fumes These are the ones this paper is mainly concerned with Metals to be welded and welding rods are partially or totally volatilized under the heat of the arc and may, according to their toxicity, cause more or less severe attacks of metal fume fever
(*b*) Generation of fumes other than metal volatilization of substances used as fluxes, i e, mainly fluorides, and, of course, substances used as coating of welding rods
(*c*) Generation of nitrous fumes
(*d*) Generation of ozone
(*e*) Generation of carbon monoxide
(*f*) Exhaustion of oxygen from the air
(*g*) Generation of injurious rays

Metal fumes —The nature of the metal fumes depends on the nature of the alloy welded and on the metallurgic composition of the welding rod Metals welded are mostly steel, stainless steel, chrome-molybdenum steel, and wrought iron Chromium is the only dangerous component of these steels and there may be quite a possibility

for systemic chromium poisoning as well as for irritation of the eyes and the mucous membranes of the respiratory tract. Some of the chest pain, eye irritations, and chronic cough complained of so frequently by welders may be caused by those fumes. Iron fumes are probably nontoxic. Any of the components of the rod may also cause formation of toxic fumes, notably chromium, manganese, and lead, if present. Chromium has been mentioned already, while manganese is capable of producing severe and chronic nervous pathology, as, e.g., a type of ataxia. Lead will be mentioned under lead poisoning.

The particular danger of welding on cadmium-plated parts has been mentioned above. Similar danger is connected with welding on other types of plated metal, such as chromium-plated metal and galvanized iron (zinc).

The symptomatology caused by the irritation of the mucous membranes from chromium fumes is common to other fumes generated in the welding process, such as nitrous fumes, fluoride fumes, ozone, etc. It is, therefore, in most instances, hard to determine which substances are at fault, and by the same token, it is possible that several factors are involved at the same time in the causation of the symptoms.

3. In gas welding metals are fused in the flame of an oxyacetylene torch. Fluxes are used in this operation, mostly fluorides. Metal worked upon is mainly dural. Some of the hazards connected with this method are the same as in arc welding. Metal fumes form, however, to a much lesser degree because of the lower temperatures produced. There is also a lesser degree of formation of nitrous fumes and ozone, but a higher degree of formation of carbon monoxide and of oxygen depletion of the surrounding air. In addition to other hazards common to both types of welding, there is the possibility of production of toxic fumes due to impurities of the oxyacetylene mixture, such as phosphine and arsine.

Other uses of the oxyacetylene torch are the following: cutting of steel on the "oxypantograph," melting of lead and kirksite on the drop hammer, preheating of metal and flux for arc welding, removal of traces of cadmium from metal to be rewelded, and brazing—this is an intermolecular fusion of two metals by a third supplied by the "brazing wire," in the heat of a gas flame. Hazards of this operation are the same as in welding on galvanized parts (zinc).

Lead Hazard

Exposure to lead is considerable in two places, i.e., in the foundry, where the so-called "dies" are made, and in the material-preparation shop, where the dies are used.

Dies are forms of metal on which sheet metal is shaped. They are mostly used in groups of two, in which one is the negative of the other. The metal sheets are shaped under pressure between the male and female dies. As a rule, one of the two dies is made of lead, the other of kirksite. In the foundry, lead and kirksite are molten in "pots" and then poured into moulds made of foundry sand (silica). In the polishing room, connected with the foundry, the dies are ground and polished.

The finished dies are installed on the drop hammer, on which they are bedded with the aid of molten lead and where, after their use, they are melted out again with the aid of an oxyacetylene torch.

All three operations are apt to produce a considerable amount of lead fumes in spite of good ventilation. Also, scraping, filing, and brushing are done on the dies on the drop hammer and thereby increase considerably the evaporation of lead into the air inhaled by the worker engaged in this operation.

Minor degrees of lead exposure exist wherever low melting-point alloys, such as cerrobend (a 13 per cent antimony, 87 per cent lead alloy), are melted and poured, as, for example, in pipe-bending operations. They exist also in soldering operations, i.e., in the final assembly where electric wires and other electric parts are assembled, inasmuch as the solder commonly used is a 60 per cent lead and 40 per cent tin alloy.

There is lead in the camouflage paint in the form of lead chromate, and lead may also be used in the commonly used paints as "drier" in combination with cobalt compounds.

RORSCHACH TEST COURSE TO BE GIVEN IN CHICAGO, JUNE 4–8

The Rorschach Test course at Michael Reese Hospital, Chicago, is scheduled this year for the week of June 4–8, inclusive. The records to be demonstrated will be representative of the older adolescent and younger adult, with especial emphasis on persons discharged from the military services. Dr. S. J. Beck, head of the Psychology Laboratory, will conduct the course. It meets twice daily, two hours each session. Interested persons may inquire of the Secretary, Department of Neuropsychiatry, at the Hospital, 29th Street and Ellis Avenue, Chicago 16.

EPIDEMIC VIRUS GASTROENTERITIS OCCURRING IN CIVILIAN POPULATION

JOSEPH S. FRIBUSH, M.D., New York City

IN THE light of recent observations made on the probable virus causation of epidemic gastroenteritis noted by Reimann and others,[1] I should like to record my own clinical observations of this disease. In the winter of 1943, I observed many cases of what appeared to be ordinary gastroenteritis. However, every patient observed had a reddened throat, and the disease was noted to spread with great rapidity throughout the family. This led me to suspect that this syndrome of nausea, vomiting, and diarrhea was not due to dietary indiscretions, but rather due to a virus. The incubation period was observed to be between two and five days. The disease manifested itself by nausea alone, nausea and vomiting, or nausea, vomiting, diarrhea, and abdominal cramps. Some patients, for example, had nausea only, accompanied by several loose bowel movements. General malaise was frequent. Temperature usually was between 100 F. and 100.5 F. In some patients the abdominal cramps, which came in waves like colic, were unusually severe, so that appendicitis was suspected. Treatment was symptomatic, with limitation of food and mild antispasmodics. Recovery in all cases was very rapid, usually occurring in one to two days. No sequelae or complications were observed. One patient, however, developed a severe melena five days after her gastroenteritis, which probably resulted from a duodenal ulcer. All age groups were attacked—infants, children, and adults. The disease would usually run through an entire family, although the severity of its manifestations varied markedly from patient to patient. Some patients, for example, were found, only upon direct questioning, to have recovered from the disease in a mild form.

I did not encounter this syndrome during the summer of 1944, but it recurred in the fall of 1944 with remarkable similarity to the cases observed in the previous year. While no laboratory investigation was done, since recovery was prompt, I felt that this atypical gastroenteritis was probably caused by a virus infection, epidemic and endemic in character, and probably associated with the rise in upper respiratory infections occurring in the fall and winter.

Case Reports

Case 1.—L. R., a 60-year-old white woman, first became ill on December 10, 1944, with nausea and abdominal cramps, without diarrhea. Two days previously, her daughter had similar complaints. Physical examination was normal except for a reddened throat. Recovery took place in thirty-six hours.

Case 2.—On November 19, 1944, J. F., 32-year-old white man, awoke one morning with sensation of nausea only. Physical examination was normal except for a reddened throat. The nausea persisted for two days, was mild, and was associated with several loose bowel movements and a feeling of malaise. Recovery was prompt.

Case 3.—S. F., a 24-year-old white woman, first became ill on November 7, 1944, with nausea, vomiting, abdominal cramps, and diarrhea. Physical examination was normal except for a reddened throat. All symptoms disappeared in thirty-six hours except the abdominal cramps; these were severe and griping, across the midabdomen, and the patient turned white whenever they occurred. The abdomen was always soft, and recovery was complete in three days. Several days after her recovery, her 2-year-old niece living with her had slight nausea and diarrhea lasting for one day and associated with a reddened throat.

REDUCTION OF INSURANCE PREMIUM FOR X-RAY THERAPISTS

ONE of the most noteworthy developments in the Group Plan of malpractice insurance of the State Society is the reclassification of x-ray therapy for the purpose of rates which was announced in the report of the Council Committee on Malpractice Defense and Insurance as published in the May 1, 1945, issue of the JOURNAL.

For over twenty years substantial extra charges have been made by insurance companies throughout the United States for protection against the malpractice hazards of x-ray therapy. Under the experience-rating provisions of the Group Plan, the Medical Society of the State of New York is the first in the entire country to secure for its qualified members protection in the use of that modality without additional cost.

The Indemnity Representative of the Society has recently sent to all members of the Society known or believed to be using x-ray therapeutically a letter containing a full report on this subject. Because it offers a dramatic illustration as to how effectively the rating provision of the Group Plan operates and because the achievements of the x-ray therapists are an inspiration to the other members of the Society, that letter is reproduced in full.

JOHN STANLEY KENNEY, *Chairman*
Committee on Malpractice
Defense and Insurance

Dear Doctor,

It is a privilege and a real pleasure for me to be able to report to you that the surcharge for x-ray therapy protection under the Group Plan of the Medical Society of the State of New York has finally been eliminated and that, beginning May 1, 1945, qualified x-ray therapists will be able to secure full protection in the Group Plan at the same rates as all other members of the Society.

This is the result of a long and determined effort on the part of the x-ray therapists insured in the Group Plan to reduce the losses of their own specialty and their success is a notable achievement. Next to the organization of the Group Plan itself, I consider this the most important development in the history of malpractice insurance. For twenty years x-ray therapy has been considered by everyone to be the most dangerous specialty in medicine and substantial additional premiums have always been charged for it in all parts of the country. That this is no longer so in New York State is due almost entirely to the unremitting efforts of the members of the Society engaged in this specialty, and all credit is due them. It cannot be said that normal evolution in the science or general improvement in technic has contributed any appreciable part of the progress because, if that were so, similar progress would have been noted in at least some of the other states, in all of which surcharges running as high as 100 per cent of the base rates are still being charged by all experienced insurance companies.

The history of x-ray therapy insurance in this State is the story of the achievements of the men engaged in that specialty, and this is an outstanding example of what can be accomplished in medicine by competent and determined men. For the benefit of the younger men who have grown up and come into the practice of x-ray therapy since 1924, and for others who may be interested, it is worth reviewing briefly the history of x-ray therapy insurance in this state.

In 1921, when the Society was obliged to organize the Group Plan of malpractice insurance to protect its members against the chaotic conditions which existed at the time, no extra charge was made for x-ray therapy, although at least one of the leading insurance companies had previously announced that their experience clearly indicated that a heavy surcharge was needed to cover it. After three years of operation, the experience of the Group Plan showed the same results, and in 1924 it became necessary to provide a surcharge of $75, which was an increase of 450 per cent in the cost of insurance for x-ray therapists. While all of them understood the danger of x-ray as a therapeutic agent, less was known about how to guard against injuring their patients, and this sharp increase in the cost of insurance served to *focus attention on the need of doing something* about it. After several conferences, the first of which I had the privilege of initiating, committees were appointed, studies were undertaken, and various recommendations were made. It was clearly understood from the outset that the only sure and sound way to reduce insurance costs was to reduce the losses that caused them and that, in doing so, a valuable service would be performed for both the public and the profession. Out of these studies and recommendations there grew a demand for better understanding of the accumulative effect of x-ray exposure; better technic to minimize or eliminate harmful reactions and for treating them when they occurred; better equipment that would be more nearly shockproof and leakproof and that would prevent leaving out filters; better histories of previous exposures or the use of contraindicated drugs on the areas exposed to the rays; and better and more frequent calibration of machines.

The effect of all this on the loss experience of the Group Plan was not sudden, but by 1928 some improvement had been recorded and the insurance surcharge was lowered to $67. Three years later it was possible to reduce it to $49 and, in 1936, when the Group Plan was transferred to the Yorkshire Indemnity Company, a further reduction of $9 was made. The loss costs continued to improve and, in

1939, the surcharge fell to $30, and, in 1944, to $15 Finally this year even that small charge has disappeared.

While the steady reduction of the loss costs was due entirely to the x-ray therapists themselves, the fact that the insurance rates faithfully and promptly followed the downward trend of losses was due to the foresight of the Society in writing into its Group Plan a provision which made those revisions of the rates mandatory. This demonstration of the flexibility in rate adjustments will leave no doubts in the minds of those who have profited from it that the rating formula of the Group Plan of their State Society really does work

By their unceasing effort as a group, the x-ray therapists have achieved splendid results for their patients, their profession, and themselves, and have demonstrated what can be accomplished in medicine by united action Having had some small part in helping to chart the course of this program at its inception and having recorded each step in its progress, I may be permitted to congratulate the x-ray therapists of the Medical Society of the State of New York upon their success and upon being the first in the United States to demonstrate that, in competent hands, their specialty is no more dangerous from a malpractice standpoint than other branches of medical science. Perhaps I may also be permitted a word of caution. The procedures and safeguards which have brought the specialty to this important milestone are now fixed and there is little danger that they will be abandoned or carelessly applied by those who have adopted them But some measure of watchfulness may be necessary to see that the present standards of efficiency are not lowered by inexperienced members who may be persuaded to experiment with x-ray therapy before they are fully qualified to undertake it.

Very truly yours,
H. F. WANVIG, *Indemnity Representative*
Medical Society of the State of
New York

HEALTH WORK RAISES ECONOMIC LEVEL OF PARAGUAY'S PEOPLE

An important by-product of Paraguay's efforts to improve health and sanitation conditions throughout [illegible] pow[illegible] Plur[illegible] stitute of Inter-American Affairs

The In[illegible]titute, an agency of the Office of the Coordinator of Inter-American Affairs, is assisting the other A[illegible]ericas in carrying out health and sanitation me[illegible]sures, recommended by the Rio de Janeiro [illegible] 1942 [illegible] being put [illegible] ve Inter-[illegible]erican Cooperative Public Health Service), formed by representatives of the national government and members of the Institute's field party in Paraguay, of which Dr. Plunkett is the chief

During a short stay in Washington, Dr Plunkett expressed the conviction that by 1948 Paraguay will have completed laying the groundwork for a smoothly operating nation-wide public health service He said that for the remainder of the contract's life the agency will mainly endeavor to maintain and improve all its existing services, with particular emphasis on leprosy control and prevention and on further development of its health programs in rural areas. Practical measures also will follow current studies of the goiter problem.

Other diseases, such as tuberculosis, syphilis, and hookworm, Dr. Plunkett said, although far from being eradicated, are being brought under increasing control, and advances already made permit the anticipation of far swifter and more satisfactory results than originally expected.

Dr Plunkett mentioned, as a factor contributing to higher professional standards among Paraguay's health and sanitation specialists the training of a number of them in United States institutions of higher learning under study grants from the Institute About eight of the trainees are Paraguayan physicians selected to study basic medical sciences, who, upon their return home, are assigned to assistant professorships on the Medical Faculty of Asuncion.

The Service's activities, in addition to improving health conditions, also have direct economic ramifications Dr Plunkett [illegible] He explained that the [illegible] to some 750 [illegible]s, and construction workers

Dr Plunkett believes that, from a United States viewpoint, the Institute's investments in the work of the Service are yielding generous returns For instance, he said, by helping keep Paraguayan workers physically fit, the Service has sped the production of strategic materials, including hides, [illegible] inced that [illegible] the Good [illegible] [illegible] period immediately [illegible] will accelerate the pace of her over-all economic development and will naturally look to the United States for the acquisition of a variety of commodities, mostly machines of all types, technical equipment, automobiles, tractors, and drugs And, he says, it will very obviously be in the best interests of North American foreign trade to deal with a people whose needs and purchasing power have been greatly enhanced.—*Release from the Office of the Coordinator of Inter-American Affairs, Feb , 1945*

MONOCYTIC LEUKEMIA

HARRY F. WECHSLER, Lt. Col., (MC), AUS

(From the Medical Service, Station Hospital, Fort Bliss, Texas)

EVANS,[1] in his comprehensive review of monocytic leukemia published in 1942, was able to gather only 197 cases, 80 of which were reported from the United States. Because of the difficulty in identifying the young cells and the marked variation in the daily blood picture in the individual cases, not only is the frequency of this disease in proportion to the other types of leukemia in dispute but even the existence of the disease entity is denied by a few hematologists. It is important, therefore, that well-authenticated cases be reported.

Case Report

A 29-year-old white man was admitted to the hospital on May 16, 1943. His past history was irrelevant. For about two weeks he had noticed increased fatigue. Three days prior to admission, while on maneuvers, he became ill with fever, sore throat, and malaise. He was treated symptomatically at his dispensary and, as his temperature was recorded as 103 F. on his third visit, he was referred to the hospital. On admission, his temperature was 102.6 F. His pharynx and tonsils were moderately inflamed and the uvula was edematous. The anterior cervical lymph nodes were slightly enlarged and tender. The remainder of the physical examination was essentially negative.

Laboratory data.—A urinalysis was negative, except for a trace of albumen. A throat smear was negative for Vincent's organisms. The erythrocyte sedimentation rate was 42 mm. in sixty minutes. A blood count showed red blood cells, 4,400,000; hemoglobin (Sahli), 85 per cent; white blood cells, 20,300; neutrophiles, 10; lymphocytes, 90. There were large numbers of abnormal lymphocytes present which were reported as resembling the leukocytoid lymphocytes found in infectious mononucleosis.

On May 18 it was noted that small, firm, discrete lymph nodes were present at the angles of the jaw, in the posterior cervical, left supraclavicular, and right axillary regions, and that the tip of the spleen was barely palpable.

By May 21 his temperature had dropped to normal and he continued to be practically fever-free and with no complaints until June 17. He then developed a moderate gingivitis and smears of the gums showed a few spirilla and fusiform bacilli. Routine treatment for Vincent's stomatitis was started. The rest of his temperature curve is shown in Fig. 1. He complained of a sore mouth, anorexia, nausea, and malaise and on June 18, it was noted that both his skin and mucous membranes were pale. The lymphadenopathy was unchanged. A moderate ulcerative gingivitis was present. The liver was enlarged to two fingerbreadths below the costal margin but was not tender, and the spleen was palpable three fingerbreadths below the left costal margin. There was moderate upper abdominal distension. A blood transfusion of 500 cc. of whole blood was given on both this and the following day.

His course was now rapidly downward. The distension of the upper abdomen became very marked and he complained of extreme nausea and a painful pressure under both ribs, especially on inspiration. He was very restless and vomited greenish fluid occasionally. The liver increased to three fingerbreadths and the spleen to four fingerbreadths below the costal arch. Wangensteen suction was begun on June 20 with marked relief in his distension. A transfusion of 500 cc. of whole blood was given. On June 21 his general condition was somewhat improved. A moderate number of small purpuric spots appeared on his upper and lower abdomen, especially the latter. There was moderate lower abdominal distension. The next day, the skin and sclerae were icteric and the purpura was more marked. He passed a tarry stool. Signs of consolidation and friction rubs appeared over the bases of both lungs posteriorly. An x-ray of the chest at this time showed a flaky density involving the base of the right lung which extended upward to the second interspace and a lesser degree of a similar condition involving the lower area of the upper lobe of the left lung. His respirations became increasingly labored and his pulse became weaker and finally imperceptible. He lapsed into coma and expired on June 23, forty-two days after the onset of his illness and thirty-nine days after his admission to the hospital. The blood counts and the results of the various laboratory procedures performed during the course of his illness are listed in Table 1.

Up to the middle of June, the diagnosis of infectious mononucleosis was not questioned. At this time, because of his progressive anemia, the increased enlargement of both his liver and spleen and his negative heterophile antibody agglutination titers, blood smears were carefully studied and a diagnosis of subacute monocytic leukemia was made. The cells (Fig. 2) were large and round or oval. The nuclei had a fine reticular pattern and were usually notched or indented. Nucleoli were present. The cytoplasm was basophilic interspersed with yellow hyaloplasm, abundant and homogeneous. Azurophilic granules were present and some were vacuolated. Smaller cells with dense blue cytoplasm and coarser, purplish nuclear chromatin were also found and considered as monoblasts. No myeloblasts were found. Most of the cells did not take the peroxidase stain and in those that did, the granules were few in number and less deeply stained than in the normal control. No supravital studies were done.

Autopsy (Maj. Jesse Shapiro).—General: The body was that of a well-developed, well-nourished man, aged 29 years and measuring 68 inches in length. The sclerae and skin were slightly jaundiced. There were numerous petechial hemorrhages over the anterior abdominal wall. There was marked crepitation over the anterolateral aspect of the left thigh which extended downward over the knee and upward over the left inguinal region. There was moderate postmortem lividity over the back. The peritoneal cavity contained about 1,000 cc. of dark-yellow fluid. The peritoneal surfaces showed occasional petechial hemorrhages, most marked over the small bowel. The mesenteric lymph nodes were increased in number and enlarged. The liver extended 5 cm. below the right costal margin and 7 cm. below the xyphoid. Each pleural

cavity contained about 300 cc of blood-tinged fluid There were no adhesions The pericardial sac contained about 100 cc of dark yellow fluid The pericardial surfaces showed numerous petechial hemorrhages There was a mass 7 by 6 by 2 5 cm in the posterior part of the anterior mediastinum which covered the upper portion of the pericardial sac On section it was firm and yellow The thyroid, parathyroids, larynx, and pharynx were not examined

Lungs The right lung weighed 690 Gm The pleura was smooth except for a nodular elevation 4 cm in diameter over the anterior surface of the upper lobe, the center of which was covered by yellow exudate The middle and upper lobes were adherent by fibrous connective tissue There were several strands of exudate over the posterior inferior surfaces of the lower lobe These surfaces were dark purple red On section of the upper lobe there was a subpleural nodule measuring 4 cm in diameter which was yellow-pink and showed a necrotic center The remaining lobe and the middle and lower lobes showed a slight excess of fluid In addition, the lower lobe showed an excess of blood There were no areas of consolidation The hilar lymph nodes were markedly enlarged The left lung weighed 600 Gm The pleural surfaces were smooth, pinkish gray, and mottled with black. There were intralobar fibrous adhesions On section each lobe showed a slight excess of fluid There were no areas of consolidation The hilar nodes were markedly enlarged

Heart The heart weighed 200 Gm Each chamber appeared to be of normal size The epicardium showed scattered petechial hemorrhages over all surfaces The myocardium was firm and dark brown The endocardium was pale yellow-brown and showed no mural thrombi Except for mild atheromatous thickening, the coronary arteries showed nothing of note The valves showed nothing of note The root of the aorta showed numerous atheromatous plaques measuring up to 6 mm in diameter The aortic arch and descending aorta [illegible]

[illegible] purple red and tense It was smooth except for a depressed area 5 mm in diameter over the diaphragmatic surface The cut surface showed the pulp to be dark purple moist, and the markings obscured

Liver The liver weighed 2,735 Gm The capsule was smooth and medium brown in color It showed numerous areas of yellow brown measuring up to 2 mm in diameter There were several patchy areas of thickening over the inferior surface of the lower lobe On section the parenchyma was light brown and showed the centers of the lobules to be a light gray-yellow There was a collar of deep yellow infiltration around the portal spaces There were scattered areas of hemorrhage, especially around the larger hepatic veins

Gastrointestinal tract The wall of the stomach was moderately thickened and less pliable than normal The rugae were raised and the sulci between the rugae were widened There were several ulcerated areas measuring up to 2 mm in diameter which extended through the mucosa The gastric contents were blood-tinged The Peyer's patches in the ileum were markedly enlarged and thickened Several of these Peyer's patches showed ulceration of the overlying mucosa The edges of the ulcers had a blackened appearance There appeared to be moderate thickening in the wall of the cecum

Genitourinary tract The right kidney weighed 220 Gm and measured 12 by 6 by 5 cm The capsule stripped easily, leaving a pale pink-yellow surface showing numerous petechial hemorrhages On section the markings were obscured by large areas of light yellow-brown in the medulla and cortex

Some of these areas had the appearance of a pale infarct The mucosa of the pelvis showed [illegible]

[illegible] ois

Bone marrow The bone marrow of the sternum was dark red That of the ribs was scanty but red

Lymph nodes Enlarged pale yellow lymph nodes were found in each axillary space, the inguinal regions, the hilum of each lung, the mesentery, the porta hepatis, the peripancreatic fat, the preaortic and periaortic regions, and the pelvis

On section most of these lymph nodes were yellow-white and homogeneous in appearance Occasional nodes appeared to be hemorrhagic.

The esophagus, gallbladder, pancreas, suprarenals, urinary bladder, prostate, and seminal vesicles

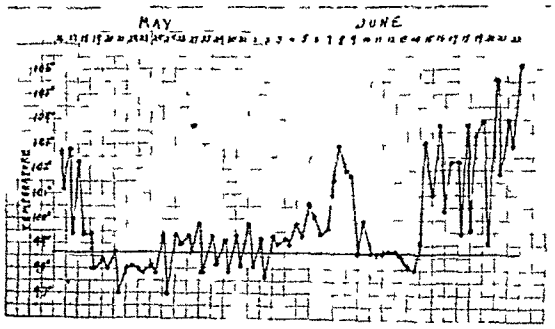

FIG. 1. Temperature curve from hospital admission to exitus.

showed nothing of note. The head was not examined.

Histopathologic examination.—Lymph nodes: The normal architecture was wiped out (Fig. 3). The predominant cell appeared to be a monocytoid cell showing a notched nucleus and a moderate amount of cytoplasm. These cells appeared to be derived from reticuloendothelial cells. Lymphocytes were also present. The blood vessels of the node were congested. The capsule was infiltrated by these cells.

Skin: The epidermis appeared normal. The corium showed a sprinkling of the monocytoid cells described above. They were also seen in perivascular arrangement.

Striated muscle: The microscopic section appeared essentially normal.

Liver: There was marked infiltration with leukemic cells in the portal spaces, producing a wide collar. There also were a moderate number of leukemic cells in the sinusoids, some appearing to be derived from the von Kupfer cells

Stomach: There was leukemic infiltration in the submucosa and between the glands of the mucosa (Fig. 4). There was a sprinkling of leukemic cells in the muscularis and the serosa. In one area, the gastric glands appeared to be necrotic.

Ileum: The Peyer's patches showed marked infiltration with leukemic tissue in all layers, most marked in the submucosa. The cellular structure had the appearance of marked reticulum-cell hyperplasia.

Heart: The epicardium showed infiltration with leukemic cells. The myocardium appeared edematous, as evidenced by the separation of the muscle fibers. There was no definite infiltration with leukemic cells into the myocardium, although the blood vessels were engorged with leukemic blood.

Pancreas: There was leukemic infiltration into the peripancreatic fat and into the interlobular connective tissue. The islets of Langerhans and gland acini showed nothing of note.

Spleen: The sinuses were congested with leukemic blood (Fig. 5). The sinus walls appeared to be quite distinct. The lymphocytic zones of the malpighian corpuscles were narrowed or entirely replaced by leukemic cells. Occasional areas of necrosis were present.

Kidneys: A rather diffuse infiltration with leukemic cells was present throughout the cortex and medulla, causing separation of the tubules. The glomeruli appeared essentially normal. The tubular epithelium showed colloid degeneration. In some areas the tubules and glomeruli showed a loss of tinctorial properties, suggesting leukemic infarction.

Lungs: The tumor of the lung was composed of the above-described monocytoid cells. Many of these cells appeared in a loose syncytium showing the characteristics of reticulum cells. The alveolar walls appeared to be thickened. The alveoli contained masses of the above-described tissue. One edge showed necrotic tissue. The other edge showed leukemic infiltration extending across the interlobar fibrous adhesions into the adjacent lobe. The adjacent lobe showed mild edema. Another section showed the alveoli to be thickened and very cellular because of congestion with leukemic blood. Perivascular and leukemic infiltration was marked.

Bone marrow: The bone marrow of the sternum was very cellular, the predominant cell type being the above-described monocytoid cell.

Pathologic Diagnoses

1. Leukemia—acute, monocytic, Schilling type
2. Leukemic infiltration of the upper lobe of the right lung, epicardium, spleen, liver, stomach, ileum, pancreas, kidneys, bone marrow, and lymph nodes
3. Bilateral leukemic infarcts of the kidney
4. Multiple ulcerations of the gastric mucosa and ileum, secondary to leukemic infiltration
5. Bilateral pleural effusion
6. Bilateral edema of the lung

Discussion

Like the other forms of leukemia, monocytic leukemia has been subdivided into acute, subacute, and chronic types. The division between the acute and subacute types, however, is purely arbitrary Because of the minimal symptoms for one month and the total duration of the illness of six weeks, the case here reported may be classified as of the subacute variety.

The clinical picture was typical. After a short prodromal period of weakness, there was an abrupt onset of sore throat and fever. The fever lasted for eight days and was followed by a latent period of seventeen days during which his only complaints were weakness and malaise. He then developed an ulcerative gingivitis of moderate severity. This was accompanied by a temperature that gradually rose to 103 F. Without any apparent change in his condition, his temperature dropped abruptly to normal on the fourth day and he remained afebrile for four days. The terminal phase was marked by a high septic temperature, progressive anemia, increased enlargement of liver and spleen, hemorrhagic phenomena, gastrointestinal symptoms, and a terminal pulmonary involvement. Lymphadenopathy, clinically, was confined to the cervical nodes and was never very pronounced.

The hematologic findings call for some discussion. It is not surprising that the cells were at first mistaken for the leukocytoid lymphocytes of infectious mononucleosis. There is a resemblance between these cells and monocytes and the early examinations were performed by a laboratory technician and not by a medical officer. Although a low heterophile antibody agglutination titer is usually emphasized as of differential importance, it is well known, however, that the Paul-Bunnell test may

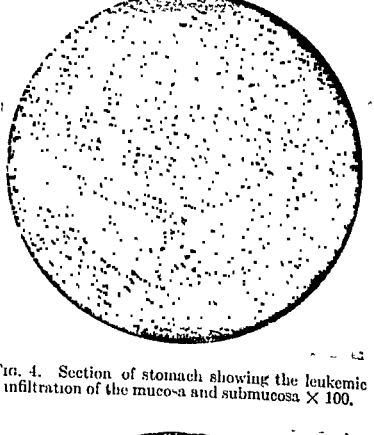

FIG. 4. Section of stomach showing the leukemic infiltration of the mucosa and submucosa × 100.

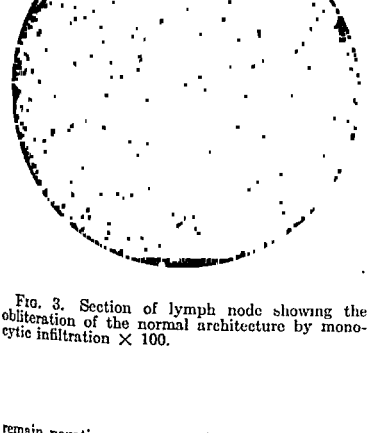

FIG. 3. Section of lymph node showing the obliteration of the normal architecture by monocytic infiltration × 100.

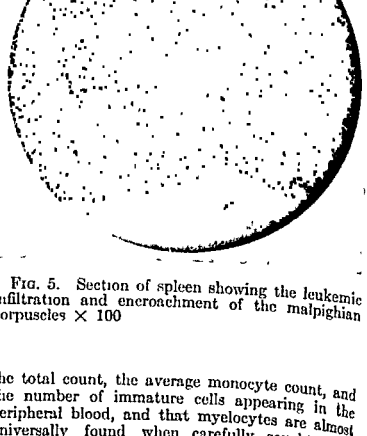

FIG. 5. Section of spleen showing the leukemic infiltration and encroachment of the malpighian corpuscles × 100

remain negative or may not become positive until late in the course of true cases of infectious mononucleosis. The low titer, therefore, did not arouse suspicion in the early phase of the illness.

The course of the disease, especially the progressive anemia, was of greater importance in arriving at the correct diagnosis. In an epidemic of over 500 cases of infectious mononucleosis, recently observed at this post, there has not been a single case of more than mild anemia. Many of these were severely affected and ran prolonged courses

Evans[1] has emphasized the great variability in the total count, the average monocyte count, and the number of immature cells appearing in the peripheral blood, and that myelocytes are almost universally found when carefully sought. The blood counts in the reported case, however, were remarkably constant and in the terminal phase, at least, a painstaking search failed to reveal any myelocytes. This case, therefore, belongs to the Schilling-Torgau rather than the Naegeli type of monocytic leukemia.

There were two other atypical features [illegible] the peroxidase stain, monocytes are sa[illegible]

positively but not so deeply as myelocytes, and with a smaller number of granules. In the single stain performed in this case, the great majority did not take the stain at all and in the few that did so, the granules were few and faintly stained.

In spite of an extreme agranulocytosis and a progressive anemia which responded poorly to repeated blood transfusions, there was no apparent depression of the thrombopoietic function of the bone marrow. However, platelet counts were not made until the last two days of the disease and after he had had numerous blood transfusions. It is possible that the latter may have altered the platelet count.

Summary

1. A typical case of monocytic leukemia with autopsy findings is presented.
2. The difficulty in differentiating the subacute variety in its early stage from infectious mononucleosis is pointed out.

THE PHYSICAL FITNESS PROGRAM

The rejection of roughly a third of the draftees for military service has attracted public attention. In an effort to correct the situation, the President, in April, 1943, appointed a Committee on Physical Fitness in the administrative office of the Federal Security Agency. This Committee and its National Council on Physical Fitness presented a proposal to the American Medical Association to join in a program specially emphasizing the importance of physical fitness. This was accepted in June, 1944, and resulted in a Joint Committee on Special Emphasis for Physical Fitness.

Physical fitness has two rather distinct phases. One depends on physical education, and the other on health. The medical profession is devoted to the subject of health and should wholeheartedly join in the Physical Fitness Program.

It was found that a large percentage of those who met the requirements for military service were not physically fit to make good soldiers. They were lacking in muscular strength, agility, and endurance, and required several months of training before they were in condition. There was evidence of need for improvement in the physical education even of recent high school graduates, 50 per cent of whom had had no such training the last two years of school. Too many were unable to swim, could not jump over a bar two feet high, or chin themselves seven times. Analysis of defects disqualifying men ranging in age from 18 to 37 showed, according to Rowntree,* the following percentages of defects: manifestly disqualifying defects such as missing limbs, congenital deformities, and obvious disabilities resulting from illness or injury, 10.5 per cent; mental disease, 16.6 per cent; mental deficiency, 13.8 per cent; other musculo-skeletal defects, 7.5 per cent; syphilis, 6.7 per cent; cardiovascular disorders, 6.5 per cent; hernia, 5.7 per cent; neurologic defects 5.1 per cent; defective vision, 5 per cent; defective hearing, 3.9 per cent; and defective teeth, 0.9 per cent. Overweight and underweight were together responsible for 1.5 per cent of rejections. The author calls attention to the fact that the incidence of defects per 1,000 men examined is a better index of the health and fitness of the young men of the country.

Medical science alone cannot prevent or cure many of these causes of disability. The prevention of certain inherited conditions depends on eugenics; of certain contagious diseases, on quarantine by health departments, as well as vaccination; of musculo-skeletal defects, on safety devices in industry, the home, and in traffic; of syphilis, on morals and public education. Refractive errors in vision cannot be prevented, although they can be largely corrected by glasses. Hernia, which accounts for comparatively few rejections, can be corrected. Dental defects were the cause of relatively few rejections. There is room, however, for improvement, not so much in the quality but in the quantity of dental care received in our country.

So the Physical Fitness Program concerns not only physical education and medicine but all agencies concerned with the physical well-being of Americans from the cradle to the grave. These include athletics of all sorts for school children; golf, fishing, hunting, and the like in which adults can participate. It includes every activity devoted to the prevention of disability through accident or disease. It involves also an educational program to inform the public of the desirability of physical fitness and health, the importance of prevention of those things which cause disability, and the possibility of correcting certain defects in the interest of greater fitness.

We have been discussing disabilities found in young men examined for military service. We have no similar gage for determining the physical fitness of young women of the draft age. They are probably no more physically fit than the young men. The fitness program concerns them and also men and women beyond the draft age. It is asserted, and doubtless rightly so, that when men and women finish their schooling and enter their life work they become progressively less fit. They have less time to devote to keeping in trim and grow careless in health matters.

When a nation goes to war, physical fitness of the young men of the country is a vital matter. Fortunately or unfortunately, fitness in our modern civilization, though desirable, is not so essential. Whether a man can chin himself seven times, or jump two feet, is not so important, but maintenance of good health is important. We can recollect many examples of individuals who would be rejected for military service but have been outstanding in business, the professions, and the arts. These men and women have triumphed in spite of physical disabilities. Fitness is a worthy objective for the laity and the medical profession alike. Every activity that favors physical and muscular development merits support. On the other hand, man has his intellectual, moral, and spiritual side in addition to his physical side. The youth movement in Germany was highly successful in developing the physical fitness of her young men and women. Lack of emphasis, however, on the moral and spiritual needs of her people has resulted in tragedy for Germany and the rest of the world.—*Minnesota Med., Dec., 1944*

POISON IVY EXTRACT

IN ALMOND OIL

Wyeth

FOR PROPHYLAXIS AND TREATMENT

PERSONS SUSCEPTIBLE TO POISON IVY may be hyposensitized preseasonally by the intramuscular injection of POISON IVY EXTRACT (in almond oil) WYETH.

PROPHYLAXIS: A 1 cc. dose may be sufficient to protect the mildly sensitive patient when exposed to the poison ivy plant. Additional injections are advisable, however, where extreme sensitivity exists.

TREATMENT: The intramuscular injection of 1 cc. of extract may give adequate relief in mild cases. If relief is not obtained, additional 1 cc. doses should be administered at intervals of 24 hours until symptoms have subsided.

Additional Annual Reports

To the 1945 House of Delegates
Medical Society of the State of New York

PARTS VII-VIII

Public Relations and Economics

The Council Committee on Public Relations and Economics was composed of the following personnel:

Carlton E. Wertz, M.D., *chairman*.....Buffalo
Harry Aranow, M.D.....Bronx
Charles M. Allaben, M.D.....Binghamton

Your Committee and its Subcommittee on (Voluntary) Medical Expense Insurance, composed of the following members:

A. H. Aaron, M.D., *chairman*.....Buffalo
Leo Simpson, M.D.....Rochester
William Hale, M.D.....Utica
Leo E. Gibson, M.D.....Syracuse
J. H. Cornell, M.D.....Schenectady
William B. Rawls, M.D.....New York
Milton J. Goodfriend, M.D.....Bronx
Abraham Koplowitz, M.D.....Brooklyn

devoted considerable time in the selection of a Director of the new Medical Care Insurance Bureau. Many applicants were examined before the final choice was made. It was finally unanimously agreed that Mr. George P. Farrell, of Buffalo, was best qualified for the position. The Council, as well as the Board of Trustees, approved the selection.

The Committee feels that the question of voluntary medical insurance is of the utmost importance and urges that the Medical Society of the State of New York give the various plans in the state its wholehearted support and with the aid of the new Bureau and its Director, develop plans throughout the state so that there will be no area in which medical care insurance is not available.

In a comparatively short period of time state-wide interest has been manifested in the Bureau's activities. Many requests have been made to the Bureau for Mr. Farrell to appear before county medical groups in the Metropolitan area and throughout the state. In areas where plans are already in operation many diversified problems have arisen regarding the lack of participation of some of the county societies and the lack of interest shown by some physicians.

A concentrated effort is being made to bring these problems before the officers of each county society in the Metropolitan area and elsewhere, in order to get an over-all picture of the interest being shown in the various parts of the state.

A study has been made of the experience of existing plans regarding enrollment regulations from a sound underwriting point of view and suggestions have been made and adopted for a more liberal enrollment policy to promote a more rapid growth of existing plans.

A study is now being made of existing benefit associations which have retarded the acceptance of nonprofit plans in certain communities.

In areas where plans are nonexistent, Mr. Farrell has appeared before representative groups and discussed the advantages of the voluntary medical plan.

As a result of these meetings aid was given to the new plans now in the process of formation in the Rochester and Albany districts and very active interest has been aroused.

Your attention is also called to the Ives Bill, introduced into the Legislature this year, which is really a Wagner Bill for the State entitling all persons who are subject to the unemployment tax and its benefits to receive complete medical care as well as their dependents. This requires careful study by all physicians.

The proposal of the Blue Cross organization of a national surgical plan requires careful thought. It has many ramifications and may lead to many inroads on medical care in the future. The medical profession should be very careful before endorsing such a plan. The question of how it will affect and compete with existing plans of the medical societies is one of the many questions that arise. If the plan is created the control should be in the hands of the medical profession.

The medical care of veterans is another serious problem and one in which the medical profession should be vitally interested. Why he should not be able to have his own physician and be hospitalized the same as any other worthy citizen in a hospital of his own choosing is a question that should be given real study. The care of the veteran at present is far from what it should be.

The medical care of the welfare group is also of great importance and our Subcommittee on Public Medical Care, composed of:

Ralph T. B. Todd, M.D., *chairman*....Tarrytown
Joseph C. O'Gorman, M.D.....Buffalo
Charles F. Rourke, M.D.....Schenectady

has done splendid work in its relation with the Welfare Department. At no time in the past has there been a better understanding between the Department and the medical profession.

PART XIV

Woman's Auxiliary:

The Council Committee on Woman's Auxiliary consists of the following personnel:

Carlton E. Wertz, M.D., *Chairman*.....Buffalo
F. Leslie Sullivan, M.D.....Scotia
Nathan B. Van Etten, M.D.....Bronx

The Woman's Auxiliary of the Medical Society of the State of New York has been very active this year in spite of the War.

Splendid work was done by the various county societies in their legislative efforts as well as public health and Red Cross work and in the selling of war bonds and many other activities for the welfare of the public as well as for the medical profession.

The Woman's Auxiliary Board had a well-attended two-day meeting in Buffalo in the Fall. The Winter board meeting was held in New York City and Drs. Van Etten and Lawrence as well as Mr. Anderson gave very stimulating and informative talks. The Woman's Auxiliary is a vital force and of great importance to the State Society and should be encouraged in every way for the splendid work it is doing.

In Peptic Ulcer . . .
Hyperacidity . . .
Gastritis . . .

Magmasil

Greater Acid Neutralizing Power

•

Longer Protective Action

•

Fewer Doses Needed

•

No Constipation

A stable aqueous suspension of hydrated magnesium trisilicate in extremely fine subdivision, Magmasil is an outstanding advancement in the treatment of peptic ulcer, gastritis, hyperchlorhydria.

Its antacid action is powerful; one teaspoonful neutralizes 86 cc. of N/10 HCl. It is prolonged, extending over fully four hours.

Hence fewer doses are needed, the customary 11 P.M. administration usually holding the patient comfortable through the night.

Magmasil is free from the drawbacks and limitations of many other antacids. There is no alkalosis, no chloride depletion, no undesirable astringency, no constipation which has made the patient uncooperative with other methods.

Pain and pyrosis are stopped promptly, and healing is brought about rapidly.

Magmasil is available through all pharmacies in 12 oz. bottles.

THOS. LEEMING & CO., INC., 155 E. 44th St., New York 17, N.Y.

Postgraduate Medical Education

Programs arranged by the Council Committee on Public Health and Education of the Medical Society of the State of New York are published in this Section of the JOURNAL. *The members of the committee are Oliver W. H. Mitchell, M.D., Chairman (428 Greenwood Place, Syracuse); George Baehr, M.D., and Charles D. Post, M.D.*

Cancer Teaching Day for Chemung County

A CANCER teaching day will be held at the Arnot-Ogden Memorial Hospital in Elmira on Wednesday, May 23, under the auspices of the Medical Society of the County of Chemung, the Medical Society of the State of New York, and the New York State Department of Health, Division of Cancer Control. The meeting will open at 4:30 P.M. with remarks by Dr. William T. Boland, president of the Medical Society of the County of Chemung, and Dr. John F. Lynch, chairman of the Committee on Cancer Control and chairman of the day's meeting.

Two lectures will be given in the afternoon. Dr. Clyde L. Randall, professor of gynecology, the University of Buffalo School of Medicine, will speak on "Hormone Therapy and the Prevention of Gynecologic Malignancies." "Carcinoma of the Genitourinary Tract" is the subject of the second lecture, which will be given by Dr. Archie L. Dean, assistant professor of clinical surgery, Cornell University Medical College, in New York City.

The evening lecture, beginning at 8:00 P.M., will consist of instruction by Dr. Cushman D. Haagensen, assistant professor of surgery, College of Physicians and Surgeons, Columbia University, New York City, on diagnosis and treatment of breast cancer.

A buffet dinner will be served at 7:00 P.M. at the Arnot-Ogden Memorial Hospital. The local committee in charge of arrangements for the teaching day is as follows: Dr. John F. Lynch, chairman, and Drs. A. A. Blash, M. Dreyfuss, and M. H. Wyttenbach.

Cancer Symposium for Physicians

AN ALL-DAY cancer symposium for physicians, arranged by the Nassau County Cancer Committee, was held on April 13 at the Garden City Hotel, Garden City, Long Island.

The three morning lectures were as follows: "Five Years of Cancer Reporting in Nassau," by Dr. Earle G. Brown, Commissioner of the Nassau County Department of Health; "The Diagnostic Problems of Early Cancer," by Dr. Lloyd F. Craver, attending physician at the Memorial Hospital, New York City; and "Cancer of the Genitourinary Tract," by Dr. Clyde L. Deming, professor of urology, Yale University School of Medicine.

In the afternoon the following four lectures were given: "Gynecological Cancer," by Dr. James A. Corscaden, clinical professor of obstetrics and gynecology, College of Physicians and Surgeons, Columbia University; "Physical Basis for the Use of X-Rays and Radium in the Treatment of Cancer," by Dr. Edith H. Quimby, associate professor of radiology, College of Physicians and Surgeons, Columbia University; "Cancer of the Breast," by Charles F. Geschickter, Lt. Comdr., (MC),USNR, Medical School, National Naval Medical Center, Bethesda, Maryland; and "Gastrointestinal Cancer," by Dr. George T. Pack, attending surgeon, Memorial Hospital, New York City.

Hemorrhages in Pregnancy

"HEMORRHAGES of the Latter Part of Pregnancy" was the topic of postgraduate instruction arranged by the Medical Society of the State of New York, cooperating with the New York State Department of Health, for a meeting of the Cortland County Medical Society at 8:30 P.M. on April 20, in the Staff Room of the Cortland County Hospital, Cortland.

Dr. Edward C. Hughes, professor of obstetrics, Syracuse University College of Medicine, spoke.

Sullivan County Discussion

WOUNDS and nerve and tendon injuries were discussed by Dr. David Lyall, assistant surgeon, New York Post-Graduate Medical School and Hospital, Columbia University, at a meeting of the Medical Society of the County of Sullivan, held at 8:00 P.M. on April 25 at the home of Dr. Harry Golembe, of Liberty. This instruction was presented cooperatively by the Medical Society of the State of New York and the New York State Department of Health.

Broome County Hears Lecture on Peptic Ulcer

"THE Peptic Ulcer Problem" was the subject of the lecture given by Dr. Albert F. R. Andresen, professor of clinical medicine, Long Island College of Medicine, Brooklyn, at a meeting of the Broome County Medical Society on May 8.

The postgraduate instruction, arranged by the Council Committee on Public Health and Education, took place at the Binghamton City Hospital

[Continued on page 1126]

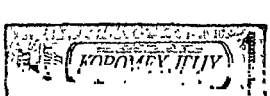
recent extensive investigation confirms contraceptive effectiveness of the active ingredient in Koromex Jelly

A most illuminating report based on extensive clinical and experimental data has recently been published by Eastman and Scott (Human Fertility, 9:33, (June) 1944.) These authors studied the safety and efficacy of phenylmercuric acetate which is the active constituent of Koromex Jelly.

1 Clinical evidence showed that in actual use, phenylmercuric acetate jelly had a remarkable record for contraceptive efficiency.

2 The earlier work of Baker, Ranson and Tynen (Lancet, 2:882, (October 15), 1938), showing a very high spermicidal potency, was confirmed.

3 Toxicity was found low.



4 No evidence of irritability on the part of either the husband or wife.

In addition to the above qualities, Koromex Jelly, which also contains oxyquinoline benzoate and boric acid in a well buffered glycerine gum base, has the properties of adhering firmly to the vaginal lining and mixing readily with the vaginal secretions. It has optimum spreading qualities. Its pH of 4.6 is constantly maintained even in the presence of the buffering action of the protein seminal fluid.

Koromex Jelly does not stain. It is not excessively lubricating, and is well tolerated. Because of these qualities you can assuredly — prescribe Koromex *with confidence.*

Write for Literature.

Treatment of Heart Disease

DR. HAROLD J. STEWART, associate professor of Medicine, Cornell University Medical College, discussed what can be accomplished in the treatment of heart disease at a meeting of the Tioga County Medical Society held at 6:30 P.M. on April 25 at the Wagner Hotel, Waverly, New York. Dr. Stewart's postgraduate instruction was presented by the Council Committee on Public Health and Education of the Medical Society of the State of New York.

"Varicose Veins and Ulcers"

THE staff of the Memorial Hospital of Greene County and the Greene County Medical Society will attend postgraduate instruction on June 28 at 9:00 P.M. at the Memorial Hospital of Greene County, in Catskill.

Dr. Isidor S. Tunick, of New York City, will deliver a lecture on "Varicose Veins and Ulcers." This instruction has been arranged by the Council Committee on Public Health and Education of the Medical Society of the State of New York.

On April 26 the same group heard a discussion by Dr. Ralph G. Stillman, assistant professor of medicine, Cornell University Medical College, on the significance of laboratory tests and methods.

DR. HOSKINS WILL DELIVER SALMON LECTURE SERIES FOR 1945

Dr. C. Charles Burlingame, chairman of the Salmon Memorial Committee, has announced the selection of Dr. Roy Graham Hoskins as the Salmon Memorial Lecturer for 1945. Dr. Hoskins, research associate in physiology, Harvard Medical School, and Director, the Memorial Foundation for Neuro-Endocrine Research, Boston, and Director, Worcester State Hospital, Worcester, Massachusetts, has, for some eighteen years, devoted much of his time to research concerning endocrine disturbances in mental disease. He is internationally known for his contributions to both the neuro-endocrinologic and physiologic fields.

"The Biology of Schizophrenia" will be the title of the Salmon Lecture Series to be given at the New York Academy of Medicine on three successive Friday evenings—November 2, 9, and 16, at 8:30 P.M.

Born in Nevinville, Iowa, July 3, 1880, Dr. Hoskins taught for some years before receiving his medical degree from John Hopkins University Medical School in 1920. His teaching has embraced the fields of zoology and physiology at Kansas State, Harvard Medical School, Starling-Ohio Medical College, Northwestern University Medical School, and Johns Hopkins University Medical School, prior to his appointment as head of the Department of Physiology of Ohio State University, 1920–1927. Since 1927 he has been established at Harvard University.

Dr. Hoskins has written two books—"Tides of Life," and "Endocrinology–The Glands and Their Functions." He also contributed the section on endocrinology to the MacLeod-Bard *Physiology in Modern Medicine.*

At present, Dr. Hoskins is serving as a member of the Advisory Committee for Research and Education to the Commissioner of Mental Health, Commonwealth of Massachusetts, and as a member of the Committee on Endocrinology, National Research Council, and Secretary, Worcester Foundation for Experimental Biology. Dr. Hoskins was president of the American Society for Research in Psychosomatic Problems in 1944.

In his introductory Salmon Memorial Lecture, on November 2, Dr. Hoskins will cover the "Nature of Schizophrenia," speaking specifically of the evolution of adaptation, emergence of integrations at different levels, and conserving mechanisms. In the second talk, on November 9, his lecture will deal with "Manifestations of Schizophrenia" at six different levels of integration—cellular, reflex, autonomic-endocrine, behavioral, intellectual, and personal-social. The third and last lecture of this series, on November 16, will concern itself with the "Treatment of Schizophrenia and Needs for the Future." Under treatment, he will discuss the symptomatic agents, shock therapies, reconditioning, and resocialization, and under future needs, preventive psychiatry (prophylaxis vs. salvage), education, and research.

Sponsoring these lectures is the Salmon Committee on Psychiatry and Mental Hygiene, appointed by the Council of the New York Academy of Medicine.

When Radiography Called For 1-Man-Power Kv./p..

Recalling the period shortly after Roentgen's famous discovery, is this depiction of how the progressive contemporary physician, inspired by the possibilities with x-rays in medicine, proceeded to obtain a radiograph of his patient's hand.

A crude set-up, as you see, yet it served his purpose—even though this two-plate static machine had to be manually cranked for a half-hour to produce a "skiagraph" of the hand!

To fully appreciate how far x-ray science has since advanced, consider today's facilities for producing chest radiographs in 1/60-second or less, and of 8-inch steel castings in 3 1/2 minutes!

Looking back upon this half-century of progress, we of the G-E organization enjoy a profound satisfaction in having been privileged to collaborate with the radiological profession and industrial engineers toward continual advancements in this science; while pledging anew our facilities for research and development as they may in the future serve the mutual interests.

Eye Bank Ready to Aid Blind with Corneal Tissue

A TREASURE-HOUSE of human eyes, from which surgeons may draw corneal tissue to restore the sight of blind persons, has been incorporated in New York as the Eye Bank for Sight Restoration, it was announced on April 13. At present the bank, which is nation-wide in scope, has its headquarters at the Manhattan Eye, Ear, and Throat Hospital.

Tissue supplied by the bank may give back sight to between 10,000 and 15,000 persons in the United States who are blind only because of corneal defects, the announcement said. The operation of substituting a healthy cornea for a damaged one can restore sight in only one kind of blindness—that caused solely by opacity of the cornea when the rest of the eye and optic nerve are normal.

Twenty-two hospitals in New York are already affiliated with the program, and all will deposit eyes with the bank. The eyes are taken from live patients whose eyes may have been removed for other reasons, although the cornea is unimpaired, from dead patients who have bequeathed their eyes to the bank (eyes must be removed within one hour after death), and from stillborn infants.

The operation has been performed successfully by opthalmologists for the last three decades. Prior to the establishment of the bank, surgeons who wished to perform the operation were forced to search various hospitals in an effort to find an eye from which the graft could be performed. Now, the bank will provide a central repository where eyes can be stored until they are needed.

To date, doctors estimate that large eye hospitals have been unable to perform more than fifty operations a year because of the difficulty of obtaining the corneal material, and most of the institutions had long waiting lists of patients. The bank was set up as an experiment at New York Hospital last May, and the present organization stems from that experiment.

Mrs. Henry Breckinridge, executive director of the bank, said yesterday that now it is possible to preserve the eyes only for seventy-two hours. They are kept in a saline solution at a temperature of between 3 and 4 C. Red Cross Motor Corps cars rush the eyes from hospitals to the bank.

Equally important, according to Mrs. Breckinridge, is the bank's program of research and education. Its directors hope, by continued research, to find a means of preserving the eyes indefinitely. She pointed out that only about fifteen ophthalmologists in the United States are now qualified to perform the operation. The bank, she said, will establish fellowships under which eye surgeons will be able to learn the operation technic.

Officers of the eye bank, besides Mrs. Breckinridge, are: chairman of the advisory council, Albert G. Milbank; president, Stanley Resor; vice-president, Dr. R. Townley Paton; secretary, Cyril B. Hartman; and treasurer, Walter C. Baker.

Chest Physicians Cancel Meeting

THE American College of Chest Physicians, with a membership in twenty-three countries, has canceled its annual meeting.

The Executive Council of the College voted to hold a business meeting of the Board of Regents at Chicago on June 17.

Neuropsychiatric Act to Provide Clinics Is Urged by National Committee for Mental Hygiene

THE National Neuropsychiatric Act *HR 2550* makes Federal provision for outclinic treatment of neuropsychiatric patients advocated by the National Committee for Mental Hygiene, it was revealed on March 29 by Dr. George S. Stevenson, medical director of the Committee.

The bill is to provide for, foster, and aid in coordinating research relating to neuropsychiatric disorders; to provide for more effective methods for prevention, diagnosis, and treatment of such disorders; to establish the National Neuropsychiatric Institute as a function of the U.S. Public Health Service; and for other purposes.

Dr. Stevenson stated that this bill for the first time expresses Federal interest in advancing knowledge of mental illness commensurate with the size of the problem. It not only provides for a central research hospital near Washington, but is prepared to offer support to universities and hospitals in the pursuit of psychiatric research. It enables states to initiate service to patients, the absence of which is greatly impressed upon us by the needs of many medically discharged veterans.

Under this bill states could establish outclinic services that would make it unnecessary for many patients to enter a hospital. The bill also provides for the training of staff. Without such provisions it would be practically impossible to establish clinics.

"A large proportion of men discharged from the armed services have neuropsychiatric disabilities and do not need hospitalization, but will need the kind of assistance that can be given in outpatient clinics," said Dr. Stevenson. "While such clinics have advanced greatly in the past two decades, in quality of service given, for the most part they are too few in number to service the needs of the country.

Meeting this need is primarily a matter of organization within the states but experience has shown that without some additional incentive and support it will be difficult for the states to provide such service."

CAMP
TRADE MARK

ANATOMICAL SUPPORTS
for
PENDULOUS ABDOMEN

Patient of stocky type of build before and after application of a Camp Support

MANY obese patients delay seeking a physician's advice until the overburdened joints show arthritic changes or severe dyspnea or anginal pain develops.

Gastro-enterologists and other clinicians report that anatomical supports are efficient aids in the treatment of these patients. Fitted in a reclining position, Camp Supports, by reason of the fact that they support the pelvic girdle, hold the forward load up and back, giving relief to the lumbar spine. They reduce the drag of the viscera upon the diaphragm, helping to improve its action in respiration and circulation. Camp Supports are comfortable and economically priced.

Governor Dewey Signs Bill for Blood Program

A BILL authorizing the State Department of Health to establish a program for collection and distribution of human blood and blood derivatives for use in transfusions was signed on March 28 by Governor Thomas E. Dewey. The bill carries an initial appropriation of $100,000.

The Governor said it was one of the "important measures" adopted at the recent session of the Legislature and would "save the lives of many people," adding: "It is a result of the remarkable discoveries in the use of blood plasma and whole blood in medical science and in the treatment of the wounded during the war." It will permit blood-collection and distribution programs in areas of the state where no such program now exists. Asserting that it would not interfere with the collection of blood for the use of the armed forces, he said the plan was developed with the assistance of the American National Red Cross.

The Governor added to his memorandum a statement of the Medical Society of the State of New York favoring the bill which read:

"It is considered that the establishment by the Health Department of a program for the collection, storage, and distribution of human blood and blood derivatives, including therapeutic and diagnostic serums, is most important in the treatment of sick and injured persons and the prevention of disease.... The diagnostic and therapeutic serums are extremely important and will aid in the treatment of many of the infectious diseases and will be a great factor in diagnosing conditions of pregnancy and lowering the maternal death rate in obstetric cases."

The bill was sponsored in the Legislature by Sen. Walter J. Mahoney, of Buffalo, and Assemblyman Lee B. Mailler, of Cornwall-on-Hudson, chairman of the long-range health program commission of the State Legislature.

County News

Albany County

Dr. Jacob Lewis Lochner, Jr., of Albany, has been appointed secretary of the State Board of Medical Examiners to fill the vacancy caused by the resignation of Dr. Robert R. Hannon. Dr. Lochner, a graduate of Tufts Medical School, has served as lecturer and instructor at Brady Maternity Hospital, Albany Training School for Practical Nurses, and Albany Medical College.*

• • • •

At the regular monthly meeting of the county society on March 28 at 8:30 P.M., Mr. George P. Farrell, Director, Bureau of Medical Care Insurance, Medical Society of the State of New York, spoke on "The Advantages of a Volunteer Medical Care Plan."

On April 25 Dr. A. Wilbur Duryee, of New York City, spoke on "Prevention and Treatment of Phlebitis." The discussion was opened by Dr. L. Whittington Gorham, of Albany, and was continued by Dr. Benjamin Etsten, of Saranac Lake.

Bronx County

The value of a wholesome diet in preventing heart disease was stressed by Dr. B. Pasquarelli on "Prevention and Treatment of Heart Disease," in a broadcast over Station WNYC, sponsored by the Bronx County Medical Society on March 24.*

• • •

On April 10 Dr. J. Lester Unger, of New York City, spoke at the Parkchester Hospital on "Rh Factor and Its Clinical Importance." The lecture was followed by discussion.

• • •

The regular monthly meeting of the county society was held at the Concourse Plaza Hotel on March 21, at 8:30 P.M. Following the executive session a symposium entitled "Organized Medicine Looks Ahead" was given. The first lecture was "Program of the American Medical Association," by Dr. Louis H. Bauer, of Hempstead. Mr. George P. Farrell then spoke on "What the New York State Medical Society Is Doing to Promote Medical Care Plans." Dr. William B. Rawls, of New York City, then discussed "What the Five Counties Have Done and Are Doing Now."

Broome County

Dr. Norman Jolliffe, of New York City, assistant professor in the College of Physicians and Surgeons, Columbia University, addressed the county society at the annual dinner meeting on March 14 at 6:30 P.M. in the Binghamton Club.

According to Dr. J. C. Zillhardt, secretary of the association and consulting physician of the Endicott-Johnson Corporation, Dr. Jolliffe is an outstanding authority on vitamins. Dr. Zillhardt introduced the speaker. The dinner was sponsored by the Endicott-Johnson Medical Department.*

Chautauqua County

Dr. Edward C. Koenig, of Buffalo, gave a talk on x-ray diagnosis and treatment, illustrated by lantern slides, when the county society met in Jamestown. Dr. William L. King presided at the association's business session at which it was voted to sponsor the State Medical Society's cancer education program locally. A committee was named by Dr. King to make arrangements for the cancer education project in Chautauqua County.*

Chenango County

Dr. William D. Mayhew left Oxford March 29 to take a course in internal medicine and medical specialties at the Mayo Clinic and Foundation, Rochester, Minnesota.

This course was originally a twelve-month course but owing to the war it has been accelerated to three months' duration.

Dr. Mayhew will return to Oxford on July 1 and will resume his general practice there.

Dr. Mayhew graduated from the Hahnemann Medical College, Philadelphia, in 1935.*

Dutchess County

A meeting of the county society in the pavilion of the Hudson River State Hospital, Poughkeepsie,

Similar to human milk

★The name is never abbreviated; and the product is not like any other infant food—notwithstanding a confusing similarity of names.

The fat of Similac has a physical and chemical composition that permits a fat retention comparable to that of breast milk fat (Holt, Tidwell & Kirk, Acta Pediatrica, Vol XVI, 1933) ... In Similac the proteins are rendered soluble to a point approximating the soluble proteins in human milk ... Similac, like breast milk, has a consistently ZERO curd tension ... The salt balance of Similac is strikingly like that of human milk (C. W. Martin, M. D., New York State Journal of Medicine, Sept. 1, 1932). *No other substitute resembles breast milk in all of these respects.*

ACCEPTED AMERICAN MEDICAL ASSN.

A powdered, modified milk product especially prepared for infant feeding, made from tuberculin tested cow's milk (casein modified) from which part of the butter fat is removed and to which has been added lactose, olive oil, cocoanut oil, corn oil and fish liver oil concentrate

M&R DIETETIC LABORATORIES, INC. • COLUMBUS 16, OHIO

[Continued from page 1130]

was held April 11. The scientific session consisted of a lecture entitled "Hay Fever," by Dr. Ira Wickner, consultant allergist, St. Luke's Hospital, Newburgh, allergist, Municipal Sanitorium, Otisville, and former head of the Fourth Division, Allergy Clinic, Bellevue Hospital; and a motion picture—"Modern Nutrition," featuring Dr. Norman Jolliffe, Dr. Tom D. Spies, of Alabama, Dr. W. H. Sebrell, of Maryland, and Dr. Robert Goodhart.

Erie County

Medicine, which has contributed tremendously to the preparation for and conduct of this war, will be called upon more than any other profession to help in the herculean job of world reconstruction, Dr. Morris Fishbein asserted on March 29 in Buffalo.

Addressing the Rotary Club in Hotel Statler, the spokesman for the medical profession packed facts and figures into an account of medicine's great strides, and then predicted even broader advances in the postwar world.*

Greene County

On April 3 the annual meeting of the Greene County Tuberculosis and Public Health Association was held in the Reformed Church chapel. A speaker, Dr. Edward X. Mikol, of Albany, plans for next year's program, the directors' meeting and election of officers, and movies for those not attending the directors meeting, were included on the program.*

Jefferson County

The regular meeting of the county society was held on April 12 at the Black River Valley Club, Watertown. Dinner was served at 6:30 P.M. The program included a lecture, "[illegible] of Acute Cardiovascular Emergencies, [illegible] E. De La Chapelle, professor of clinical medicine, New York University College of Medicine.

Kings County

The stated meeting of the county society was held on March 20 at 8:45 P.M. in MacNaughton Auditorium. Dr. Morris Ant, associate physician at Beth El and Kings County Hospitals, gave a lecture entitled "The Basal Metabolic Test—a New Concept in Interpretation." This was followed by "Newer Concepts in the Mechanism and Treatment of Head Injuries," by Dr. E. S. Gurdjian, associate professor of surgery (neurosurgery), Wayne University, Detroit.

• • •

Dr. Edmund Vincent Cowdry, professor of anatomy, Washington University School of Medicine, delivered the Adam M. Miller Memorial Lecture at Polhemus Memorial Building on April 23. The lecture, entitled "Microscopic and Chemical Properties of Precancerous Lesions," was sponsored by the Long Island College of Medicine.

Madison County

The regular Spring meeting of the county society was held on April 11, at the Hotel Oneida, Oneida.

Dinner was served at 6:30 P.M., with the members of the Woman's Auxiliary and wives of the physicians as guests.

The business and scientific program was held at 8:00 P.M. and a short business meeting preceded the reading of papers.

The papers of the evening were upon "Pregnancy and the Rh Factor," which were presented by Dr. Raymond J. Pieri, professor of clinical obstetrics, Syracuse University College of Medicine, and Dr. Robert C. Schwartz, instructor in clinical pediatrics, Syracuse University College of Medicine. This program was arranged by the Council Committee on Public Health and Education of the Medical Society of the State of New York.

Monroe County

Dr. Albert D. Kaiser, who assumed the position of Rochester's health officer on April 1, was appointed a full professor of child hygiene on the faculty of the University of Rochester School of Medicine and Dentistry on March 30.

Dr. Kaiser has been associate professor of pediatrics since the school started.

Dr. George H. Whipple, Dean, stated that appointment of Dr. Kaiser to full professorship was in recognition of his long service to the school and his role as health officer.

Dr. Kaiser, a member of the Board of Trustees of the university, is a graduate of the class of 1909.

• • •

Hospitals should be distributed "in proportion to the need rather than in proportion to the concentration of wealth," in the opinion of U.S. Surgeon General Thomas Parran.

Speaking on March 31 at a county society dinner honoring Dr. Arthur M. Johnson, retiring Rochester city health officer, Parran outlined a postwar health program which included: a sanitary environment free from sources of pollution and disease bearers; more hospitals and three thousand health centers for preventive health work; expanded public-health service; better training and distribution of doctors, dentists, and nurses; intensified and better coordinated research of diseases for which there is at present no method of prevention or control; and better distribution of the cost of medical care.*

Nassau County

One of the principal functions of pathology is to afford a scientific and accurate approach to the diagnosis of disease and to remove all guesswork from medical treatments, Dr. Theodore J. Curphey, Nassau County medical examiner, asserted in an address at the Hempstead Kiwanis Club on March 22.

Since 1900, many important advances have been made in surgery but behind the scenes, in the laboratories, pathologists have been working to bring forth some of the marvelous drugs, such as penicillin and the sulfonamide, which have greatly advanced medical science, Dr. Curphey pointed out.*

• • •

The regular monthly meeting of the county society was held on March 27 at 9:00 P.M. in Mercy Hospital auditorium, Rockville Centre. Dr. Clarence C. Little, managing director of the American Cancer Society, spoke on "Today's Philosophy in the Diagnosis and Treatment of Cancer."

New York County

Dr. John Scudder, director of the blood bank at the Presbyterian Hospital, arrived in Kunming, China, March 13, to organize the plasma service for the Chinese armies. In this work he will serve as a

The Annual Rothschild Lecture was delivered at Beth Israel Hospital by Dr. Frank H. Lahey, of Boston, on April 24 at 8:30 P.M. The subject of the lecture was "The Management of Thyroid Disease, Some of the New Developments, Including a Review of Our Experiences with Thiouracil."

* * *

Organization of a committee of representatives of several large chemical and pharmaceutical concerns to raise $500,000 for "badly needed expansion" of the library of the New York Academy of Medicine was announced on March 20 by Carleton H. Palmer, chairman of the board of E. R. Squibb & Sons, who is chairman of the fund-raising committee.

The fund, Mr. Palmer said, would permit construction of a nine-floor addition to the stack room, which will increase capacity to 374,000 volumes. It would also provide for a new catalogue of 2,800,000 cards, and improved handling, delivery, photostating, and bibliographic service.

The academy's medical library is the second largest and most used in the Western Hemisphere, Mr. Palmer pointed out. It is open to all who seek its aid, and handles about 40,000 inquiries a year. It provides the necessary up-to-the-minute data from which all new research must begin.*

* * *

Postwar expansion of several of the hospital units of the Columbia-Presbyterian Medical Center was announced on March 23 by Charles P. Cooper, president of the Board of Managers of the Presbyterian Hospital, in the annual report of the center.

Plans have been completed for an addition of one hundred and twenty rooms to Maxwell Hall, the student nurses' residence, which will release one ward floor in the Presbyterian building now housing student nurses. Further plans call for an extension of the Vanderbilt Clinic, the addition to Harkness Pavilion of a number of moderately priced private rooms, and similar changes in the Babies Hospital, the Neurological Institute, and the Eye Institute. Additional operating rooms and laboratory facilities will also be provided.

Three new units are included in New York City's proposals for the future development of city-owned and operated buildings for hospital care and research. These include completion of the Florence Nightingale Hospital for cancer patients, a new public health institute for teaching and research, and a hospital of about three hundred and fifty beds to provide care for tropical and communicable diseases. They will be located on sites at the Medical Center made available by the Presbyterian Hospital and Columbia University.*

* * *

The College of Medicine of New York University and Irvington House, a sanitarium for cardiac children located at Irvington-on-Hudson, jointly announced a medical affiliation on March 27 to provide additional care and rehabilitation for underprivileg[illegible] from heart disease.

The [illegible] will be responsible for the direction, supervision, and administration of the medical and research program at Irvington House. Young doctors will be trained there in the early recognition and treatment of rheumatic heart disease.

One major result expected from the new affiliation, according to Dr. Donal Sheehan, acting dean of the College of Medicine, is an expansion of the sanitarium's research activities in the cause, prevention, and treatment of rheumatic fever. In the last three years promising studies in the prophylactic use of sulfa drugs have been conducted at Irvington House, and that type of work will be continued.

Founded twenty-five years ago, Irvington House has provided care for more than three thousand boys and girls who were sent there by forty hospitals of Greater New York and Westchester. The sanitarium will continue its pioneering work in preventing and correcting youthful maladjustment due to physical handicap from heart disease, while the victims are still young and responsive to adjustment.

Although the New York University Medical College will have full medical responsibility for the direction of the institution, Irvington House will continue to depend upon an annual appeal for voluntary contributions for its financial support.*

A new service designed to help discharged Army and Navy doctors get offices, homes, furniture, and scientific equipment was announced on March 26 by *James E. Bryan, executive secretary of the* county society.

Plans have been approved by the society's directors and were reported to the seven thousand readers of its official bulletin, *New York Medicine*, in the April 5 issue.

Outlined by the society's new committee on public relations, under the guidance of Dr. John De Paul Currence, of the New York Post-Graduate School and Hospital, the program includes finding "part- or fulltime employment in governmental or private service," on which the committee has already been working, and "opportunities for postgraduate instruction." Mr. Bryan said a Medical Veterans Aid Fund, to be raised through donations of members, would give noninterest-bearing small loans to

The monthly meeting of the Utica Academy of Medicine was held on March 15 at the Hotel Utica. Maj. Louis Dantzig, from Rhoads General Hospital, spoke on "Lichen Planus." This was followed by "The Physician and the Rh Factor," by Dr. Harold Pender. The next meeting was held on April 19 in the Hotel Utica. Dr. Howard Frank Root, of Boston, associate in medicine, Harvard Medical School, discussed "Diabetic Coma." Dr. Richard H. Hutchings, of Utica, then spoke on "Psychosomatic Medicine."

* * *

The regular meeting of the county society was held in the Hotel Utica on April 10. Dr. Ellery G. Allen, associate professor of clinical medicine and assistant professor of clinical pathology, Syracuse University College of Medicine, gave a lecture entitled "General Résumé of the Hematological Disorders Including the Anemias."

Necrology

Sol J. Applebaum, M.D., physician and consultant to the University of Rochester School of Medicine and Dentistry, died on April 9 at Miami Beach, Florida. He was 64 years old. Born in Poland, he received his medical degree from Johns Hopkins Medical School in 1908. After serving as intern at the Western Pennsylvania Hospital in Pittsburgh, he began practice in 1910 in Rochester, where he held various posts with the Rochester General Hospital. He was former attending obstetrician and assistant surgeon at Monroe County Hospital, and also served on the staffs of the Park Avenue Hospital, Rochester State [illegible] and the Roches[illegible] former director of the Rochester Welfare Department Medical Bureau, and a former president of the Monroe County Medical Society, a member of the Medical Society of the State of New York, the American Medical Association, and the Rochester Academy of Medicine.

Joseph S. Bendetson, M.D., of Brooklyn, died on March 6 at the age of 53. Dr. Bendetson was graduated from the University and Bellevue Hospital Medical College in 1920, and served his internship at the Brooklyn Jewish Hospital, where he later became adjunct physician. He was also associate physician at the Jewish Hospital for Chronic Diseases. He held membership in the Medical Society of the State of New York and the American Medical Association.

Lewis E. Bratt, M.D., of Akron, died suddenly on March 23 of coronary thrombosis. He was 63 years old. A native of Akron, Dr. Bratt was graduated in 1911 from Loyola University School of Surgery and Medicine, Chicago. After practicing ten years in Roanoke, Illinois, he returned to Akron, where, in addition to his other duties, he became physician of Akron High School and the Newstead Township schools. At the time of his death he was an officer of the Akron Health Board.

John D. Hamill, M.D., of Brooklyn, died on April 14 at the age of 66. He was a former member of the medical staff of the Misericordia Hospital in Manhattan and a specialist in x-ray technic. Dr. Hamill received his medical degree from Cornell Medical College in 1901.

Antonio Elias Malavazos, M.D., of New York City, endocrinologist, died on April 20 of a heart ailment at the age of 56. Born in Sparta, Greece, Dr. Malavazos was graduated from the University of Athens in 1911 and did postgraduate work at the University of Vienna for several years. He began his medical career in the Hippocrates Clinic, Athens, in 1911 and served as a medical officer in the Greek Army from 1912 to 1920. After coming to this country in 1924 he became assistant visiting physician at the Metropolitan Hospital, clinical assistant at the Polyclinic Hospital, and a member of the staff of the Newark Beth Israel Hospital.

Frank A. Nobiletti, M.D., of Kew Gardens, Queens, died on April 21 of pneumonia at the age of 34. Dr. Nobiletti received his medical degree from the College of Physicians and Surgeons of Columbia University in 1936. He interned at Bellevue Hospital and was later resident surgeon in fractures at the Presbyterian Hospital. At the time of his death he was instructor in surgery and fractures at that hospital, and was also on the staff of the Seton Hospital in Manhattan, Mary Immaculate, Queens General, and Triborough hospitals in Queens, and the Lutheran Hospital in Brooklyn. He was a fellow of the American College of Surgeons, a diplomate of the American Board of Orthopedic Surgeons, and a member of the Queens County and New York State medical societies and the American Medical Association.

Samuel I. Seidenberg, M.D., of Bronx, died on February 4 at the age of 65. Dr. Seidenberg received his medical degree from the Imperial University in Odessa, Russia, in 1911. He was a member of the North Bronx, the Bronx County, and the State medical societies and the American Medical Association.

Penicillin DOSAGE TABLE*

INDICATIONS	INITIAL DOSE (UNITS)	CONTINUING DOSAGE (UNITS)	UNITS IN 24 HR.	REMARKS
Serious Infections (staphylococcus, clostridium, hemolytic streptococcus, anaerobic streptococcus, pneumococcus, gonococcus, anthrax, meningococcus) Adults and children	15,000 to 20,000	(a) Intravenous drip 2000 to 5000 every hr.	40,000 to 120,000 or more	(a) Dissolve ½ of 24 hr. dose in 1 liter (1000 cc) normal saline; let drip at 30 to 40 drops per minute.
		or (b) Intramuscularly: 10,000 to 20 000 every 3 or 4 hr.	40,000 to 120,000 or more	(b) Concentration 5000 U. per cc. normal saline.
		or (c) Intramuscular drip	40,000 to 120,000 or more	(c) Total daily dose in 250 cc. normal saline.
Infants	5000 to 10,000	3000 to 10,000 intramuscularly every 3 hr.	20,000 to 40,000 or more	Each dose in 1 or 2 cc. of normal saline.
Chronically infected compound injuries, osteomyelitis, etc. Adults and children	5000 to 10,000	10,000 every 2 hr or 20,000 every 4 hr. intramuscularly or intravenously. Larger doses may be necessary at times.	40,000 to 120,000 or more	Concentration for intramuscular inj: 5000 U. per cc. normal saline. For intravenous inj. 1000 to 5000 U. per cc. Supplement with local treatment.
Sulfonamide Resistant Gonorrhea	20,000 every 3 hr. intramuscularly for 5 doses		100,000	Results of treatment should be controlled by culture of exudate.
Empyema Adults and children	30,000 to 40,000 once or twice daily into empyema cavity		30,000 to 80,000	Dissolve in 20 to 40 cc. normal saline and inject into empyema cavity after aspiration of pus
Meningitis Adults and children	10,000 once or twice daily into subarachnoid space or intracistemally		10,000 to 20,000	Concentration 1000 U. per cc. normal saline.
Bacterial Endocarditis Adults and children	25,000 to 40,000	25,000 to 40,000 every 3 hr. intramuscularly	200,000 to 300,000	Continuous treatment for 3 weeks or longer. In a few cases the intravenous drip is more advantageous.

*Based upon recommendations by Chester S Keefer, *War Production Board Penicillin Leaflet*, Apr 1, 1945; and by Wallace E. Herrell and Roger L. J Kennedy, *Journal of Pediatrics*, 25 505, Dec., 1944.

Hospital News

U.S. to Buy Crugers Park as Hospital Site

THE Federal Government exercised an option on April 16 to buy Westchester County's Crugers Park for a two-thousand-bed veterans' hospital. County officials said they were informed it would be one of the largest hospital developments of its kind in the nation, costing $6,000,000 for construction, and possessing 400 acres of woodland, flower gardens, vegetable plots, beaches, and historic sites. Yet it will be within forty miles of New York, accessible by main-line trains, steamers, and buses.

Crugers Park, in Cortlandt Township three miles south of Peekskill, comprises 251 acres bordering the Hudson River on the west and the Albany Post Road on the east. The New York Central Railroad's main line skirts one side of the property and the Hudson River Day Line has piers at near-by Indian Point. In addition to the park property, the Veterans Administration has options on adjacent private lands that will increase the size of the hospital grounds 400 to 500 acres.

Soon after an agent of the Veterans Administration began searching Westchester early last winter for a hospital site the Peekskill Chamber of Commerce, American Legion, and other groups began working for the selection of Crugers Park. The only organized opposition came from the Westchester County Historical Society, which objected especially because the future of the historic Boscobel mansion at the park would be in jeopardy if the hospital were built.

Boscobel, built in the eighteenth century, is operated temporarily by historians under an arrangement with the County Park Commission. Mr. H. C. Gerlach, County Executive, said that efforts would be made to have the Federal Government preserve the place as a historic shrine and museum for hospital patients and their friends. He asserted that Grasslands Hospital, at Eastview, largest general hospital between New York and Albany, has only 800 beds, and that the utilitarian, educational, and recreational needs at the veterans hospital would be proportionately greater.

Six Hospital Ships Join Navy

THE U.S.S. Tranquillity, first of a new class of Navy hospital ships being converted from Maritime Commission C-4 hulls, was inspected on April 16 at the Atlantic Basin Iron Works in Brooklyn.

The Navy is acquiring six of the 15,000-ton air-conditioned ships with a speed of seventeen and a half knots. They will be known as the Haven class.

The Tranquillity will be the first of the converted ships to join naval forces in the Pacific. She will be followed soon by the Haven, with three more in May and the sixth about mid-June.

The ships will retain only the basic original features of the C-4. The vessels will have hospital beds for 802 patients, including 742 enlisted men and 60 officers. Under emergency conditions, however, the craft may carry several hundred more cases. A ship's company will consist of fifty-eight officers, thirty nurses, two women Red Cross workers, twenty-four chief petty officers, two hundred and thirty crew members, and two hundred and thirty-eight hospital ratings.

The Tranquillity will be commanded by Capt. Merritt D. Mullen, USNR, a veteran of the Merchant Marine. Senior medical officer will be Capt. B. W. Hogan, USN, with Lieut. Sylvia Koller, USN, as chief nurse.

Features of the Haven class are: full air-conditioning, for the first time in any Navy ship, throughout the hospital and crew's quarters; single, double, or multiple litter hoists, five on each side of the vessel, to expedite loading of wounded, and large medical storerooms that will permit a ship to be a medical supply depot in advanced areas.

Hospitals Fight on Two Fronts

FIGHTING on two fronts, civilian hospitals celebrated National Hospital Day, 1945, on May 12 in a nation requiring their services abroad and at home.

Their record to date includes: 54,000 hospital-trained nurses and 60,000 hospital-trained doctors plus many thousands of technicians serving our fighting men in the services; and the admission of over 12 per cent of the American population to community hospitals in 1944—one every two seconds—for civilian hospital care.

"The past year has seen an increase of almost a million patients admitted to the hospitals of this country," stated Dr. Donald C. Smelzer, president of the American Hospital Association, in announcing May 12 commemorations by hospitals over the country. "Despite a decrease in the total number of voluntary hospitals, the bed capacity in them has actually grown by several thousands. Shortages of personnel and difficulties in obtaining supplies, added to this increased demand for hospital care, have necessitated patience and understanding on the part of administrators and the community as well.

"May 12, the one hundred and twenty-fifth anniversary of the birth of Florence Nightingale, who initiated modern hospital practices, nevertheless finds the three thousand, five hundred voluntary hospitals in the Association aware of increased public interest in hospital care and making plans for expansion and improvement. As agents of society, community hospitals must keep pace with the desires of that society. The nation-wide analysis of hospital facilities by the independent Commission on Hospital Care, the contemplated billion dollar expansion plans of hospitals, the rapid extension of hospital-sponsored, nonprofit Blue Cross prepayment plans for hospital care, as well as the vital role played by hospitals in the health care of our men in uniform—all give conclusive proof that hospitals, on National Hospital Day, are worthy of the nation's support and interest."

DIET PROBLEMS IN GERIATRICS

As digestive efficiency declines, along with other faculties, there may be increasing difficulty in meeting the need for foods with bland nutritional properties. The requirement for adequate protein is also one that should not be neglected in the diet of the older patient.

Knox Gelatine (U.S.P.) is helpful in maintaining the nutritional optimum. It is all protein, containing no sugar or artificial, acid flavoring. Used in warm milk, as in the drink described below, it is often prescribed to aid sleep. And in the many dietary recipes developed for Knox Plain Gelatine, patients find a pleasing variety.

Knox Gelatine Milk Drink: *Soak one envelope of Knox Gelatine in ½ cup milk. Stir over hot water until gelatine thoroughly dissolves. Add ½ cup of cold milk Flavor with vanilla or chocolate syrup if desired Mix and drink.*

[Continued from page 1138]

Directors of the Boulevard Hospital, Queens, announced on March 14 that the War Production Board had authorized construction of a new wing. It will be named in memory of Dr. Jacob N. Feinberg, one of the hospital founders.*

• • •

It was reported on March 6 that the Sidney Hospital, in Unadilla, plans to build a new wing to the existing building in the near future. Plans call for the wing to be built on the front of the present structure.

At present, the hospital is not large enough to accommodate certain types of patients; for example, there is no children's ward. In the new wing this will be provided for with the construction of a six- to eight-bed ward. In addition there will be ten to twelve beds for medical and surgical patients. Altogether, the plans call for about twenty additional beds.*

• • •

The Middletown Sanitarium became custodian on March 31 of an iron-lung respirator purchased by the Middletown Elks Lodge for the community. It was the second respirator purchased by the organization in seven years. Horton Hospital, Middletown, is custodian of the first lung, which has been in use since 1938. A brief formal presentation program was held in the reception room of the Sanitarium.*

• • •

An automatic oxygen tent of radically new design—the first of its kind in the Triple Cities area—was installed on March 26 at Lourdes Hospital, Binghamton.

The new equipment provides a combination of oxygen therapy and air-conditioning for a patient and does not require icing or constant attention, as does the familiar type of oxygen tent.

The equipment was given to the hospital in memory of the late Dr. William A. Behan, chief of staff of Lourdes Hospital, who died January 23. The donors were Morris S. Cohen, of Binghamton, and his son and daughter-in-law, Mr. and Mrs. Charles Cohen.

Equipped with electrical refrigerating facilities, the oxygen tent can be put into operation merely by the insertion of a plug into an ordinary wall socket. The operator sets a dial and the temperature control is maintained automatically.

When used as an air-conditioning unit for a patient, the unit has proved useful as an aid in the treatment of respiratory cases, particularly in hot, humid weather.

One of its functions is to draw vitiated air from within the canopy back into a sealed cleaning chamber. In this manner the air is cleansed, cooled, dehumidified, and changed four times a minute.*

• • •

Construction is under way at Rhoads General Hospital, Utica, to provide space for five hundred and fifty additional beds for wounded soldiers being returned from overseas, it was announced on April 2 by Col. A. J. Canning, commanding officer.

The project, costing more than half a million dollars, calls for the erection of eighteen new buildings to house the enlisted men and women of the medical detachment at the hospital, and the conversion of eleven barracks, now used as living quarters, into wards.

Completion of the project in June, Colonel Canning said, will increase the bed capacity of Rhoads to two thousand, five hundred. With casualties returning to the United States at the rate of fifty an hour, the additional facilities are urgently needed, he declared.

The new buildings, all of which are of a modified theater-of-operations type of construction, will resemble, when finished, all other Rhoads Hospital buildings. Of frame construction, they will have asphalt roofing and outside walls of tan, mineral-surfaced siding.*

At the Helm

Appointment of J. Dewey Lutes, of Bethesda, Maryland, as administrator of the Yonkers General Hospital, has been announced by John G. Kelly, president of the board.

The appointment was effective April 1.

Mr. Lutes has had more than twenty-two years of experience in hospital administration, his first twenty years having been spent in Chicago, with the Lake View, Ravenswood, and Presbyterian hospitals.

He left the Presbyterian Hospital to go to Bethesda, to construct, equip, and staff the Suburban Hospital, which he opened in January, 1944, and has managed since then.

Mr. Lutes is an organizer of the American College of Hospital Administrators and its first director. He is a life member of the American Hospital Association, and served as a member of its house of delegates and on various committees.

A past president of the Chicago Hospital Association and the Hospital Association of Illinois, he served as chairman of a Chicago committee that organized and incorporated a hospital insurance plan, and as vice-president until he left Chicago.*

• • •

Dr. Arthur M. Johnson, who retired April 2 as Rochester health officer, is a new member of the board of visitors of Rochester State Hospital. Appointed April 1 by Governor Dewey, Dr. Johnson will succeed M. Bruce Potter, Pittsford.*

• • •

George B. Bernheim was elected president of Mount Sinai Hospital April 10 at a meeting of the hospital's board of trustees. Joseph Klingenstein, George Lee, and Alfred Rose were elected vice-presidents; Joseph F. Cullman, Jr., was elected treasurer; and Richard Goldsmith, secretary.

Mr. Bernheim, who succeeds the late Waldemar Kops, who died January 13, has been a member of

At the Annual Meeting of the New York Society for the Relief of the Ruptured and Crippled, Dr. Carlisle S. Boyd, was appointed Senior Consulting Physician and Physician-in-Chief Emeritus of The Hospital for Special Surgery, formerly known as The Hospital for the Ruptured and Crippled. Dr. Boyd had been head of the department of medicine and pediatrics for over thirty years.

* * *

John B. Kelly, for nearly fifteen years superintendent of the New York State Reconstruction Home, West Haverstraw, applied for retirement on April 1 after thirty-three years in the state service and will leave West Haverstraw as soon as his successor arrives.

In July, 1930, when a $2,000,000 construction program was under way, Mr. Kelly was "loaned" for four or five months by the Division of Standards and Purchase to the Rockland County institution. The temporary loan grew into years during which Mr. Kelly made an outstanding record as superintendent of one of the finest institutions in the world for the treatment of crippled children, especially those affected by poliomyelitis.

When Mr. Kelly arrived at the institution, it had a capacity of 190 patients, but most of the buildings were of wooden construction and had been condemned by the state. He was assigned for a special job and sat in on plans for the general layout of the new institution and was present all during the construction of the east and west wards, the connecting corridors, the auditorium, the dining rooms and kitchens, and the physiotherapy pools which have proved one of the best known methods of rehabilitating crippled children.*

Newsy Notes

Thomas J. Watson, vice-president of the Roosevelt Hospital in New York City, and cochairman of its current $1,000,000 service-expansion fund campaign, presided on April 17 at a luncheon meeting at the headquarters of the International Business Machines Corporation. The campaign seeks funds to extend its accident-emergency, outpatient clinical, and semiprivate facilities.

Mayor La Guardia signed on April 18 in his office at City Hall the contract under which the city will construct and equip a $1,500,000 cancer hospital adjacent to the Memorial Hospital for the Treatment of Cancer and Allied Diseases. The city institution, to be built after the war on land deeded by the Memorial Hospital, will be staffed by the private institution.

The new city hospital will have a capacity of three hundred beds. The city will construct, operate, and maintain the buildings. Medical and professional services will be supplied by the Memorial Hospital staff.*

* * *

The training program of Adelphi College School of Nursing, Garden City, is providing five hundred badly needed student nurses to seven nearby hospitals and the Nassau County Department of Health, Miss Mildred Montag, director of the school, has announced.

Under the program, the school established agreements with the seven institutions and the health department so that its students may be rotated from one hospital to another to obtain the maximum practical training during their course. With the wartime shortage of nursing help, it has enabled the hospitals to maintain effective nursing service which would have been impossible without student help.

Established in January, 1943, the school was designed to increase the nurse educational opportunities in New York. Agreements were made to train students, under direct school supervision, at Mercy Hospital, Rockville Centre; Meadowbrook Hospital, Hempstead; the Nassau County Hospital for Tuberculosis, Farmingdale; Queens General Hospital, Mineola; Central Islip Hospital, Central Islip; United Hospital, at Port Chester; and Queens General Hospital, Jamaica.*

* * *

Plans for replacing the frame portion of the Wyoming County Community Hospital with a structure of fireproof construction is being considered as arrangements also proceed for erection of new quarters to house student nurses, class rooms and laboratories, library, and recreation rooms.

Preliminary plans for this latter structure have already been approved by the State Planning Committee and will now come before the Board of Supervisors for their approval.*

* * *

The major contribution, $400, from funds raised by the Republican Women of the Legislature at their annual dance, will go to Rhoads General Hospital to aid in equipping a darkroom for use of patients in developing and printing film, Miss Dorothy Emerson, Cayuga, president, announced on March 29.*

Health News

Active Year Shown for Visiting Nurses

Four hundred thousand visits to 88,808 sick persons in Manhattan, the Bronx, and Queens were made in 1944 by the staff of the Visiting Nurse Service of New York, James L. Harrison, president, reported on March 28 at the service's annual meeting. Officers and board members whose terms expired were re-elected.

Miss Marian G. Randall, executive director, reported that the staff had seventy vacancies that cannot be filled because of demands of the armed services, but had lived up to its tradition that "no call goes unanswered." Hours for the staff have been extended from forty to forty-four, with volunteers and practical and cadet nurses assisting, she explained.

Last year the organization gave some service to one third of all babies born in the three boroughs. In addition, three thousand expectant mothers received instruction in baby care, while the service gave 23,000 hours to war plants in teaching health principles and first aid.*

Fees Paid to Diplomates of Specialty Boards Increased by E.M.I.C. Program

Ever since the beginning of the Emergency Maternity and Infant Care Plan in New York City in July, 1943, attempts have been made by the Department of Health to modify the plan in accord with recommendations of various medical and hospital groups. One of the recommendations made was that physicians with superior training be paid increased fees. Approval for such an increase was finally secured. As of December 15, 1944, physicians who are diplomates of their respective specialty boards are entitled to a 50 per cent increase in the fee for services given to E.M.I.C. patients. A schedule of these facts is available at the Health Department E.M.I.C. office.

Additional administrative staff now makes it possible for the Health Department to process payments much more rapidly than formerly. Doctors are urged to send in their bills promptly by filling in the E.M.I.C. invoices forwarded to them.

From July, 1940, to March 1, 1945, the E.M.I.C. Plan has paid for the care of 27,483 maternity cases and 3,218 infant cases. A total of $1,919,860.44 has been paid for medical and hospital care rendered these patients. The average cost for maternity cases, including medical and hospital care, has been $100, and for infant cases $40.

At the present time the Plan in New York City does not provide payment to physicians for well-baby supervision. Physicians, however, may refer E.M.I.C. patients to child-health stations of the Department of Health which provide well-baby service including immunizations.

Further information about the Plan and application blanks may be secured at the E.M.I.C. Office, 100 Center Street, New York 13, New York, telephone WOrth 2-6900, Extension 321.

Announcement of Fellowships in Health Education—1945

Fellowships for a year's graduate study in health education leading to a master's degree in public health are being offered to qualified men and women by the U.S. Public Health Service through funds made available by the National Foundation for Infantile Paralysis. The sponsors of the fellowships are concerned chiefly with meeting the existing shortage of trained health educators and preparing to meet future demands both in this country and abroad for qualified personnel having a thorough understanding of both public health and education.

The fellowships provide a year's study in public health education at the University of North Carolina, Yale University, or the University of Michigan. This training includes an academic year (eight or nine months) in the Schools of Public Health, and three months of supervised field experience in community health education. Courses studied in the Schools of Public Health include: epidemiology, public health statistics, public health administration, public speaking, health education, public health education problems, and school health education. Upon successful completion of the course, the candidate is eligible for a master's degree in public health education.

The fellowships provide a stipend of $100 a month for the entire period of academic and field training, tuition at one of the above three universities, and travel expenses for field experience. Candidates must pay their own travel to and from the university at the beginning and end of training.

Effective for the Fall collegiate quarter of 1945, the fellowships are available to qualified men and women between the ages of 22 and 40 who are citizens of the United States. Candidates must meet the entrance requirements of the Schools of Public Health, which include a bachelor's degree from a recognized college or university. Desirable prerequisites include training and/or experience in the basic sciences, sociology, education, and psychology, plus the ability to use the English language effectively and to work with all kinds of people. Address inquiries to the U.S. Public Health Service, Washington 14, D.C.

Farris Wins National Research Foundation Award

Edmond J. Farris, Ph.D., of Philadelphia, Pennsylvania, was selected by the National Research Foundation for the Eugenic Alleviation of Sterility, Inc., to receive its special 1945 award of $500 together with a commemorative medal in recognition of his work in the physiology of reproduction.

Presentation was made c[illegible] 27, 1945, at the meeting of the [illegible] Heredity and Eugenics at [illegible] at that time gave a lecture on "Studies in Determining Time of Ovulation."

State and Territorial Health Officers' Conference

The forty-third annual conference of the United States Public Health Service with the State and Territorial health officers was held April 9, 10, and 11 in the National Academy of Sciences, Washington, D.C. The meeting was required by law, and therefore was approved by the Committee on Conventions.

General sessions of the conference were open to all interested persons but attendance by out-of-town visitors was not encouraged in view of travel restrictions.

Mobile Operating Room is Perfected by the Navy

The Navy unveiled on March 22 its answer to the urgent need for a complete, mobile operating room permitting major surgery in front-line areas of the Pacific.

The self-contained unit, measuring 8 by 10 by 20 feet inside, is mounted on a trailer which can be towed by any vehicle.

The Navy said twenty-eight such units have been ordered. Eighteen will be delivered to the Pacific in the next thirty days, three to a division. The other ten will be held in reserve for replacements.

The unit can be unloaded and ready for use within one hour.

Navy medical officers explained that any type of operation can be performed in it. They said it will be of immeasurable benefit in providing surgical attention within the essential six hours after men are wounded.

After six hours, they explained, the chance of infection and subsequent fatality is increased seriously in many types of combat wounds.

Particularly in the Pacific area American forces know by experience not to move after nightfall because the chances of being shot even by friends are great. Therefore, wounded men brought in late in the evening frequently cannot be evacuated to ships or base hospitals for hours.*

Mass Dental Aid Is Postwar Plan

Mass protection against dental decay in children is envisaged as a postwar possibility by Dr. John W. Knutson, one of the public health surgeons engaged in the fluorine experiments of the United States Public Health Service.

Caries in children appeared as the first and worst dental problem in the country as a result of the draft, when one out of every twelve in the first 2,000,000 men examined were barred from military service because of dental defects, Dr. Knutson explained. Later, the Army needed men so badly it took over the prodigious task of their dental rehabilitation.

Surveying the dental decay situation, Dr. H. L. Dean, senior dental surgeon of the Public Health Service, learned that there is only from one-third to one-half as much dental decay in areas where there is fluorine in the drinking water as in areas where the water is fluorine-free.

The Public Health Service is making a double attack on dental decay through the addition of fluorine to city water systems and through the direct application of fluorine to the teeth of children.

Experiments and field studies of the service show that the protective treatment must be given during the first eight years of the child's life, while the teeth are forming. Fluorine has no effect on the teeth of adults.

Three years ago, in April and May, 1942, Dr. Knutson with Dr. W. D. Armstrong, in cooperation with the Minnesota Department of Health, started treating a pilot group of 300 school children in three Minnesota towns, with, of course, the consent and cooperation of their parents. They treated upper and lower teeth of half of the mouth of each child, painting a fluorine solution on the teeth, but leaving the other half untreated as a control. Over a two-year period, they found 40 per cent less decay among the treated teeth than among the untreated. Dr. Knutson expects to find this percentage still holding when he goes out there next month to make a third examination.

A broader experiment has now been set up, using a variety of fluorine solutions and different methods of testing, on two thousand school children of Rochester, Minnesota.

Dr. Knutson pointed out that the direct method of application might be used with sufficient frequency to give protection if it were done as a routine matter with each periodic dental examination and also each time a new tooth came in during the early years of childhood.

The Minnesota school children were treated from seven to fifteen times during a two-month period. This direct method would have to be used for the third of the country which gets its water supply from wells and springs.

For the other two-thirds of the country, however, there is the possibility of protection from dental decay through addition of one part per million of flourine to municipal water supplies, Dr. Knutson said. The results of this will not be fully known for eight or ten years, until the children affected are grown.

The Public Health Service, in cooperation with the State Department of Health in Michigan and the University of Michigan, is conducting a project of thus fluorinating the Grand Rapids, Michigan, water supply. It was started in January of this year.

The New York State Health Department is now conducting an independent survey of the same type at Newburgh. A third experiment is being considered in Canada.

Dr. Knutson said that the incidence of dental caries increases from South to North and that it is also very heavy along the Eastern seaboard.*

Cancer Campaign Launched

A campaign designed to acquaint the public with the cause, cure, and prevention of cancer has been launched through a joint effort by the Dutchess County Medical Society and the Dutchess County Health Association.

Dr. Helen Palliser, chairman of the medical society's cancer committee, and also a member of the board of directors of the Dutchess County Health Association, assigned speakers to talk to clubs and various organizations throughout the county. Letters were sent from the health association offices offering speakers to appear at regular meetings.*

Speed—An Important Factor In Antianemia Therapy

Speedy remission of symptoms in secondary anemia is of primary importance to the patient. Hemoglobin restoration and return of well-being are hastened when therapy not only provides iron, but also compensates for the other deficiencies usually manifested.

LIVITAMIN, an unusually palatable liquid, supplies: iron which is highly available and promptly utilized; liver concentrate presenting the fractions found valuable in the anemias; a rich store of B vitamins which aid in overcoming the frequently severe anorexia and in correcting nutritional deficiencies.

LIVITAMIN

Each fluidounce of Livitamin presents:

Pantothenic Acid.....5 mg.
Iron and Manganese Peptonized.....30 gr.

Contains the vitamin B complex factors naturally occurring in liver and rice bran, fortified with synthetic B_1, niacinamide, B_2, B_6, pantothenic acid and with iron and manganese.

In doses of 2 to 4 teaspoonfuls t i d. Livitamin rapidly corrects hemoglobin deficiency. Available in 8 oz. bottles.

The Problem of Aging

Columbia University College of Physicians and Surgeons announces that it will conduct research on the process of growing old. The study, which will be carried on by the department of pathology, will be financed by a grant of $30,000 from the Albert and Mary Lasker Foundation, designated as the Wendell Willkie Memorial Grant, and $85,000 contributed by the Josiah Macy, Jr., Foundation. According to the New York *Times* the department of pathology will study the underlying process of aging which results in the gradual loss of ability and in the progressively increasing death rate as the years roll by; the mechanism by which fat is deposited in the artery walls as part of arteriosclerosis, or hardening of the arteries; the depositing of collagen in artery walls in arteriosclerosis; the changes in tissue metabolism with increasing age; the changes in water balance and resistance to shock; the changes in circulation and capillary permeability; the renewal of worn-out tissues, and the enzyme content of tissues. A colony of rats and mice of all ages will be set up, a matter of two or three years, because the rats and mice must have time to grow old. They will be raised under ideal conditions, which means air conditioning, uniform lighting, and freedom from disturbing factors.

1945 Lasker Award to Be Given for Service in Field of Rehabilitation of Mentally Handicapped

The Lasker Award for 1945 will be given for an outstanding contribution to the rehabilitation of the mentally handicapped, it was announced on April 1 by the National Committee for Mental Hygiene. The committee is now receiving nominations with supporting data, to be presented to an anonymous jury selected each year for its competence to judge accomplishment in the field chosen.

The award of $1,000, established in 1944, is made annually in November by the Mary and Albert Lasker Foundation for meritorious service and significant contributions to promoting mental health and increasing public understanding of mental hygiene.

Col. William C. Menninger, M.C., Chief Consultant in Neuropsychiatry, Office of the Surgeon General, U.S. Army, was the first recipient of the award, for his outstanding contribution to the mental health of men and women of our armed forces.

Passano Award Goes to Dr. Cohn

As the result of a nation-wide poll among leaders in medical science, Dr. Edwin J. Cohn, professor of biochemistry at Harvard University, has been chosen as the first winner of the Passano Foundation award. Presentation of the $5,000 cash award will be made at a ceremony in historic Osler Hall of the Medical and Chirurgical Faculty of Maryland, in Baltimore, on May 16.

The Foundation, established in 1944 by the Williams and Wilkins Company, medical publishers, of Baltimore, proposes to aid the advancement of medical research, especially research that bears promise of clinical application. For the encouragement of such research the Foundation has established the award as one of its activities.

Dr. Cohn is distinguished for his work on the fractionation of blood. Beginning in 1919 with a study of blood and blood proteins, Dr. Cohn's research has progressed until it has yielded a spectacular group of five principal fractions of blood plasma which hold untold promise of usefulness in medical science.

Hortense Hilbert Appointed Director of Health Department Nursing Bureau

Health Commissioner Ernest L. Stebbins on March 20 announced the appointment of Hortense Hilbert, R.N., of Manhattan, as director of the Bureau of Nursing of the New York City Health Department. Miss Hilbert assumed her new post on April 1.

Previous to her appointment to the Health Department, Miss Hilbert was associate director of the National Organization for Public Health Nursing. From 1936 to 1942 she was Regional Public Health Nursing Consultant in the Children's Bureau of the U.S. Department of Labor, and before that was Public Health Nursing Consultant for the American Child Health Association. Miss Hilbert also served for four and a half years as assistant director of a child health demonstration conducted in Austria by the Commonwealth Fund, and in 1932 directed a nation-wide survey of public health nursing. She has also done extensive public health nursing work with state health departments.

Miss Hilbert is a graduate of the University of Minnesota School of Nursing, and did postgraduate work at Johns Hopkins University.

In assuming the directorship of the Bureau of Nursing, Miss Hilbert succeeds Ella M. Ashe, who has served as acting director of the Bureau since August, 1943.

National Society for Prevention of Blindness Elects Board Members

The National Society for the Prevention of Blindness has announced the election of the following new members to its Board of Directors: Clarence G. Michalis, Dr. R. Townley Paton, and Charles Sheard, Ph.D., director, Division of Biophysical Research, Mayo Foundation for Medical Education and Research, Rochester, Minnesota.

Announcement has been made, also, that Dr. Willis S. Knighton, New York ophthalmologist, will serve as chairman of the Committee on Glaucoma of the National Society for the Prevention of Blindness, succeeding the late Dr. Mark J. Schoenberg. Additions to the Committee on Glaucoma include Maj. Fred Heffinger, superintendent, and Dr. F. L. P. Koch, chief of the Glaucoma Clinic, Manhattan Eye, Ear and Throat Hospital, New York City.

Since its establishment in 1915, the National Society for the Prevention of Blindness has worked in close cooperation with the medical profession, especially ophthalmologists. The Society works for the protection of eyesight and the conservation of vision among the large majority of persons who have normal sight and the considerable number of partially sighted persons. Mrs. Eleanor Brown Merrill is the Executive Director. Headquarters are maintained at 1790 Broadway, New York City.

A critical shortage of qualified physical therapists which endangers the proper care of infantile paraly-

[Continued on page 1150]

For LOCAL ANESTHESIA

PROCAINE HYDROCHLORIDE Brewer

Current literature continues to report on the use of Procaine Hydrochloride as a local anesthetic.

In the removal of moles, ordinary seborrheica and senile keratoses from the body, the area is first anesthetized with procaine hydrochloride (A. Benson Cannon, *N. Y. S. J. M.*, Vol. 40, No. 21, p. 1569).

As less toxic than most cocaine substitutes it is especially safe for the production of spinal anesthesia. Its continued use for infiltration anesthesia, conduction anesthesia, for topical use in ophthalmology, in rhino-laryngology and for urethral anesthesia finds it still indispensable to the doctor.

Supplied in 2 per cent solution
in ampules of 2 cc. and 30 cc.

sis victims has caused the National Foundation for Infantile Paralysis to appropriate $1,267,600 for the training of these vitally needed specialists, Basil O'Connor, president announced on March 19.

Present-day medical treatment of patients with infantile paralysis demands more and more physical therapy, Mr. O'Connor explained. "A physical therapist is a technician who uses physical agents such as heat, electricity, light, exercise, rest, muscle training, and similar methods in contrast to the use of drugs, biologic, and surgical technics.

"Today there are only two thousand, five hundred qualified physical therapists, of whom more than half are in the armed forces. With earlier and more extensive use of such methods of treatment, so imperative in the treatment of infantile paralysis, twice the number already trained could be used for this disease alone. It is estimated that an additional five thousand could be used right now, not only for the treatment of infantile paralysis, but also for aiding recovery from many other diseases and disabilities."

Information and applications may be obtained by addressing the National Foundation for Infantile Paralysis, 120 Broadway, New York 5, New York, or the American Physiotherapy Association, 1790 Broadway, New York 19, New York.

Cardiology Course Offered at Montefiore Hospital

A postgraduate course in cardiology for the summer of 1945 has been offered at Montefiore Hospital, Bronx, in affiliation with Columbia University. The course, entitled "Elementary Cardiology," will be given from June 5 to August 14, at 10 A.M. on Tuesdays. The fee is $35. Drs. Abraham Jezer, E. Goldberger, Harry Gross, Joseph Ballinger, and others will conduct the course.

The purpose of this course is to give the general practitioner an introduction to the methods of diagnosis and treatment of heart disease. Chief emphasis will be placed on bedside teaching and demonstration of cases to small groups of students. The course, including demonstration of cardiac fluoroscopy, of measurements of venous pressure and circulation times, discussions on criteria of classification, on correlations with pathology and on principles of treatment, may be taken simultaneously with elementary electrocardiography and elementary cardiovascular roentgenology. It is a prerequisite to all subsequent courses in the integrated cardiology program. For further information, address the Dean, Faculty of Medicine, Columbia University, 630 West 168th Street, New York 32, New York.

WAR OBJECTORS LOAF TO PROVE DOCTOR'S THEORY

A new role for conscientious objectors—what might appear to be the pleasant task of spending two to six weeks resting in bed—has furnished medical science with evidence that too much bed rest upsets normal chemical adjustments of the body, it has been disclosed.

The experiments, tending to corroborate the Army Air Forces view that convalescence may be accelerated by giving patients physical and mental activity, were discussed before the Medical Society of the County of New York, 2 East 103d Street, by Maj. Donald A. Covalt, MC, executive officer, convalescent training division, Office of the Air Surgeon General.

But they left the problem of when convalescence begins still far from mathematically solved. Major Covalt commented that that still must depend on "how the patient feels" and "the clinical judgment of the doctor."

The latest chapter of the conscientious objectors' saga of this war, which has included exposure to drastic climatic changes, drinking sea water, and infection with typhus, influenza, and pneumonia, took place at the University of Minnesota.

There Dr. Ancel Keys, professor of physiology and physical education, subjected to laboratory tests for chemical balance a number of healthy conscientious objectors who had spent anywhere from a fortnight to a month and a half lying in bed and eating normally. The tests showed "it takes more than twice as much protein to keep a positive protein balance of a bed patient," and that it was "practically impossible to keep an otherwise normal patient in calcium balance while flat on his back."

Heart output also suffered. Dr. Keys found that a normal man, bed-ridden six weeks, will have an 11 per cent average decrease in heart size. The result, borne out in Army Air Force tests under similar conditions, showed that work capacity went down "very rapidly while the patient is in bed," Major Covalt said.

Major Covalt spoke on the second anniversary of the A.A.F. convalescent training program, which he recalled started when more than fifty thousand men were found "doing nothing but waiting" in military hospitals. Now it includes exercises and calisthenics, which may begin in bed two days after an operation, and mental activity in educational classes.

A study of 645 controlled cases of atypical pneumonia, Major Covalt recalled, showed a group recovering under the old method averaged forty-five days' hospitalization and a 30 per cent recurrence rate. A second group under planned convalescent training averaged only thirty-one days' hospitalization and a 3 per cent recurrence rate.—*N.Y. Her. Trib.*

Number 1 of a Series

THE practice of prescribing hemoglobin and erythrocyte substrates upon the diagnosis of pregnancy is accepted. The wise clinician knows that the additional burden of even early pregnancy may accentuate an existing subclinical anemia.

As the gestation proceeds the fetus makes preferential demands upon the maternal organism—diverting needed erythropoietic substances to its own use. These substances *must* be replaced to assure adequate maternal and fetal protection against anemia.

HEPATINIC

presents iron in readily assimilable ferrous form, together with crude (unfractionated) liver concentrate in the form of a pleasant-tasting elixir.

The value of the crude (unfractionated) liver concentrate in Hepatinic is of the highest order, for all the erythropoietic principles are retained. In addition, this unique liver is subjected to a special enzymatic digestion process which converts it to a most readily assimilable form.

FORMULA:
Each fluidounce contains: Ferrous Sulfate 12 gr., Crude Liver Concentrate (equivalent to 660 gr. fresh liver) 60 gr., Thiamine Hydrochloride 2 mg., Riboflavin 4 mg., Niacinamide 20 mg., together with pyridoxine, pantothenic acid, choline, folic acid, vitamin B_{10}, vitamin B_{11}, biotin, inositol, para-amino-benzoic acid and other factors of the vitamin B complex as found in crude (unfractionated) liver concentrate.

Elixir Hepatinic is supplied in bottles of one pint and one gallon

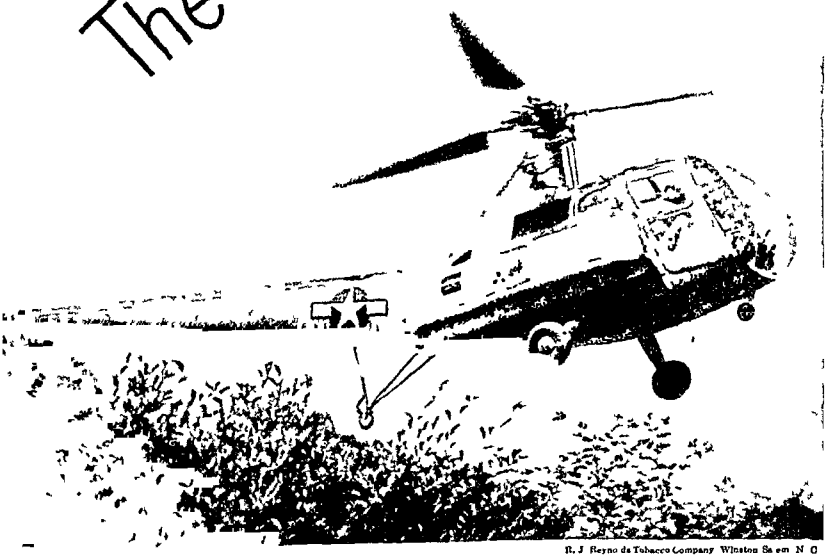
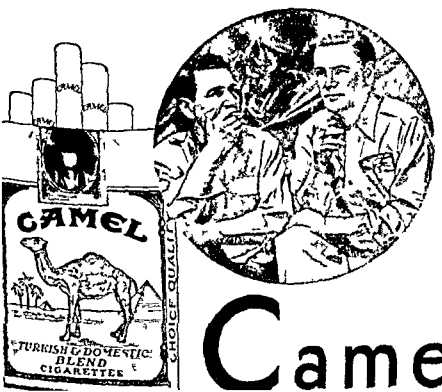
DIFFERENT IN FORM



Physicians appreciate the honey-like liquid form and purely professional publicity which distinguish Maltine with Vitamin Concentrates . . . because these advantages afford valuable prescription control. Potent and economical, this balanced multiple-vitamin supplement finds equally high favor with patients. Its taste is a pleasant citrus flavor. Each fluid ounce contains:

Vitamin A	10,000 U.S.P. Units
Vitamin D	1,000 U.S.P. Units
Vitamin B_1	3 Milligrams Thiamine Hydrochloride
Vitamin B_2	4 Milligrams Riboflavin
Nicotinamide	40 Milligrams
Pantothenic Acid	350 Micrograms
Dicalcium Phosphate	17 grains
Maltine	q.s.

Available through prescription pharmacies in bottles of 12 fluid ounces *The Maltine Company*, New York. Established 1875



Maltine with Vitamin Concentrates

The Flying Capsules

R. J. Reynolds Tobacco Company, Winston-Salem, N. C.

Now in use on the battle fronts, for speedy evacuation of wounded from nearly inaccessible areas, is this Helicopter with "capsule" stretchers attached to sides

WHEREVER our soldiers are fighting, Army medical men have established a speedy life line for wounded. So fast and so efficient is it that often the wounded are under the care of skilled medical officers *within a matter of mere minutes!*

In this stepped up tempo of war, however, the Army doctor finds little "time out" for himself. When there is a "break" in his long hours, his relaxation may be limited to a few pleasant moments with a cigarette . . very likely a Camel, for Camels are such a big favorite with men in all the services.

Acetylization of sulfanilamide in the preparation of SULAMYD (Sulfacetimide-Schering) differs essentially from that occurring within the liver and results not only in a compound of lower toxicity, but one of enhanced therapeutic effectiveness.

SULAMYD is a readily absorbed, easily excreted, rapidly acting bacteriostatic drug for the treatment of urinary tract infections, especially those due to *B. coli*, the organism which is most frequently responsible.

SULAMYD is available in tablets of 0.5 Gm. (7.7 grains) in bottles of 100 and 1,000; and as a powder in bottles of 5.0 Gm. for the preparation of laboratory standards.

Sustained Estrogenic Effect...

Schieffelin
BENZESTROL
(2, 4 di (p hydroxyphenyl) 3 ethyl hexane)

• Of proven value for the better management of vasomotor and nervous symptoms of the menopause, this synthetic estrogen justifies the trust which the profession places in it.

Its complete estrogenic action with minimum discomfort provides effective medication in the treatment of the menopausal syndrome and in all conditions where estrogenic therapy is indicated.

Schieffelin Benzestrol is available for oral, parenteral and local administration, enabling the physician to select the mode of administration best suited to each individual patient.

Literature and Sample on Request

Safe SINGLE DOSE Digitalization

ACCEPTED AMERICAL MEDICAL ASS'N Council on Pharmacy and Chemistry

COUNCIL ACCEPTED

"...possesses properties which place it first in the choice of digitalis materials for general therapeutic use."*

Digitaline Nativelle, long the choice of outstanding cardiologists, brings to digitalis therapy a convenience, simplicity, and safety in initial digitalization not offered by other digitalis principles.

A pure, crystalline glycoside, its potency is dependably uniform. Hence its dosage is safely governed by weight, in milligrams.

It is the most potent digitalis preparation available, 1000 times as potent as digitalis leaf—orally *1 mg.* of Digitaline Nativelle equals *1 Gm.* of digitalis leaf.

Absorption is practically complete, hence the effects of oral and [illegible] of action whether administration is oral or by vein.

The average dose for initial digitalization, as determined in a study of more than one thousand consecutive cases, is 1.2 mg. This dosage "may be given at one time with complete safety,"* producing its full effect in 3 to 6 hours. Because this dose is so small, gastric irritation is rarely encountered. In the occasional patient who requires more of the drug, the daily maintenance dose will rapidly complete digitalization.

For maintenance, the average dose is 0.2 mg. per day. In some patients 0.3 mg. may be required, for others 0.1 mg. will suffice.

Digitaline Nativelle is available through all pharmacies in 0.2 mg. (white) and 0.1 mg. (pink) tablets in bottles of 40 tablets. Also in 2 cc. ampuls (0.4 mg.) and 1 cc. ampuls (0.2 mg.) in packages of 6 ampuls for patients in whom the oral route cannot be used.

*Gold, H.; Cattell, M.; Modell, W.; Kwit, N.T.; Kramer, M.L., and Zahm, W.: Clinical Studies on Digitoxin (Digitaline Nativelle) with Further Observations on Its Use in the Single Average Full Dose Method of Digitalization, J. Pharmacol. & Exper. Therap. 82.187 (Oct.) 1944.

Physicians are invited to send for clinical test sample and literature

PROVED
THREE-WAY TREATMENT
IN MUCOUS MEMBRANE THERAPY

ARGYROL therapy offers virtually three treatments in one For ARGYROL properties are three fold

DECONGESTIVE—ARGYROL S decongestive effect in the membrane is the result of its demulcent, osmotic action The withdrawal of ARGYROL tampons from the post nasal cavities frequently brings forth a long ropy mucous discharge measuring as much as two feet or more

BACTERIOSTATIC—Although proved to be definitely bacteriostatic, ARGYROL is non toxic to tissue In nearly a half century of wide medical use of ARGYROL, no case of toxicity, irritation, injury to cilia or pulmonary complication in human beings has ever been reported

STIMULATING—Soothing to nerve ends in the membrane and stimulating to glands, ARGYROL S action is more than surface action For it acts synergetically with the membrane s own tissue defense mechanism

NEVER DUPLICATED CHEMICALLY OR IN CLINICAL ACCEPTANCE

Solutions of mild silver protein similar in appearance to ARGYROL are chemically different Different in degree of colloidal dispersion, in size of particles and in Brownian movement viewed under the ultra microscope Unlike other mild silver proteins and regardless of the concentration of the solution employed in ARGYROL, the pH remains constant, the pAg is properly correlated Unlike most mild silver proteins, ARGYROL remains equally bland and non irritating *in all concentrations from 1 per cent to 50 per cent* To insure the results which you expect from genuine ARGYROL it is important that you insist on Original Package ARGYROL.

Announcing

SYNTRONAL *'ROCHE'*

A DEPENDABLE SEDATIVE-ANTISPASMODIC

Syntronal 'Roche,' a new, well-balanced combination of Syntropan*'Roche' with phenobarbital, has a threefold therapeutic effect in spastic disorders. Like papaverine, it has a direct relaxing effect on smooth muscle fibers; moreover, it selectively inhibits the parasympathetic innervation of smooth muscle but in therapeutic doses it is remarkably free from the untoward by-effects of atropine. In addition, Syntronal has a gentle sedative effect which is important in view of the significant role of nervous tension and apprehension in many spastic disorders of the gastrointestinal and urinary tracts, and spastic dysmenorrhea.

HOFFMANN-LA ROCHE, Inc. • Roche Park, Nutley 10, N. J.

Effective, safe, ***LOCAL*** *chemotherapy in oropharyngeal infections*

HIGH LOCAL CONCENTRATION

HIGH and PROLONGED salivary concentration of sulfathiazole is brought directly to the site of oral and pharyngeal infections following the use of—

White's SULFATHIAZOLE GUM*

Even a single tablet of White's Sulfathiazole Gum chewed for *one-half to one hour* provides a high concentration of locally active sulfathiazole. The medication is brought into immediate and *prolonged* contact with oropharyngeal areas which are not similarly reached by ordinary measures of topical chemotherapy. Moreover, resulting blood levels of the drug, even with maximal dosage, are so low that systemic toxic reactions are virtually obviated.

INDICATIONS: Local treatment of sulfonamide-susceptible infections of oropharyngeal areas:

a. acute tonsillitis and pharyngitis;
b. septic sore throat;
c. infectious gingivitis and stomatitis;
d. Vincent's disease

DOSAGE: One tablet chewed for *one-half to one hour* at intervals of one to four hours depending upon the severity of the condition.

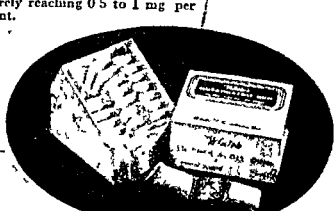
Available in packages of 24 tablets, sanitaped, in slip-sleeve prescription boxes.

*

A product of

WHITE LABORATORIES, INC.

pharmaceutical manufacturers



NEWARK 2, NEW JERSEY

LOW SYSTEMIC ABSORPTION

High Local Concentration· One [illegible] sulfathiazole (average 10 mg per cent) *that is maintained throughout the chewing period.*

Low (negligible) Systemic Absorption Blood levels of the drug, even when maximal dosage is employed, are almost negligible—rarely reaching 0.5 to 1 mg per cent.

IMPORTANT: Please note that your patient requires your prescription to obtain this product from the pharmacist.

"In Rheumatic Fever—

Salicylates either in the form of aspirin or sodium salicylate, should be given as needed for pain and control of temperature."

—Sherwood, K.K. and Zimmerman, B.: Northwest Med. J., 42:288-292 (Oct.) 1943

Full clinical advantage of the analgesic effect of salicylates with sodium iodide is made possible by prescribing

Salici-Vess

Buffered—for Increased Tolerance and Increased Effectiveness

Ethically promoted—available through your prescription pharmacy in bottles of 30 tablets.

Indicated therapy in Sequelae of

Epidemic Encephalitis

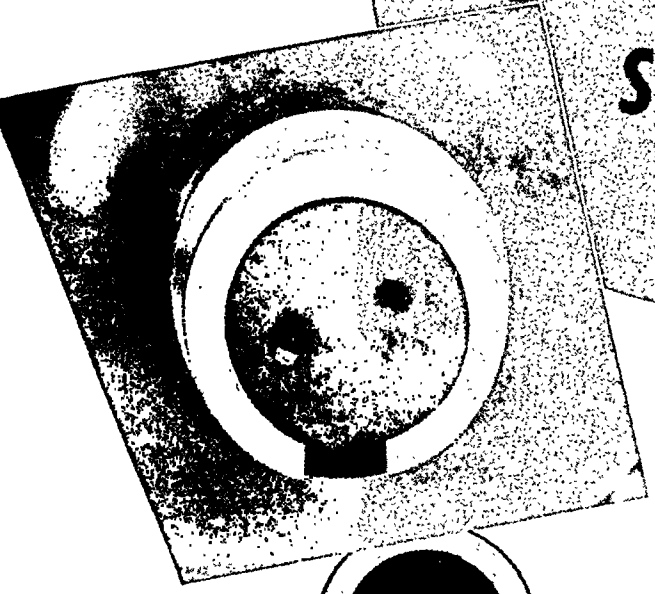
Pills Stramonium (*Davies, Rose*)

2½ grains

Physicians in private practice as well as in neurological clinics have widely prescribed these pills since 1929, and their continued interest in and use of them point to the serviceability of this therapy.

Stramonium Pills (*Davies, Rose*) exhibit in each pill 2½ grains of alkaloidally standardized Stramonium (powdered dried leaf and flowering top of Datura Stramonium, U.S.P.), equivalent to 25 minims (1.54 cc.) of Tincture U.S.P.

As a reassurance of the activity of the finished pills, they, too, are alkaloidally assayed, thus establishing as far as possible uniformity and dependability.



A package for clinical trial and literature mailed free of charge upon request.

Research on ERTRON in Arthritis

For over ten years, Ertron in the treatment of arthritis has been studied intensively in leading universities, hospitals, clinics and private practice.

Reports and follow-up surveys have appeared regularly in leading medical journals. This work is still going on, as new methods of attack are evolved.

These studies confirm both the effectiveness of Ertron in arthritis and the non-toxicity of Ertron in therapeutic dosage.

The clinical work has been done on Ertron—the bibliography specifies Ertron—the results apply to Ertron alone—no other product contains electrically activated vaporized ergosterol (Whittier Process).

Complete bibliography and mode of administration will be sent to interested physicians.

ERTRONIZE THE ARTHRITIC

Ertronize Means: Employ Ertron in an adequate daily dosage over a sufficiently long period to produce optimal results. Gradually increase the dosage to that recommended or to the toleration level. Maintain this dosage until maximum improvement occurs.

Capsules—bottles of 50, 100 and 500
Parenteral—packages of six 1 cc. ampules.

ETHICALLY PROMOTED

NUTRITION RESEARCH LABORATORIES • CHICAGO

Ertron is the registered trade mark of Nutrition Research Laboratories.

Views of the right hand of a male, aged 40 years; illustrating a typical *atrophic or rheumatoid arthritis;* duration of disease, 12 years; occupation, filling station attendant, bookkeeper.

This hand illustrates an advanced stage of the disease with marked muscular atrophy and absence of subcutaneous fat The gross appearance is exaggerated by the chronic subnutritional status of the patient The atrophic changes of the musculature with involvement of support ng tendons have resulted in marked deformities and a functionless claw hand The metacarpals as well as the fingers particularly show subluxations with typical ulnar deviations. The nails are markedly thickened and horn-like and falsely suggest psoriatic changes. General symmetrical involvements nearly all joints in body with extensive ankylosis of shoulders, jaws, knees, ankles, wrists and hands. Patient is a complete invalid and takes only soft, ground food due to inability to masticate X-ray shows areas of atrophic destruction and marked decalcification of the osseous structure, subluxations and overriding of the bones.

When Soft Food and Fluids Are Advised -

RELIEF FOR MYALGIA

The patient seeks relief for vague muscular pains and aches but often before definite etiology can be determined a dependable analgesic is desired.

By prescribing 'Tabloid' 'Empirin' Compound, assistance for troublesome myalgia is quickly obtained. The synergistic action of the acetylsalicylic acid and the acetophenetidin is enhanced by the caffeine which combats the general depression.

Each product contains acetophenetidin gr. 2½ (0.162 gm.), caffeine gr. ½ (0.032 gm.), acetylsalicylic acid gr. 3½ (0.227 gm.). Also 'Tabloid' 'Empirin' Compound with Codeine Phosphate, gr. ⅛, gr. ¼, and gr. ½.

'Tabloid' and 'Empirin' are Registered Trademarks

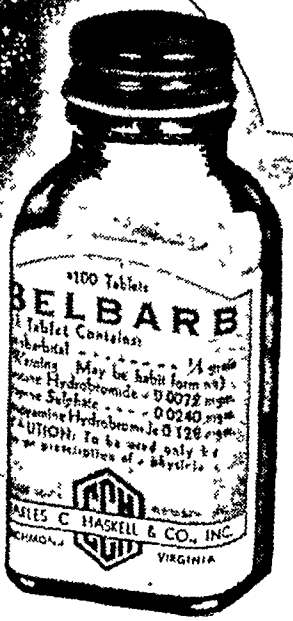
PENICILLIN—*The "accidental" discovery that calls for "accident-proof" production*

The contamination of a bacterial culture with *Penicillium notatum*, observed by Fleming was an "accident". The production of penicillin for the medical profession, however, calls for the most rigid control to prevent any "accident" which might impair its potency and purity.

Now that the penicillin you order is a matter of personal choice, the confidence with which you specify any brand is inextricably bound to the program of control safeguarding its production.



As this photograph of the "seeding" of *Penicillium* culture shows, elaborate precautions are observed at every step at Schenley Laboratories in the production of Penicillin Schenley.

SCHENLEY LABORATORIES, INC.

BELBARB

AN *Excellent* SEDATIVE *and* HYPNOTIC

The potentiation of the central action of phenobarbital by the belladonna alkaloids (Friedberg, Arch. f. exp. P. & P. CLX, 276) renders possible attainment of desired effects with relatively small doses, thus avoiding "hang over" and other unpleasant side-actions. In contrast to galenical preparations of belladonna, such as the tincture, Belbarb *has always the same proportion of the alkaloids.*

Indications: Neuroses, migraine, functional digestive and circulatory disturbances, vomiting of pregnancy, menopausal disturbances, hypertension, etc.

Formula: Each tablet contains ¼ grain phenobarbital and the three chief alkaloids, equivalent approximately to 8 minims of tincture of belladonna.

Belbarb No. 2 has the same alkaloidal content but ½ grain phenobarbital per tablet.

When Bacteremia Supervenes...

Before the advent of penicillin, bacteremia had to be regarded as a grave prognostic sign since distant secondary foci of infection were apt to be established before the organisms could be eradicated from the circulating blood. Penicillin has improved this outlook.* Used early and in adequate dosage, it has proved successful in combating bacteremia caused by susceptible organisms. Penicillin usually produces rapid response, leading to sterilization of the blood stream and to marked improvement or complete disappearance of the original infectious process.

PENICILLIN—C.S.C.

These features bespeak the physician's preference for Penicillin-C.S.C.: It is made under rigid laboratory controls which safeguard its potency, sterility, nontoxicity, and freedom from fever-inducing pyrogens. The state of purification reached in Penicillin-C.S.C., indicated by the small quantity required to present 100,000 Oxford Units, makes untoward reactions comparatively rare, even when massive dosage and prolonged administration are required.

Thantis Season

Winter time is the season of throat affections. Crowded transportation facilities, due to wartime conditions, cause exposure of more people to infection.

Many physicians have found Thantis Lozenges to be effective in relieving throat soreness and irritation, because they are antiseptic and anesthetic for the mucous membranes of the throat and mouth.

Thantis Lozenges contain Merodicein (H. W. & D. Brand of Diiodooxymercuriresorcinsulfonphthalein-sodium), 1/8 grain, and Saligenin (Orthohydroxybenzylalcohol, H. W. & D.), 1 grain. They are effective and convenient; they dissolve slowly, permitting prolonged medication.

Thantis Lozenges are supplied in vials of twelve lozenges each.

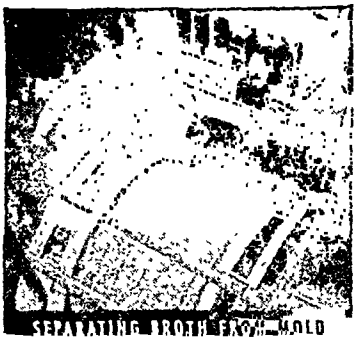
"*suddenly . . . life was worth living*"*

In depressed patients, Benzedrine Sulfate is virtually unique in its ability to banish apathy, subjective weakness, and despondency . . . to restore mental alertness, enthusiasm and the capacity for work . . . to increase the sense of energy . . . and to reawaken the zest for living.



The quotation which heads this page provides, out of the author's own experience, striking testimony to the dramatic value of Benzedrine Sulfate in the relief of simple depression, with its associated symptoms of anhedonia, chronic fatigue and retardation.

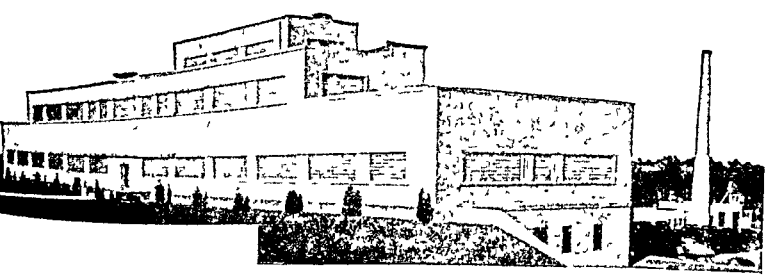
NEW $3,000,000 "DEEP TANK" LABORATORIES— SCIENTIFIC STAFF WITH SPECIALIZED KNOW-HOW— MAKE CHEPLIN A LEADER AMONG PENICILLIN PRODUCERS

WORLD WAR II—and the critical need for life-saving penicillin—has changed Cheplin Laboratories from a modest manufacturer, specializing for two decades in parenteral therapeutics, to one of the five largest producers of penicillin in the world. This almost miraculous metamorphosis is not the result of haphazard growth. It is the result of careful planning by far-seeing, aggressive management and a carefully-selected, balanced staff of technicians and scientists.



MANUFACTURING LABORATORIES — Cheplin's new, air-conditioned penicillin laboratories represent an investment of $3,000,000. Our facilities are devoted solely to the manufacture of penicillin by the "deep tank method" which gives high yield at low cost.

SCIENTIFIC STAFF AND PERSONNEL—The amazing production record of these laboratories was achieved through the teamwork and ability of our meticulously-selected staff of bacteriologists, pharmacologists, chemists and medical men, and our highly-trained personnel. Research by this modern science-wise group has solved the many problems of large-scale production of penicillin. Today their research is aimed at broadening the uses of penicillin for the medical profession.

QUALITY OF CHEPLIN PENICILLIN — Our penicillin measures high against all known standards,— absolutely sterile and pyrogen-free. Strict control insures a parenteral antibiotic of high purity.

STAT SERVICE—Our carefully-planned, improved distribution facilities make Cheplin penicillin *quickly available* to serve the physician. We ship overnight *all orders* received.

When you ask your pharmacist or nurse for penicillin, you may in all confidence specify Cheplin penicillin.

FOOTWEAR

SHOES AS THERAPEUTIC AGENTS

No doctor can ignore that shoe therapy is a major factor in the treatment of many foot disorders. In some cases, however, when further medical or surgical treatment is required, the shoes must be adjusted to conform to any changes such treatments make in the shape or size of the feet.

Pediforme shoes are prepared through experienced craftsmen to make the necessary adjustments as prescribed by the orthopedic surgeon or physician in these cases.

With purchases restricted it is readily apparent that substantial shoes, capable of reconstruction or easy adjustment, should be prescribed. For all practical purposes, Pediforme footwear may well be considered in shoe therapy.

SOPRONOL *Inhibits* FUNGOUS INFECTIONS

MONILIA albicans

EPIDERMOPHYTON inguinale

MICROSPORUM audouini

TRICHOPHYTON purpureum

. . . As demonstrated by clinical investigation in a leading United States hospital

In tests on a large number of hospital patients, Sopronol was found to exert an *inhibitory* rather than a destructive action on the fungus. The advantages of this method are obvious. Sopronol, taken readily into the fungous organism, prevents its development and spread. Hence the infection is quickly brought to an end, but without the customary skin irritation caused by poisonous by-products resulting from strong fungicides in contact with the mold. The chemical basis of Sopronol is sodium propionate.

ALL SUPERFICIAL MYCOSES (RINGWORM)

Prescribe Sopronol for: Tinea Pedis, Tinea Cruris, Tinea Capitis, Tinea Glabrosa, due to "the dermatophytes"—Trichophyton, Epidermophyton, Microsporum, Monilia (Candida) and pathogenic aspergillae infections. Sopronol is non-irritating, non-keratolytic, non-toxic.

Available in alcoholic solution, powder and water soluble ointment bases

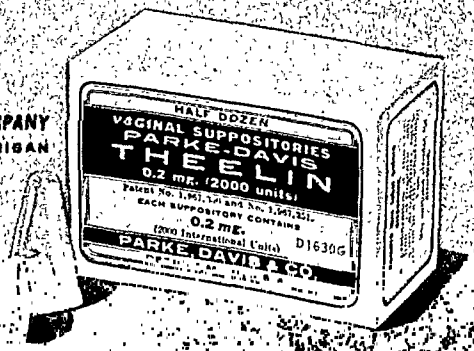
THEELIN

per VAGINA

Although sulfathiazole and sulfadiazine have been found effective in the treatment of gonococcic vulvovaginitis, the danger of sensitization of the patient with these compounds makes an estrogen the drug of choice for the child.[1] Most physicians prefer to reserve the sulfonamides for the more serious diseases of childhood in which their use is imperative.



Available in small, conical-shaped suppositories for intravaginal administration, THEELIN produces temporary cornification of the vaginal epithelium, a favorable vaginal pH of 4.5 to 5.5, cessation of discharge, and negative smears for gonococci in two to four weeks.

Theelin Suppositories (Vaginal) contain 0.2 mg. Theelin in a glycero-gelatin base. Available in boxes of 6 to 50.

★ IODINE...A PREFERRED ANTISEPTIC ★

Efficient
Under Adverse Conditions

In clinical practice it is essential that an antiseptic retain its efficiency even in the presence of blood, serum, exudates and other interfering agents.

In vitro tests comparing the bactericidal efficiency of Iodine and organic mercurial antiseptics recently were conducted, using thioglycollate medium which inactivates or neutralizes the antiseptic action of many substances and preparations.*

Markedly greater bactericidal efficiency of the U.S.P. Iodine Solutions was demonstrated under these conditions.

MILK DIETS

are usually deficient in B vitamins

Average human and cow's milk, in the amounts usually present in the ordinary diet of early infancy, provides less than the safe daily allowances* of thiamine and nicotinic acid and, in the case of human milk, of riboflavin as well. [1,2]

White's
MULTI-BETA LIQUID

—supplies the clinically known factors of B complex in drop dosage form—*and is specifically formulated to supplement* the average diet of early infancy in those very factors in which it is too frequently deficient, *and in amounts proportionate to the dietary inadequacy of these B factors.*

The daily addition of *five drops* of White's Multi-Beta Liquid to the usual formula or to the diet of the breast-fed infant will provide generous amounts of the clinically proved B factors.

Prepared in a tasty, non-alcoholic vehicle, White's Multi-Beta Liquid is readily miscible in any formula or fruit juice, or may be administered directly.

In 10cc., 25cc. and 50cc. bottles (with droppers) and 8 oz. dispensing size. Ethically promoted—not advertised to the laity. White Laboratories, Inc., Pharmaceutical Manufacturers, Newark 7, N. J.

Penicillin DOSAGE TABLE*

INDICATIONS	INITIAL DOSE (UNITS)	CONTINUING DOSAGE (UNITS)	UNITS IN 24 HR.	REMARKS
Serious Infections (staphylococcus, clostridium, hemolytic streptococcus, anaerobic streptococcus, pneumococcus, gonococcus, anthrax, meningococcus) Adults and children	15,000 to 20,000	(a) Intravenous drip: 2000 to 5000 every hr.	40,000 to 120,000 or more	(a) Dissolve ½ of 24 hr. dose in 1 liter (1000 cc.) normal saline; let drip at 30 to 40 drops per minute.
		or (b) Intramuscularly: 10,000 to 20,000 every 3 or 4 hr.	40,000 to 120,000 or more	(b) Concentration: 5000 U. per cc. normal saline.
		or (c) Intramuscular drip	40,000 to 120,000 or more	(c) Total daily dose in 250 cc. normal saline.
Infants	5000 to 10,000	3000 to 10,000 intramuscularly every 3 hr.	20,000 to 40,000 or more	Each dose in 1 or 2 cc. of normal saline.
Chronically infected compound injuries, osteomyelitis, etc. Adults and children	5000 to 10,000	10,000 every 2 hr. or 20,000 every 4 hr. intramuscularly or intravenously. Larger doses may be necessary at times.	40,000 to 120,000 or more	Concentration for intramuscular inj.: 5000 U. per cc. normal saline. For intravenous inj.: 1000 to 5000 U. per cc. Supplement with local treatment.
Gonorrhea	20,000 every 3 hr. intramuscularly for 5 doses		100,000	Results of treatment should be controlled by culture of exudate.
Empyema Adults and children	30,000 to 40,000 once or twice daily into empyema cavity		30,000 to 80,000	Dissolve in 20 to 40 cc. normal saline and inject into empyema cavity after aspiration of pus.
Meningitis Adults and children	10,000 once or twice daily into subarachnoid space or intracisternally		10,000 to 20,000	Concentration: 1000 U. per cc. normal saline.
Bacterial Endocarditis Adults and children	25,000 to 40,000	25,000 to 40,000 every 3 hr. intramuscularly	200,000 to 300,000	Continuous treatment for 3 weeks or longer. In a few cases the intravenous drip is more advantageous.

*Based upon recommendations by Chester S. Keefer, War Production Board Penicillin Leaflet, Apr. 1, 1945, and by Wallace E. Herrell and Roger L. J. Kennedy, *Journal of Pediatrics*, 25 505, Dec, 1944.

FIVE MORE TROOP SHIPS TO BE CONVERTED TO HOSPITAL SHIPS

Five more troop ships are being stripped of their armament and converted into United States Army hospital ships in order to insure speedier return of America's combat wounded.

The addition of these new ambulance-type hospital ships will bring the number of hospital ships operated by the Army to twenty-nine with facilities for transporting [illegible] ca

months. They will be painted white with red crosses and green bands—which insures protection under the Geneva Treaty—and be ready for service by June or July.

The Saturnia, with a speed of 19 knots and gross tonnage of 24,470, will be the largest and fastest hospital ship afloat. A former Italian luxury liner, built at Trieste, Italy, in 1937, she is 630 feet long and will have a capacity of 1,300 litter and 388 ambulatory patients.

The other vessels slated for conversion are the former French liners Columbie, with a capacity of 608 litter and 172 ambulatory patients, and Athos II, which will carry 615 litter and 264 ambulatory cases; the former United States liner Republic, with a capacity of 900 litter and 300 ambulatory patients; and the President Tyler, with a capacity of 650 litter and 158 ambulatory patients.

Two other Army vessels now under conversion as hospital ships are the Ernistine Koranda, named for an Army nurse, and Louis A. Milne, named for a former New York Port surgeon.

STOP THE URGE TO SCRATCH...
ELIMINATE THE ITCHING...
WITH ENZO-CAL

Prompt control of itching, which means less danger of infection from scratching, — the "aid-to-[illegible]" and [illegible]

favorite among antipruritics.

It's the favorite with patients, too, because it's a pleasing, greaseless vanishing cream — so clean and convenient to use.

In pruritus ani, pruritus vulvae, intertrigo, eczema, diaper-rash, poison-ivy dermatitis, and skin excoriations specify Enzo-Cal.

ELIXIR BROMAURATE IS A UNIQUE REMEDY OF UNIQUE MERIT

Cuts short the period of the illness, relieves the distressing cough and gives the child rest and sleep. Also valuable in other PERSISTENT COUGHS and in BRONCHITIS and BRONCHIAL ASTHMA. In four-ounce original bottles. A teaspoonful every 3 or 4 hours.

GOLD PHARMACAL Co., New York

THESODATE *Brewer*

The ORIGINAL ENTERIC-COATED TABLET OF THEOBROMINE SODIUM ACETATE

to control frequency and severity of attacks in CARDIOVASCULAR AND RENAL DISEASES *and to prevent* EDEMA

Clinical experience and studies have proven the value of Theobromine Sodium Acetate in certain Cardiovascular and Renal Diseases. In Angina Pectoris, used adequately, it permits more work by the individual without developing precordial pain or distress. As one of the most effective Xanthine Vasodilators it helps increase the available blood supply to the heart and kidneys to increase the efficiency of these organs.

It has also been found an effective aid in treating and preventing Edema of Cardiac or Renal origin. The enteric coating (especially developed for Thesodate) permits larger doses without the drug's contact with the Gastric Mucosa.

AVAILABLE IN various potencies with or without Phenobarbitol. Literature on request.

BREWER & COMPANY, INC. *Worcester Massachusetts*

Pharmaceutical Chemists Since 1852

PROOF

* The usual precipitous depression of hemoglobin following donation of 500 cc. of blood was prevented by Licuron-B. Premedication with iron salts alone did not prevent this hemorrhagic anemia, and upon blood donation the level of hemoglobin fell as though no medication had been given. These patients required an average of 26 days to recover from this anemia. In those receiving Licuron-B the hemoglobin values described an almost horizontal line in spite of blood donation.*

Licuron-B is the bi-active antianemic. (1) It provides the copper-iron ratio which is basic therapy in hypochromic anemia. (2) It raises the nutritional status of the patient with liver B-vitamins augmented by the crystalline vitamins, thiamine, riboflavin and niacinamide.

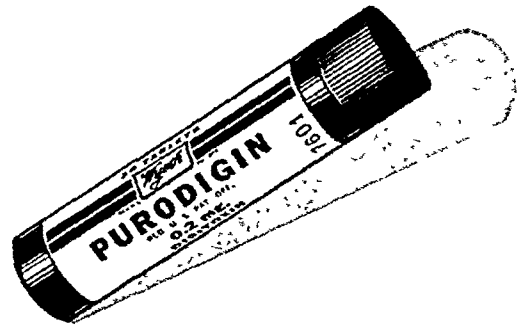
REG. U.S. Wyeth PAT. OFF.

Eliminate 2 of the 3 GREAT VARIABLES IN DIGITALIS THERAPY WITH PURODIGIN

REG. U. S. PAT. OFF.



DIGITOXIN

WYETH

1. THE VARIABLE OF POTENCY—Purodigin, the pure digitoxin, is a substance of constant, ever-uniform potency, *administered by* weight.

2. THE VARIABLE OF ABSORPTION—Unlike other digitalis preparations which are absorbed in varying degree and require, orally, several times the intravenous dose, Purodigin is completely absorbed from the human intestinal tract.[1] Identical dosage, by mouth or vein, produces the same effect.[2]

3. THE VARIABLE OF THE HEART—Since proper dosage can be determined only by careful study of the requirements of each individual patient, no digitalis can overcome this variable. However, the constant potency and complete absorption of Purodigin simplifies therapeutic control of heart function.

PURODIGIN

Easier, more exact digitalization.

Veterans' Medical Care

Recently, apparently well-documented allegations have been made of poor medical care for veterans.[1] Many of the charges seem to be true. We quote the following as a sample:

"Yes, our disabled veterans are being betrayed by the incompetence, bureaucracy, and callousness of the Veterans Administration, the agency set up over twenty years ago to insure not just good care but the finest medical care in the world for our war veterans.

"We have never stinted the Veterans Administration. We have given it over a quarter of a billion dollars to build a magnificant chain of nearly a hundred great hospitals. Recently Congress appropriated over $105,900,000 just to run these hospitals.

"Yet only one patient in six ever leaves these beautiful buildings labeled as 'cured.'

"Only three out of five complete their hospitalization and win even the label of 'improved.'

"The rest die or are discharged as 'unimproved,' or run away to enter other hospitals or to suffer and die quietly at home!

"Strong statements?" Yes. But they are based on the published figures issued by the Veterans Administration itself. In many of the veterans' hospitals I have visited, the death rates are actually far higher, the 'cure' rates far lower and conditions far, far worse than any cold statistics can ever indicate.

"I have spent nearly half a year visiting more than a dozen of these hospitals, from Minnesota to Massachusetts. Everywhere I have found disgraceful and needless overcrowding.

"I have found doctors so overloaded that they could give the average patient only seven minutes' attention a week. Not seven minutes a day, mind you—seven minutes a week!"

We note[2] that the Subcommittee on Wartime Health and Education of the Committee on Education and Labor of the United States Senate has issued an interim report on the health needs of veterans. This report is worthy of study not only because it affords a good picture of what the probable health needs of the veterans will be, but also because in Item 6 of the summary and conclusions it proposes

"to examine and appraise both the quality of the medical services given in Veterans Administration facilities and the ability of the Administration to discharge the heavy duties which will be placed on it. Special attention will be given to neuropsychiatric services. The investigation will be conducted with the help of recognized authorities in various medical specialties, of veterans' organizations and of professional groups."

Says the *J.A.M.A.* editorially[2]

"Many theories have been offered as to just why medical care of the veterans should reach a low state. The majority opinion seems to tend toward the concept that the nature of the system whereby the medical staff is chosen and whereby its administration is developed and the conditions under which the medical staff serves are the factors chiefly responsible. The charge has been made that the chief administrator of the Veterans Administration has little sympathy with a high quality of medical service. A series of articles by Albert Deutsch in *PM*, following a personal investigation made by him, apparently served to arouse many legislators to demand an investigation. . . . .

"Another article called attention to the low quality of rehabilitation available for men with surgical disabilities. . . . .

"Medical care for veterans would involve some 13,000,000 people, and, if their families are included, as many as 40,000,000. The senate committee has felt that the whole program of educational, employment, and monetary benefits for veterans should be re-examined in the light of the accumulated experience. The subcommittee, of which Senator Claude Pepper is chairman, proposes to examine both the quality of medical service given in Veterans Administration facilities and the ability of the administration to discharge the heavy duties which will be placed on it. The committee points out that criticisms of the quality of service given by the Veterans Administration have been made by organizations and individuals who speak authoritatively. It is emphasized that the personnel classifications and salaries for physicians, nurses, and social workers are not sufficiently high to attract the best practitioners and workers. The hospitals of the Veterans Administration are likely to be isolated geographically and medically. Although the administrator has full authority and adequate funds to avail himself of the very highest quality of consultation and part-time services of leading physicians, the utilization has been minimal.

"During the last few months storm clouds have gathered over the Veterans Administration; the rumblings of thunder point toward a possible stroke of lightning aimed toward medical care specifically in the Veterans Administration. A continuous flow of charges comes from a variety of investigators, commentators, periodicals, and publications whose observations have led them to believe that medical care in the Veterans Administration is on a standard far lower than that prevailing in ordinary practice in the United States. The deteriorated service seems especially poor when contrasted with the high quality of medical care rendered to those in the armed forces."

Now, it seems to us that the responsibility for the poor medical care of the veteran, while directly chargeable to the Veterans Administration, must be shared by all of us. If we have permitted the agency we created to do its work badly, the fault is ours. There has been time since the last war to have investigated, to have sought out the faults and the weaknesses, the incompetence, and the lack of adequate facilities.

That we have not, before this, carried out our obligations as citizens will forever remain to our discredit. Any criticism of the medical care provided by the Veterans Administration must be borne also in part by the medical profession and by the public. The *J.A.M.A.* says:

"Perhaps the time is ripe for a really authoritative, independent investigation of the administration of medical service to veterans, made by a committee responsible directly to the executive office of the President."

We feel that because of the seriousness of the charges being made, the time already lost, and the urgent need for rectification of deplorable conditions, there is no "perhaps" about it.

The Practical Nurse

Some time ago the Public Relations Committee of the New York Academy of Medicine, with commendable foresight, said, "The practical nurse has become an indis-

pensable agent in the community organization for the care of the sick. . . ."

This observation carries more and more weight as the demands of the armed services, justified or not, subtract ever-increasing numbers of registered nurses from civilian practice. The Committee said further, in part, "Every effort should be made without delay to develop an effective method for the recruitment of women for practical training and for the development of facilities for the training and placement of this auxiliary nursing corps."

The imminent prospect of the passage of the nurse draft bill by Congress without a National Service Act should focus our attention more sharply on this auxiliary nursing corps. We quote from an article by Hilda M. Torrop, President, National Association for Practical Nurse Education:[1]

"In order to avoid misunderstanding, the term 'practical nurse' as used in this article refers to a man or woman who has received a formal course of instruction, usually nine months to a year, in a school of practical nursing that meets the standards approved by state boards of nurse examiners, in states where these workers are licensed, or by the National Association for Practical Nurse Education.

She (or he) is between 18 and 50 years of age, has completed at least eight years of elementary school, is in good health, and will be prepared by classroom work and hospital experience to care for semiacute, convalescent, and chronic patients in hospitals, at home, or with visiting nurse associations. Upon graduation, she is a vocationally prepared worker. In no sense of the word should she be looked upon as comparable to a poorly prepared professional nurse. She stands on a sure foundation, equipped to give necessary nursing care to the largest category of our sick population, the chronic and the long-time convalescent."

Here we have a body of women prepared to care for semiacute, convalescent, and chronic patients either in hospitals or at home.

By the greater use of their services patients can be evacuated more quickly from overburdened hospitals, and home care may be improved. In our aging population this is a matter for some concern. If the difficulty of obtaining domestic help continues, and if the pressure upon district nursing associations, already great, is increased as it is likely to be, we would certainly be shortsighted were we not to encourage effective methods for the recruitment, training, and placement of practical nurses.

"The Joint Committee on Auxiliary Nursing Service of the three national nursing associations, the Working Committee on Practical Nursing of the U.S. Office of Education, and the Public Relations Committee of the New York Academy of Medicine are actively concerned with the definition of practical nurse services, promotion of good schools with sound curricula, licensure of all who nurse for hire, and suitable placement of the graduate group."

Already twelve schools in the State are prepared to train candidates, who must be between the ages of 18 and 50, and elementary school graduates or the equivalent, citizens of the United States or in possession of first papers and in good health. Courses vary from nine months to a year. Graduates are now acceptable as assistants to the public health nurse in visiting nurse associations, and eligible for duty in general, tuberculosis, cancer, mental, orthopedic, and veterans' hospitals.

Physicians of the State would do well to familiarize themselves with the elegibility and training requirements for practical nurses. The hospital expansion program must inevitably be delayed by the war, and home nursing seems to be the answer for many of the semiacutely and chronically ill. Older women have here an opportunity for a career of usefulness and service which does not require a prolonged course of training but which could be of immense benefit to the overworked medical profession of the State and a source of comfort to the semiacutely and chronically ill.

The Womans' Auxiliaries of the various county societies might well assist in the procurement of candidates for training in this work. Classes are conducted at night as well as during the day, and tuition fees are extremely moderate. We urge the physicians to give consideration to this possible solution to some of the urgent problems of the civilian nursing shortage.

Treasury Department
Bureau of Narcotics
New York 7, New York

Office of District Supervisor
District No. 2
State of New York
and
5th Collection District
State of New Jersey

April 9, 1945

To All Members of the Medical Profession in District 2:

In November, 1940, I addressed a letter to you requesting your cooperation in preventing the improper and illegal distribution and use of all types of narcotic drugs. I want to extend my thanks to you for your assistance in the past, and once again to ask your cooperation in the situation which is now confronting us.

The extremely high cost of illicit drugs bought from the underworld and the extreme dilution of such drugs make it very difficult for the criminal addict to satisfy his or her degenerate craving. The result is that such addicts are increasing their efforts to establish a source of supply among doctors and pharmacists, and to thus divert for their own loathsome use the drugs that are so badly needed by our armed forces and by our needful sick. Many of these criminal addicts are able to have the physicians prescribe in excessive amounts, or "raise" the amount placed on the prescription by the physician, or to secure prescriptions from several physicians, and through these means procure sufficient drugs to establish themselves as underworld dealers.

The improper and illegal prescribing of narcotic drugs to individuals merely to satisfy their addiction is a menace to our country and we must all work together to stop it finally and completely. Remember that an order for narcotic drugs written and issued merely for the gratification of drug addiction is not a "prescription" within the meaning of the Federal Narcotic Law and protects neither the physician who issues it nor the druggist who knowingly accepts and fills it. There may continue to be certain unscrupulous physicians who will overlook their responsibility in this matter. I warn you that it may become necessary to limit or completely stop the sale of narcotic drugs to such persons and to advise pharmacists to exercise extreme caution in filling prescriptions signed by such persons. In still other cases we will have to report the facts to the United States Attorney for prosecution in Federal Courts.

Do not write so-called narcotic prescriptions for narcotic drugs for general office use. The pharmacist is not authorized to fill such a "prescription." Narcotic drugs for direct dispensation in the course of professional practice should be obtained by the practitioner upon his official order from a person or firm registered as a manufacturer of or wholesale dealer in narcotic drugs. Do not telephone a "prescription" for a patient to a druggist except in a case of extreme emergency and in such case be sure to furnish a properly written prescription at or before the time of delivery of the narcotic drug called for. The pharmacist may not legally sell or transfer narcotic drugs to a patient without receiving a proper prescription, and if he ignores this requirement, both he and the physician aiding and abetting the transaction may be liable to prosecution for the violation.

Let me remind you again of the methods used by common addicts to secure a prescription or drugs from you, and permit me also to indicate to you how you may circumvent their evil designs.

1. Simulating ailments that may or may not require narcotics. Addicts are peculiarly adept at this.—Thoroughly examine patients, take x-rays, "test meals," and perform other proper scientific tests before prescribing narcotics regularly. Be extremely wary of patients who suggest that a certain narcotic is the only medication that will help them. Maximum use of nonhabit-forming drugs as substitutes for narcotics.

2. Stealing doctor's prescription blanks, writing their own "prescriptions," and forging a doctor's signature. Stealing medical bags.—Do not keep your prescription pad on your desk or in sight of an addict. Do not leave your medical bag containing narcotics on the seat of your car, or in sight of an addict in your office.

3. Presentation of letters from other physicians stating that patient is suffering from certain ailments; stating that they are traveling home or to a hospital and require a certain amount of drugs; showing an application from the U.S. Public Health Service Hospital, Lexington, Kentucky, and requesting narcotics until such time as they have to report to the hospital.—Many of these letters are forgeries and it is incumbent upon the physician to determine for himself whether or not the person has a genuine medical need for narcotics.

In all cases of suspected irregularities, telephone or write the facts to the nearest office of the United States Bureau of Narcotics.

NOTE

The attention of our readers is called to the "Club Talk Bulletins" issued by the Public Relations Bureau. These are valuable to physicians who must give talks to lay groups on medical subjects. The most recent one deals with "Rehabilitation of the Tuberculous," Number 67. A copy will be forwarded on request to the State Society office at 292 Madison Avenue, and a list of previous bulletins will also be attached on request.

SUDDEN AND UNEXPECTED NATURAL DEATH—GENERAL CONSIDERATIONS AND STATISTICS

MILTON HELPERN, M D , and S MILTON RABSON, M D , New York City

(From the Office of the Chief Medical Examiner)

THIS paper is based on a study of 2,030 cases of sudden and unexpected natural death in the Borough of Manhattan from January 1, 1937, to June 30, 1943, necropsy was performed by the Office of the Chief Medical Examiner Perhaps it would be better to emphasize the unexpected character of these deaths occurring in apparently healthy people, rather than their suddenness In many instances such deaths are not immediate or instantaneous, but occur with varying rapidity from a few minutes up to twenty-four hours or more after the onset of illness The term "natural death" implies that death was due entirely to disease and that trauma did not play any role in its causation It is sometimes difficult to draw a sharp line of distinction between natural death and death which may have been remotely initiated by some external factor Thus, cirrhosis of the liver may be a sequel of chronic alcoholism, the former condition coming within the scope of this paper and the latter obviously excluded

In an analysis of sudden deaths in the Borough of Manhattan one should consider the unique age distribution of its population,[1] 75 per cent of whom are over 21 years of age Many of the adults who are employed there do not live in its confines, especially so if they have children Thus, Manhattan has a far greater proportion of adults than any other borough, and this disparity is further enhanced by the fact that most of the visitors to the city, also chiefly adults, spend most or all of their time in this borough

Chief among the many selective factors which determine the performance of a necropsy in sudden or unexpected death, regardless of cause, is the operation of the Medical Examiner's Law in New York City The latter provides for the investigation of all sudden and unusual, as well as of obviously suspicious deaths, a provision which is not found in most statutes governing the office of coroner or medical examiner Only Essex County, New Jersey, and Nassau County, New York, have medical examiner's laws similar to that operative in New York City The Office of the Chief Medical Examiner, New York City, investigates approximately 16,000 deaths each year (about 20 per cent of all deaths) [2] Of these, more than half are due to natural causes

The most important reason for autopsy in a case of sudden or unexpected death is to determine whether violence in any form, criminal accidental, or suicidal, has been a factor Thus there have been deaths seemingly natural when first encountered by a layman or doctor, which were proved violent only by necropsy

Case 1.—For example, the body of a woman in late middle age was found lying on the sidewalk about two hours after midnight It was removed to the nearby police station where it was viewed by a medical examiner There was no external evidence of injury, nor was any fracture of the limbs found The deceased's clothing was clean and in order Only one fact seemed to deserve explanation Despite the cool weather, the body was fully clad except for hat and coat No purse was found, and there was no one available to give a history of the deceased's former condition It seemed at first as if death had been caused by disease, and had a relative appeared at the police station and said that the deceased had suffered from a heart malady, a death certificate might have been issued with some form of cardiac disease as the cause of death Because of the circumstances rather than from the physical findings, however, the body was ordered removed for autopsy, which uncovered severe blunt-force injuries to the heart and lungs, indicating a fall from a height Only a few ribs and no other bones were broken The deceased had either fallen or jumped from the fifth floor, and her body had struck the pavement without any resulting external evidence of injury

Another circumstance influencing the selection of necropsy material is the insurance claim Impending litigation or the prospect of the collection of double indemnity for accidental death prompts relatives to ask for postmortem examination, a procedure to which they undoubtedly would object were there no insurance Sometimes the

Distribution of sudden and unexpected natural death according to organ systems. Comparison of present series with those of Weyrich[5] and of Lauren.[6]

existence of an insurance policy is concealed or denied lest autopsy disclose anatomic changes prejudicial to the beneficiaries' interests. An example of the latter is the case of an elderly man who collapsed and died at home before the arrival of the family physician. The latter, aware that the deceased had been injured and had sustained fractures in a street car about a half year before, issued a death certificate giving traumatic cerebral hemorrhage as the cause of death. The doctor violated the medical examiner's law in two ways: first, he was not in attendance on the deceased at the time of death and therefore could not issue a certificate; second, he is forbidden to issue a death certificate when death is linked to trauma. The death certificate was rejected by the Health Department when presented by the undertaker, and the case was referred to the Medical Examiner's Office for investigation. The family maintained that death was caused by the accident and admitted that litigation was pending, but attempted to prevent action by the medical examiner. Despite their objections, however, necropsy was performed. There was no evidence of any intracranial injury, and only a few healed rib fractures were found. Death was caused by severe coronary arteriosclerosis. The correct cause of death may discourage unnecessary and unwarranted litigation. Without autopsy there is too much room for speculation by misguided or interested "experts."

Age plays a role in deciding whether autopsy is to be done. Natural death is less frequent in younger persons, thus leading to the suspicion of violent death and the performance of necropsy. In older people, however, in whom sudden death is more frequent and usually occurs under obviously nonsuspicious circumstances, the investigation without autopsy is usually adequate. In addition, objections to postmortem examination are more frequent in such cases, and the medical examiner ordinarily finds it difficult to justify the arbitrary performance of a necropsy. There are cases, however, in which the relatives desire to know the cause of death and the examination is done. Because of these factors only 16 per cent of all cases of natural death come to the autopsy table, as compared with a total autopsy percentage of 25 per cent.[2]

The insurance claim may determine necropsy even in the absence of suspicion of foul play. The autopsy may reveal that death was caused by accidental injury, thus entitling the beneficiary to the accidental-death benefit provisions of the policy. In other cases, when violence was suspected because of the circumstances, death was found to be due to natural causes. There are other more difficult cases in which trauma and natural causes have combined to produce death. When payment on an insurance policy is contested because of the allegation of fraudulent application, the autopsy findings may clarify the point at issue. The presence of a fatal natural disease does not *per se* prove that the deceased was aware of his condition.

When the question of workmen's compensation arises, it is to the interest of both the claimant and the insurance carrier to have the cause of death accurately determined. At the same time, there is an opportunity to evaluate the lesions found at autopsy in their relationship to the alleged occupational accident or injury.

One of the most important factors in determining which cases shall come to postmortem examination is the circumstances under which death

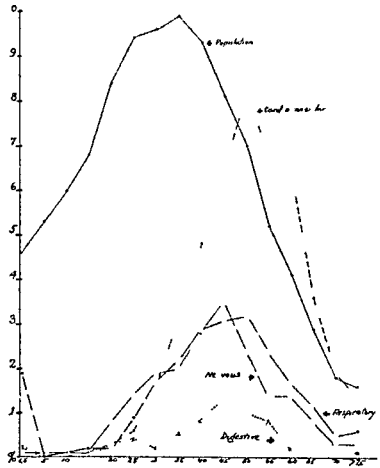

FIG 1 Graphic representation of percentage distribution by half decades of population (Borough of Manhattan, New York City, 1940), and of major categories of sudden and unexpected natural death

occurred The presence of witnesses will tend to confirm natural death and so militate against autopsy, whereas death without witnesses will weigh heavily in its favor

In the careful performance of postmortem examinations the Medical Examiner contributes valuable data for the compilation of accurate vital statistics He does this even though he is not concerned primarily with this problem, as much as he is with the medical detection of violence as a cause of death Of the large number of deaths occurring outside of hospitals, only those under the jurisdiction of the Medical Examiner come to autopsy

Finally, the Medical Examiner functions, at times, as a public health officer The early fatalities in epidemic disease may escape recognition except for his investigation of sudden or unexpected natural death Such was the case in the Fall of 1933, when the Medical Examiner's Office detected the first cases of a fatal outbreak of estivo-autumnal malaria in drug addicts [3] Calling attention to the existence of the disease and the mode of transmission, the Office was responsible for the recognition and treatment of subsequent cases

In general, the economically less fortunate are better represented in the material of the Medical Examiner's Office, probably because those in better circumstances are more likely to have had medical attention when ill and when dying

The anthropologic composition of the material here presented has many interesting aspects One is struck by the paucity of women Of the 2 030 cases reviewed, only 19 per cent were women, although according to the 1940 census[1] 51 per cent of the inhabitants of Manhattan Island are female Even if every one of the 500 000 visitors to New York City were a male, confined his visit to Manhattan, and were included in the population so that the percentage of women sank to 41 per cent, a considerable discrepancy would remain between that value and 19 per cent

When a racial analysis is made (Table 1), it is found that each race contributes to the reservoir of sudden natural death in almost exact proportion to its share in the population Whites make up 83 5 per cent of Manhattan's inhabitants and furnish 84 2 per cent of the material studied in this paper, Negroes, who comprise 15 8 per cent, yield 15 2 per cent, and Asiatics, 0 7 and 0 6 per cent, respectively Negresses, however, who are outnumbered by white women in the ratio of almost 5 to 1, make up more than 26 per cent of all female cases, or almost twice the expected proportion This would suggest that among Negro women the signs of disease are less apt to be heeded and medical attention is less often sought, so that death takes place more often without a physician in attendance

In general, the lesions responsible for sudden and unexpected natural death fall into three categories [4] First, the largest group is made up of natural disease processes which are of slow or insidious development, damaging a vital organ without the production of apparent symptoms, finally, there results a sudden cessation of function The second group comprises sudden and unexpected rupture of blood vessels with the occurrence of fatal hemorrhage The third group includes latent infectious disease Of the three, vascular rupture with hemorrhage is the easiest for the pathologist to evaluate as a necessarily immediate cause of death Infection is perhaps less obvious whereas chronic degenera

At the same time, there is an opportunity to evaluate the lesions found at autopsy in their relationship to the alleged occupational accident or injury.

One of the most important factors in determining which cases shall come to postmortem examination is the circumstances under which death

disease is next in frequency (9.2 per cent, 4.1 per cent), then cardiac hypertrophy unassociated with valvular defects and chiefly hypertensive in origin (3.8 per cent, 1.7 per cent), and spontaneous rupture of the aorta (2.7 per cent, 1.2 per cent). Last, there is a miscellaneous group, including congenital heart disease, which totals 4.9 per cent and 2.2 per cent, respectively.

Lobar pneumonia leads in the respiratory group, and is next to coronary artery disease in frequency, comprising 8.7 per cent of the total of all sudden deaths in which autopsy was done. Next in frequency come bronchitis and bronchopneumonia (6.5 per cent), pulmonary tuberculosis (3.4 per cent), and pulmonary embolism and infarction (1.6 per cent).

Among the deaths from diseases of brain and meninges, spontaneous cerebral hemorrhage is most frequent, comprising a third of this category and 5.4 per cent of the entire series of 2,030 cases. Subarachnoid hemorrhage has 4.6 per cent, cerebellar hemorrhage and pontine hemorrhage, 0.6 per cent each, cerebral thrombosis and embolism, 1.3 per cent, suppurative meningitis, 1.9 per cent, and brain tumors, 1.4 per cent.

When a half-decade distribution of disease by organ systems is made (Table 4, Fig. 1), the greatest incidence of sudden and unexpected natural death is found to occur between 45 and 54 years of age. This period is ten to fifteen years later than the percentage peak of population (35–39 years).

Summary

An analysis is made of 2,030 sudden and unexpected natural deaths in the Borough of Manhattan, in which necropsy was done by the Office of the Chief Medical Examiner, and classified according to organ systems on the basis of pathologic anatomy and causation.

Coronary artery disease caused 30 per cent of the deaths; lobar pneumonia, 8.7 per cent; syphilitic aortitis, 5.3 per cent; valvular disease, 4.1 per cent; cerebral hemorrhage, 5.4 per cent; subarachnoid hemorrhage, 4.6 per cent.

Sudden and unexpected natural death occurred four times more frequently among men than among women. Racial incidence was in proportion to population.

Note.—Separate studies devoted to coronary artery disease and to spontaneous subarachnoid hemorrhage are in preparation.

NAVY NURSE CORPS APPLICATIONS

Registered nurses seeking to become officers in the Nurse Corps, United States Naval Reserve, may now make application through the Office of Naval Officer Procurement at 33 Pine Street, New York.

All inquiries in the past have had to be directed to the Surgeon General in the Navy's Bureau of Medicine and Surgery in Washington.

The aim [illegible] which [illegible] Under [illegible] Navy [illegible] physical [illegible] Other [illegible] office. [illegible] local [illegible] In the [illegible] work. This procurement program carries a 1-plus priority, with a quota of 4,000 additional Navy nurses by June 30 having been set.

Application forms are now available at 33 Pine Street. Nurses are interviewed there, physical examinations are given, and the various necessary documents collected for forwarding to Washington. Nurses in the city are asked to come to the Pine Street office; those out of town are asked to write.

Qualifications include the following: registered nurse, graduate of an accredited school of nursing; high school graduate; native-born or naturalized citizen of the United States for at least ten years; [illegible] r divorced, pre- [illegible] member of a [illegible] the American [illegible] dified by stan-

PHARMACEUTIC TREATMENT OF RINGWORM OF THE TOES

HERMAN GOODMAN, B.S., M.D., New York City

FOR reasons neither space nor inclination permit reciting, some variant of an ointment of salicylic and benzoic acids has been held of value in the treatment and relief of all symptoms of infection of the toe spaces. Let it be said now for all time—no one medicament, no one approach, no one prescription is suitable for *all* persons with this affliction.

A hasty review of the clinical findings is convincing. The reaction of the skin of the toe spaces to the presence of the fungus may be: immediate with vesicles and bullae, that is, with small and large water blisters; or fissures and cracks; or thickening, infiltration, and horn formation simulating callus.

The physician presented with the problem of treatment of ringworm must decide the phase of reactivity of the skin. If he is convinced the patient is in the phase of immediate reaction to insult by invasion of the fungi (this is not related to the period or chronicity of the case), he selects a remedy in the pharmaceutic group of solutions or liquors. On the contrary, if the physician is convinced the patient with infestation of fungi of the skin of the toe spaces is in the fissure phase, the treatment with pharmaceuticals must be designed for penetration. Last, if the physician regards the skin before him as ringworm with keratinization or callus formation, treatment with pharmaceuticals requires the application of keratolytic agents and antiseptics.

In easy review, then: treatment of ringworm of the skin of the toes depends upon the exact location of the offending organism and the reaction of the host. The first requisite is that the medicament does not add to the insult. The next consideration is that the medicament reach the fungi. The third thought is that the medicament be in sufficient concentration to destroy the fungi when it reaches them.

Phase One.—This phase consists of immediate reaction to insult with small and large blisters. Suggested formulas for presentation to prescribing physicians are:

Sodium thiosulfate	50
Water, enough to make	100

Dissolve. Filter. Sig. Apply to the feet after washing and drying.

Potassium permanganate	4
Water, enough to make	100

Dissolve. Sig. A tablespoonful into foot bath.

Iodine	0.6
Potassium iodide	1.0
Water, enough to make	100.0

Dissolve. Sig. Apply to affected parts night and morning.

Phase Two.—This phase is the subsiding reaction. Suggested formulas for presentation to prescribing physicians are:

Tincture of iodine	6
Camphor	10
Alcohol, enough to make	100

Dissolve the camphor in the alcohol and add the tincture. Sig. Apply to affected parts night and morning after washing and drying carefully.

Salicylic acid	6
Alcohol, enough to make	100

Dissolve. Sig. Apply to affected parts night and morning.

Chlorthymol	0.6
Isopropyl alcohol, enough to make	100.0

Dissolve. Sig. Apply to affected parts night and morning.

Phase Three.—Phase three is the infiltrating reaction of hyperkeratinization or pseudo-callus formation. Suggested formulas for presentation to prescribing physicians are:

Salicylic acid	5
Benzoic acid	6
Soft paraffin	32
Cocoanut oil, enough to make	100

Powder the acids and incorporate with the soft paraffin. Mix this with the cocoanut oil to make 100 parts. (This is the original Whitfield formula.) Sig. Apply after washing and drying the affected parts. Cover with clean white socks for walking. At night, wash, remove the fringes of skin and softened callus. Follow by application of:

Chrysarobin	5
Chloroform, enough to make	100

Physical agents or modalities such as x-ray may be required to return the affected skin to normal.

New York City

THE INTERPRETATION OF VISUAL FIELDS IN NEUROTIC PATIENTS

JOHN F GIPNER, M D , Rochester, New York

"IT IS a peculiarity of perimetry that its outward technic is so simple as apparently to make no demand, but to be feasible for the least experienced assistant of a clinic, and yet of all ophthalmic examinations it is perhaps the one which in reality requires the most experience and detachment"—Roenne *

A diagnosis of functional nervous disorder made from the ophthalmologic findings is not difficult if, on examination of the field of vision, the characteristic tubular field or, more rarely, concentric contraction or reversal of color fields, or interlacing of their boundaries, are found in patients with eyes which are normal, externally and ophthalmoscopically When, however, the field defects found correspond, either accurately or only roughly, to the defects characteristic of definite disease syndromes, the task is more difficult, and only repeated careful examinations combined with suggestion therapy will disclose the true nature of the case

Since perimetry, like visual acuity testing, is a subjective examination, errors in field-charting may result from the poor or faulty cooperation of the patient or from ideas transferred from the examiner to the patient through suggestion Once the examiner has obtained a true chart of the patient's field defect, the diagnosis is usually easily made, as the various field defects for retinal and optic nerve pathway lesions are fully recorded in textbooks and special articles The diagnosis of the patient's nervous and emotional status in evaluating the perimetric charting is always more difficult and little has been written on the subject

Five types of situations encountered in the perimetric examination of neurotic patients will be mentioned and illustrated with case histories

A neurotic person with negative fundal examination may present a field defect which simulates the field defect of an organic lesion involving the optic pathway such as retrobulbar neuritis, chiasmal lesion, lesion of the optic tract, internal capsule, optic radiation, or occipital cortex Such a problem was presented by the patient in the following case report

Case Reports

Case 1 —Miss M T , aged 15, who lives in a small town some distance from Rochester, was struck in the right eye while playing basketball, with force sufficient to knock her unconscious for a few minutes She reported for examination the next day complaining of complete amaurosis in the right eye

The right eyelids were ecchymotic There was no disturbance of the ocular movements A mild hyphemia was present in the right eye but the bleeding point in the iris was not seen The tension was normal The pupils were equal and reacted rather sluggishly to light Both fundi were entirely negative

She would not admit of light perception in the right eye except for an occasional "glimmer" The visual acuity of the left eye was 20/20 and the visual field was negative to a rough test A diagnosis of hysterical amaurosis of the right eye was made, atropine ointment was instilled in the conjunctival sac, and the eye was securely padded She was told not to remove the pad and to return in three days When she returned the hyphemia was gone but a subconjunctival hemorrhage was present under the nasal ocular conjunctiva of the right eye Central acuity was 20/20 — 4 but there was marked contraction of the right nasal field, while the left field was negative

A week later visual acuity was 20/20 O U Perimetric fields taken at this time suggested a chiasmal lesion (Fig 1) The right field showed marked concentric contraction, nasal hemianopsia, and enlargement of the blind spot The left field showed a temporal hemianopsia with the line which demarcated the amaurotic from the seeing portion of the field passing through the blind spot This certainly was not the finding of a true chiasmal field defect, where the line of demarcation passes through the macular field in the midline, but disregarding this discrepancy, a left homonymous hemianopic defect was present with an enlarged blind spot on the right side with negative fundi, findings which are frequently seen in chiasmal lesions

At the end of another week central visual acuity was still normal but typical hysterical tubular fields of vision were found for both eyes, with concentric contraction within the 10-degree meridians and present when tested on the perimeter, the campimeter, and the tangent screen at various distances With positive proof that we were dealing with a hysterical manifestation, the condition was explained to the patient, and after several minutes of reassurance and positive suggestion, the patient's visual fields were widened to almost normal dimensions She returned to school and had no recurrence of the trouble

A fundal lesion in a neurotic patient may be interpreted wrongly because an improper visual-field defect has been charted This usually results from unintentional suggestion by the perimetrist, especially when the perimetrist is a well-informed ophthalmologist The following case report illustrates the fact that a technician in the

Read at the Annual Meeting of the Medical Society of the State of New York, New York City, May 10, 1944

* H M Traquair quotes in An Introduction to Clinical Perimetry "

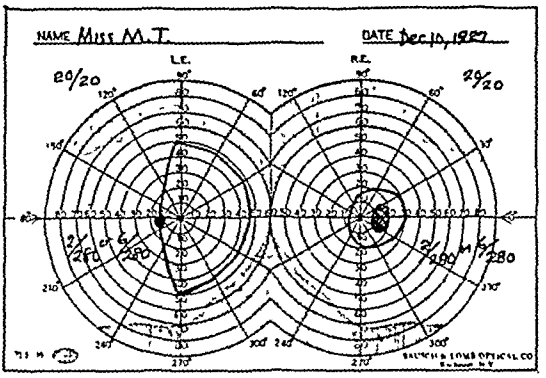

FIG. 1

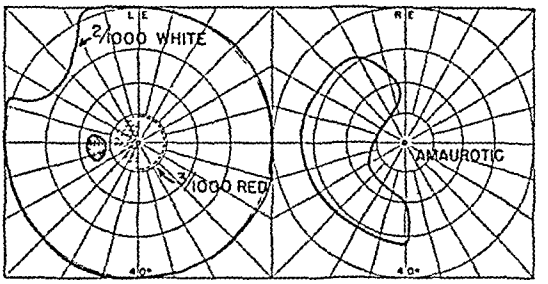

FIG. 2

ophthalmologist's office can also produce erroneous field defects in suggestible patients.

Case 2.—Miss N. E. B., aged 55, was referred to the Strong Memorial Hospital by an ophthalmologist in a neighboring city with a diagnosis of chiasmal lesion, pallor of the nasal half of the right disk, and bitemporal hemianopsia (Fig. 2), definite on the right but easily overlooked on the left, where he found a small superior temporal notch and temporal hemichromatopsia for a red $^{3}/_{1,000}$ object. This field was charted by a technician but was checked by the ophthalmologist. The chief complaint was poor vision in the right eye.

About two years previously while at work she discovered that she could see only one half of the person sitting opposite her, probably due to ophthalmic migraine. Since that time there had been a steady decrease in the visual acuity of the right eye. Throughout her life, she had suffered periodic attacks of migraine which had disappeared about one year ago along with the loss of vision in the right eye. She had received muscle exercises and had worn base-out prisms for years.

V. O. D. −.75 C.Ax. 180° = 8/50−3, V. O. S. −2.00 C.Ax. 170° = 20/25+. Intraocular pressure (Schiötz) 20 mm. each eye.

Our field studies showed (Fig. 3) concentric contraction with greater temporal field loss for the right eye and an essentially normal field for form and colors in the left eye. No suggestion of hemichromatopsia could be elicited. Neurologic examination was negative; x-rays of skull were normal and a diagnosis of right optic atrophy secondary to optic neuritis was made. The cause of the optic neuritis was obscure.

The neurotic patient may present a fundal lesion which could be interpreted as due to disease but which in reality is a congenital anomaly or a physiologic change. A false field may result from suggestion by the perimetrist who considers the lesion to be of pathologic origin. The most common anomaly thus falsely interpreted is the structurally full optic nerve head. Others are the large physiologic cup and senile atrophy of the optic nerve. The following case report is illustrative of these anomalies.

Case 3.—Mrs. E. F., aged 26 years, had always been very nervous and neurotic and subject to migraine since childhood. Her eyes had constantly given her trouble and correction of a moderate compound hyperopic astigmatism by glasses had given no relief. She consulted us stating that her vision seemed blurred and that she had experienced difficulty in stepping down.

The external ocular examination was essentially negative. The muscle balance was normal. Her glasses made a satisfactory correction of her refractive error. The media of both eyes were negative. There was no evidence of intraocular inflammation in either eye in the form of precipitates on the posterior corneal surfaces or vitreous opacities. The upper margin of the right disk was structurally full and protruded slightly forward. The appearance of the left disk was as shown in Fig. 4. There was a peculiar, swollen, baggy mass at the upper edge of the disk, which protruded forward about one-half diopter and hid the upper fifth of the disk. The superior, temporal vessels passed over the swelling, the superior nasal vessels passed through it. The surface of the swelling was grayish white and had every appearance of being composed of medullated nerve fibers.

The condition was considered a bilateral, structural fullness of the upper disk margins, the left being combined with medullation of the nerve fibers. However, upon learning that the condition was not reported in the notes of the ophthalmologists who had previously examined her, the possibility of its being a healed cystic retinitis juxtapapillaris was considered and perimetric fields were made. Although there were no signs of inflammation in the eye, the history of difficulty in stepping down seemed to support this latter view. The patient was visibly disturbed and nervous over the interest displayed in her and promptly gave us the field defect illustrated in Fig. 5. This defect was found not only on the perimeter but also on the stereocampimeter. She left the office weeping.

A few days later she returned very much worried about the condition of her eyes. The fundi remained the same. In checking the visual fields she produced defects continuous with the blind spot in many directions, never twice the same and as often

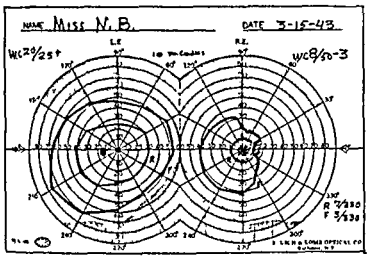

FIG. 3

FIG. 4

above as below. Sufficient time was taken to carefully reassure the patient that nothing was wrong with her eyes and she was asked to return in two weeks At this examination the fields were found to be negative.

Neurotic patients with complaints referable to the eyes may develop real organic lesions with similar or the same complaints. The finding of a real field defect may be the only means of ruling out a diagnosis of functional disorder. In this group are found cases of glaucoma which develop in neurotics, and cases of retinal detachment, especially when the detachment is hidden by hemorrhage into the vitreous. Minimal vascular accidents of the internal capsule involving only the visual fibers with resultant homonymous hemianopsia may be seen in patients who have had migraine for life, with recurring attacks of transient hemianopsia. The true field defect in these cases can be reproduced repeatedly and is constant in dimension and nature.

The reverse malingerer has a definite field defect due to organic disease but conceals its presence and also hides other symptoms of the disease syndrome from the examiner. The psychologic basis for such simulation of normalcy may be incomprehensible to the examiner at the time of the examination. Because of the tragic consequences which result when such patients are not recognized, ophthalmologists must be on guard to discover them and force them to cooperate in their subjective ophthalmic examinations. In the following case the examiner permitted himself to misdiagnose reverse malingering as stupidity or mental retardation.

Case 4.—Miss M. E. Y., aged 17 years, was brought in apparently against her will for an examination of her eyes by her mother, who had noticed a slight ptosis of the left upper lid A satisfactory history could not be obtained because the girl was uncommunicative herself and did not permit her mother to speak for her. She specifically denied headaches or deep pain in the region of the glabella. Except for the slight ptosis the external examination was negative V. O. D. 20/65, V. O. S. 20/65, O. D. +.50 C.Ax 90° = 20/40−, O. S +.50 C.Ax. 90° = 20/40−. Muscle balance orthophoria. Intraocular pressure (Schiötz) O. D. 18 mm., O. S 17 mm. The pupils were equal, reflexes normal, and fundi negative. Because of the negative fundi and reduced acuity unimproved by glasses, a chiasmal lesion was suspected and fields were taken. The patient was exasperatingly uncooperative and roughly full-form and color fields were recorded, although the examiner was not at all sure of his findings. A diagnosis of mental retardation with congenital amblyopia was made.

Three months later another ophthalmologist easily diagnosed a chiasmal lesion on the basis of a complete bitemporal hemianopsia and beginning optic nerve pallor. A malignant neoplasm of the pituitary caused her death following an attempt at surgical removal. An effort to discover the motive for this patient's desire to conceal symptoms and signs of disease from the mother, and hence from the medical examiner, was made by questioning friends of the family.

It was learned that the girl had always distrusted her mother but was very fond of her father; that she was a very intelligent girl who had a scholarship for a college which she was anxious to attend in the fall; that she admitted of headaches only to her grandmother, who supplied her with headache medicine on the promise not to tell her parents, that she was a devout Catholic who had recently attended a novitiate in which she had vowed to stand pain and suffering without complaint.

Conclusions

1. Perimetric fields of patients with functional disorders which simulate field defects found in organic disease often are inaccurate in

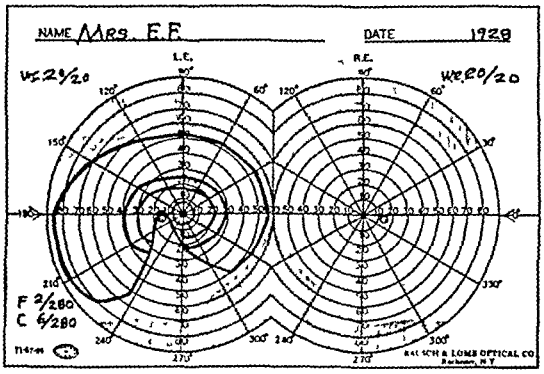

FIG. 5

some details. They tend to change irregularly and disappear with the cure of the patient.

2. The perimetrist must carefully avoid suggestion when charting the field of vision in neurotic patients, so as not to transfer his preconceived ideas of the possible field to the suggestible patient.

3. The examiner must keep an open mind in examining neurotic patients so as not to miss perimetric signs of organic disease.

4. Ophthalmologists must be alert to discover patients with organic disease field defects who hide them from the examiner under a feigned normalcy.

Discussion

Dr. Walter F. Duggan, *Utica, New York*—Dr. Gipner has described 4 cases in which perimetry showed unusual field defects. In each case the patient showed symptoms which are classified as neurotic. Briefly, I would summarize the cases as follows:

Case 1 had a contusion of the globe and probably a concussion of the brain. The injured eye was first amaurotic. Later she showed a left hemianopsia and still later the tubular fields of hysteria in both eyes.

Case 2 had suffered from migraine. She also had a right optic atrophy due to an old retrobulbar neuritis.

Case 3 had suffered from migraine and "nervousness." She gave varying field defects.

Case 4 had a brain tumor. She was uncommunicative and uncooperative. There was conflict at home, and the picture was complicated by what might be called excessive religious fervor.

To me, these cases are interesting because (1) all of the patients were females and (2) every case had an organic condition (injury, migraine, optic atrophy, or brain tumor). Therefore, these cases must be viewed as cases of psychosomatic disease rather than as purely neurotic. Hence, neuropsychiatric problems are involved.

Case 1 brings up the question of the relation of head trauma to physical and mental changes. A blow sufficient to cause unconsciousness must have caused a cerebral concussion. With such a blow, there is the possibility of chiasmal damage through rupture of nutrient blood vessels. Carl Rand (*Arch. Surg.* 32:945 (June) 1936) described a case of "hysterical" contraction of the left field following a fracture of the skull behind the left orbit. However, the patient had a left optic atrophy. There was also mental deterioration. Rand also mentions that subdural or subarachnoid hemorrhages may pass forward to surround the optic nerve and cause blindness. He also described a complete bilateral amaurosis following a blow on the head in which vision returned to normal within twenty-four hours.

H. Van Wagenen operated on 2 patients (quoted in E. Campbell and E. White, *New York State J. Med.* 38:841 (June 1) 1938) with bitemporal hemianopsia following a head injury. He evacuated hematomas from within the sella turcica. Head injuries can cause a fracture of the optic canal leading to total blindness due to optic atrophy. Less severe injuries can undoubtedly cause transitory amaurosis. The late subconjunctival hemorrhage in Case 1 may have resulted from a small fracture at the apex of the orbit.

J. Malone (*J.A.M.A.* 119:861 (July 11) 1942) states that the postconcussional syndrome of headache, dizziness, and emotional disturbances (singly or together) is due to vascular pathophysiologic changes, and he quotes Zacks, Glaser, and Courville to support this view. In Case 1 the emotional disturbances apparently predominated.

The occurrence of a retrobulbar neuritis in a patient with migraine might be expected because of the vascular nature of both diseases.

B. Cushman (*J.A.M.A.* 101:837 (Sept. 9) 1933) reported 10 cases of periodic headache in which there was either a general contraction of the red fields or a superior or inferior temporal contraction of the fields for red or for red and white. Nine of her patients were women. The headaches and field changes were attributed to swelling of the pituitary. She said ". . . the added demands on the pituitary gland during . . . adolescence, pregnancy, and menopause cause temporary hyperemia and enlargement of it, with a consequent compressure of the gland within its closely fitting capsule and sella turcica."

In T. D. Allen's case of hysteria (*J.A.M.A.* 110:38 (Jan. 1) 1938), there had been periodic headaches for eight months in a 14-year-old girl. The fields were slightly contracted. Mental changes associated with the onset of puberty were considered to be the cause of the "hysterical" field changes. In this patient, swelling of the pituitary may have been the cause, in which instance we have an organic cause of the field contraction.

Rosenthal and Seitz (*Amer. J. Ophth.* 23:545 (May) 1940) reported that quantities of amphetamine sulfate insufficient to change the blood pressure altered the angioscotomas. Is it not possible that temporary flooding of the bloodstream with epinephrine, pituitrin, or other endogenous substances could, by a similar mechanism, account for transitory scotomas or field defects in so-called neurotic patients?

J Ketterman (*J A M A* 106 26 (Jan 4) 1936) has written about psychic and somatic disorders He quotes Klander, who cited "instances of emotional disorders causing not only blushing or dermographia but edema, vesicles, bullae, and even ecchymoses and hemorrhages" The brain and the whole visuosensory system is of ectodermal origin just as the skin is If "emotional" disorders can cause visible pathology in the skin, may they not also cause analogous changes (edema, ecchymoses etc) in the retina, optic nerves, chiasm, tracts, and radiations, and in all other parts of the brain, invisible to the eye but visible to the imagination as deduced from the evanescent field defects and the altered personality reactions of the patient—reactions which we label as "neuroses"?

Many psychiatrists explain the psychoneuroses by one of two hypotheses According to Meyer's psychobiologic concept, stress is placed on the conscious life experiences of the patient such as a feeling of futility, or failure, or insecurity, loss of love or a loved one, or anything causing grief, remorse, fear, shame, dread, or despair According to Freud's psychoanalytic concept, a neurosis arises out of unresolved conflicts of the unconscious mind There is guilt, anxiety, frustration, and conversion

I personally prefer Much's statement that all psychic disturbances are of physical origin Or, as Fetterman says, "Correlation of psyche and soma makes it possible to understand neurotic diseases more intelligently The reality of neurotic symptoms, however unphysiologic they sound, must be believed in, for through the autonomic nervous system actual physiologic and even tissue changes may take place Alvarez says, 'Just as there is blushing and blanching of the skin, there may also be vasomotor changes inside'"

I do not believe that transitory field defects in neurotics are due to a malfunctioning psyche I do believe that there are definite transitory changes in the nutrition and blood supply of various parts of the brain with resulting alterations in both mental and physical function The outlook for progress is not too promising for, as Pickworth (*Brit M J* 1 265 (Feb 5) 1938) recently said, "Superstition demands an infinitely more complex control of the already complex nervous system and thus hinders study of a humbler control by the vascular system"

I can find nothing to criticize in Dr Gipner's essay I have seen cases similar, in many ways, to his 4 cases At this time I wish to stress the necessity of taking fields in all cases of persistent headache or of optic atrophy because of the following case

Two years ago I saw a man who had had poor vision (with optic atrophy) in the left eye for twenty years For five months he had suffered from blurring of vision in the right eye, dizziness, headache, and loss of "side vision" Ophthalmologists had given him glasses and investigated all "foci of infection", many teeth had been removed to eliminate the "toxin" causing the left optic atrophy A field had never been taken! When I saw him, he had a typical bitemporal hemianopsia, demonstrable even by confrontation Dr H Van Wagenen operated on him a few days later for a pituitary tumor The patient is alive and well today

It has been a privilege and a pleasure to discuss Dr Gipner's paper I have two questions to ask (1) Does Dr Gipner believe that the amaurosis occurring immediately after the injury in Case 1 was of psychic or organic origin, and (2) does he believe that the so-called functional field defects are due to pathologic psychology or that they can or will at some future time be explained as manifestations of pathologic physiology?

Dr Thurber Le Win, *Buffalo, New York*—The paper we have just listened to is a most timely one The author, Dr Gipner, said little has been written on the subject If my reading can be evaluated, I would make the statement that precious little has been written

We never know when we may run into these patients Today in our busy offices the neurotic patient may receive too little sympathy We have more than enough to do to take care of those with definite organic disease, definite symptomatic troubles, and well recognized infections and injuries without spending a great deal of time with those unfortunates who have the triad of too much time, money, and imagination We cannot however, dodge the fact that neurotic patients are still a problem and we must attempt conscientiously to help solve their difficulties In other words, we

difficulty She had a real injury and her fields showed that she expected sympathy above all else

In Case 2, he told us the fields were checked by an ophthalmologist I think it was Dr Walter Lillie, of Philadelphia, who said the technician should not be given the entire responsibility of field taking I think this is most wise, especially again in times such as these I wish to emphasize this as strongly as I can As Dr Gipner says, a perimetrist may consider the lesion to be pathologic when no pathology exists

Again we must remember that neurotic patients may develop true organic lesions I recently saw a young lady who was extremely neurotic and had been told at an excellent clinic in the East that her eyes were normal Her fields were never the same twice Her physician, upon her return from the clinic, told me he found an abnormal oblique muscle insertion Puzzled at this, a careful examination was made and it was found, in addition to her neurotic symptoms, that she had a tumor of her lachrimal gland which was proved by biopsy

If I may be permitted I would say patients with refractive errors alone are fortunate Those with diagnosed pathology may or may not be fortunate and the neurotic patient can be, unless we are ever on guard, the most pitiful one of all

So I think the calling to our attention of using care, extreme care, in handling these patients, is both timely and valuable

Dr Gipner—In reply to Dr Duggan's first question, it was my impression that the immediate blindness in Case 1 as well as the subsequent field defects were functional. As to the second question,

TABLE 1.—Analysis of 62 Consecutive Pantopaque Myelograms

	Cases	Per Cent

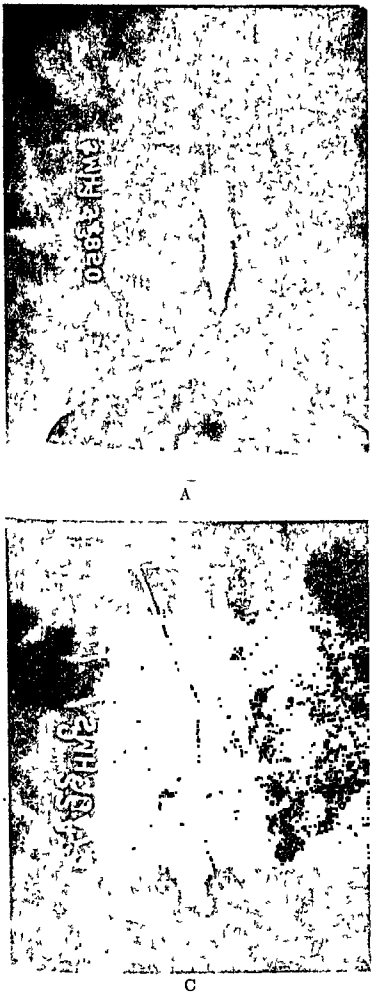
the needle, and the medium is injected slowly into the subarachnoid space. This should be accomplished easily; and if marked resistance is encountered, the exact position of the point of the needle should be checked. When the pantopaque has been injected, the syringe is detached from the needle and the stilette is replaced. A sterile gauze dressing is then placed over the adaptor of the needle and the patient is ready for the examination.

Fluoroscopy and Radiography.—After the examiners have become dark-adapted, fluoroscopy is carried out. The pantopaque should be seen pooled in the middle lumbar region near the point of the needle. The fluoroscopic table should be manipulated slowly, since the medium flows very rapidly. To prevent pantopaque from flowing into the cranial cisterns, where it may be immobilized, or from flowing rapidly over the lumbar curve, which may lead to globulation, the examiners should avoid lowering the head of the patient too much or too rapidly. The foot of the table should first be lowered gradually, and any deviations in the pantopaque column, particularly of the head of the column, studied under fluoroscopy. "Spot" radiographs are taken as defects in the outline of the opaque column are noted, and of all suspicious areas, since occasionally minimal defects will be apparent only on the films. When the pantopaque has been collected in the terminal sac, the table should be tilted slowly in the opposite direction, and the medium observed for deviations as it flows in this direction. These maneuvers may be repeated until a satisfactory examination is completed. Sometimes it is desirable to roll the patient from side to side in order to study each nerve root adequately. For medially located lesions it is important to make supplementary lateral and oblique radiographs.

Removal of Pantopaque.—Following radiography, the pantopaque is collected around the tip of the needle under fluoroscopic visualization, and aspirated by means of an empty sterile syringe attached to the needle. It should be possible to remove 80 or 90 per cent of the injected pantopaque without much difficulty. The amount removed can be identified in the barrel of the syringe, where it forms a layer under the spinal fluid. At times it is necessary, during aspiration, to turn the needle gently when its bevel becomes blocked by a nerve root or a meningeal margin. Occasionally the medium must be maneuvered under the tip of the needle two or three times before all of it can be removed. Finally, the needle is removed, and a sterile dressing is applied.

Aftercare of Patient.—The patient may be permitted to move off the fluoroscopic table into his bed, but the same precautions should be taken as those followed after a simple lumbar puncture. The patient should be kept in bed for six to twenty-four hours. If the examination has been carefully done, there should be little discomfort.



Side-Effects.—The incidence and severity of the side-effects following pantopaque myelography with aspiration of the medium are but slightly greater than with ordinary lumbar puncture. In 10–30 per cent of such cases there may be transient symptomatic reactions consisting of slight temperature elevation and increase of symptoms referable to a back condition. When the medium is not removed, similar transient side-effects occur with a slight elevation of temperature in a greater per cent of patients. To reduce the reactions to a minimum and to facilitate the absorption of the medium, most of the pantopaque should be removed by aspiration after myelography.

Contraindications.—Pantopaque should not be injected when a lumbar puncture is contraindicated, nor within ten days of a previous lumbar puncture. The latter precaution is necessary to avoid subdural and extra-arachnoid extravasation. An injection should not be carried out until the operator is certain that his needle is in the subarachnoid space.

A number of typical pantopaque myelograms are given in Figure 1.

Analysis of Sixty-Two Consecutive Myelograms

The diagnostic value of pantopaque is illustrated by the analysis in Table 1 of 62 consecutive myelograms selected from the middle of the series of 125. Each of the persons involved in the interpretations had had an experience of 10–12 cases with pantopaque, and the results may be regarded as fairly typical of what may be obtained using the new medium without special experience. Of the group of 62 cases, 45 had posi-

A B C D

FIG. 1. T

tive and 17 negative radiographic findings. Surgical exploration was carried out on 38 of the cases with positive findings, and in all but 2 of these the radiographic diagnosis was confirmed at operation. The 36 cases with confirmed diagnoses included 29 protruded disks, 5 tumors, 1 arachnoiditis, and 1 thickened ligamentum flavum. The 2 cases in which the radiologic findings were positive, but which were found to be negative on operation, showed such definite defects in the myelograms that there is some question as to the completeness of the surgical exploration. Subsequent follow-up may reveal persisting symptoms. Provisionally, at least, these two cases must be scored against the accuracy of the procedure. The 7 cases in which a protruded disk was diagnosed both on the basis of radiographic and of neurologic findings, but which were not operated upon are, of course, questionable. Nevertheless, they may be fairly included in the analysis as having been correctly diagnosed.

Turning to the 17 cases in which the radiographic findings were negative, 2 of these were subsequently operated upon. In one case a protruded disk was found at the fifth lumbar, and in the second a syringomyelia was discovered at the sixth cervical vertebra. In the first of these cases the radiographic interpretation was too cautious, and in the second the technic employed for the visualization of the cervical region was at fault. Another case that clinically presented the picture of a protruded disk showed a completely normal myelogram. Since operation was refused, the diagnosis is questionable. Provisionally this case, also, must be considered as having been incorrectly diagnosed by radiographic methods. The 14 cases that gave negative radiographic and negative neurologic findings, and which were not operated upon, may be included among the accurately diagnosed patients, although the proof is not as objective as could be desired. Summing up, out of the series of 62 cases, 5 appear to be incorrectly diagnosed, which leads to an apparent diagnostic accuracy of 92 per cent. It may be added that in the myelograms carried out subsequent to the above series, the diagnostic accuracy, scored in the same way, has been nearly perfect.

Discussion

Apart from the group associated with the development of pantopaque,[2] recognition of the value of the medium for myelography is due to Spurling and Thompson,[3] Spurling and Scoville,[4] Wyatt and Spurling,[5] Cone,[6] Bradford,[7] Bell,[8] Echols,[9] and others.[10] It has been pointed out by Pugh[11] that in some respects pantopaque is too fluid, and that it tends to globulate as it is passed over the lumbar curve. This rarely occurs if the patient is properly supported and the fluoroscopic table is manipulated carefully. It has been reported by Bell[12] that a considerable degree of globulation of the medium occurred in one patient with a high protein content of the spinal fluid. In this case the medium could be removed satisfactorily, but the aspirated fluid was essentially an emulsion of pantopaque and spinal fluid.

In spite of a considerable experience with pantopaque over a period of several years, the rate of absorption of the medium in man cannot be stated with any exactness. A variety of factors evidently influence the rate of absorption. If the conditions within the spinal canal are such that a marked degree of globulation of the residual pantopaque occurs, or if the medium is spread over a large surface, the rate of absorption in man appears to approach the rate of 3 cc. per year that was noted in dogs. On the other hand, when the medium is contained in the cauda equina region, the rate of absorption is so slow that it may be of the order of 0.5 to 1.0 cc. per year. As time passes small particles of the medium become fixed, and the rate of disappearance becomes slower and slower. Nevertheless, observations by several groups, particularly by Wyatt and Spurling,[5] indicate that absorption should be complete at the end of several years. Studies on the rate of absorption of residual pantopaque in the group of patients discussed in this paper will be reported later.

WILMS' TUMORS

ARCHIE L. DEAN, M.D., New York City
(From the Department of Urology, Memorial Hospital)

STATISTICAL studies made by us of the clinical material of the Memorial Hospital and by others of the incidence of all malignant tumors of infancy show Wilms' tumors second in frequency only to tumors of the eye. In adults renal tumors make up only about 0.5 per cent of all cancers, but in children approximately 20 per cent are in the kidney. With few exceptions all of these are embryonal adenomyosarcomas, or Wilms' tumors, by far the most common tumor of the genitourinary tract in infants.

Wilms' tumors are congenital, embryonal, mixed tumors. They arise from the kidney anlage. The disease has been found in the seven-month fetus and 30 cases have been reported in adults, but it is exceedingly rare after the seventh year. The average age of patients when the tumor has been discovered is about three years. The sexes are affected equally.

In a short discussion it is impossible to describe the many theories of the genesis of Wilms' tumors. Since these tumors may show marked variations in the degree of differentiation of their component cells and in the number of tissues represented, it seems reasonable to suppose that they originate at different developmental periods of the embryo. If the tumor arises before the urogenital ridge has formed the nephrotome multipotency of these cells may account for the elaboration of smooth and striated muscle fibers, fat and cartilage cells, and sarcomatous and tubular elements. At a later stage, if the renal blastema or nephrotome is the predominant contributing structure to the tumor, primitive renal tubules or even primitive glomeruli may be recognized. We believe that the stage of embryonal development at which Wilms' tumors arise is a matter of great clinical importance because this factor modifies not only the structure of the growth but its natural history and also to a considerable degree its response to various types of treatment.

Grossly these tumors are usually unilateral, although in Wilms' collected series 7.2 per cent were bilateral, and Kretschmer and Hibbs found bilateral occurrence in 12 per cent. I believe the bilateral origin of Wilms' tumors is somewhat exaggerated by these figures which, in many instances, were based on autopsy examinations. Usually at the time of death Wilms' tumors have metastasized widely and it is impossible to determine whether involvement of the contralateral kidney was primary or metastatic.

The tumor may occur in any part of the kidney, although usually the lower half is first involved. At first the growth is always within the renal capsule. When this is ruptured extension rapidly follows the routes of least resistance. Practically all Wilms' tumors are surrounded by a dense capsule which completely separates the tumor from renal parenchyma. This capsule usually remains intact until the growth is quite large. Due to this encapsulation many observers have described Wilms' tumors as "in" the kidney but not "of" the kidney. The capsule also is largely responsible for the infrequency of urinary signs.

Wilms' tumors grow aggressively. They may extend toward the renal pelvis, pushing kidney tissue outward to form a pseudopolyp, or the growth may protrude from the hilus. The kidney may retain its shape, but in many cases it has been found fitting like a small cap on the tumor mass. The tumor usually is bluish and smooth, although irregular lobulations are present in more advanced stages. On section the substance is soft and grayish-white or yellow. In parts it may look medullary, fibrous, gelatinous, vascular, or edematous. When situated retroperitoneally the tumor displaces the colon forward and mesially. On the right side it may press against the duodenum and obstruct it. After the renal capsule is ruptured the disease is likely to extend through the peritoneum and involve the omentum and adjacent organs of the abdominal cavity. All of the viscera may be affected. The walls of large blood vessels, especially veins, and the ureters have been destroyed; even the diaphragm is but a temporary barrier. These tumors may grow to a weight of 5,000 Gm., which may be 25 per cent or more of the weight of the infant.

The veins of Wilms' tumors are comparatively large and their walls are thin and fragile. They frequently rupture spontaneously, causing infarcts. Often they are invaded by tumor cells. As a result, although lymphatic extension occurs, the earliest demonstrable metastases are usually blood-borne and are found in the lungs, the brain, or in the skin. The majority of the patients seen by us within a week of the discovery of their primary tumors had demonstrable metastases, while patients examined after a greater delay had metastases with even more frequency. On the other hand, there was a small group of children

Read at the Annual Meeting of the Medical Society of the State of New York, New York City, May 9, 1944.

who had no metastases several months after the primary tumor had been found.

Histologically, Wilms' tumors are composed entirely of tissues of mesodermal origin. In some specimens the predominant cells are round, hyperchromatic, and undifferentiated; in others differentiation is more complete and one can see abortive attempts at the reproduction of renal tubules and glomeruli. Interspersed among these structures of renal blastema origin may be found other tissues such as smooth tissue, striated tissue, myxomatous tissue, and, rarely, cartilage and fat.

The epithelial elements of the tumor consist of tubules of variable sizes and shapes lined by cylindrical or cuboidal cells. The basement membrane is often imperceptible. The glandlike tubules are usually single layered and have a tendency to form cysts. In some areas the epithelial tissues form solid cords or strands. Abundant mitoses in the cells of these tubules indicate their activity in the histogenesis of the tumor. Smooth muscle fibers are found in these tumors with some regularity. Ribbert and Busse assert that the rarer striated muscle fibers develop from them by metaplasia. Other structures, such as fat and myxomatous tissue, are only occasional components of the tumors but they occur sufficiently often to justify the use of the term "mixed tumor."

Symptoms

In common with all other kidney tumors, Wilms' tumors produce no symptoms until late in their life history. When symptoms arise the disease is far advanced. As the tumor grows in the infant there is a gradual enlargement of the abdomen, which may be accompanied by constipation and malaise. After a time, in the majority of cases entirely by accident, a large mass is discovered in one side of the abdomen. If growth continues it is not long before there is vomiting, loss of weight, asthenia, anorexia, an increased rate of tumor growth, and the appearance on the abdomen of tortuous, dilated, superficial veins. Soon the terminal stage is reached with ascites, marked emaciation, a tremendously enlarged abdomen, and perhaps obvious metastases. Death is usually caused by cachexia, and occasionally by intercurrent disease.

The first symptom in the 80 patients seen at the Memorial Hospital was:

1. Accidental discovery of a mass in the abdomen—64 per cent.
2. Pain in the loin or abdomen—16 per cent.
3. Asthenia and malaise—12 per cent.
4. Hematuria—4 per cent.
5. Frequency of urination—4 per cent.

Pain is seldom an important symptom and it is always difficult to evaluate. It may be colicky, associated with constipation, or it may occur when the rapidly growing tumor exerts tension on the renal capsule or traction on adjacent organs.

Hematuria, usually painless, has been reported in between 10 and 25 per cent of children with Wilms' tumors, in contrast to an incidence of between 75 and 85 per cent of adults with tumors of the kidney parenchyma. This marked differenc probably is caused by the encapsulation of Wilm tumors. Not infrequently the bleeding is fro the congested parenchyma of the kidney rath than from the tumor proper. Hematuria is a ways intermittent, with recurrences at irregul and sometimes widely separated intervals. I common with all kidney bleeding, the blood is di fused throughout all of the voided urine, and i the absence of clots it is painless.

Urinary symptoms are infrequent and insign ficant. This, again, probably is due to the separ tion of the tumor by its capsule from the ren pelvis and parenchyma. Erythrocytes in th urine sometimes are found on microscopic exan ination, but many tests may show normal urin especially when the diseased kidney does not fun tion because of pressure atrophy. Urinalysis ma aid in detecting the onset of infection, and it significant when albuminuria follows pressure o the tumor.

Diagnosis

A palpable tumor is an important discovery i either a child or an adult, but in a child it may l the only diagnostic sign. There may be difficult in feeling the tumor if the child is obese. Als in young infants the kidney normally lies deep in the pelvis than in adults. Careful bimanu palpation of a Wilms' tumor may demonstrate i location, size, shape, consistency, mobility, ar tenderness on pressure. The surface is usual smooth, although it may become lobulated. I most cases the consistency is elastic, althoug when necrosis occurs or bleeding takes place in i substance the tumor may be as soft as in hydr nephrosis. Mobility depends on the size of th growth and the amount of available space remai ing in the abdomen. For a time, at least, prima tumors are not adherent and move with respir tion. Fever may be the first and for a time th only symptom. It is frequent with Wilms' tumor as it is in children who have lymphosarcoma or e dothelial myeloma. A majority of our patien had intermittent fevers ranging from 101.5 104 F. The temperature elevations seemed u related to the stage of the disease.

Differential Diagnosis

The clinical features of a large, rapidly growi kidney tumor in a young child are usually so de

inite that a tentative diagnosis should be made in most cases by physical examination. However, there are a number of intra-abdominal masses from other causes:

1. Lymphosarcoma of retroperitoneal lymph nodes is centrally located and is surrounded by resonant intestines. In the case of a Wilms' tumor resonance is mesial to the abdominal mass. Regional lymph nodes are more frequently affected by lymphosarcoma.

2. Tumors of mesenteric lymph nodes such as lymphosarcoma, malignant lymphogranuloma, or tabes mesenterica are massive, somewhat superficial, and situated near the umbilicus.

3. Suprarenal tumors in children are often associated with disturbances of the endocrine system.

4. Tuberculous kidneys are seldom as large as renal adenosarcomas. Urinary symptoms are more prominent and laboratory findings are often pathognomonic.

5. Hydronephrosis should be differentiated by a urologic examination.

6. Polycystic disease is always bilateral, but one kidney may be considerably larger than the other. Retrograde pyelograms furnish the best diagnostic evidence.

7. Tuberculous peritonitis is sometimes difficult to differentiate from a Wilms' tumor. The general physical examination, doughy consistence of the abdomen, chest films, and family history should furnish clues.

8. Hepatic tumors are rare in children. Although they seldom are accompanied by jaundice, there usually are severe gastrointestinal symptoms and abdominal pain.

9. Ovarian tumors are rare in childhood. Usually they are bilateral and can be palpated bimanually with one finger in the rectum.

10. Splenomegaly is more superficial than adenosarcoma of the left kidney and is situated higher in the abdomen. Blood examinations aid in detecting leukemia, malaria, or syphilis.

11. Pancreatic tumors are rare in children and cause unusually severe gastric symptoms and intractable pain.

12. Fecal tumors are more superficial than Wilms' tumors, and they are freely movable and accompanied by obstipation or intestinal obstruction. Roentgenograms taken after a barium enema usually clear up this diagnosis.

13. Psoas abscesses should be differentiated by their more chronic febrile course, pain in the vertebral column, and characteristic roentgenographic changes in the spine.

Because the most painstaking general physical examination cannot establish a clear-cut diagnosis of a Wilms' tumor, and because by the time a suspicious mass has been discovered the disease is far advanced, more specific diagnostic measures must be carried out without delay. In most cases excretory urography will show enlargement of the kidney with displacement and characteristic pressure deformities of the pelvis and calices. However, poor function or complete obliteration of the pelvis and calices by pressure may render this test inconclusive. When the diagnosis has reached this stage a urologist should be consulted without further delay. Any properly trained urologist with modern equipment can perform a complete examination without injuring the youngest infant of either sex.

Even when excretory urography has demonstrated a kidney tumor I recommend cystoscopy with bilateral ureteral catheterization, functional studies, and retrograde pyelograms. These procedures corroborate the earlier findings, show more accurately the function of the good kidney, and determine whether or not the disease is bilateral.

Under no circumstance should one incise a Wilms' tumor to obtain material for a microscopic examination. This ill-chosen operation destroys the capsule of the tumor and encourages rapid and widespread growth.

Treatment

Perhaps there is no question we have been asked more frequently during the past few years than "What is the best treatment for a Wilms' tumor?" Unfortunately, there can be no clear-cut unqualified answer because the problem is so complicated. We have observed that Wilms' tumors originate at different developmental periods of the embryo, and as a result may show marked differences in structure, rate of growth, and response to various kinds of treatment. Other variable factors of fundamental importance are presented by the condition of the patient, the ability of the surgeon, and the availability of the best radiotherapy. Finally, no sufficiently large groups of patients have received the same treatment so that comparison of results clearly establishes the superiority of one procedure.

Fortunately, there is one fact of which we are certain—the cure of a patient with a Wilms' tumor depends on the removal or complete destruction of the growth before metastasis occurs, because there is no recorded instance of any patient with a metastasis having been cured by any type of treatment or combination of treatments. After a Wilms' tumor has grown large enough to be palpable there is always imminent danger of metastasis taking place. We have repeatedly observed the appearance of metastases within two to three days of the discovery of the primary tumor in patients under study in the hospital. Therefore, only prompt, complete sur-

gical removal of the tumor provides ideal treatment.

The possibilities of the best surgical care have been demonstrated by Ladd,[1] who, after promptly supplying the infant's needs of blood and fluids, utilizes the transperitoneal approach and first ligates the renal vessels to prevent disseminating viable tumor cells, then removes the growth *en masse*. The end results of this procedure, as reported from the Children's Hospital in Boston, are incomparably better than those from any other source, and we must consider Ladd's methods the ideal.

About fifteen years ago, when little encouragement seemed to follow the treatment of Wilms' tumors by any methods, we decided to employ radiation alone, and did so in 20 cases. Of the patients so treated 5 are living, without any evidence of disease, five or more years after treatment was given. Although this is a high proportion of cures, this form of treatment is not recommended because in even the most radiosensitive cases it probably requires many months to completely devitalize the tumor, and during this time metastasis can take place. Furthermore, irradiation does not conserve any functioning renal tissue because in cases we have treated the kidney function has been lost. On the other hand, we have never seen evidence of any constitutional injury to the child from radiation, nor have any of the infants treated by us developed in any abnormal way.

In spite of the exceptional success of Ladd, the treatment of Wilms' tumors by surgery alone has been unsuccessful. Not infrequently the tumors are so large as to make up 20 per cent or more of the infant's body weight and their removal is difficult for even the most skilled. At the same time it must be remembered that the great majority of Wilms' tumors are treated by surgeons who see only an occasional case, and in their hands preoperative shrinking of the tumor appears to be of great assistance. For this reason I believe that preoperative radiation will result in the successful removal of a certain number of Wilms' tumors now considered inoperable because of their large size. Priestly and Broders[2] have reported that the patients with Wilms' tumors who did best at the Mayo Clinic were treated by radiation and surgery.

As soon as the primary tumor has been demonstrated every part of the body should be searched for metastases. If any are found the patient is inoperable and should be treated with radiation exclusively. Even when the lungs appear normal, roentgenograms of the chest should be repeated every two to three weeks. Complete studies of the blood should be made at five-day intervals during treatment. If no metastases are found, three portals (anterior, lateral, and posterior) should be outlined on the patient. In length these portals should extend from the upper to the lower limit of the tumor and each should be one third of the distance between the anterior midline and the posterior midline on the side of the patient's abdomen affected by the tumor. Using the 200-kv. roentgen-ray unit, with the usual filters, at 50 cm. distance, 100 r is delivered daily to a single port, the portals being treated in turn. In most cases within a few days shrinking of the tumor will be noted. Not infrequently by the end of two weeks the mass will have disappeared. Without delaying longer, the tumor should be removed. Occasionally the growth does not shrink under irradiation. If this does not take place after six or eight treatments one should operate without further delay.

The transperitoneal approach is best because the renal pedicle can be doubly clamped and ligated before manipulation of the tumor begins. However, if the tumor is small the usual loin approach can be employed. In this case one should also ligate the renal vessels as early in the course of the operation as possible. After the tumor has been removed one should carefully search the wound for extensions of the disease beyond the kidney. Not infrequently they are present but are not discovered. If disease beyond the kidney is found, postoperative radiation should be given. Since this condition requires more prolonged irradiation, four portals are outlined on the side of the abdomen over the tumor and 100 r is given to a single portal per day, the portals being treated in turn.

Infants not infrequently are intolerant of radiation. If administration of a daily dose of 100 r is followed by nausea, 75 r should be used. Blood counts should be performed every three to four days, and if the white cells fall below 2,000 per cu. mm. transfusions of whole blood should be given. Meanwhile, every effort should be made to maintain the infant's health at its best.

If metastases have been discovered, irradiation is usually worthwhile for its palliative effect, but practically without exception these infants steadily progress downhill, in spite of our best efforts.

Discussion

Dr. Benjamin S. Barringer, *New York City*—The doubt that was implanted in my mind when Ladd first published his paper on the results of surgical removal of Wilms' tumors has not been resolved by

hearing Dr Dean's paper today Ladd's five-year survivals of some 50 per cent in some 60 cases is unduplicated by any previous statistics

Years ago we were enthusiastic at the Memorial Hospital over irradiation alone of such tumors Up to then there had been comparatively few five year survivals So we believed we had a clear field for experimental work Irradiation alone, while it generally caused a great shrinkage of the tumor, rarely cured these cases Then we tried irradiation followed by nephrectomy of the reduced tumor This, while it resulted in some controls, did not appreciably improve the statistics Such kidneys were certainly easier of removal, but metastases occurred just the same Then along came Ladd's results One or more competent surgeons operating in a children's hospital gave unprecedented results

Other competent surgeons have operated upon these tumors with poor results The tumors operated upon by Ladd were apparently not smaller than is seen at any other hospital and so not earlier diagnosed Therefore I am still puzzled Irradiation certainly has a place in the treatment I have seen a hopelessly large tumor with metastasis controlled for five years by irradiation alone Yet my confusion still exists I believe we must await further publications and analysis from Ladd to resolve the confusion

"DOCTOR JONES' SAYS—

This business of self medication—folks doctoring 'emselves of course there's some of 'em right now—at times they have to do their own doctoring or go without But a good many of 'em, in my opinion, they'd be better off to let nature take its course Nature's a pretty fair doctor, under ordinary conditions if she's left alone and given a chance And,

that're liable to affect his judgment

Of course there's a certain amount of family medication—using the ordinary home remedies for simple conditions—it's often necessary and usually it's perfectly safe, so long as it's handled by somebody their ing oil for an abdominal pain that may come from acute appendicitis

But about the worst form of self medication I know of (it's always a surprise to me when I find intelligent people doing it)—that's taking medicine the doctor's left some time for somebody else Like Grandpa Pepper, the time he thought he had "rheumatiz" He took some pills, he said "the doctor left for Mis' Doane, the time she had rheumatiz She said they helped her," Grandpa says, "but they didn't seem to hit my case" Well, one reason they didn't was that he didn't have "rheumatiz" at all, he had "water on the knee"

The doctors, in spite of years of preparation and experience—every now and then, even after they've made a definite diagnosis, they're in doubt as to what it's wise and safe to give a patient What'd cure one

ists call incomple drug like calomel (a chloride of mercury) if it's mixed with certain other things, it's changed into bichloride of mercury, a violent poison Other things mixed together, like iodine and ammonia compounds, or glycerine and certain chemicals, may form explosives I never actually heard of anybody exploding from taking some blown up a few of igh to do it —*Paul*

GENES SOMETIMES FUNCTION ALONG WITH "PRIMERS"

Genes, the course reign alor sity of In in which genes that determine certain factors or courses of events could not operate except in the presence of at least traces of other substances which he called "primers" He gave them this name, he explained, because their action is rather like priming a pump—you put a little in and you get a lot out

Although primers are found in the general protoplasm of the cell, their origin is still tied up closely with that of the genes themselves, they arise with them if not indeed actually out of them Prof Sonneborn has also found evidence for the existence of primers in the cell nuclei, therefore in intimate association with the genes themselves, which are commonly conceived as chemical units in or on the chromosomes of the nucleus —*Science News Letter, Jan 20, 1945*

THE SIGNIFICANCE OF HYPOSTHENURIA IN PROSTATISM, WITH SPECIAL REFERENCE TO NOCTURIA—A CLINICAL STUDY

JOSEPH A. LAZARUS, M.D., and MORRIS S. MARKS, M.D., New York City

INCREASED nocturnal frequency of urination, a prominent and troublesome manifestation of prostatism, is frequently the earliest symptom associated with prostatic disease, and at times the primary reason which compels patients with prostatic disease to seek medical advice. Nocturia is usually associated with increased diurnal frequency, but the urologist not infrequently encounters patients who complain of one and not the other urinary disturbance.

In order to better evaluate the significance of nocturia, a proper understanding of its causes is indispensable. Nocturia is a frequent symptom in cases of chronic nephritis, and is due to failure of the kidneys to concentrate urine. A brief review of the modern concepts of renal physiology and pathology will help to clarify the subject under discussion.

The two main functions of the kidneys are (1) glomerular filtration and (2) tubular absorption. Tubular function is closely dependent upon glomerular activity. It is to be recalled that the renal tubules are supplied with capillaries which take their origin in the efferent arterioles of the glomeruli. In fact, the total blood flow through the human kidneys is approximately 500 cc. per minute, and all this blood passes through glomeruli and through the peritubular capillaries. It therefore follows that anything affecting the glomeruli must at some time or other affect the capillaries supplying the tubular epithelium, and consequently affect tubular function. Furthermore, any lesion affecting the glomeruli will produce changes in the rate of blood flow through the involved glomerular tufts with resultant change in the quantity of filtrate. Tubular function is also directly affected by certain noxious agents capable of producing necrotizing changes in the tubular epithelium, which may escape with the glomerular filtrate. The rate of flow of glomerular filtrate also affects tubular function. Glomerular filtration depends directly upon the tension driving the blood through the glomerular tufts, the number of functioning glomeruli, and inversely upon the tension present within Bowman's capsule. Any condition capable of influencing these factors will, sooner or later, lead to changes in glomerular filtration, which in turn will ultimately affect tubular function.

It is estimated that about 100 liters of glomerular protein-free filtrate with a specific gravity of 1.010 pass into the tubules every twenty-four hours. This filtrate consists of a watery solution of crystalline substances in about the same concentration as these substances are present in the plasma. The largest portion of this filtrate, however, is reabsorbed by the tubular epithelium. The proximal convoluted tubules, which are situated within the renal cortex, reabsorb water, sugar, urea, and chlorides and have the property of excreting phenolsulfonphthalein and diodrast. The cells of the distal convoluted tubules, which are also situated within the renal cortex, render the urine highly acid. The final function of concentrating the urine by absorption of water is carried out by the tubular epithelium of Henle's loops. The collecting tubules act only as conduits to the calices.

The hydrostatic pressure of the blood in the renal vessels is higher than in any other capillary system in the body, estimated at about 60 per cent of the pressure within the aorta. The persistently high hydrostatic pressure within the glomeruli is maintained by the small caliber of the glomerular efferent arterioles. The differential between the high hydrostatic pressure in the glomeruli and the lower osmotic pressure of the plasma protein accounts for the fact that water and solutes pass from the blood into Bowman's capsules. The direction of flow in the tubular spaces is diametrically opposite that of the glomeruli; and this is due to the fact that the blood in the peritubular capillaries differs from the blood in the glomeruli in two important respects. Because of loss of water from the glomerular blood, the blood in the peritubular capillaries is more concentrated, with the result that the osmotic pressure of its proteins is approximately 25 per cent higher than that of the glomerular blood plasma. Second, the hydrostatic pressure of the peritubular capillary blood stream is lower than the osmotic pressure exerted by plasma proteins contained in this fraction of the blood. This combination of factors explains why the direction of flow of water and solutes in this system is from the tubules into the blood stream.

Renal efficiency may be impaired by pathologic changes within the kidney or by obstructive lesions in the lower part of the genitourinary tract. The two most frequent disorders occurring within the kidneys are (1) primary pathologic changes within the glomeruli (glomerulonephritis); and (2) sclerotic changes in the efferent glomerular arterioles. Although the cause or inciting agent of acute glomerular nephritis is still unknown, it is quite certain that in the vast majority of cases

bacteria cannot be demonstrated within the lesions

The permanent somatic effects are due to scar formation which follows the initial inflammation (chronic glomerulonephritis) The underlying cause of renal pathology in chronic glomerulonephritis (azotemic type) is an interference with the free flow of blood and subsequent reduction in blood volume through the glomeruli and peritubular capillaries, resulting finally in the total obliteration of many glomeruli and the complete atrophy of their accompanying tubules As a result of this, a reduction in the size of the renal filtration system occurs, which is manifested clinically by a rise in systemic blood pressure, a reduction in the concentrating power of the kidneys and the presence of albumen in the urine Since in this type of nephritis the pathologic process is not primarily one involving the afferent glomerular arterioles, but rather groups of glomeruli, it is obvious that the glomeruli which are spared attempt to compensate by increasing the amount of filtrate which they pass This in turn is accomplished by an increase in hydrostatic pressure within these glomeruli resulting from a general rise in the systemic arterial blood pressure The rapidity with which the filtrate is forced through the intact tubules is augmented to such a degree that reabsorption is hindered Further impairment of water reabsorption occurs as the renal damage progresses to include the cells of Henle's loops by virtue of impaired circulation through the peritubular capillaries

The second type of renal involvement causing impairment of renal function is sclerosis affecting the afferent arterioles of the glomeruli Although the pathogenesis of this type of renal disease differs from that found in glomerulonephritis, the end result is the same, namely, the reduction in blood flow through the glomeruli and subsequent curtailment of circulation through the peritubular capillaries, with resultant impairment of tubular function, leading to reduction in the concentrating power of the kidneys

Obstructive uropathies cause renal impairment in two ways (a) by increasing the intratubular hydrostatic tension and causing pressure atrophy of the tubular epithelium This in turn leads to (b) increased pressure upon the peritubular capillaries which impairs circulation through them and produces further damage of the tubular cells The end result of these changes is impairment of tubular reabsorption and the passage of urine of reduced specific gravity Should the obstruction continue, glomerular damage invariably follows as a result of the increased hydrostatic pressure within Bowman's capsules By increasing intracapsular tension there occurs a reduction in glomerular filtration

Evaluation of Renal Function

Renal function, as judged by laboratory standards commonly employed by urologists, continues apparently unaffected as long as enough blood is driven under adequate hydrostatic pressure through a sufficient number of normal glomeruli Retention of increased quantities of nitrogenous products within the blood plasma occurs only after approximately two thirds of the functioning renal mass has become incapacitated The reason for this is that the remaining glomeruli compensate by hypertrophy and by increased work For this reason it is useless, in the majority of urologic cases, to rely upon blood chemistry studies to ascertain renal function, particularly in the early stages of disease

In the urea clearance test, however, we have a procedure which is capable of measuring glomerular activity and of permitting one to estimate the degree of glomerular reserve This test does not depend upon the urea content of the blood, but varies directly with the quantity of blood flowing through the kidneys, and inversely with the hydrostatic pressure within Bowman's capsule In other words, any condition which influences the volume-blood flow through the kidneys or the pressure exerted within Bowman's capsule will be reflected in the urea clearance values Although blood chemistry figures may remain unaltered in spite of extensive renal destruction, urea-clearance values will be lowered since it is impossible for the same amount of blood to be cleared of its urea per minute because of curtailment of the number of functioning glomeruli Reduction of the urea clearance to 40 per cent of normal is consistent with a fairly good state of well being

To ascertain the ability of the kidneys to concentrate urine is to establish the status of the renal tubular apparatus As a renal function test, it might be stated that a reduction of specific gravity of the urine is of greater clinical significance than either the urea clearance or phenolsulfonphthalein tests in renal disease, since it antedates both of these It can definitely be assumed that a patient who fails to concentrate urine, even though the urea clearance values are normal, is suffering from renal insufficiency When coupled with lowered urea clearance values, it may be assumed that the underlying renal pathology is of a more serious nature Mosenthal states that diabetes mellitus and severe anemia may be associated with lowering and fixation of the specific gravity of the urine In this connection it is well to state that there is no fixed standard of normality as regards specific gravity readings, since values differ markedly among relatively normal persons What does matter

is the degree of reduction in specific gravity which may occur in a person afflicted with renal pathology.

The problem which confronts the urologist in dealing with patients with prostatic disease whose chief complaint is nocturia is to determine, as far as it is possible to do so, the underlying cause of the nocturia. Is it the result of an antecedent chronic nephritis; is it due to impairment of tubular function resulting from back pressure caused by the obstructing prostate; or is it due to local irritation of the vesical neck, reduced bladder capacity, or increased residuum, or to a combination of these factors actually produced by the prostatic enlargement?

A carefully taken history may reveal the fact that the patient had had scarlet fever during childhood or symptoms suggestive of an attack of acute glomerulonephritis. The presence of albumen (not due to blood or pus) and casts in the urine are always of the utmost importance. A careful fundoscopic examination will frequently reveal the presence of arteriolar disease. A routine urologic survey should include a blood chemistry study (urea nitrogen, creatinine, uric acid, urea clearance), urine concentration test (Fishberg), and a fractional two-hour phenolsulfonphthalein test. Of these, we place our greatest reliance upon the urea clearance and concentration tests.

Should the urologic survey indicate the presence of renal insufficiency, the question naturally arises as to whether it is due to primary or secondary renal pathology. This is often difficult to ascertain with any degree of certainty. The presence of hypertension and of positive ophthalmoscopic changes would speak strongly in favor of a primary, and therefore irreversible, renal involvement. In the absence of such evidence we are forced to rely upon the "therapeutic test." Our experience has led us to believe that renal pathology resulting directly from an obstructive uropathy, i.e., an ascending renal injury, will usually subside following the relief of the bladder-neck obstruction.

Nocturia occurring in a patient with prostatic disease who clinically shows no evidence of renal involvement and who presents no abnormal laboratory findings can definitely be assumed to be due to the local pathology. Under these conditions it can further be assumed that after the removal of the offending lesion and the establishment of free drainage from the bladder the nocturia will most likely disappear or improve.

To correctly evaluate the significance of nocturia in a case of prostatism, we might state that when a pre-existing primary nephritic condition can definitely be established, the prognosis is poor. When the renal deficiency is found to be secondary to a bladder-neck obstruction, the chances of relief are infinitely better. And finally, when the cause is found to be purely local, a cure can be predicted with a fair degree of certainty once the cause is removed.

Our study consisted of a follow-up survey of a series of patients with prostatic disease both before and after operation, with the view of ascertaining the reliability of the concentration test as a means of appraising the true significance of nocturia. We found that improvement of the concentrating power of the kidneys was practically always associated with improvement in nocturia. In fact, we have been able, in the vast majority of our cases, to predict with reasonable certainty which patients would show symptomatic improvement by the way the specific-gravity curve acted. This condition held true in the case of patients who were subjected to surgical intervention and those who were treated conservatively. A patient who was subjected to the removal of a vesical-neck obstruction who did not show a steady and progressive elevation in the specific-gravity curve within a month or two after operation would rarely show any marked degree of improvement of his nocturia. Furthermore, a subsequent study of patients falling within this group would frequently show unmistakable evidence of irreversible renal pathology, which had undoubtedly been present before operation.

As regards therapy, we have found that in the group of patients suffering from primary renal disease, any improvement which had been noted in the nocturia was the result of the removal of obstructive lesions which had only aggravated an active or impending pre-existing nocturia resulting from failure of the kidneys to concentrate urine properly. However, when the presence of a vesical-neck obstruction was merely a coincidental finding in a patient complaining of nocturia resulting from a primary renal disease, little or no improvement of the nocturia could be expected from surgery, or from any other type of therapy, as far as we were able to determine.

Summary and Conclusions

Increased nocturnal frequency of urination is an outstanding and troublesome symptom of prostatism and one which has received but scant notice in urologic literature. We have in this paper attempted to discuss the causative background and the clinical implications of this condition, with the view of appraising its value as a prognostic aid in dealing with cases of obstructive uropathies. The laboratory procedures which we found to be most reliable in this work are urine concentration and urea clearance tests, in the order mentioned. Since nocturia is an outstand-

ing symptom in primary renal disease as well as in many cases of vesical-neck obstructive uropathies, it is incumbent upon the examiner when dealing with patients presenting themselves with prostatism to elicit all pertinent information regarding antecedent conditions which might point to pre-existing kidney disease, and to resort to examinations which might aid in bringing to light evidence of primary renal pathology.

Nocturia due to impairment of ability of the kidneys to concentrate urine resulting from vesical-neck obstruction is usually reversible. The rate of improvement varies directly with the ability of the kidneys to concentrate urine. A rising concentration curve offers a fairly accurate guide in predicting relief of this annoying symptom. Failure of the kidneys to concentrate urine following removal of the obstructing lesion usually signifies a pre-existing renal disease, and therefore warrants a doubtful prognosis. In the event that both conditions coexist in a patient, namely, primary renal disease and vesical-neck obstruction, any relief of nocturia which might be obtained is due solely to the removal of a condition which only aggravated the interference with the mechanism of water reabsorption by the renal tubular epithelium. It is our belief that improvement of nocturia in this group of patients is temporary, since the underlying renal disease is progressive and nonreversible.

There is another group of patients who present themselves for annoying increased nocturnal urinating frequency, and who have unmistakable evidence of primary renal pathology, but in addition are found to have varying degrees of vesical-neck obstruction. Following the removal of the obstructing lesion, nocturia persists and repeated urine concentration tests fail to show any elevation in the curve. The prognosis in these cases is poor and it can be assumed that the obstructive lesion of the vesical neck was coincidental and played no active part in the causation of the nocturia. We have found no form of treatment which offers permanent relief for nocturia resulting from primary renal disease.

ADDED PROTECTION AGAINST DIPHTHERIA BEING GIVEN TO MORE THAN 4,000 BRONX CHILDREN

More than 4,000 school children in the Tremont, Fordham, and Riverdale health districts in the Bronx who have been found to have an unsatisfactory immunization status are being treated with toxoid. Dr. Sophie Rabinoff, the district health officer, announced that the majority of these children w[illegible] re enrolled [illegible] t time this at[illegible] unization [illegible] their school admission cards.

Health Department procedure calls for the immunization of every infant, beginning at six months of age and a "booster" dose three years after the first injection. Emphasis is placed on giving the [illegible] for children who [illegible] group had not received the booster dose and some had never been given any toxoid, Dr. Rabinoff contacted the parents of the youngsters. Two forms were sent to the parents. One form was to be filled out by the family doctor after the child had been given the injection. The other gave the parent's consent, when signed, for the school doctor to give the injection without charge, if the parent was unable to pay the fee of the private physician. At that time Dr. Rabinoff wrote physicians of the district asking them to urge parents to have their young children given the booster injection.

In stressing the importance of this injection, Dr. Rabinoff cited the recent death of an 8-year-old Bronx girl who had been immunized when an infant but who had not received any subsequent injections. "The death of this child," said Dr. Rabinoff, "should certainly be a warning to all parents. Experience has shown that the immunizing power of toxoid wears off, but that an addition of only one injection usually gives complete protection against diphtheria and no injections are necessary later. [illegible] twenty years ago it was one of the major maladies, carrying off hundreds of New York City children every year. However, should laxity in immuniza- announcement in a recent issue of its *Bulletin*. At the same time it reproduced the forms the Health Department asks physicians to fill out when children are immunized by them. It also urged physicians to cooperate with Dr. Rabinoff *in keeping* the districts free from diphtheria. The Regional Health Counsellors of the Department of Education in the district are also aiding in the work.—*Release from the Health Commissioner of New York City, Jan. 19, 1945*

CONFERENCES ON THERAPY

DEPARTMENT OF PHARMACOLOGY AND MEDICINE, CORNELL UNIVERSITY MEDICAL COLLEGE AND THE NEW YORK HOSPITAL, AUGUST 5, 1943

THESE are stenographic reports, slightly edited, of conferences by the members of the Departments of Pharmacology and of Medicine of Cornell University Medical College and the New York Hospital, with collaboration of the other departments and institutions. The questions and discussions involve participation by members of the staff of the college and hospital, students, and visitors. The next report will appear in the July 1 issue and will concern "The Treatment of Subacute Bacterial Endocarditis."

Surgical Measures for the Relief of Pain

DR. H. G. WOLFF: Today Dr. Ray is going to talk about pain which cannot be modified by an attack on its origins. He will give us some ideas about what can be achieved by cutting afferent pathways from painful areas.

DR. BRONSON S. RAY: Surgical treatment of pain is reserved largely for the patient whose pain is due to a cause for which there is no suitable treatment. The operation must be employed before the patient has become addicted to opiates, because very few with the drug habit will give up drugs even after complete alleviation of pain. It is also important to arrive as early as possible at a decision regarding the severity and intractability of the pain so that surgical treatment, if indicated, may be employed speedily enough to afford the patient early relief and before his general condition makes him a poor risk for an otherwise relatively safe operation. Most of the unsatisfactory results and the complications occur in those subjected too late to surgical relief of their pain.

To decide upon the kind of operation to be employed in the relief of intractable pain one must bear in mind the anatomy concerned. Here is a brief outline to refresh your memories: The afferent nerve fibers from the viscera travel through the sympathetic nervous system, and they have their cell bodies in the dorsal spinal-root ganglia, not along the sympathetic ganglionated chains. They enter the cord and synapse with the second neuron which crosses to the opposite side and ascends to the thalamus in the lateral spinothalamic tract. Visceral pain impulses take the same course within the cord as do somatic pain impulses, which traverse the peripheral nerves, the posterior roots, and the spinothalamic tract on the opposite side.

When we interrupt the pathway from a painful area we must decide upon the optimum point. If we are dealing with a restricted area of pain it may be that all that is needed is to interrupt the particular nerve which innervates that area. Sometimes that is possible, as I will bring out shortly, but we must remember that when a peripheral nerve is interrupted motor fibers may also be cut and in this case motor power must be sacrificed to get anesthesia. So interruption of peripheral nerves has its limitations, and if the pain is spread over a wide area one obviously cannot go about cutting all the peripheral nerves which supply and overlap in that region.

I may use as an example the chronic ulcerating lesion on the inside of the calf due to varicose veins. These ulcers may not heal over periods of years. One reason is because they are painful and this prevents adequate local treatment. One can relieve the pain by cutting the saphenous nerve, and although it will usually regenerate in due time, in the meanwhile the patient is free of pain.

One can cut peripheral nerves, crush them with a clamp under operative exposure, or one can inject a nerve with alcohol, which will cause its destruction. The alcohol can sometimes be injected into a peripheral nerve without surgery, but it is much safer to expose a nerve through a small incision before injecting with alcohol.

One can interrupt the nerve in the paravertebral region, i.e., where the nerve enters its spinal foramen. This site is often chosen as the point of interruption because one can introduce a long needle readily into this position and infiltrate the region with procaine if a temporary block is wanted, or inject 2 or 3 cc. of absolute alcohol if a more prolonged effect is desired. Both the sympathetic fibers and the somatic fibers can be dealt with by some kind of destructive procedure in the region of the paravertebral foramina.

The next procedure to be considered is that of the division of the dorsal root. This requires laminectomy, opening of the dura, and the exposure of the cord and of the posterior root as it enters the cord. Such an operation has the ad-

vantage of sparing motor fibers, and therefore preserving motor function to the part affected This operation is termed posterior or dorsal root section, or posterior rhizotomy

The second neuron can be interrupted as it crosses in the commisure, and an operation has been devised in which the posterior sulcus is entered and the spinal cord incised longitudinally This is a hazardous procedure which has obvious limitations and I think it is seldom used However, the division of the ascending pain tract, the lateral spinothalamic tract, above the level at which the painful impulses enter the cord, is a very useful procedure

You can realize that if one is dealing with a large painful area, as, for example, the entire lower extremity, interruption of peripheral nerves or even cutting all the dorsal roots which supply the lower extremity would be an unjustified procedure It would result in too much needless destruction If all the posterior roots supplying the lower extremity were cut, leaving only the motor roots, a useless extremity would result, because an extremity which lacks sensation lacks in particular the sense of position which is necessary in skilled movements Therefore, in dealing with large areas which are painful, we resort to procedures which interrupt masses of pain fibers coming from the region and avoid interfering with other functions

Section of the lateral spinothalamic tract interrupts pain and, at the same time, the temperature sense Chordotomy has in many places a bad reputation which, I believe, is not entirely deserved We must face the fact that division of the spinothalamic tract carries some hazard to life but the chief objection raised is that the operation has often not resulted in the complete loss of pain which had been hoped for I believe, however, that if the cord is divided sufficiently high above the upper segmental level of the pain and if the division of the cord is deep enough to take in a large enough area of the anterior-lateral portion of the cord, one can expect to produce complete analgesia below a certain level There will be a discrepancy of from three to five segments between the area of complete analgesia and the level of chordotomy Thus, in a chordotomy in the first thoracic segment the uppermost level of analgesia on the opposite side of the body would be the fourth to sixth thoracic segment This is due to the fact that pain fibers do not cross immediately on entering the cord

There are two optimum places to perform a chordotomy One is the upper thoracic region and operation here will produce, as I have implied, analgesia up to the nipple line If analgesia is desired at a higher level, the chordotomy must be done at a high cervical segment The latter naturally carries more hazard with it since there is danger of interfering with respiratory function at this level, either by the transitory edema of the cord that may accompany the maneuver or by actual division of pathways controlling respiration However, carefully performed, a high chordotomy may have great value

Often enough we are faced with the problem of bilateral pain in the pelvis and lower extremities In that case we can do, with a fair degree of safety and facility, a bilateral chordotomy at the upper thoracic level, on the other hand, a bilateral chordotomy at the upper cervical level is too hazardous for these cases and perhaps is never warranted

INTERN You do not section both sides at the same level?

DR RAY No, the incisions are separated by one or one and a half segments

There are times when it is useful to combine chordotomy and root section I mention that because we are often faced with a special problem in which I think the procedure is advantageous I refer to intractable pain in the upper chest and upper extremity Such a syndrome results often from malignant tumors at the apex of the chest the so-called Pancoast tumor In that case the pain can be relieved if all the posterior roots from the fifth cervical to the fourth thoracic are cut but this leaves a useless arm which has no sensation, so the procedure is not usually desirable If a high cervical chordotomy alone is employed it is usually found that the level of analgesia is not high enough to include the whole extremity But we have found that the combination of high cervical chordotomy on one side with division of appropriate posterior cervical roots on the other may afford the desired relief of pain in the upper extremity, yet preserve enough position sense so that the limb can still be used

Some have made attempts to divide the spinothalamic tract even higher, namely, in the medulla However, the landmarks for placing the incision in the medulla are indefinite and the results are not uniformly good, also the hazards to life are greater Walker has recently devised a procedure, in which he cuts the tract still higher, namely, in the midbrain You will recall that the anatomy of the pain tract in the midbrain is such that the tract lies superficially on the dorsal surface

One can slip down along the tentorium between the cerebrum and cerebellum and reach this area where, theoretically, the entire pain tract could be cut and produce satisfactory analgesia that would include the entire side of the body and face I believe, for practical purposes, that this operation too is a much more serious one

than is required and its results have not been uniformly good.

There is another procedure which should be mentioned in passing, and that is the introduction of alcohol directly into the subarachnoid space. Alcohol will result in the destruction of nerve fibers and advantageously enough it would appear that pain fibers, touch fibers, and motor fibers are sensitive in that order; that is, pain fibers are affected first and most severely by alcohol. Absolute alcohol can be injected in the subarachnoid space in 1 cc. amounts and, if the patient is in the Trendelenburg position or on one side, alcohol rises to the uppermost level in the sac and can be made to bathe nerve roots of both sides or of one side only, depending on what position the patient is turned. However, this procedure is one that cannot be accurately controlled, and there is some danger of producing loss of bladder or bowel control and even weakness in the lower limbs. Even though these effects may be transitory for a few days or weeks they cannot be taken lightly. Also, some patients will complain of pain resulting from the irritation of the alcohol and occasionally many days ensue before this pain subsides. These complications limit the usefulness of the procedure. Subthecal alcohol injection has its greatest usefulness in cases of visceral pain in the pelvis such as that arising from malignant disease of the bladder, rectum, and uterus. It gives little relief from pain arising from metastasis to the pelvic bones and femur. An ideal use of subthecal alcohol is that in a painful bladder tumor which has previously required cystostomy or ureterostomy. It thus obviates the complication of bladder incontinence.

One of the most satisfactory types of intractable pain to treat is tic douloureux. The cause of this pain is not known. No medical treatment is effective and the pain almost never disappears for more than temporary periods. Alcohol injection of various branches or divisions of the trigeminal nerve gives temporary relief, but the only suitable method for obtaining permanent relief is division of the sensory root of the trigeminal nerve. Often a selective division of the nerve root will preserve sensation in parts of the face unaffected by the pain. The operation can be performed by an extradural approach through the temporal region or by an intradural approach through the posterior fossa.

In a recent series of about 10 cases I have employed an operation in which the descending tract of the trigeminal nerve is divided in the medulla about 1 cm. caudad to the obex. This tract is made up mostly of pain fibers and the advantage of the operation is that other forms of sensation including the corneal reflex are preserved. The disadvantages of the operation are that the risks are greater and there are likely to be variations in the results due to the uncertainty of the local landmarks, making difficult the accurate placement of the incision into the medulla.

There is an interesting problem in the relief of cardiac pain, particularly in those patients who have angina pectoris without advanced heart disease. They are made very miserable and are incapacitated by the pain alone. It is evident in many that if they could get rid of pain they could be useful and happy people. There has been a good deal of confusion with regard to the pathway for pain from the heart, and several kinds of operations have been performed and recommended. The afferent fibers from the heart, regardless of what initial pathways they take, whether through the middle or inferior cardiac nerves or directly through upper thoracic nerves, all join the sympathetic chain sooner or later in the lower cervical and upper thoracic region and then enter the cord by way of the posterior roots, thoracic 1 to 5. If it is desired to interrupt pain pathways from the heart it is therefore possible to do so by a paravertebral block with alcohol in that region or by surgical resection of the upper thoracic sympathetic chain. If the pain from the heart is bilateral the procedure must be done on both sides.

An alternative procedure is posterior rhizotomy, thoracic 1 to 5, which can be performed bilaterally at a single operation and which, I feel, has certain advantages that have not been sufficiently appreciated.

It has been suggested that paravertebral injection is a much safer procedure than rhizotomy, particularly in a patient who has advanced disease of the heart. But that does not always follow because the paravertebral injection of alcohol for whatever purpose carries a certain likelihood of producing pleurisy or other pulmonary complications.

Another disadvantage of alcohol is the possibility of injecting it inadvertently into the subarachnoid space where it can produce a myelitis which may be permanent. It has other hazards. We should note the fact that alcohol injected around any nerve may result in painful neuritis. This replaces the original pain with another which, for a while at least, may be just as severe. Regardless of what technic is used the injection of alcohol at a depth cannot be an absolutely accurate procedure and in my experience 20 to 25 per cent of patients complain of some pain resulting from irritation by the alcohol.

DR. WOLFF: Dr. Ray, there are certain pains that are particularly hard to manage and I would like to ask you about those specifically. How would you deal with intractable herpes? Interruption of what pathways is most useful?

DR. RAY: We have gone along with those who believe that herpes zoster is a disease of the spinal-root ganglia or cranial-root ganglia. If that is correct, the procedure of choice for relief of chronic pain of herpetic origin should be division of nerve roots proximal to the diseased ganglia. As a matter of experience, the division of those roots does not give patients more than about 50 per cent relief of their pain, which suggests that in those who have chronic pain after herpes zoster there is more central involvement than of the spinal or cranial ganglia.

I believe that when the problem is completely investigated we may find that division of the pain tracts higher up, a chordotomy, or, in case of the trigeminal nerve, a tractotomy in the midbrain, will meet the need, but the question is still unanswered.

DR. WOLFF: There is another difficult problem. I refer to a pain called causalgia, a burning pain referred to the extremities after these parts have been injured. How would you manage such a pain? Do you agree with that definition?

DR. RAY: Causalgia is an entity and a disagreeable pain. Its relief, on the whole, has not been very satisfactory by the methods employed, although sympathectomy will sometimes give a brilliant result and good effects have been reported occasionally from repeated paravertebral sympathetic block by procaine. Posterior rhizotomy, curiously enough, may not relieve such pain even though the limb be completely deafferented. A few patients have had cervical chordotomy performed for causalgia in the upper extremities but, I believe, without consistent benefit.

The problem of causalgia brings to mind another—that of the phantom limb. Most of those who have an arm or leg amputated have the sensation of the amputated part still being present. In some the sensation becomes a disagreeable one and a frequent complaint in such patients is that a phantom hand, for example, feels tightly closed, so tight in fact that it hurts. You can perhaps simulate the sensation by clenching your own hand and maintaining it thus. There develops a disagreeable and finally an unbearable sensation.

Occasionally, sympathectomy of the involved extremity before the condition has been permitted to exist for too great a time seems to be beneficial. Multiple posterior rhizotomy for the more intractable cases has almost uniformly failed to give relief and, although experience with chordotomy in such cases is meager, its benefits are probably no better than those from rhizotomy. In one such patient recently I excised the motor and sensory cortical centers for the involved extremity and produced immediate relief of his phantom limb. It is too early to evaluate the late result.

DR. WOLFF: What cortex?

DR. RAY: The motor and sensory cerebral cortex, that is, areas 4 and 6 and the region just behind them which I presumed constituted the sensory cortex representing the affected extremity. In my patient sympathectomy and multiple posterior rhizotomy had failed to abolish the phantom hand and arm. The results following excision of the cerebral cortex suggest that the existence of a phantom limb at least in the more chronic cases is dependent on a central mechanism and not upon peripheral impulses arising in the remaining portion of the limb.

DR. WOLFF: Gastric crisis associated with tabes gives us a great deal of trouble. How do you approach that?

DR. RAY: I believe that tabetic pain can be relieved if the pain tracts are cut high enough, and by that I mean chordotomies that are done high enough to give a level of analgesia which includes the area of pain. The thing that has happened in the past is that the chordotomies have usually been too low, and this has resulted in incomplete relief of pain. We know, for example, that chordotomy which provides a level of analgesia only to the nipples or below may not entirely relieve pain which is located in abdominal or pelvic viscera or perhaps even in the blood vessels of the leg. The cause of the failure may be that the visceral afferents enter the cord higher than the level of analgesia. Therefore, the way to minimize the likelihood of failure is to perform the chordotomy in the cervical portion of the cord. Although the procedure has not been popular I have found that bilateral chordotomy can be done safely through the lower cervical segments without impairment of motor function to the arms. At this level there is no danger of respiratory embarrassment.

DR. WOLFF: Cancer of the head and face may be associated with pain that is very hard to manage. How would you approach that?

DR. RAY: The majority of these problems are the result of cancer about the face, pharynx, and mouth. If the lesion lies in the maxilla or above, the interruption of the fifth nerve alone will usually serve to relieve the pain satisfactorily. However, if the lesion involves the lower jaw, the resulting pain impulses may traverse several difficult pathways. The relief of pain in this area may require the interruption not only of the trigeminal, but also of the glossopharyngeal nerve, and perhaps of the sensory portion of the vagus and the intermediate fibers of the facial as well as the upper cervical nerves. Each case thus presents a problem of its own.

DR. WOLFF: Sometimes all those are cut and

still the patients have the pain. What do you do then?

DR. RAY: I don't know. Does anybody know of any instance in which all these nerves have been cut, including the seventh?

DR. WOLFF: Dr. Grant has cut the seventh along with others and the pain has continued.

DR. RAY: My only answer is that there must be other pathways for the pain, pathways we do not know about, but on the whole our experience with nerve sections for relief of pain of the head and neck has been fairly satisfactory.

DR. WOLFF: Would you do a midbrain section?

DR. RAY: Loss of sensation in the head with the section in this region has not been as complete as would be expected. I have reviewed Dr. Walker's cases and I believe he has not had complete analgesia of the head in any of them.

Dr. Hausman has expressed the opinion that we do not employ excision of the sensory cortex enough.

He feels that even though we recognize the fact that pain has a bilateral representation in the brain, the possibility still remains that the excision of the cortex on one side might be quite enough to provide comfort to the patient.

DR. WOLFF: Do you look upon intermittent claudication as a reason for deafferentation or any other procedure?

DR. RAY: This rarely constituted a problem in intractable pain. Sympathectomy is useful in some cases in improving blood supply to the legs and counteracting vasospasm.

DR. WOLFF: It is not comparable to the intractable pain of disturbances in coronary circulation?

DR. RAY: I think intermittent claudication is a condition in which one directs the treatment to the vascular system. If the vessels are still elastic, interruption of the sympathetics may be useful, but interruption of the pain pathways would rarely be called for. I have not seen a case in which that was true.

DR. WOLFF: Perianal pruritis seems to give considerable difficulty.

DR. RAY: I think that should be dealt with locally. A low bilateral chordotomy might be employed but even in the thoracic region it leaves about 15 or 20 per cent of the patients with some impairment in bladder function, and I believe most patients who have pruritis ani are the kind of patients who would not tolerate much bladder disturbance.

DR. WOLFF: It is interesting that all male patients who have had chordotomies are left without the ability to ejaculate. They are capable of erections but ejaculation seems to be absent. Fortunately, most persons who require bilateral chordotomy do not live long enough to make this a major defect, but what do you do about that sort of thing?

DR. RAY: I think you have to consider the drawbacks of any operation for relief of pain, and I have tried to indicate that none was ideal. Certainly I would hesitate to do a bilateral chordotomy on a patient who might expect a long life.

I believe the reason men lose the ejaculatory function is probably because the chordotomy interrupts the autonomic pathways at the same time. We know, for example, that cervical chordotomy almost always produces Horner's syndrome to some degree, which means that the sympathetic pathway travels very near to the region we have to cut and I think the same applies to the autonomic pathway for the reproductive system.

DR. WOLFF: Would there be an efferent defect too?

DR. RAY: There could be. In doing the splanchnicotomies for hypertension in males we usually avoid cutting the first and second lumbar sympathetics on both sides, otherwise they lose their ability to ejaculate.

DR. WOLFF: That is a mixed nerve?

DR. RAY: Yes, that is a mixed nerve.

DR. WOLFF: What do you think about an operation for migraine headache?

DR. RAY: We have operated on a few such people, Dr. Wolff.

DR. WOLFF: It illustrates a principle which you did not mention. I thought you might discuss that.

DR. RAY: We have interrupted the temporal and the middle meningeal arteries in those patients in whom we felt the degree of pain justified the procedure. At the time the artery is resected or divided the visceral afferent fibers that lie in the vessel wall or around the wall in its adventitia are interrupted. There is no way I know of to prevent regeneration even though one resects quite a segment of the vessel, and I believe that such an operation would be unjustifiable on that ground as a routine procedure.

DR. WOLFF: Four to six months seems to be the usual time for freedom from pain in such patients.

Would anybody else like to ask some questions?

INTERN: How about Raynaud's syndrome? What do you do for that?

DR. RAY: That again is a disease which we attempt to relieve by sympathectomy. In other words, we try to treat the vasospasm which causes pain, and not the pain itself, by interruption of the visceral afferent fibers. I would like to be sure you understand the distinction between conditions that we attempt to improve by one method or another, and conditions in which

all such procedures fail, forcing us to fall back on the interruption of the pain tract

INTERN The pain of angina pectoris is some times called an alarm or defense mechanism and there have been arguments saying that if you eliminate this the patient may overexert and drop dead

DR RAY Pain is only one part of the warning that the patient has, and we have found that if pain is relieved such patients still get an unusual sensation which serves as a warning It consists of a feeling of tightness of the throat, a full feeling which is not pain These patients are not, therefore, without their signals

In all fairness I think I should state that in a few such patients, even through we have interrupted what we believe are the pain pathways from the heart, the extreme state of coronary occlusion has been accompanied by some pain We do not know the pathway concerned, but that has no particular bearing on the fact that we can relieve the usual type of angina by operation

DR WOLFF It is sometimes said that deafferenting the heart of such patients causes them to live longer Is there any reason to believe that that is true?

DR RAY I feel there is a theoretic reason Dr Wolff, but it has not been substantiated as far as I am aware

STUDENT When you relieve the pain by cutting the sensory nerve I presume you also get degeneration of reflexes which we suspect control the nutrition of the skin Would that delay healing of an ulcer?

DR RAY No, the nutrition to the skin is not impaired by interruption of peripheral nerves Actually, nutrition may be improved, since one of the desirable effects of the interruption of the peripheral nerves for a peripheral ulcer is that it hastens healing by the resulting vasodilatation From this standpoint it is not a detriment but an advantage

DR HARRY GOLD Would we be correct in concluding that you recommend dorsal rhizotomy in preference to alcohol block for cardiac pain? That would be opposed to the view taken by Dr James White

DR RAY Yes I think too often angina pectoris turns out to be bilateral and, therefore, the injection of alcohol on one side does not relieve the pain, and the bilateral injection of alcohol carries double the hazard The alcohol neuritis which occurs in some patients is difficult to deal with White has reported 3 per cent mortality with paravertebral injections

DR GOLD With the rhizotomy, what is the mortality?

DR RAY I don't know what it is I think the collected cases of rhizotomy for angina pectoris would comprise less than 20, and I do not think we can compile a true mortality percentage with that number

DR GOLD I believe that the lack of success with alcohol is often ascribed to inaccurate technic

DR RAY But there are no suggestions as to how to perfect it After all, it is not easy to put a needle in so deep and have the point lie in correct relation to a nerve 3 mm across especially since there may be anomalies At best the procedure is still a blind one

DR WOLFF Dr McLean, is there any way of dealing with the pain of glaucoma by deafferenting an eye?

DR JOHN MCLEAN Yes, but that is usually done more simply and more safely by alcohol injection within the muscle cone of the orbit That is only done on blind eyes

DR WOLFF Are there any other conditions of intractable pain in the eye which you would care to discuss in terms of surgical approach or any other approach?

DR MCLEAN Practically all intractable ocular pain occurs in eyes that are hopelessly blind and that pain is usually completely cured by the removal of the globe There have been operations devised for cutting the sensory fibers behind the globe in the orbit but they are rather extensive and there is practically no occasion for their use

DR MCKEEN CATTELL I would like to ask Dr Ray to what extent the results from the use of procaine as a local anesthetic are of value from the standpoint of giving a preview of the relief to be obtained by other procedures

DR RAY I believe the procedure has definite limitations One of the things which is wrong with it is that when you inject 2 cc or 3 cc of procaine, which is the same amount of alcohol which you may propose to use later, it will not produce the same kind of sensory impairment that the alcohol will If you put in more procaine, 5 to 20 cc , which is usually what is done, it has a much wider effect than the 2 or 3 cc of alcohol is going to have when you finally put that in

In other words, I don't believe paravertebral procaine is always a reliable guide to what you may get from the injection of a small amount of alcohol

I feel, however, that the disadvantages must not be stressed too strongly because there are places in which one may want to employ procaine beforehand The other disadvantage, and this is perhaps more important, is with regard to the time the procaine may last The period may not be sufficient to allow for the evaluation of the relief from the pain which the patient may get

DR. WOLFF: Have you found procaine helpful in any states?

DR. RAY: It has been claimed that procaine and benzyl alcohol in oil has a more prolonged effect, but still it does not last long enough for really intractable pain. Larger doses are also likely to cause a slough of the tissues into which they are injected.

Summary

DR. GOLD: The control of the symptom, pain, by surgical means was the chief subject of the discussion in the conference today. Cardiac pain (angina pectoris), intermittent claudication, Raynaud's disease, and severe headaches of hypertension are examples of conditions in which relief of pain is achieved by severing nerve supply.

However, in these the relief of pain is indirect. The objective in most of these is to remove vasoconstriction and thereby relieve pain.

The discussion centered on the problem of blocking pathways carrying pain impulses to the brain. Candidates for these measures are, for the most part, incurable conditions in which all other means for the control of pain have failed. Blocking pathways for pain impulses by surgical means involves mortality hazards, frequent therapeutic failures, and accessory disabilities resulting from the fact that the fibers conveying pain sensation usually lie in close proximity to those mediating other functions, such as temperature, deep muscle or position sense, motor fibers, eye reflexes, sympathetic controls, bladder and bowel control, and others.

Many types of procedures have been devised, such as sectioning of a peripheral nerve to a localized painful area, severing the sensory roots (dorsal rhizotomy), section of the spinothalamic tract (anterolateral cord incisions), and other special tractotomies. Attempts to block pain pathways in the central nervous system have been made by incisions all the way from the thoracic to the high cervical region, medulla, midbrain, and in the cortex itself.

It is noteworthy that the level of the cord section and analgesia are not the same, and that the analgesia may start three to five segments below the level of the incision.

Some of the special indications which were considered for surgical interruption of pathways are intractable pain in the head and neck, upper chest, and upper extremities, abdominal and pelvic pain, pain in the lower extremities, cardiac pain, herpes zoster, gastric crises, perianal pruritis, and tic douloureux. The merits and dangers of paravertebral and subthecal alcohol were contrasted with those of surgical measures.

Emphasis was placed on the desirability of applying these measures to intractable pain before the patient's health has deteriorated so as to make them poor surgical risks and before they have developed morphine addiction, which is frequently incurable and adds to the patient's burdens.

Surgical skill, experience, and judgment in the proper selection of the type and site of operation are decisive factors in the successful relief of intractable pain.

VIRUS CAN INDUCE PRIMARY ATYPICAL PNEUMONIA

Investigations by the Army Medical Department's Commission on Acute Respiratory Diseases, made with forty-two conscientious objectors, all of whom had volunteered for the experiment, produced results demonstrating that bacteria-free filtrates, presumably containing a virus, can induce primary atypical pneumonia in man, the Commission reports in the *Journal* of the American Medical Association for January 20.

The report explains that studies on the cause of primary atypical pneumonia which have been reported recently in medical literature have shown that bacteria, rickettsias, fungi, and viruses, particularly those of the psittacosis or parrot-fever group, may produce the syndrome of atypical pneumonia.

No causal relationship to these known agents, however, has been demonstrated in the majority of cases, it says, "and the assumption has been made that an unknown virus is the causative factor."

The inoculum given the forty-two volunteers consisted of throat washings and sputum collected from 6 cases of atypical pneumonia produced in a previous experiment by inoculation of untreated throat washings and sputums from cases in a military hospital. Each of the experimentally produced illnesses had the characteristics of primary atypical pneumonia.

One third of the inoculum was filtered, to remove bacteria; another third was autoclaved at 15 pounds pressure for ten minutes, which apparently killed all disease-producing organisms, and the remainder was untreated.

Three of the 12 patients receiving the filtered material and 3 of the 12 receiving the untreated inoculum developed characteristic symptoms, signs, and x-ray evidence of primary pneumonia. None of the 18 receiving the autoclaved material was similarly affected.

Another finding of interest was the fact that in the 3 patients receiving the filtered material the onset of the disease occurred on the twelfth, thirteenth, and fourteenth days, respectively, after inoculation. The onset in 2 patients receiving untreated material was on the seventh day, and in the third patient it occurred on the eighth day after inoculation.

The symptoms and signs observed at onset and during the course of the disease did not differ materially in the two groups. In general, illnesses were milder in patients in the "filtered" group.

EXTRASYSTOLIC AURICULAR TACHYCARDIA—A REPORT OF TWO CASES

EMANUEL GOLDBERGER, M.D., and SIDNEY P. SCHWARTZ, M.D., New York City

(From the Medical Division, Montefiore Hospital, New York, Dr. Louis Leiter, Chief; and the Department of Medicine, Lincoln Hospital, New York, Dr. Leander Shearer, Director)

ALTHOUGH tachycardia of auricular origin in the form of the classic paroxysmal auricular tachycardia is well known, it is not generally recognized that runs of auricular extrasystoles may occur sufficiently frequently not only to cause a tachycardia which may be easily mistaken for auricular fibrillation, but may be the cause of severe circulatory embarrassment. Since the original description of the condition by Lewis[1] there have been but scattered reports in the literature.[2–6] This extrasystolic auricular tachycardia is, however, by no means infrequent.* Clinically the cases may be divided into two groups:

1. Cases in which paroxysms of more or less regular tachycardia alternate with slower periods of sinus rhythm and isolated auricular extrasystoles.

2. Cases in which the auricular extrasystoles are irregularly spaced so that clinically the picture is that of auricular fibrillation.

This classification, however, is not rigid, because the same individual may show both types at different times.

These two types are illustrated in the following two cases chosen from our files.

Case Reports

Case 1.—H. C., a very nervous 54-year-old white woman, entered the hospital on February 11, 1943, complaining of pain in the right side of the chest, fever, and blood [illegible] sputum of several days' duration. [illegible] of the c[illegible] secondar[illegible] having [illegible] three or four years, the attacks often being precipitated when she lay on her left side. They would disappear spontaneously after a few minutes.

Examination of the heart revealed a regular sinus rhythm; blood pressure 110/74; heart sounds of good [illegible] electrocardiogram showed [illegible] on [illegible] ed [illegible] -k- [illegible] nic [illegible] re- vealed a sinus rhythm. Because of her fever, the patient was placed on sulfathiazole therapy with prompt subsidence of her febrile state.

On February 20, at 2 A.M., she had a sudden attack of her "heart knocking" which lasted two minutes. The intern described it as a "regular tachycardia with a rate of 125 per minute." Electrocardiograms taken later in the morning revealed bouts of tachycardia caused by multiple auricular extrasystoles, for which she was given 9 grains of digitalis powder by mouth on February 21, and 9 grains on February 22. On February 22 one of us (E. G.) saw the patient during an attack which consisted of "paroxysms of five and six auricular premature contractions alternating with sinus rhythm." Quinidine was ordered, 30 grains a day to be given after a test dose of 3 grains to determine if the patient had an idiosyncrasy to the drug.

The next few days showed a marked improvement in her condition, with only an occasional bout of extrasystoles. However, on February 26, she was again seen during an attack (by E. G.). She had broken out into a cold sweat and complained of faintness and heart knocking. On auscultation the heart appeared to be beating at a rate of about 200, the rhythm consisting of long runs of tachycardia separated by irregularly spaced slower intervals lasting a second or so. Since the patient was in obvious discomfort, carotid sinus stimulation was immediately tried. Pressure over the left sinus was ineffectual, but pressure over the right carotid sinus for three seconds produced an immediate cessation of the paroxysms of tachycardia. The slow rhythm which resulted was not completely regular but was occasionally interrupted by an isolated premature contraction. Quinidine was increased to 36 grains a day. The patient was well until March 1, 1943, when she again developed attacks of tachycardia alternating with isolated auricular extrasystoles. [illegible] *the rhythm immedi-* [illegible] arch 3, the quinidine [illegible] lay; this resulted in [illegible] con[illegible] [illegible] rch 9, it [illegible] , to 15 [illegible] nd she was placed on a maintenance dose of 36 grains [illegible], when she was [illegible]. She had dis- [illegible] while at home. [illegible] results, but with bed rest she responded fairly well, and was discharged in two weeks with only an occasional extrasystole.

She remained well until January, 1944, when, [illegible]

Occasionally an auricular extrasystole is blocked (x), resulting in momentary slowing of the heart rate with marked irregularity of the rhythm.

In Fig. 1B, representing lead II, which was next taken by the technician, a normal sinus rhythm is present. As the technician was prepared to take the next lead, she noticed the heart rate suddenly increase and continued to record lead II (Fig. 1C.)

Work done in part under the Martha M. Hall Foundation Fund for research in cardiovascular disease, in memory of William Henry Hall.

* Recently, at Lincoln Hospital, we have been seeing a case almost every month.

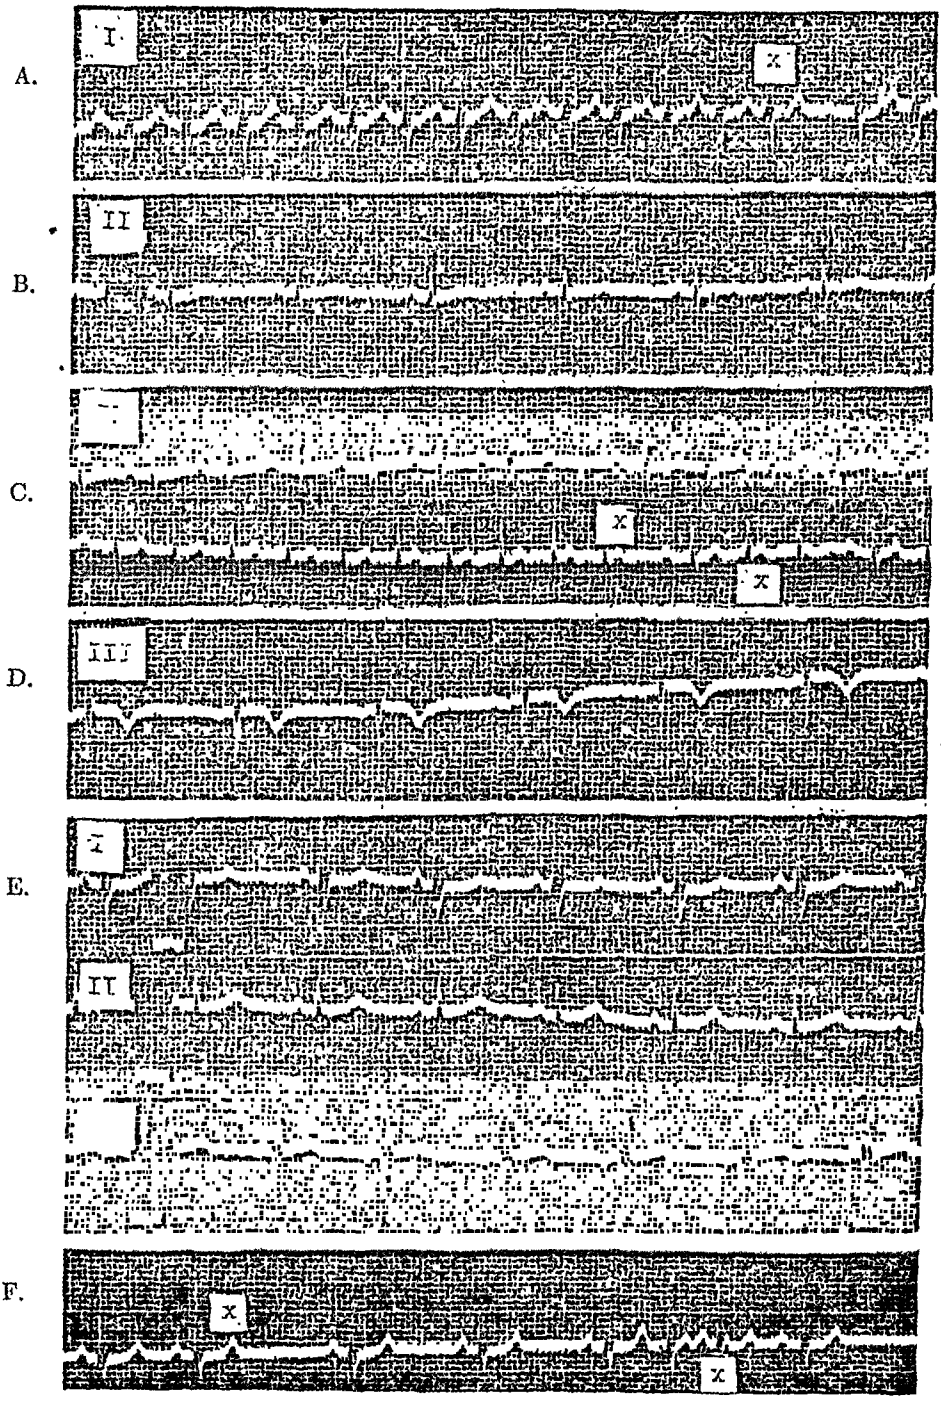

FIG. 1. Case 1. February 21, 1943. The strips are arranged in the order in which they were taken.

A. Lead I. Paroxysmal tachycardia, caused by auricular extrasystoles, is present. The auricles are beating at a rate varying from 150 to 165 a minute, with regular ventricular responses at first. Occasionally an auricular extrasystole is blocked (x), resulting in marked irregularity of the rhythm and slowing of the ventricular rate.

B. Lead II, taken j[illegible]rhm.

C. (Continuous str[illegible] increase of the heart rate from 120 to 165 a minute with a [illegible]m 0.16 to 0.24 seconds, until, finally, an auricular extrasysto[illegible]ion).

D. Lead III. Sinus rhythm has returned.

E. *February 25, 1943. Regular sinus rhythm resulting from quinidine therapy.*

F. March 1, 1943. Lead I. The sinus rhythm is interrupted by isolated auricular extrasystoles, some of which are blocked and do not result in ventricular contraction.

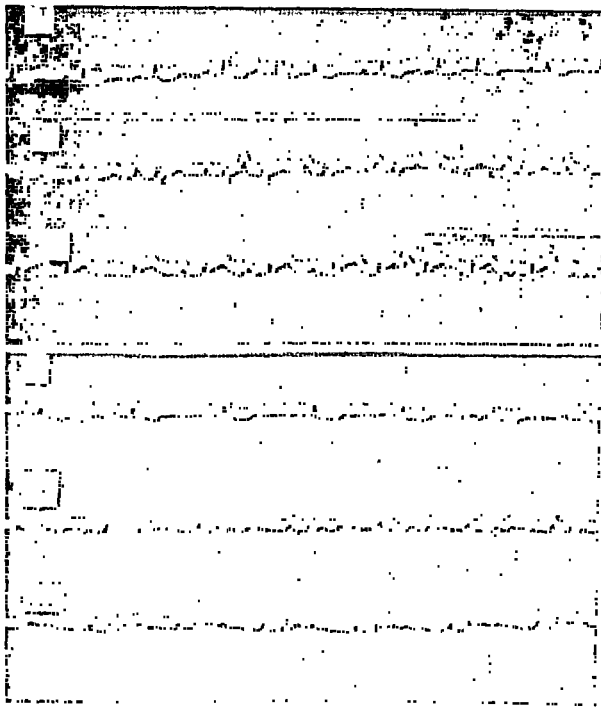

FIG. 2. Case 2.

A. December 2, 1942. The patient had been digitalized. Numerous auricular extrasystoles interrupt the basic sinus rhythm, resulting in marked irregularity of the heart rate
B. December 12, 1942 Regular sinus rhythm is present. The patient was receiving quinidine, 30 grains a day.

It will be noticed that there is a gradual increase of the heart rate from 120 to 165 with a corresponding increase of the p-r interval from 0.16 to 0 24 second, until finally an auricular extrasystole is blocked (x) This is known as the Wenckebach phenomenon Lead III, taken right after this, has normal rhythm.

The effect of quinidine in producing a sinus rhythm is shown in Fig. 1E. Fig 1F illustrates how isolated and multiple auricular extrasystoles occur at irregularly spaced intervals.

Case 2.—H. K., a 55-year-old white man, was admitted to the hospital on November 29, 1942, complaining of dyspnea and orthopnea. His past history disclosed a chancre in 1916 and a "stroke" three years prior to admission in which aphasia and left [illegible] sure was found to be [illegible] sent in the lungs; the apex impulse was felt in the seventh intercostal space, 4 cm to the left of the midclavicular line. A clinical diagnosis of auricular fibrillation with an apical rate of 180 was made. There was a diastolic blow at the aortic area and a systolic murmur at the apex.

The next day an acute attack of respiratory distress occurred, which was relieved by intravenous aminophyllin and subcutaneous morphine. Digitalization was started, but the patient did not

improve. The heart rate continued elevated, and he was somewhat noisy and disoriented. In view of the fact that the electrocardiogram showed an extrasystolic auricular tachycardia (Fig. 2A), quinidine therapy was instituted, and he received 30 grains a day. Within two days the rhythm had returned to normal (Fig. 2B), and the quinine was cut to 9 grains a day. In spite of the cardiac improvement, his course was downhill. By December 13, he lapsed into coma. At this time there were no signs of cardiac decompensation and his rhythm was normal. He died the following day. There was no autopsy.

Discussion

Diagnosis.—There may be no subjective evidence of an arrhythmia in these cases; often palpitation is common, and during a long paroxysm, all the characteristics of a Stokes-Adams syndrome, including syncope, may be present. (This occurred in one of our other cases in which the extrasystolic auricular tachycardia was of type 1.)

In the first type, in which paroxysms of more or less regular tachycardia alternate with periods of sinus rhythm and isolated extrasystoles, the diagnosis may be suspected on this basis, although there are forms of extrasystolic ventricular tachycardia which can give the same clinical picture.[7] If the case be of the second type, in which irregularly grouped auricular extrasystoles are the cause of the tachycardia, differentiation from auricular fibrillation on clinical grounds may be impossible, and the diagnosis must be made with the electrocardiogram.

Therapy.—Mild attacks, as has been shown, need no medication and disappear spontaneously. When the attacks are severe and incapacitating, often heroic measures are needed. Although digitalis has been recommended by some,[3] we have found quinidine to be the drug of choice, although even with this it may be impossible to eradicate completely all the auricular extrasystoles, and cases have been reported which are refractory to quinidine.[4,5] After a test dose of 3 grains to see whether there is any idiosyncrasy to quinidine (tinnitus, etc.) at least 30 grains should be given in divided doses day and night. For the acute paroxysm of tachycardia, carotid sinus pressure or vagal stimulation may be of value.

Prognosis.—Although both these patients had evidence of enlargement of the heart (as have most of our other cases of extrasystolic auricular tachycardia) the prognosis is not necessarily serious. In fact, one of our patients (not reported here) is living and well ten years after her original attack.

Summary

1. Auricular extrasystoles may occur with sufficient frequency to cause an irregular tachycardia which clinically is often indistinguishable from auricular fibrillation.

2. Another type of tachycardia caused by auricular extrasystoles is that in which paroxysms of more or less regular tachycardia alternate with slower periods of sinus rhythm and isolated auricular extrasystoles.

3. The treatment of choice in both types, which may occur in the same individual at different times, is quinidine therapy.

4. The condition is often, but not necessarily, associated with some evidence of organic heart disease.

EXTERNAL SIGN IN RETROPERITONEAL RUPTURE OF THE ABDOMINAL AORTA

GRISWOLD D. NAMMACK, M.D., AND SYDNEY HIRSCH, M.D., Far Rockaway, New York

(From the Surgical Service of St. Joseph's Hospital)

BECAUSE of the scarcity of recorded cases of retroperitoneal apoplexy, we consider the following one worthy of reporting. The diagnosis of an abdominal aneurysm is difficult to make antemortem. The rupture of such an aneurysm, especially if it is a slowly bleeding one, is difficult to recognize, so that the presence of the sign described below should immediately help to establish the diagnosis.

Case Report

No. 73020; Mr. C. A. V. was admitted October 14, 1943, at 10:45 A.M. He died October 15, 1943, at 4:30 P.M. The patient was a 76-year-old man with a history of left lower abdominal pain radiating to the left scrotal region for the past twenty-four hours. This was associated with some nausea but no vomiting. There was a good bowel movement twenty-four hours before admission.

His previous history included the presence of syphilis many years before. This was very inadequately treated because of the patient's lack of cooperation. He also had a bilateral inguinal hernia of many years' duration. There had been no other illnesses or operations except for chronic cardiovalvular disease that remained fully compensated.

Physical Examination.—The patient was an acutely ill elderly man. His pupils were equal and regular but fixed, and did not react to light or accommodation. The tongue was furred; the teeth

were poor Heart sounds were distant and irregular, blood pressure was 160/90 Liver and spleen were slightly palpable there was no costovertebral tenderness No edema was present in the extremities Reflexes were sluggish Rectal examination was negative Easily reducible right and left inguinal hernias were present

Local Examination—Moderate abdominal distention was present, there was a tender, pulsating mass extending from the umbilicus to the outer border of the left rectus The mass was about the size of an orange, it pulsated mildly synchronously with the heart and the pulsations were only slightly expansile in character No thrill was palpable compression of the abdominal aorta proximally made no difference in the pulsation or in the size of the tumor No bruit was heard The femoral pulse on the left side was not altered in comparison with the right There was no edema of the left leg

The External Sign—There was considerable ecchymosis of the left inguinal region the left lower quadrant the upper portion of the left upper thigh and the left side of the scrotum

The patient's condition rapidly deteriorated and he died about thirty hours after admission

[illegible] noglobin was 49 9 per [illegible] 000 white blood cells, 91 per cent, lymphocytes, 1 per cent, immature granulocytes, 8 per cent blood nonprotein nitrogen, 69 mg per 100 cc creatinin, 2 5 mg per 100 cc

X-Ray of Abdomen—X-rays showed marked distention of the proximal colon from the cecum to the splenic flexure, and also of the distal coils of the ileum No gas was seen in the distal colon from the splenic flexure to the rectum Findings suggest an obstructive lesion somewhere in the distal colon

Admission Diagnosis—Rupture of an aneurysm of the abdominal aorta

Postmortem Examination—The essential findings were

1 Peritoneal cavity—ecchymosis of mesenteric-bowel junction throughout

2 Extensive ecchymosis of the left side of the abdominal cavity extending from the left perinephric region down the retroperitoneal tissues to the left scrotum

3 Thoracic aorta—widened, marked intimal atherosclerosis with large areas of ulceration

4 Abdominal aorta—marked sclerosis with ulceration throughout, large saccular aneurysm between abdominal vessels and bifurcation, about 10 mm in diameter, with adherent blood clot about 60 by 100 by 80 mm Extending from here there is a massive retroperitoneal hemorrhage extending along the spermatic cord into the left side of the scrotum

Summary

The presence of iliac, inguinal, and scrotal ecchymosis is here presented as an external sign of a retroperitoneal rupture of an aneurysm of the abdominal aorta

---

PENICILLIN REPORTED EFFECTIVE FOR RAT-BITE FEVER

[illegible]

February 3

Although rat-bite fever is a relatively rare disease of man, there is one form for which no satisfactory treatment agent previously has been available, the investigators point out This is the form caused by the disease organism Streptobacillus moniliformis

One of the other forms of rat bite fever is caused by the organism Spirillum minus, which responds well to arsenical treatment

The three investigators say a review of the medical literature reveals only 17 cases of rat-bite fever due to S moniliformis in th[illegible] diagnosis was verified

In their paper they

Penicillin was used in the treatment of these 3 patients, it being the first time the drug had been used for this disease They say that the response to the penicillin treatment was prompt and permanent in 2 cases but in the third a relapse occurred after the administration of an inadequate amount of penicillin

"A comparison of the course of our cases," they say, "with those previously reported gives the impression that penicillin is an effective chemotherapeutic agent which shortens decidedly the course of the disease

"In the future, treatment with penicillin is recommended in the therapy of rat-bite and Haverhill fevers"

Haverhill fever is caused by the same organism as rat-bite fever but without the bite of the rat or another animal

The three investigators explain that there is some tendency in rat-bite fever for the disease to clear up spontaneously after a varying number of relapses Of the 17 cases reported in medical literature up to and including 1943, there were 2 deaths Three of the patients were left with persistent arthritis lasting fifty-three days in one case, eight months in another, and for more than two years in the third In the United States the disease has now been reported in twenty-eight states and the District of Columbia, but the incidence has been greatest in Ohio, Pennsylvania, New York, and Illinois The [illegible]

Additional Annual Reports

To the 1945 House of Delegates

Medical Society of the State of New York

Supplementary Report of the Council—Part IX: Legislation

To the House of Delegates; Gentlemen:

The Council Committee on Legislation respectfully submits the following supplementary report.

The New York State Legislature was in session from January 3, 1945, to March 24, 1945. During that period of time there were one thousand, nine hundred and eighty-one bills introduced in the Senate and two thousand, three hundred and fifty-six in the Assembly. Besides the above, there were many bills amended and many resolutions introduced.

The Legislative Committee was interested in sixty-nine of the bills introduced in the Senate, copies of which were sent to the chairmen of the legislative committees of the county medical societies. Your Legislative Committee also followed twenty-two other bills in the Senate and reported their progress to those interested in these bills. There were eighty-three of the Assembly bills sent out and twenty-nine whose progress we watched and reported. It is to be realized, of course, that a number of the Assembly bills which we followed were concurrent with bills in the Senate, so the total number of individual bills which we followed would not be as large as would appear on first glancing at these figures. It is to be remembered, however, that a bill that is concurrent with a bill in the other house must be followed in the same manner as individual bills.

A review of these bills shows that seventy-five were defeated in committee or not reported out by the end of the session; two were lost on vote in the Assembly, one of which was the bill introduced by Mr. Brees that would license the practice of chiropractic; forty-eight bills passed both houses and were sent to the Governor. Of the bills sent to the Governor, thirty-eight were signed and became laws; ten were vetoed. Those who have received the bulletins have had information on many of these bills as they progressed and are familiar with the action on the individual bills. The final group of thirty-day bills is now being assembled in a bulletin which will be in the hands of those who received the bulletins in the near future. Among the bills that caused us a great deal of concern this year were the bills that would have licensed the practice of chiropractic, the DiCostanzo bill making vivisection of dogs illegal, and the two bills that would have lowered the requirements for admission to the practice of medicine.

There was every indication at the beginning of the session that a bill to license chiropractors would be introduced in both the Assembly and the Senate at an early date and, if voted on, would have a good chance of passing both houses. The sponsors of the chiropractic bill were given a promise last year that these bills would be introduced early and would come to a vote. It was because of this situation that your Legislative Committee was so apprehensive about these bills becoming a law that they urged all interested in them to make a representation to their legislators. It would appear that it was only because of the energetic educational campaign along these lines that the chiropractic bill was defeated on the floor of the Assembly by a vote of 96 to 43. In order to emphasize the dangers of these bills, it was felt necessary that we ask for a public hearing on them. It would appear that this public hearing had the effect of calling to the attention of some of the legislators, at least, the danger of licensure for the practice of chiropractic by those who had not had adequate training of sufficiently high standards to be a proper protection to the public. Out of this resulted the proposal of amendments to the bill which were suggested independently from any suggestion from the Medical Society. It appeared at the time that had these proposed amendments been accepted the bill for the licensure of chiropractors would have had an excellent chance of passing the Assembly. The proposed amendments apparently were not acceptable to those representing the chiropractors and were defeated. The defeat of these proposed amendments seemed to assure the defeat of the chiropractic bill in the Assembly which resulted in the vote when taken as given above. With this decided defeat in the Assembly, the Senate bill was amended along the lines of the third amendment suggested in the Assembly, and then recommitted to the Committee on Public Education. It was not reported out from that committee at the end of the session. It is not thought that this will end the efforts of the chiropractors to obtain licensure in New York State. It will mean that it will be necessary for us to be prepared to oppose legislation in the future that would license chiropractors or any cult in which the standards of education and experience are not sufficiently high to be a proper protection to the public. It is understood, of course, that we would not oppose any school of practice whose graduates have received adequate scientific training of sufficiently high standards that they would not be a danger to the public if permitted to practice.

The DiCostanzo bill which was introduced in the Senate would have prohibited scientific experiments on living dogs for medical purposes now permitted by authority of faculty of a regularly incorporated college or university. This bill was very quietly introduced, lay dormant for quite a period of time, starred on the calendar, indicating that it had been laid aside, and then was suddenly called to life in the Senate, was voted on, and passed with only nine opposing votes. At the same time there appeared quite a campaign in the Hearst newspapers and the legislators of both houses received a considerable number of communications urging that they pass this bill. The bill was sponsored by the Hearst newspapers, as was mentioned in certain articles in those papers at a later date. Because of the organized campaign to pass this bill, it required, as you recall, considerable activity on the part of those who were opposed to this legislation. It is believed that proper scientific experiments on dogs are necessary for the advancement of medical knowledge

and it would be a great handicap to such advancement in the field of medicine, public health, and surgery should this be prohibited. Many organizations interested in keeping up the advancement of knowledge in the field of medicine, public health, and surgery opposed the passage of this legislation

The bill was not reported out of committee in the Assembly and did not come to a vote in that house.

There was one bill introduced in the Senate and two in the Assembly that would have set aside the requirements of four courses of eight months each in registered medical schools of this country and graduation from a registered medical school for admission to the medical licensing examination of the

These bills were introduced to provide for licensure for certain individuals who had attended and graduated from unrecognized medical schools It was distinctly class legislation or legislation favorable for a very small group of persons at the expense and to the danger of the public. These bills were introduced under the guise of acute shortage of physicians during the present war emergency The two Assembly bills passed the Assembly with-

as then stricken

bills were sent to

Senate both of

of 34 to 15. The

York law would

lical licensing ex-

amination not only to a few recent graduates of unrecognized schools but to graduates of all extinct medical schools, diploma mills, whose standing had been so low that their graduates had been excluded from licensure in New York State as not meeting the requirements of the Education Law for admission to the practice of medicine in the State. It is to be realized that these standards are the minimum standards that are considered to be adequate protection to the public. It is also to be realized that an extremely high percentage of the candidates in the New York medical licensing examination greatly exceed the minimum requirements set by law, as these minimum requirements are not as extensive as a vast majority of the medical students desire in their preparation for their practice of medicine. On the passage of these bills in both houses strong representation was made by those interested in the protection of the public along these lines to the Governor, requesting that he veto these bills. The Department of Education, the Depart-

these bills No doubt you saw in your paper on April 22 that the Governor did veto these bills It is thought that it would have been nothing short of a tragedy had they become a law At the time of his disapproval of these bills the Governor issued the following memorandum

the licensing of persons to practice medicine and

Number 2197,

'An act to amend

the education law, in relation to admission to examination for practice of medicine'

"*Not approved.*

"Each of these bills would grant permission to the graduates of certain unapproved medical schools to take licensing examinations in the State of New York. One bill extends this privilege merely for one year, the other would do it permanently.

"The Department of Education, which is charged with responsibility for medical educational standards, has approved a large number of schools and has declared that certain others are substandard These bills would overrule the chosen agent of the people of the State, the Department of Education, and make admissible to practice medicine, men whom the Department declares may not be trusted with that great privilege and responsibility.

"The lives and health of the people of the State are a sacred charge They cannot and must not be exposed to the danger of bad medical treatment The Department of Education certifies that such would be the result of these bills and I am compelled, therefore, to disapprove them

"The bills are disapproved

"(Signed) THOMAS E DEWEY"

A bill that was introduced at the request of the

professions may be heard by three persons, one of whom may be a member of Regents, to be designated by the Regents or Chancellor of the University; hearings shall be upon record before Grievance Committee or Board of Examiners of professions for which there is no Grievance Committee, Regents' committee shall report to Regents for final decision; $4,000 is appropriated for payment of

Regents of the extreme amount of time and work required in reviewing the proceedings of the Grievance Committees of the various professions in disciplinary cases in those professions and the hearings necessary on these proceedings It has been customary for at least three members of the Board of Regents to sit as a subcommittee for these hearings and those members so sitting were expected to cover the testimony and evidence presented at the previous hearing of the Grievance Committee on each case The work being done by the many Grievance Committees, and especially in medicine, had grown to the point that it was extremely time-consuming for the members of the subcommittee of the Board of Regents in attempting to do this work conscientiously. It was thought that a more permanent three-man committee, which could devote more time to this work, would be more efficient and would be a great relief to the Board of Regents This arrangement will not change the disciplinary procedures of the Medical Grievance Committee, nor will it change such procedures in the Board of Regents, with the exception that this permanent three-man committee will hold the

by the law of a

the Board of

gs to be held

at other times than during the meeting of the Board of Regents Recommendations of this committee will be made to the Board of Regents and the final action will be taken by the Board of Regents as heretofore. With this change having been made and the relief given to the Board of Regents, there has been no further request for a hearing

ficer and no bill was introduced this year of this nature. Up to the date of this report it is understood that the Board of Regents are working on the appointments to this committee of three persons but such appointments have not been made. The change was apparently necessary and the results will be watched with interest. It is thought that it will be an advantage to all concerned and will enable a more expeditious handling of disciplinary matters.

A bill was also passed this year and became Chapter 417 of the Laws of 1945. This bill amended the Education Law in relation to the members of the Board of Regents and provided that no person shall serve as Regent after the first day of April next succeeding his seventieth birthday, provided, however, that the term of any person serving as Regent on April 2, 1945 shall not be shortened by reason of the provisions of this paragraph. Your Legislative Committee and the chairmen of the legislative committees of the county medical societies went on record as being opposed to this legislation. Your opposition was made known to the legislators. This law will not affect the term of any of the Board of Regents that are now in office with the exception of those who come up for reappointment by the Legislature after this year. It would appear that any Regent who is appointed by the Legislature from now on may not serve as a Regent after the first day of April next succeeding his seventieth birthday. It was thought that you would be interested to know that this amendment to the law has been made although you expressed your disapproval at the time it was being considered.

There were two bills introduced this year, one of which would have amended the Workmen's Compensation Law; the other would have amended the Education Law, in regard to the practice of certain specialties in hospitals. When the change was made in the law last year, making it illegal for the splitting of fees or taking credit or gratuity in connection with medical service, it was found that this change in the law made it necessary to make changes in many hospitals in connection with the service in x-ray, pathology, [illegible]. These bills provided that the pro[illegible] physicians in workmen's compensation or for the annulment or suspension of medical license for fee splitting or for taking credit or gratuity in connection with medical service, including x-ray examinations, etc., shall not apply to compensation paid by a legally incorporated nonprofit hospital to a physician giving service in a hospital as radiologist, pathologist, anesthetist, or physiotherapist. Both of these bills passed both houses and were sent to the Governor. Your Legislative Committee first went on record as being opposed to these bills and your opposition was indicated. Later a meeting between members of the Medical Society, the Hospital Association, and persons representing pathologists and radiologists agreed on amendments to these bills that would be considered satisfactory. Unfortunately, the agreed amendments were arrived at too late to be made at the past legislative session. The bills that were introduced were passed unamended. The Governor vetoed both of these bills without issuing any comment. It is understood that some change should be made in this law and that a bill will be introduced in the session of the Legislature next year that will incorporate the amendments that were agreed on this last year. When those bills are introduced they will be called to your attention.

Respectfully submitted,
WALTER W. MOTT, M.D.
LEO F. SIMPSON, M.D.

Postgraduate Medical Education

Programs arranged by the Council Committee on Public Health and Education of the Medical Society of the State of New York are published in this Section of the JOURNAL. *The members of the committee are Oliver W. H. Mitchell, M.D., Chairman (423 Greenwood Place, Syracuse); George Baehr, M.D., and Charles D. Post, M.D.*

The Treatment of Burns

A LECTURE on the treatment of burns was presented on May 22 at the Rome Hospital and Murphy Memorial Hospital in Rome by Dr. Earle B. Mahoney, assistant professor of surgery at the University of Rochester School of Medicine and Dentistry. The lecture was arranged by the Council Committee on Public Health and Education for the medical staff of the Rome Hospital and Murphy Memorial Hospital.

This instruction was presented as a cooperative endeavor between the Medical Society of the State of New York and the State Department of Health.

Medical News

County News

Albany County

Dr. Herman F. Senftner, of Albany, associate director of the Division of Communicable Diseases of the State Health Department, was guest on April 25 at a dinner in the DeWitt Clinton Hotel, given as a testimonial to his retirement after twenty-seven years of state service. Approximately thirty of his associates attended.

He was appointed to his present position in 1924. Previously he had practiced pediatrics in New York City and was connected with the California State Health Department.

In 1917, he came to New York as sanitary supervisor for Genesee, Erie, and Orleans Counties with headquarters at Buffalo.*

• • •

Commissioner of Education George D. Stoddard announced yesterday the appointment of Dr. Jacob Lewis Lochner, Jr., of Albany, as Secretary of the State Board of Medical Examiners. Dr. Lochner fills the vacancy caused by the resignation of Dr. Robert R. Hannon on December 31, 1944.

Dr. Lochner is a graduate of Tufts College Medical School, and served as intern and resident at Fifth Avenue Hospital, at Tufts College Maternity Clinic, at Providence Lying-In Hospital, as attending obstetrician and lecturer to nurses at Brady Maternity Hospital, Albany, as lecturer to nurses at Albany Training School for Practical Nurses, and as instructor at Albany Medical College.*

Bronx County

Dr. Nathan B. Van Etten was formally elected chairman of the Board of United Medical Service, Inc., at the first annual meeting of the service. Dr. Van Etten and other executives have been serving in a temporary capacity since the organization was founded in June, 1944.

Other Bronx residents elected for the period of one year are Dr. Harry Aranow, chairman of the nominating committee, and Dr. Milton J. Goodfriend, executive committee member.

Dr. Van Etten and Dr. Goodfriend are also members of the Board of Directors of Associated Hospital Service of New York.*

• • •

The regular meeting of the county society was held on April 18 at 8:30 P.M. in the Concourse Plaza Hotel. Following the executive session Dr. Walter A. Coakley, F.A.C.S., of the plastic and oral surgery staff of Kings County Hospital, spoke on "The Care and Treatment of Burns, Experience in Over 1,000 Cases."

Broome County

Dr. J. G. Fred Hiss, professor of clinical medicine, Syracuse University College of Medicine, addressed the April meeting of the county society on April 3 on the subject of "Rheumatic Fever—Rheumatic Heart Disease."*

• • •

The regular meeting of the county society was held on May 8 at 8:30 P.M. in the auditorium of Binghamton City Hospital. A lecture entitled "The Peptic Ulcer Problem" was given by Dr. Albert F. R. Andresen, professor of clinical medicine, Long Island College of Medicine.

Chenango County

Dr. Hugh S. Gregory, superintendent of the Binghamton State Hospital, was a speaker at a district three meeting of the New York State Community Service Council held on April 8 at Norwich High School.

Dr. Gregory's topic was "Our Responsibility as Young Adults to Returning Veterans." He said "we are pioneering a new field" and to help "we must familiarize ourselves with the problems they will meet." In illustrating his point Dr. Gregory turned to history and related how returning soldiers were received or treated after each of the major conflicts in which this country has participated.

It was his opinion that attempts should be made in advance to determine certain policies regarding the returning young men.*

Clinton County

The Medical Society of the County of Clinton held its semiannual meeting on May 22 at the Hotel Cumberland. The business meeting was called at 5:30 P.M., followed by dinner at 6:30 P.M.

Maj. Norman Levy, of Plattsburgh Barracks, spoke on "Emotional Problems of Returnees." Maj. Anthony D'Alfonso spoke on "A Flight Surgeon's Experience in the South Pacific."

Medical officers from Plattsburgh Barracks were guests of the society.

Cortland County

A talk on the health program in Geneva schools by Dr. James S. Allen, school physician, highlighted the April meeting of the Cortland Street School P.T.A., held on April 10 at the school.*

Essex County

Gov. Thomas E. Dewey announced on May 2 the appointment of Dr. Robert H. Gray, of Westport, as coroner of Essex County. He succeeds the late Dr. John M. Stafford.

Dr. Gray is health officer of the town and village of Westport and president of the county society.*

Herkimer County

The county society meeting on April 17 in the Prospect Hotel included two addresses pertaining to medicine and hospitals.

Maj. Maurice Stone, of the U.S. Public Health Service, explained the treatment of syphilis in the armed forces by the use of penicillin and other drugs.

The other speaker, H. C. Stephenson, of Utica, manager of the Hospital Plan, Inc., discussed new plans now being offered, which provide for several changes in benefits offered for medical and hospital care.*

Presentation of a three-point program for action against venereal disease highlighted the Rochester Social Hygiene Day meeting at the Chamber of Commerce on April 26.

Dr. John Roderick Heller, Jr., Assistant Surgeon General in charge of venereal disease control, U.S. Public Health Service discussed the effect of the war on prevention of venereal disease. Other speakers included Dr. Norris Orchard, of the Rochester Health Bureau, and Miss Rose Knobles, Rochester policewoman.

The three-point program calls for adequate facilities for detection and treatment of venereal infections, legal and protective action to promote whole-

gram, which was open to the public, included the Rochester Health Bureau, University of Rochester, State Department of Health, Monroe County Medical Society, Junior Chamber of Commerce, and the Tuberculosis and Health Association.*

Nassau County

The regular monthly meeting of the county society was held on April 24 at 9:00 P.M. in the auditorium of Mercy Hospital, Rockville Centre. Dr. J. William Hinton, of New York City, associate professor of surgery, College of Physicians and Surgeons, spoke on "The Intractable Ulcer, with Emphasis on the Indications for Surgery."

New York County

Expansion plans for the Post-Graduate Medical School and Hospital as a center for care of the sick and the advanced training of practicing physicians were outlined at the seventieth anniversary dinner of the institution on May 10.

as a memorial and tribute to the "fighting doctors" in the armed services.

Post-Graduate's development plan, as described by Dr. William B. Talbot, superintendent of the hospital, contemplates a new clinic, classroom, and laboratory building, to be erected on the land adjacent to the present plant. The cost of the new building is estimated at $1,500,000, and an additional $3,500,000 in endowment is required for staffing and research.

Other steps include a private pavilion of two hundred beds, a new medical school building, and a new hospital unit for ward beds to replace Roosa Building, opened for service in 1894. Total construction costs are estimated at $6,500,000, with an additional $8,500,000 needed for endowment.*

Dr. Milton J. Rosenau, president-elect of the American Public Health Association, and the dean of the School of Public Health, University of North Carolina, was the principal speaker at the annual meeting of the Public Health Association of New York City on May 17. For many years Dr. Rosenau was affiliated with the Harvard School of Public Health Service; his textbooks on public health are standard and are used not only in the schools of this country but also throughout Canada and South America.

The Public Health Association's annual meeting opened with an afternoon session at 4:00 P.M. at which there was a panel discussion on "New Fields of Development in Public Health" and a review of the public-health aspects of the use of penicillin, sulfonamides, and vitamins. Participating in the discussion were: Arthur I. Blau, M.D., district health officer, Jamaica Health Center, chairman; Otto A. Bessey, Ph.D., director and chief of the Division of Nutrition and Physiology, the Public Health Research Institute of the City of New York; Earle G. Brown, M.D., commissioner, Nassau County Department of Health; Jerome S. Peterson, M.D., district health officer, Red Hook-Gowanus Health Center, Brooklyn; John L. Rice, M.D., consultant in public health, Lederle Laboratories, Inc.; and Clarence L. Scamman, M.D., director, Division of Public Health, Commonwealth Fund.

Onondaga County

A joint meeting of the county society and the Syracuse Academy of Medicine was held on April 13 at the University Club. Dr. Alexander Mason discussed "Diagnosis in Urology," which was illustrated with lantern slides. Discussion was opened by Dr. Lucas S. Henry. Dr. Leon H. Griggs then spoke on "Overtreatment in Dermatologic Diseases."

A joint meeting of the county society and the Syracuse Academy of Medicine was held on May 15 in the Syracuse Psychopathic Hospital. The scientific program consisted of four lectures: "Masked Neuroses in Internal Medicine," by Dr. A. B. Siewers, "Psychiatric Implications of Internal Medicine," by Dr. H. A. Steckel, "Electroencephalography," by Dr. J. E. Alderman, and "Some Notes on Penicillin in General Paresis," by Dr. A. N. Fleiss.

Ontario County

The second quarterly meeting of the county society was held at Clifton Springs Sanitarium and Clinic on April 10. The program was as follows: 5:00 P.M.—business meeting in the Woodbury Building; 6:30 P.M.—dinner; 7:30 P.M.—scientific session: "Remarks on Some of the Newer Drugs," by Max B. Riepel, Ph.B.; "Surgical Treatment of Prolapse of Rectum with Case Report," by Dr. A. S. Taylor; and "Case of Myocardial Infarction with Autopsy Reports," by Drs. P. V. Newland and John W. Karr.

Queens County

Dr. William M. Cooper, F.A.C.S., surgeon at the Polyclinic Hospital, New York, was the guest speaker at the regular meeting of the Rockaway Medical Society on March 15 at the Lawrence Country Club. At the scientific session Dr. Cooper spoke on "Modern Treatment of Varicose Veins and Complications." Dr. Herman Gliboff, of Rockaway Beach, president of the local society, presided.*

• • •

Dr. Edward J. Buxbaum, of Jamaica, inventor of the valve which prevents blood from flowing from the patient at the time he is receiving a transfusion, on March 12 explained, by means of slides, the testing of blood for possible disease, at the John H. Hessel Memorial Hall of the Woodmere Academy.

Dr. Buxbaum demonstrated how the red and white cells change form as infection in the body grows.

Dr. Buxbaum brought the actual equipment used in transfusions. He defined serum, plasma, and liquid blood, and explained blood types and how they can be kept.*

• • •

The stated meeting of the county society was held on March 27 at 9:00 P.M. at Forest Hills Inn. Dr. James E. Perkins, director, Division of Communicable Diseases, New York State Department of Health, spoke on "Recent Changes in Our Conception of Manner of Spread and Control of Communicable Respiratory Diseases." The discussion was opened by Drs. Goodwin A. Distler, Evan W. McLave, James R. Reuling, Jr., and A. W. Victor.

• • •

On April 6 at 4:30 P.M. Dr. Samuel Zwerling, associate surgeon, Brooklyn Eye and Ear Hospital, and associate attending surgeon, Greenpoint Hospital, spoke on "Problems of the Hard of Hearing."

On April 13 at 4:30 P.M., Dr. Albert F. R. Andresen, professor of clinical medicine, Long Island College of Medicine, and attending physician (gastroenterologist), Long Island College Hospital, discussed "The Management of Gastrointestinal Hemorrhage." These meetings took place at the County Society Building, in Forest Hills.

Rensselaer County

Capt. Julien A. Hebert, well-known Troy physician who has taken part in four invasions in Europe and is now home on leave for treatment of wounds received in France, was the principal speaker at the first report meeting of the Red Cross War Fund drive on March 7.

Captain Hebert has been serving in the Medical Corps with a glider outfit of the Airborne Infantry. He came down by glider into Holland during that invasion. Previous to that he took part in the invasions of Sicily, Italy, and Normandy. He has been overseas for twenty-four months.*

Richmond County

Dr. Madge C. L. McGuinness, authority on physical therapy, spoke at the open luncheon meeting of the Staten Island Council of Social Agencies on March 21 in the Meurot Club, St. George. Dr. McGuinness spoke on "Rehabilitation."

Her talk included a general discussion of the whole field of physical therapy, which has become increasingly important because of its use in hastening recovery from war injuries. It is described as the treatment of disease and injury by nonmedical means as prescribed by physicians.*

Schenectady County

"Functional Nervous Disorders Associated with Warfare" was the topic discussed by Dr. Foster Kennedy, professor of clinical neurology at Cornell

University Medical College, at a meeting of the county society on April 3 at 8:30 P.M. in Ellis Hospital.*

Steuben County

The Spring meeting of the county society was held at the Baron Steuben Hotel, Corning, on April 12. The scientific program, following luncheon and the business meeting, consisted of a lecture entitled "Penicillin Therapy," given by Dr. Fred T. Schnatz, assistant professor of medicine, Buffalo Medical College.

Ulster County

The regular Spring meeting of the county society was held at the Governor Clinton Hotel, Kingston, on April 4 at 8:45 P.M. The scientific session consisted of a symposium on the treatment of diabetes. Dr. Herman O. Mosenthal, of New York City, discussed insulin; Dr. George E. Anderson, of Brooklyn, talked on diet; Dr. Henry Dolger, of New York City, spoke on ketosis; Dr. Frederick W. Williams, of New York City, told about Camp Nyda. General discussion with questions and answers followed.

Warren County

An honorable medical discharge from service in the U.S. Army Medical Corps has been granted Dr. Roger S. Mitchell, former practicing physician in Glens Falls. Dr. Mitchell plans to resume his practice there.

A major in the Medical Corps, Dr. Mitchell was given his discharge while at Fitzsimons General Hospital, Denver, Colorado. Previously he had served at Miami Beach, Orlando, and Eglin Field, Florida, the School of Aviation Medicine at Randolph Field, Texas, and at the A.A.F. Classification Center, Nashville, Tennessee.

Dr. Mitchell enlisted in the service and had been on active duty twenty-eight months.*

Westchester County

"Child Behavior" was the topic of Dr. Reginald A. Higgons, Port Chester pediatrician, when he addressed the Harrison Avenue Home and School Council recently in the school library.

Dr. Higgons is attending pediatrician at United Hospital, consulting pediatrician at Grasslands Hospital, and attending pediatrician and chief of staff at St. Luke's Hospital, convalescent branch.*

. . .

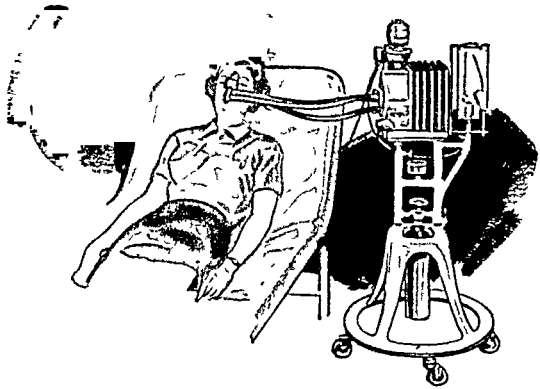
Dr. Natale Colosi, of Yonkers, professor of bacteriology and public health at Wagner College and director of the Parkway Hospital, has been appointed a member of the Interstate Sanitation Commission by Governor Thomas E. Dewey.*

. . .

A financial appeal, conducted by the Westchester Committee for Planned Parenthood, started on April 2.

A goal of $10,000 has been set to provide funds to support seven county clinics and to establish a central office in White Plains with a fulltime paid executive.

Clinics in Port Chester, Mount Kisco, Ossining, Yonkers, Mount Vernon, White Plains, and New Rochelle are now operated on a part time basis, through assistance of volunteers, with the services of a doctor and a case worker.*



Necrology

Clyde Hulee Brown, Comdr., (MC), USNR, was killed in action on Okinawa, at the age of 42. He was in charge of the Military Government Hospital there. Commander Brown was a native of Cullman, Alabama; he graduated from Vanderbilt University Medical School, Nashville, Tennessee, in 1926. He served his internship and residency at Knickerbocker Hospital, and then specialized in internal medicine, practicing in New York until he entered the Navy in 1941. He was assistant attending physician at French Hospital and City Hospital, chief physician of the arthritis clinic of the French Hospital Outpatient Department, and a member of the American Rheumatism Association, the State medical society, and the American Medical Association.

Walter Gray Crump, M.D., surgeon and gynecologist, of New York City, died on May 2 at the age of 75. Dr. Crump was professor emeritus of surgery at New York Medical College, Flower and Fifth Avenue Hospital, where he taught from 1897 to 1936. He was also consulting professor of surgery at New York Polyclinic Medical School and Hospital and consulting surgeon at the following hospitals: Middletown State, Connecticut; Mt. Vernon; and Yonkers General; and consulting gynecologist at United Hospital, Port Chester. He was a graduate of the New York Homeopathic Medical College, class of 1895. Dr. Crump was one of the founders of the Broad Street Hospital, and he helped to establish the New York Medical College for Women and was a member of its faculty until it closed in 1919. He was a fellow and a governor of the American College of Surgeons, and a member of the Homeopathic Medical Society of the State of New York, the State medical society, and the American Medical Association.

Abraham Wilson Dods, M.D., of Fredonia, died on April 13 at the age of 91. He was born in Dingwall, Scotland, but came to this country at the age of 18 and graduated from Chicago Homeopathic Medical College in 1878. He practiced in Silver Creek until 1884. Following a postgraduate course in surgery at Edinburgh University he went to Fredonia, where he practiced until his retirement in 1923. He specialized in surgery in the latter years of his practice. Dr. Dods was a member of the American Institute of Homeopathy, the New York and New England Association of Railway Surgeons, Dunkirk-Fredonia Medical Association, Chautau-

[Continued on page 1244]

In Hyperthyreosis, too

The symptom complex of increased appetite, exaggerated psychomotor tension, hyperhidrosis, and loss of weight, in addition to spelling thyrotoxicosis, also reflects the intense metabolic activity characteristic of this condition. Utilization of nutrients may be 50 per cent above normal.

Whether therapy be conservative or surgical, metabolic deficits must be eradicated and some of the consumed body tissue restored. To this end the intake of virtually all essential nutrients must be doubled. If surgery is contemplated, nutritional preparation ranks in importance with iodine preparation for a successful outcome.

Ovaltine can be a valuable component of the high-caloric, high-vitamin diet required. This delicious food drink, made with milk, appreciably increases the caloric intake and significantly augments the intake of complete proteins and of vitamins and minerals, all of which are required in greater amounts in hyperthyreosis.

THE WANDER COMPANY, 360 N. MICHIGAN AVE., CHICAGO 1, ILL.

Ovaltine

Three daily servings of Ovaltine, each made of ½ oz. Ovaltine and 8 oz. of whole milk,* provide:

qua County Society, the State medical society, and the American Medical Association.

Edwin Breck Eckerson, Maj., (MC), USNR, of New York City, was killed in the suicide attack of a Japanese pilot on the hospital ship *Comfort,* where he was chief surgeon. He was 40. Major Eckerson graduated from the College of Physicians and Surgeons, Columbia University, in 1931. He interned at St. Lukes Hospital, New York City, and was a resident at the Lahey Clinic, Boston. In civilian life he was assistant surgeon at St. Lukes Hospital and St. Lukes Outpatient Department, assistant surgeon at New York Post-Graduate Hospital, and chief surgeon of Post-Graduate's Outpatient Department, and assistant surgeon at Mt. Vernon Hospital. He was a member of the New York Academy of Medicine, the State medical society, and the New York County Society, and was a fellow of the American College of Surgeons.

Sidney Lasalle Ford, M.D., of Hensonville, died at 79 on April 16. He graduated from New York University Medical College in 1891 and practiced in Brooklyn for a time before settling in Hensonville. He had practiced for over fifty years. He was a member of the Greene County society, the Medical Society of the State of New York, and the American Medical Association.

Carl T. Harris, M.D., orthopedic surgeon, of Rochester, died on April 17. He was 54. Dr. Harris was born in Spencerport, graduated from Harvard Medical School in 1916, and interned until 1918 in Boston City Hospital. He served overseas in the first World War. He was consulting surgeon, Iola Sanatorium, orthopedic surgeon, Strong Memorial Hospital, chief orthopedic surgeon, Highland Hospital, and orthopedic surgeon, Genessee Hospital and Monroe County Infirmary. He was a member of the American Orthopedic Association and the American Academy of Orthopedic Surgery, the State medical society, and the American Medical Association.

Irene A. T. Kenny, M.D., of New York City, died on April 27, of a heart ailment, at the age of 57. She graduated from Leland Stanford Medical School in 1916, interned at Bellevue, and was resident and visiting surgeon at Bellevue and St. Vincent's hospitals, and after 1931 director of the outpatient department of the Jersey City Medical Center. She was a member of the New Jersey Medical Society and the American Medical Association.

James Herbert Lawson, M.D., of New York City, medical director of several American Olympic teams, died on April 26 at the age of 68. Dr. Lawson was born in Baltimore; he graduated from the College of Physicians and Surgeons, New York City, in 1902, and was an intern at St. Vincent's and New York Lying-In hospitals. He had been attending surgeon at General Memorial Hospital and chief surgeon of the outpatient departments of Babies' Hospital and St. Mary's Hospital for Children. A lifelong devotee of amateur sports, Dr. Lawson was medical director for the American Olympic teams at the games in Amsterdam, Lake Placid, Los Angeles, and Berlin.

Peter Francis Purcell, M.D. of Schenectady, died on May 2; he was 63 years old. He graduated from Albany Medical College in 1911 and engaged in the general practice of medicine for the following thirty-two years. He was a member of the Schenectady County society, the Medical Society of the State of New York, and the American Medical Association.

Hyman John Rubinstein, M.D., otolaryngologist, of New York City, died on April 30 at the age of 41. He graduated from Tufts Medical College in 1927. He was clinical assistant visiting otorhinolaryngologist at Metropolitan Hospital and assistant otolaryngologist in the outpatient department of Mt. Sinai Hospital. He was active in the Zionist movement. He was a member of the American Academy of Ophthalmology and Otolaryngology and a diplomate of the American Board of Otolaryngology, and a member of the New York County society, the State medical society, and the American Medical Association.

Ulysses B. Stone, M.D., of Buffalo, died on January 18; he was 73 years old. He graduated from the Medical College of the University of Buffalo in 1896.

Hiram N. Vineberg, M.D., F.A.C.S., died on May 4 at the age of 90. He was born in Russia but went to Cornwall, Ontario, at the age of 5. In 1878 he was graduated from McGill University Medical School with highest honors. At the advice of his professor, Dr. William Osler, he went to London; then he went to New Zealand and Hawaii, and back to Canada, where he practiced, in Portage La Prairie, Ontario; it was at this time that he decided to specialize in gynecology. He is credited by his fellow gynecologists with a major role in the development of modern gynecologic methods. He was consulting gynecologist at Mt. Sinai, Montefiore, and Beth Moses hospitals, and was also connected with Polyclinic and St. Mark's hospitals. He was a member of the New York Obstetrical Society, the American Gynecological Society, and the New York Academy of Medicine, the State medical society, and the American Medical Association.

Max Winsor, M.D., psychiatrist affiliated with the Bureau of Child Guidance of the Board of Education, died on May 4 at the age of 47. He graduated from Columbia's College of Physicians and Surgeons in 1932 and interned at the Warwick State School Extension of the Neurological Institute of New York. At the time of his death he was also director of clinical work for a two-year research project established in 1943 by the New York Foundation and a lecturer on social psychiatry at the New York School of Social Work. He was a member of the American Orthopsychiatric Association, the State medical society, and the American Medical Association.

DR. CARL BINGER WINS PRIZE FOR BOOK FOR LAYMEN

W. W. Norton and Company have announced that the award of $3,500 offered to encourage the writing of books on medicine and the medical profession for the layman has been won by Dr. Carl Binger, a member of our Society. The book, "The Doctor's Job," undertakes to put the lay public in touch with the medical world as it exists today, to relate medicine to society, and to demonstrate the spirit which inspires and sustains medical men in their work. Dr. Binger, a graduate of Harvard Medical School, who has served with the Rockefeller Institute for Medical Research, is now on the faculty of Cornell University.—*N.Y. Med., Feb. 5, 1945*

Hospital News

Existing Hospitals Can Treat Most Veterans, Dr. Aaron Says

IN HOSPITALIZATION, a veteran should be treated like any other private patient—in a hospital of his own choice and with his own physician to take care of him, Dr. A. H. Aaron, president of the Medical Society of Erie County, asserts in an editorial in the society's bulletin dated April 26, 1945.

Dr. Aaron points out that he is in no way opposed to the erection of a veterans' hospital in Buffalo, as proposed, but he suggests that this hospital be arranged to take care of neuropsychiatric, tubercular-convalescent, and other types of difficult cases. Aside from such cases, veterans should have free choice of hospitals, he asserts.

"The medical profession," Dr. Aaron points out, "believes that the paramount consideration is: Every possible step must be taken to make certain that the best medical care is placed within the reach of all veterans—those disabled as the result of military service and those whose disabilities are not service-connected. I am 100 per cent behind that attitude and pledge."

Dr. Aaron announced the appointment of a special committee on the veterans' hospital question, with Dr. Roy L. Scott as chairman. Every member of this committee is a veteran of World War I or World War II—Drs. Scott, Robert E. DeCeu, John C. Brady, Maj. A. F. Bellanca, Frank H. Long, P. H. J. Buckley, Lt. Comdr. C. A. Koch, and John D. Naples. Dr. Scott has invited the following to participate in the committee's deliberations: Dr. Edward W. Koch, Dr. R. W. Groh, the Rt. Rev. Albert Rung, Dr. Fraser D. Mooney, Henry T. Brandt, and Carl M. Metzger.

Agreement With Doctors Reached by State Executive Committee

AGREEMENT in specific terms with representatives of the State Medical Society on the vexed question of the status of certain specialists in the hospitals was arrived at by the Executive Committee of the State Hospital Association at the special meeting with the physicians' committee held in New York on February 17. This agreement, which is, of course, subject to the action of the governing bodies of the two organizations, is as follows:

(*a*). It is agreed that pathology, anesthesiology, roentgenology, and physical therapy are medical services and the practice of medicine.

(*b*). That these specialties are so recognized.

(*c*). That an equitable arrangement can be made between the individual hospitals and the doctors who practice these four specialties recognizing the above principle, whereby the hospital may bill for these services in the name of the person rendering the service. (This can be done by inserting the name on the regular hospital billhead, i.e., instead of x-ray, indicate "Professional Services of Dr. ———, roentgenologist.")

(*d*). Until such time as a medical service plan is available, there is no objection to inclusion of these medical services in the hospital service plan contract as long as the principle of recognition and proper remuneration to these specialists is carried out.—*Hospital Forum, March, 1945*

Improvements

The new Doctor's Hospital on Shore Road, Port Washington, opened in April and its facilities were expected to help ease the acute bed shortage in Nassau County medical institutions.

The hospital can accommodate twenty bed patients. It has laboratory and x-ray facilities and a house physician is available at all times.

The new institution is all set to go ahead with an expansion program in the near future. Obstetrics are not being handled at the present time, but all other medical and surgical cases are being accommodated.

A number of physicians have been invited to join the staff as consultants. They include Dr. Philip Allen, chief surgeon at Bellevue Hospital, and Dr. Reginald Conklin, attending physician at St. Luke's Hospital, in New York City.

An "open hospital," its facilities are available to all doctors registered with the State medical society as long as there are beds available.

The building has been completely renovated.*

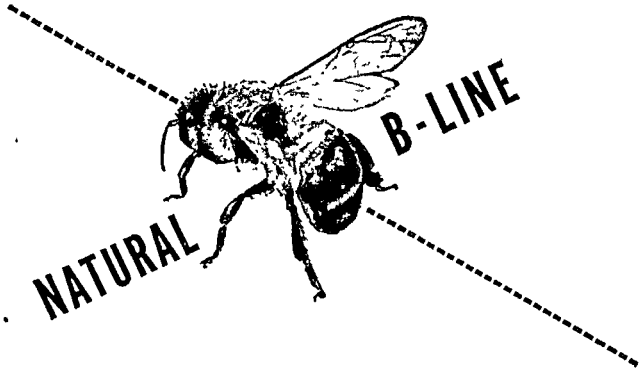
* * *

The new hospital grounds of Tarrytown Hospital were opened to the public from 3:00-6:00 P.M. on Sunday, May 13, which was observed as Hospital Day, it was announced by the Board of Directors of the Tarrytown Hospital Association on April 15.*

* * *

An iron lung was recently presented to Glens Falls Hospital as a result of a drive sponsored by Glens Falls Council 417, United Commercial Travelers.*

* * *



Dr. Frank A. Calderone, Acting Commissioner of Health, New York City, announces the establishment of a city-wide nutrition clinic at the Lower East Side Health and Teaching Center with Dr. Norman Jolliffe as Chief of Clinic.

The purposes of the clinic are as follows:

1. To furnish a diagnostic and treatment center and consultation clinic for patients suspected of having nutritional abnormalities.
2. To furnish a training center for physicians, nurses, and others interested in the diagnosis, treatment, and prevention of deficiency diseases.
3. To develop and correlate diagnostic methods for the detection of early nutritional diseases.
4. To determine the significance of various manifestations of nutritional diseases.

[Continued on page 1248]

* Asterisk indicates that item is from a local newspaper.

In a straight-to-the-point attack on vitamin B-complex deficiency states, Elixir 'OMNI-BETA'* provides all the known as well as the unidentified factors of the complex as derived from three of its richest natural sources... yeast, liver and rice polishings.

Blended for balance in a palatable liquid form, Elixir 'OMNI-BETA' is highly concentrated for potency— a single teaspoonful daily provides the minimum adult requirements.

5. To determine the most effective methods of treatment and prevention of deficiency diseases.

6. To obtain information concerning food habits in relation to nutritional disease.

7. To translate, when indicated, the diagnostic procedures and conclusions of this clinic into practice in other Health Department units.

Plans are being formulated for the Public Health Research Institute and the Nutrition Division of the Department of Health to cooperate with the nutrition clinic so that it will be possible to correlate the dietary and chemical studies with the medical findings.

A Hodgkin's disease clinic and research laboratory, under the direction of Dr. Antonio Rottino, has been established at St. Vincent's Hospital in New York City. The clinic and laboratory will collaborate with Dr. Herman Hoster, of Ohio State University, Columbus, Ohio, Dr. Robert Chambers and C. G. Grand, of New York University, and with Maj. Perk L. Davis at the Walter Reed General Hospital, Washington, D.C., in studying the etiology and treatment of Hodgkin's disease (lymphogranuloma). The preliminary work on etiology has already been done by C. G. Grand, who first demonstrated by tissue-culture methods inclusion bodies in tissues removed from patients with Hodgkin's disease.

Inasmuch as cases of Hodgkin's disease are comparatively rare, and because fresh, unfixed tissue is essential for the studies to be pursued, the clinic must have patients referred by private physicians. It is therefore asked that those reached by this notice send cases of unexplained lymph node enlargements to Dr. Rottino and his group at St. Vincent's Hospital. It is understood that any patient referred for such stu[illegible] private attention, will not be c[illegible] or surgical service extended. It is further understood that a report of the results of each study will be sent to the referring physicians. Patients whose disease proves to be other than Hodgkin's disease will be sent back to the referring physician; those diagnosed as Hodgkin's disease will be retained in the clinic for follow-up care and treatment, with the permission of the referring physician.

Jones Memorial Hospital, in Wellsville, has been equipped with a modern and complete operating table as the result of a joint gift made by the Moore Steam Turbine Division of Worthington Pump and Machinery Corporation, Sinclair Refining Company, Air Preheater Corporation, Bradley Producing Company, and Empire Gas and Fuel Company, Ltd.

Announcement of the latest contribution of hospital equipment was made on April 11 by L. W. Coon, hospital superintendent.

The table, known as American Model 1075, is the most modern piece of this type of equipment on the market today.*

At the Helm

Dr. Cornelius P. Rhoads, since 1939 director of Memorial Hospital for the Treatment of Cancer and Allied Diseases, New York, returned to his post on April 15, after nearly two years' leave of absence, during which he was chief of the Medical Division of the Chemical Warfare Service of the Army of the United States.

• • •

Maynard L. Kast, assistant cashier of the First National Bank, was named to succeed Frank D. Dingman as treasurer of Herkimer Memorial Hospital on April 10 at the annual election of officers, marked also by the return of George J. Sluyter for his twentieth term as president.

Others chosen were: Mrs. C. B. Root, first vice-president; W. P. Small, second vice-president; and Miss Mae C. Harter, who was advanced from assistant secretary to secretary, succeeding the late Mrs. Margaret Jackson, incumbent since the hospital was organized in 1925.*

• • •

Mayor Walker B. Lounsbery, of Binghamton, announced on April 7 the appointment of Mrs. F. F. Ingwall to the Board of Managers of City Hospital for a six-year term.*

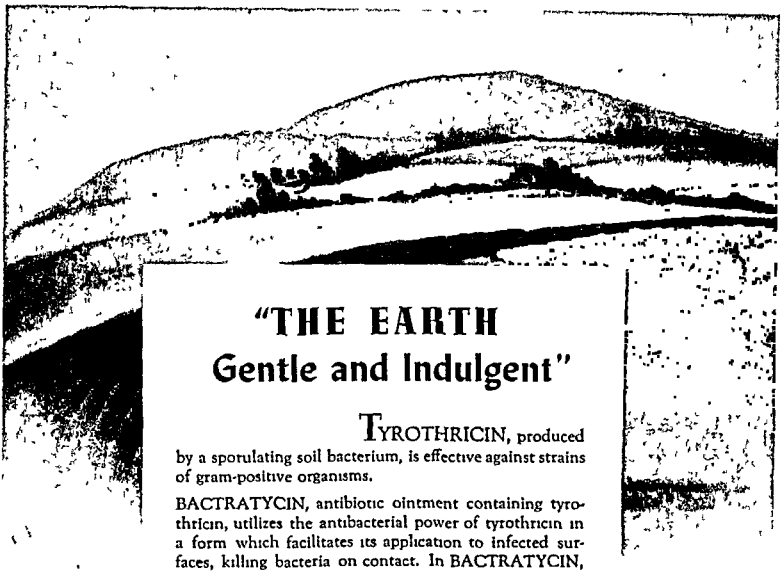
• • •

In the April meeting of the board of directors of F. F. Thompson Hospital on April 13, Howard G. Kennedy, a member of the corporation, was elected a board member to fill a vacancy. John D. Hamilton, president, conducted the meeting, when routine reports were presented.*

• • •

Dr. Frederick Gifford, Dr. Ernest H. Panasci, and Dr. Mary Lou Squires have been appointed associate members of the medical staff of the Rome Hospital and Murphy Memorial Hospital, Rome, it has been announced by the board of managers.*

• • •



Dr. Arthur L. Drew, Jr., has been appointed resident physician at the Potts Memorial Institute. Dr. Drew, whose home is in Pleasantville, graduated from the College of Physicians and Surgeons, Columbia University, in 1941. He had one year of rotating internship at Grasslands Hospital, Valhalla, and then entered upon active duty in the U.S. Navy and was thus engaged from 1942 to 1945. He served in the Amphibious force and aboard ship in the North Atlantic and the Mediterranean Sea, and in the invasion of North Africa. During his service he also received special instruction in neuropsychiatry in Philadelphia, followed by a year of duty in neuropsychiatry at the U.S. Naval Hospital, Portsmouth, Virginia.*

• • •

Charles H. Griffin, general manager of the New Rochelle *Standard-Star*, was elected to the Board of Governors of the New Rochelle Hospital Association at a meeting of the board on April 16 at the hospital.*

"THE EARTH Gentle and Indulgent"

TYROTHRICIN, produced by a sporulating soil bacterium, is effective against strains of gram-positive organisms.

BACTRATYCIN, antibiotic ointment containing tyrothricin, utilizes the antibacterial power of tyrothricin in a form which facilitates its application to infected surfaces, killing bacteria on contact. In BACTRATYCIN, tyrothricin is in true solution—not in suspension, thus imparting a desirable degree of tissue penetration.

BACTRATYCIN *is effective in*

impetigo	*indolent ulcers*
pustular dermatitis	*chronic abscesses*

and related conditions either caused or complicated by streptococci, staphylococci, pneumococci and other gram-positive organisms. Each gram of BACTRATYCIN contains 0.30 mg. tyrothricin.

BACTRATYCIN is for topical use only. It must not be used in freely bleeding wounds. Apply directly to infected areas.

Available in jars containing 2 oz

Eight officers, including one Medical Corps captain, three Army nurses, and four Medical Administrative Corps officers, have reported for duty to Rhoads General Hospital, it was announced recently by Col. A. J. Canning, commanding officer.

Capt. Edward P. Webber, of Palmer, Massachusetts, is the doctor. Nurses include First Lt. Millicent E. Moore, Westfield, Pennsylvania, First Lt. Gelda L. Johnson, Exira, Iowa, and Second Lt. Josephine Conte, Hudson, New York.

The administrative officers are Lt. Charles R. Rothemich, Providence, Rhode Island; Lt. Francis K. Sullivan, Sault Ste. Marie, Michigan; Lt. Harold C. Haag, Mt. Horeb, Wisconsin; and Lt. Abraham A. Kaplan, Malden, Massachusetts.

* * *

Isaac Albert, for many years actively identified with philanthropic and community endeavors, has been re-elected for a second term as president of the Jewish Sanitarium and Hospital for Chronic Diseases of Brooklyn, it has been announced by the institution's board of directors. Mr. Albert has been affiliated with the hospital for thirteen years.

In assuming the hospital presidency for a second term, Mr. Albert said plans are being completed for the construction of an additional $1,000,000 building which will add three hundred more beds to the hospital's present complement of five hundred and twenty-five.

* * *

The appointment of Mrs. Madolin Woods Wang as director of nursing service and as principal of the School of Nursing of Mount Vernon Hospital was announced by Arthur L. Zerbey, president of the hospital board of trustees, at a meeting on March 19 at the hospital.

A resident of Port Chester and until recently assistant in nursing administration at Grasslands Hospital, Mrs. Wang assumed her post on March 28, succeeding Miss Mildred E. Schwier, who resigned in December. The post, in the interim, had been filled by Miss Gertrude Welch of the hospital nursing staff.*

* * *

Dr. Jacob Sobel, of New York City, has been appointed medical director of the Home and Hospital of the Daughters of Israel for the Aged, in New York City.

* * *

Resignation of Dr. Christopher G. Parnall, medical director of Rochester General Hospital for the past twenty-one years, effective October 1, was disclosed March 28 following a meeting of the board of directors of the century-old institution.

In a letter to Elliott W. Gumaer, president of the hospital's board of directors, Dr. Parnall told of his intention to resign, a surprise action, Gumaer said, because the directors had anticipated his tenure would continue until retirement. The board accepted the resignation "reluctantly and with genuine regret," a statement said.*

* * *

Appointment of Arthur B. Solon, superintendent of Mount Vernon Hospital for the past four years, as Superintendent of the Suburban Hospital in Bethesda, Maryland, effective April 15, was announced recently by officials of the Maryland institution.

Mr. Solon will be succeeded in Mount Vernon by Dr. Donald M. Morrill, formerly superintendent of Malden Hospital, Massachusetts. Dr. Morrill's appointment as Chief Administrative Officer of Mount Vernon Hospital was announced in April by the hospital's Board of Trustees. Previous to his duties at Malden, Dr. Morrill was administrator of two large hospitals in Michigan.

At Suburban Hospital Mr. Solon will succeed J. Dewey Lutes, who has resigned to become Superintendent of the Yonkers General Hospital.

The Bethesda Hospital, which was opened in December, 1943, has a capacity of 135 beds and serves an area comprising Bethesda, Chevy Chase, and the northwest sector of the District of Columbia.

A native of Wisconsin, Mr. Solon came to Mount Vernon in the Spring of 1941, after serving as assistant superintendent of the Wisconsin State General Hospital.*

Newsy Notes

A miniature Army evacuation hospital, complete with actual surgery and ward tents, field nurses' quarters and the most modern medical equipment, was opened for public inspection on April 27 in the Civilian Defense Volunteer Office War Information Center in New York City.

The exhibition, scheduled to go on nation-wide tour after closing in New York on May 9, forms a part of the current national drive to sign up 14,000 nurses for the Army before June 1. Within the last week American Red Cross volunteers have begun making individual calls on each of the fifty-five thousand nurses throughout the country who have been classified as eligible for military service by the War Manpower Commission.*

* * *

Plans for the construction of a $1,000,000 building are being completed by the Jewish Sanitarium and Hospital for Chronic Diseases, Brooklyn, it was announced by Isaac Albert, who was re-elected recently as president of the hospital for a second term, as announced above.

The building will add three hundred beds to the hospital's present complement of five hundred and twenty-five and will make the sanitarium one of the largest in the State for the care of incurable patients. Mr. Albert said groundbreaking ceremonies would be held as soon as priorities are cleared with the War Production Board. More than four hundred applicants are awaiting admission to the hospital.*

[Continued from page 1250]

Vincent's Hospital is now being planned as a memorial to the late Alfred E. Smith, according to an announcement by the Most Rev. Francis J. Spellman, Archbishop of New York and Honorary President of the Hospital.

The new structure, to be known as the Alfred E. Smith Memorial Building, will replace sections of the hospital on West 12th Street, between Seventh Avenue and the Nurses' Residence, and will cost $3,000,000. Funds for the purpose will be raised through a public campaign, soon to be launched by the Hospital's Advisory Board.

St. Vincent's, which is conducted by the Sisters of Charity, will have facilities in the new unit for all classes of patients, the Archbishop announced, because "Alfred E. Smith himself was a friend to all sorts and conditions of men." In addition to enlarging the Hospital's present capacity by two hundred and fifty beds, the new building will also house the Hospital's laboratories, its blood bank, its emergency admitting department, its medical records, the kitchens, dietary department, locker rooms, refrigerating system, power plant, and other facilities.

. . .

Camp Upton, originally a reception center, is being rapidly transformed into an extensive hospital and rehabilitation center. Sixteen new large buildings, including an administration building, post exchange, Red Cross recreation hall, two gymnasiums, eight classroom buildings, and a central heating plant are being constructed or will soon get underway. All will be fireproof and of concrete construction. Seventy-one former barrack buildings are being converted into hospital wards and equipped with sprinkler systems and fire escapes.

Additional large buildings on the post will be converted into physical reconditioning, shop, physiotherapy, library, and music studio space. Classroom and shop space will be used both for occupational therapy and for teaching new trades and giving refresher courses in old trades to men who are to be discharged.

. . .

Mr. Max Wilner, chairman of the Board of Trustees of the Hospital for Joint Diseases, announces that Mr. Frederick Brown, the president of the Hospital, created the Mr. and Mrs. Frederick Brown Orthopedic Research Fellowship by an initial contribution of $7,500 on the occasion of his seventy-fifth birthday. Immediately after the war and as soon as young physicians return from military service, the hospital will begin awarding the research fellowship to carefully selected candidates to be nominated by a Committee on Awards. The Committee consists of Mr. Brown, president of the Hospital; Mr. Max Wilner, chairman of the Board; Mr. L. F. Rothschild, treasurer; Dr. A. J. Beller, president of the Medical Advisory Board; Dr. Henry L. Jaffe, director of laboratories; and Dr. J. J. Golub, director of the Hospital.

Under the terms of the fellowship the recipients of the awards will be chosen without regard to race, creed, or color. Applicants must be graduates of grade-A medical schools, and must have completed previous internships and approved residencies. The selection will be made on a merit basis, the qualifications being essentially scholarship, previous training, and research tendencies.

. . .

Plans for the new Kenmore Mercy Hospital were shown and details of the $250,000 building fund drive in April were discussed at a meeting attended by about fifty northern area physicians, on March 20, in Mercy Hospital, Buffalo. Dr. Daniel E. Stedem, chairman of the professional committee, presided.

. . .

Seventeen institutions received bequests aggregating more than $1,500,000 from the estate of Clarion B. Winslow, late executive of F. W. Woolworth Co., according to an estate tax appraisal filed on March 27. Principal legatees were the White Plains Hospital Association, with $497,661, and the White Plains Y.M.C.A., with $347,661.*

. . .

Stating that he wanted to do something for the village that "had been so good to me," Dr. Devillo N. Bulson, Rockville Centre physician, banker, and civic worker, in his will named the Mercy Hospital Association and the South Nassau Communities Hospital as two of his beneficiaries.*

. . .

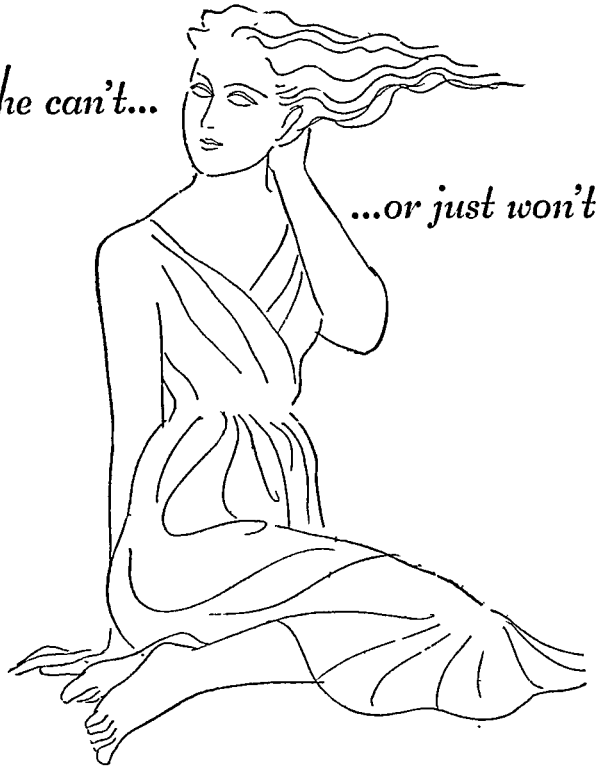
George Rosenberg, founder of Rex Products Corporation and vice-president of the firm, has made a donation of $10,000 to New Rochelle Hospital's $750,000 building fund campaign, it has been announced.

A check in that amount was turned over to Alex E. Norton, hospital superintendent, and Campaign Director A. R. Williams by Mr. Rosenberg.

In addition to making this cash contribution, Mr. Rosenberg has also accepted the chairmanship of a special gifts committee and has personally undertaken the solicitation of forty to fifty prospects.*

. . .

Two hundred volunteers in New Rochelle Hospital's $750,000 building fund campaign formally launched their drive in March at a dinner meeting at Wykagyl Country Club.



Samuel F. McDonald, chairman of the campaign, announced that contributions totaling $63,267 have already been received. Of that amount, he said, $30,000 came from members of the board of governors and $15,000 from the doctors.

The volunteers heard hospital officials discuss the building program from the standpoint of the hospital's present and future needs and received instructions and advice on how to make their solicitations.

The campaign seeks funds to build a $250,000 seven-story addition immediately and a new south wing within the next two years, or as soon as possible.*

when she can't...

...or just won't

So many pregnant women can't—or just plain won't—drink milk in sufficient quantity to meet their calcium requirements, that nutritive prophylaxis is frequently indicated. For simple routine to assure adequate intake of calcium, phosphorus and vitamin D, prescribe 2 capsules of Squibb Dicalcium Phosphate with Viosterol t. i. d. in conjunction with dietary adjustment. This recommended dosage supplies a total of 7.8 grains of calcium (in itself about one-half the total daily requirement) and an adequate amount of vitamin D to assure its utilization.

SULFA DRUGS FOUND TO HELP LEPROSY CASES

Leprosy may be brought under control in the British West Indies within the next twenty years through a program of public-health education, surveys and isolation, and treatment of the disease itself, Dr. Ernest Muir, medical secretary of the British Empire Medical Relief Association, told members of the American Mission to Lepers on February 8.

Dr. Muir is in New York en route back to England after passing four years at the leper hospital in Trinidad. He said experiments are under way there with two drugs of the sulfa family, promin and diasone. He called both "promising leads," though neither is a specific cure for the disease, any more than is the older chaulmoogra oil treatment. However, the drugs seem to aid in clearing up the ulcers peculiar to the disease.

"Leprosy," Dr. Muir declared, "is not the fearsome plague it has been pictured to be. It is not highly infectious like smallpox and is not necessarily fatal. It may be cured just as tuberculosis is curable; and, in fact, known cures have been made within a short time as with tuberculosis. Sometimes the disease has even seemed to cure itself, as the discovery of its presence is only detected after death."

Because the progress of the disease depends to some extent on the general health of the patient, Dr. Muir explained that occupational therapy is practiced in leprosariums, so that patients may be kept as healthy and happy as possible.

Leprosy thrives in conditions of poverty, undernourishment, congestion, and unsanitary surroundings, and while not originally a tropical disease it is on its way toward becoming one, Dr. Muir said, because it is in these areas that such conditions are most prevalent. The Empire Medical Relief Association, according to Dr. Muir, has been following a policy of educating doctors and lay personnel in recognition and treatment of the disease in those parts of the British Empire where it is endemic.

He stressed that, in the future, the problem must be dealt with on a regional basis, since infected persons, some of whom do not even know they have the disease, have been known to pass immigration officials with ease.

In Trinidad Dr. Muir organized a system under which each district medical officer came to the leprosarium for three months of study. After the officer had been there for two weeks Dr. Muir would leave the hospital and go to his district to make surveys, particularly among school children. In one school 4 per cent of the student body was infected, he said. Clinics were then set up where the local officer could treat those who were not ill enough to be sent to the hospital.

The American Mission to Lepers is conducting a campaign to raise $500,000 from voluntary subscriptions for the financing of a five-year postwar antileprosy program in eight foreign countries where the disease is most widespread. Chairman of the meeting was Dr. William Jay Schieffelin, chairman of the American mission.—*N.Y. Herald Tribune, Feb. 9, 1945*

WHEN WILL IT *Erupt?*

NO ONE CAN FORECAST the time when a volcano will become dangerously active nor the hour of a peptic ulcer attack

However, when peptic or duodenal ulcers do act up, medical consensus favors conservative measures.. including strict dietary regimen and the administration of adsorbents, demulcents and protectives

BISMAKAOLIN, exhibiting the known therapeutic efficacy of bismuth and kaolin, protects eroded surfaces provides adsorbent and detoxicant action in the treatment of chronic ulcerative colitis

For dependable and efficient medication in certain stomach and bowel conditions where surgical intervention is contraindicated, specify

BISMAKAOLIN

Woman's Auxiliary

To the Medical Society of the State of New York

County News

Broome County. The Woman's Auxiliary to the Broome County Medical Society held its March meeting in the Nurses' Home of the Wilson Memorial Hospital in Johnson City, with Mrs. Manuel Monserrate presiding at the business session.

Mrs. William E. Low, program chairman, introduced Miss Beatrice E. Ritter, R.N., director of nursing at the City Hospital in Binghamton, who reviewed the book, "Anything Can Happen." Miss Frances Van Campen, a student nurse at Wilson Memorial Hospital, rendered two piano selections during the evening.

Mrs. Raeburn Wharton was in charge of the refreshment committee.

Members of the county society were guests at a dinner dance held at the Arlington Hotel in Binghamton on April 18.

Erie County. Mrs. Edwin Griffin was installed as president of the Woman's Auxiliary to the Medical Society of the State of New York at a meeting of the executive board held April 30 and May 1 at the Hotel Statler in Buffalo. Mrs. Griffin succeeds Mrs. Carlton E. Wertz in the office of state president.

On April 30 the Executive Board was honored to have Mrs. David W. Thomas, national president, as its guest at a dinner in the Georgian Room of the Hotel Statler. Dr. Carlton E. Wertz and Dr. Abraham H. Aaron were guest speakers.

During the final day of the meeting Mrs. Griffin was installed as president, Mr. Harold Jarvis, executive secretary of the Erie County Medical Society, addressed the board members, and the Honorable Victor B. Wylegala spoke to them on the subject of juvenile delinquency.

Mrs. William Rennie was general chairman of arrangements for the meeting.

On May 3 Mrs. Allen E. Richter entertained the American Red Cross knitting group of the Erie County Auxiliary at her home. Mrs. Arthur R. Gibson will be the next hostess.

The next auxiliary meeting will be held on May 29 with Dr. Leslie A. Osborn, psychiatrist, as the guest speaker.

In cooperation with the Medical Society, the Woman's Auxiliary to the County of Erie Medical Society sponsored a cancer education meeting on April 18 at the Hotel Statler. Mrs. Carlton E. Wertz, former president of the Woman's Auxiliary to the Medical Society of the State of New York, headed the reception committee for the meeting.

Dr. Louis C. Kress, state director of cancer control, spoke and a group of medical authorities on malignant diseases conducted a panel discussion. The meeting was open to the public.

The special committee of the Woman's Auxiliary for the Cancer Control meeting was headed by Mrs. Jesse G. Levy. Others on the committee were Mesdames Fraser D. Mooney, William H. Handel, Allen E. Richter, Charles R. Borzilleri, Jr., Milton E. Kahn, Patrick J. Hurley, Joseph S. Tumiel, Ira C. Woolen, Lewis F. McLean, William Clark, Henry H. Goldstein, Louis A. Kaiser, William Rennie, John D. Naples, and Dexter S. Levy.

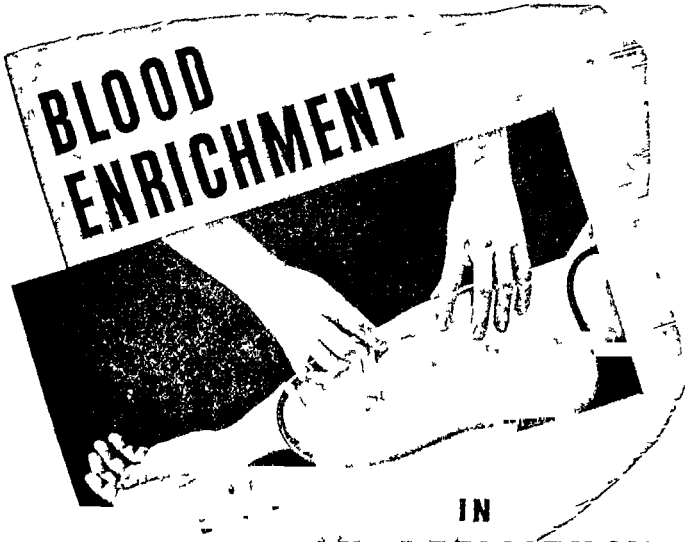
The regular luncheon meeting of the county auxiliary was held in the Chinese Room of the Hotel Statler on April 24. Mrs. Eleanor Chilcott, of the House of Stuart, gave a cosmetic demonstration, and gifts were presented to holders of lucky numbers.

Oneida County. The Woman's Auxiliary to the Medical Society of the County of Oneida held a luncheon meeting on April 10 at the Officers' Club of the Rome Army depot with twenty-six members attending.

Colonel Harbiman welcomed the guests, after which there was a brief business meeting presided over by Mrs. Bradford Golly, of Rome.

The guest speaker, Captain Richard Richards, gave a most interesting talk on "Juvenile Delinquency." The annual meeting of the auxiliary was held in Utica in May.

AMERICAN PSYCHIATRIC ASSOCIATION ANNUAL CONVENTION CANCELED

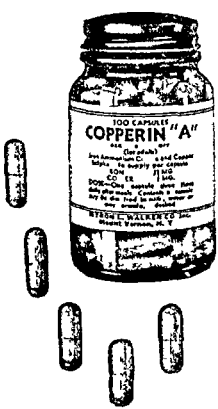


The American Psychiatric Association, the oldest medical society in America, has announced the cancelation of their one hundred and first annual meeting, which was to have been held in Chicago, in May of this year. It was the feeling of the Association that it would be the duty of the membership to fall in line with the request of the United States government to cancel conventions in the spirit of the war cooperation.

There will be a meeting of the Councillors of the American Psychiatric Association on February 26 and 27 to devise the means of taking care of urgent business of the Association arising out of the cancelation of the annual meeting.

The Association has been extremely active in war psychiatry during the past two years and the councillors of the Association will formulate plans for continuing the contribution made by members of the Association toward the advance of the war effort.

The Association was founded in 1844, the first meeting being held at the Jones Hotel, Philadelphia, on October 16, 1844.



Meetings of the organization have been held annually with the exception of 1861, during the outbreak of the Civil War, when it was recorded, "no meeting held on account of the disturbing conditions of the country."

IN IRON-DEFICIENCY ANEMIA

The blood in iron-deficiency anemia is markedly benefited by Copperin administration: hemoglobin percentages quickly rise; red blood cells increase in quantity and improve in quality.

Due to the action of the catalyst, copper sulphate, the amount of iron ammonium citrate per capsule is reduced to only 32 Mgm. But as ALL the iron is made available, maximum therapeutic effect is obtained. Copperin does not stain teeth or irritate the gastrointestinal tract and is water soluble. Prescribe Copperin "A" for adults, Copperin "B" for children.

All About Feeding Children. By Milton J. E. Senn, M.D., and Phyllis Krafft Newill. Octavo of 269 pages. Garden City, Doubleday, Doran & Co., 1944. Cloth, $2.50.

The Abortion Problem. Proceedings of the Conference Held Under the Auspices of the Committee on Maternal Health, Inc., At the New York Academy of Medicine, June 19 and 20, 1942. Editorial Committee, Earl T. Engle, Ph.D., and others. Octavo of 182 pages, illustrated. Baltimore, Williams & Wilkins Co., 1944. Cloth, $2.50.

The 1944 Year Book of Industrial and Orthopedic Surgery. Edited by Charles F. Painter, M.D. Duodecimo of 432 pages, illustrated. Chicago, Year Book Publishers, Inc., 1945. Cloth, $3.00.

Microbiology and Pathology. By Charles F. Carter, M.D. Third edition. Octavo of 777 pages, illustrated. St. Louis, C. V. Mosby Co., 1944. Cloth, $3.50.

Modern Methods of Amputation. By Edmundo Vasconcelos. Translated from the Portuguese by Walter Ratto. With an Introductory Survey of the Development of Amputation. By Maj. Gen. Norman T. Kirk (MC), Surg. Gen., U.S. Army. Quarto of 253 pages, illustrated. New York, Philosophical Library, 1945. Cloth, $10.

The Marihuana Problem in the City of New York. Sociological, Medical, Psychological and Pharmacological Studies. By the Mayor's Committee on Marihuana. Octavo of 220 pages, illustrated. Lancaster, Jaques Cattell Press, 1944. Cloth, $2.50.

A Textbook on Pathology of Labor, the Puerperium, and the Newborn. By Charles O. McCormick, M.D. Octavo of 399 pages, illustrated. St. Louis, C. V. Mosby Co., 1944. Cloth, $7.50.

REVIEWED

Principles and Techniques of Nursing Procedures. By Sister Mary Agnita Claire Day, R.N. Octavo of 574 pages, illustrated. St. Louis, C. V. Mosby Co., 1943. Cloth, $3.50.

This is a carefully compiled work for the preclinical student nurse. The material is well planned and organized with emphasis on the important parts of the technics and procedures. The illustrations are well done and adequate in number and show that considerable thought has been given to them. The steps in procedures as outlined can be followed without difficulty. The book has a good public health attitude; the patient is considered as an individual and not as just a condition. The book would make an excellent text and certainly should be used as a reference work. The bibliographies at the end of each unit are helpful for further study.

MARIE M. BEHLAN

Diseases of the Digestive System. Edited by Sidney A. Portis, M.D. Second edition. Octavo of 932 pages, illustrated. Philadelphia, Lea & Febiger, 1944. Cloth, $11.

This is the second edition of an important work, including contributions from fifty outstanding men each a specialist in his field. The chapter on the "Physiology of the Liver, Bile, and Gall Bladder" by A. C. Ivy and the one on "Diseases of the Liver" by Sidney A. Portis make the book worth possessing. The volume is packed with detailed information concerning gastrointestinal diseases, and references to very recent literature are well documented. The chapter on "Psychosomatic Disturbances" is interesting, although the theory of the cause of ulcer expounded by Franz Alexander will be accepted with difficulty by most gastroenterologists.

On the whole it is a complete résumé of the knowledge accumulated by the important workers in the field of gastroenterology. As an authoritative textbook its status is secure.

HENRY F. KRAMER

The Blood Pressure and Its Disorders Including Angina Pectoris. By John Plesch, M.D. Octavo of 149 pages, illustrated. Baltimore, Williams & Wilkins Co., 1944. Cloth, $4.50.

The author divides this book into three parts: (1) The arterial blood pressure, (2) the venous pressure, and (3) angina pectoris. However, approximately half of the book is devoted to the arterial blood pressure, and the greater part of this section is used to describe the tonoscillograph in which the author is greatly interested.

The author's style of writing makes it difficult for the reader to follow him, especially as his ideas are frequently not those which are most generally accepted.

VICTOR GROVER

The Urinary Tract. A Handbook of Roentgen Diagnosis. By H. Dabney Kerr, M.D., and Carl L. Gillies, M.D. Duodecimo of 320 pages, illustrated. Chicago, Year Book Publishers, Inc., 1944. Cloth, $5.50.

A wealth of knowledge is presented in this book in a clear and concise form. Illustrations are plentiful, of excellent quality, and most informative; legends are found conveniently near each picture, printed in legible type and worded carefully. As the authors exhibit remarkable talent for teaching, the book will be very useful for novice roentgenologists, for medical students, and also for nonroentgenologists.

Every page gives testimony of close cooperation

[Continued from page 1258]

between the urologist and the roentgenologist. The step-by-step x-ray appearance of the urethra after the different stages of transurethral resection should be of interest even to many experienced roentgenologists; and many a urologist may receive valuable suggestions as to what help may be expected from a cooperative roentgenologist.

In a later edition we would advise adding a chapter on excretion urography with particular reference to its advantages and disadvantages in comparison with retrograde urography.

S. W. WESTING

Manual of Urology. By R. M. LeComte, M.D. Third edition, revised. Octavo of 305 pages, illustrated. Baltimore, Williams & Wilkins Co., 1944. Cloth, $4.00.

This is the third edition of a manual primarily written for the medical student and general practitioner. It furnishes the fundamentals of all the common urologic diseases and includes the cause, pathologic anatomy, symptoms, differential diagnosis, prognosis, and treatment. The surgical procedures are indicated but are not described in detail. This newest edition includes the advances made in chemotherapy, a section on injuries to the genitourinary tract, and a chapter on pain and associated reaction.

This book is well written and will be appreciated by the student and practitioner and will answer their questions satisfactorily and quickly.

PHILIP GOLDFADER

Principles and Practice of Surgery. By W. Wayne Babcock, M.D. With the collaboration of 37 members of the faculty of Temple University. Quarto of 1,331 pages, illustrated. Philadelphia, Lea & Febiger, 1944. Cloth, $12.

This volume is particularly designed for students and practitioners, as it attempts to include in one number the basic principles of surgery and the more recent advances in surgical diagnosis and treatment. Although many of the sections are brief when they pertain to basic principles, nevertheless, sufficient underlying principles in surgery are included to make it extremely valuable both to the student and for ready reference by the general practitioner and surgeon.

The section on traumatic surgery is up to date and many of the new methods of treatment are stressed. The section on infections adequately presents the modern concept of the treatment of these problems. Surgical technic is well illustrated and amply discussed to be a sufficient guide as a ready reference. The illustrations and bibliography are very well presented.

IRWIN E. SIRIS

The Medical Clinics of North America. Boston Number. September, 1944. Octavo, illustrated. Philadelphia, W. B. Saunders Co., 1944. Published bimonthly (six numbers a year). Cloth, $16 net; paper, $12 net.

This symposium can be described as excellent. The articles are all timely, well written, and authoritative. The subjects include the treatment of staphylococcic infections, pneumonia, the use of thiouracil, and many problems of present-day interest. The authors are all well recognized in their respective fields. The result is a volume which can be highly recommended to the general practitioner and specialist.

VICTOR GROVER

Atlas of the Blood in Children. By Kenneth D. Blackfan, M.D., and Louis K. Diamond, M.D. Quarto of 320 pages, illustrated. New York, The Commonwealth Fund, 1944. Cloth, $12.

This excellent book will undoubtedly enjoy a well-deserved and universal popularity. It contains a mine of meaty information in a palatable and quickly assimilable form. The numerous comprehensive plates resemble color photographs, and were painstakingly drawn by hand with no effort spared to insure accuracy. They beautifully and faithfully portray every cellular detail so that the use of these plates will be invaluable when the problem arises of identifying puzzling blood cells encountered on smears of blood or bone-marrow. The text is written in terse but interesting and lucid style, and each of the plates is fully and authoritatively explained. Since the information and plates are useful in the study of the blood of adults as well as children, every physician should obtain a copy of this book, if he can do so before the edition is exhausted, as it undoubtedly quickly will be.

A. S. WIENER

The Woman Asks the Doctor. By Emil Novak, M.D. Second edition. Octavo of 130 pages, illustrated. Baltimore, Williams & Wilkins Co., 1944. Cloth, $1.50.

The necessity for a second edition of this small volume published for the laity attests to its usefulness and popularity, although this edition has been somewhat abridged due to wartime restrictions. However, the important subjects which appeal mostly to the average intelligent lay woman have been retained. It is illustrated with simple line drawings which are quite a help to the understanding of the subject matter. Figures 3 and 5 have been erroneously exchanged, but this is barely noticeable except on close scrutiny. The fifteen chapters, lucidly written and authoritatively explained, cover the range of female anatomy, physiology, and pathology from puberty to the menopause.

This book is highly recommended to the woman who wishes to understand her own body and her sex life.

J. HALPERIN

Control of Pain in Childbirth. Anesthesia. Analgesia. Amnesia. By Clifford B. Lull, M.D., and Robert A. Hingson, M.D. Octavo of 350 pages, illustrated. Philadelphia. J. B. Lippincott Co., 1944. Cloth, $7.50.

This book is an excellent and very comprehensive compilation of up-to-the-minute information of great value to the obstetrician. Caudal anesthesia in particular is very well covered, yet as much can be said for all other forms of anesthesia and analgesia. The experience and prominence of the authors, their simple, easy style, and the handsome illustrations make this book very much worth while. Every serious practitioner of obstetrics will enjoy this book and profit much by reading it.

CHARLES A. GORDON

Soldier to Civilian. Problems of Readjustment. By George K. Pratt, M.D. Octavo of 233 pages.

BAUNER LAB., 309 FIFTH AVENUE, NEW YORK 16, N. Y.

"DOCTOR JONES" SAYS—

Back two or three years ago somebody told one of the county nurses that Dr. Jones referred to nurses as "angels without wings." "Well," she says, "I don't know about the angel part of it but we sure could use some wings." If they needed wings then they certainly need 'em more'n ever today. But even if they had 'em there still wouldn't be enough nurses to go around.

The trouble is: when most of these nurses were getting their training we weren't figuring on another world war with hundreds of thousands of sick and wounded servicemen to be looked after. And our standards as to the number we ought to be employing in civilian nursing work were so low—well, it was practically rock-bottom minimum. That's why, when the war takes so many of 'em, it leaves us pretty well strapped, so far as civilian service is concerned.

Around seven thousand nurses from New York State have gone into military service already, so I'm told. And still they haven't got anywhere near enough. This Procurement and Assignment Service (of the War Manpower Commission): their job is to see that the armed services get the nurses they need but also to see that essential civilian services are maintained.

Naturally, the armed services head the priority list. But public-health nursing is war work, too (and, for that matter, the instruction of nurses in the first place) and it's high up on the list. Preventing the spread of communicable diseases, looking after the wives and babies of servicemen, keeping health conditions at a safe level on the home front—it all contributes to manpower and morale, and lessens the likelihood of interruption of the flow of war supplies. Without the public-health nurses we can't do any of those things effectively.

The way they're stimulating young women to go

we've ever had. It'd not only mean better health
for the com-
e've got any

[Continued from page 1260]

New York, McGraw-Hill Book Co., 1944. Cloth, $2.50.

The author of this timely book speaks from a wealth of experience in the skillful manipulation of the working tools of understanding and ameliorating the manifold problems in adjusting the civilian to military life and his return to civilian status. The book is written in an easy, flowing style with the use of terms so well chosen that the meaning is effectively brought home to the reader, be he physician, relative, friend, or employer.

The contents critically evaluate in a practical fashion the equipment the soldier took with him into service, what the military experience did to him, and how the army prevents strains of adjustment. The chapter dealing with soldiers with psychiatric disabilities is of particular interest to every physician. Since approximately 45 per cent of those discharged from the army are released for neuropsychiatric disabilities, every physician must be adequately professionally attuned to this number-one health problem of our returning men. The family *and relatives will profit by the chapter on* "The First Weeks at Home" and "Getting Reacquainted with the Family." The employer will need to grasp the significance of the chapter on "Going Back to Work." There is an appendix, "Community Services for Veterans," which makes known all types of community services aiding information service centers in assisting returning men and women to civilian life. Dr. George S. Stevenson, Medical Director for the National Committee for Mental Hygiene, keynotes the book with a pithily formulated foreword. Our responsibility in understanding and serving the needs of returning servicemen and -women needs the enlightened experience-determined assistance which this practical and scientific book offers to all of us.

FREDERICK L. PATRY

Handbook of Diagnosis and Treatment of Venereal Diseases. By A. E. W. McLachlan, M.B. Duodecimo of 364 pages, illustrated. Baltimore, Williams & Wilkins Co., 1944. Cloth, $5.00.

This concise work of some 350 pages is intended primarily for the medical student and the clinical practitioner. Venereal diseases only are considered—the major portion of the work is devoted to the study of syphilis in all stages. The book is fully and clearly illustrated, adding greatly to the value of the text. Despite the fact that it is is a new publication nothing is given concerning the penicillin treatment of gonorrhea. The various tabulations included in the work are valuable. The author is to be commended for his contribution to the diagnosis and treatment of venereal diseases.

AUGUSTUS HARRIS

Textbook of General Surgery. By Warren H. Cole, M.D., and Robert Elman, M.D. Fourth edition. Octavo of 1,118 pages, illustrated. New York, Appleton-Century Co., Inc., 1944. Cloth, $10.

The fourth edition of this *Textbook of General Surgery* is the product of careful and competent research by the authors and consulting authors. The job has been well done and the subject matter brought up to date.

As would be expected because of military medical activity, war surgery has been amplified. This is a most fortunate amplification of the text and has been well done. It is refreshing to see again entire chapters contributed by outstanding, able surgeons throughout the United States.

This text is for the student and the surgeon and we trust that the surgeon will always be a student. In detail and in arrangement the subject matter is well suited to students, surgeons, and general practitioners. There are many parts of the text so ably written as to be without equal. We recommend without qualification the entire text to the medical profession.

ROBERT F. BARBER

Traumatic Injuries of Facial Bones. An Atlas of Treatment. By John B. Erich, D.D.S., M.D., and Louie T. Austin, D.D.S. In collaboration with the Bureau of Medicine and Surgery, U. S. Navy. Octavo of 600 pages, illustrated. Philadelphia, W. B. Saunders Co., 1944. Cloth, $6.00.

Traumatic Injuries of Facial Bones by Dr. John B. Erich and Dr. Louie T. Austin is a compact and informative atlas which ought to be available to those surgeons who are called upon to treat injuries of that nature. At the expense of repetition, each problem is handled in detail with adequate semidiagrammatic photographs and explanatory notes sufficient to enable the man inexperienced in this field to cope with the many situations that may arise. The use of many dental and surgical appliances in conjunction with good surgical principles should recommend reference to this book to those who have had a fair background in maxillofacial surgery.

DAVID TEPLITSKY

Clinical Cystoscopy. A Treatise on Cystoscopic Technic, Diagnosis, Procedures, and Treatment. By Lowrain E. McCrea, M.D. Drawings by B. Engle Shaffer. Two volumes. Large octavo of 1,056 pages, illustrated. Philadelphia, F. A. Davis Co., 1945. Cloth, $25.

This two-volume work is printed on fine paper and the color plates, black-and-white illustrations, and photographs of bladder lesions are all excellent.

This book is a valuable urologic museum. It presents the clinical observations on diagnosis, management, and treatment of most urologic conditions. It is replete with classically sound advice for average cases. It belongs in any complete library and will be especially useful for the practitioner in small hospitals in small places.

The complete schematic presentation of the various topics will be of great aid to any teacher, and to students. There is a chapter on medical diseases of the kidney, one on urology in women, and another on urology in children.

The statements are made in clear, simple words with no complex phraseology, and while one may question their entire accuracy, still this is a better way to write such a book than to present a hundred latest theories and let the student or general surgeon take his choice.

IN THE CONSERVATIVE MANAGEMENT OF

Gallbladder Disorders

Torocol augments the secretion of bile, and tends to improve evacuation of the gallbladder. Constipation, due to deficient bile flow, is overcome through effective stimulation of peristalsis. Torocol is of special value in low-grade, chronic gallbladder disease, particularly when surgery is deemed inadvisable.

TOROCOL relieves:
Epigastric and right upper quadrant pain.

TOROCOL overcomes:
Food intolerance.

TOROCOL corrects:
Postprandial pyrosis and eructation.

TOROCOL permits:
Liberalization of the diet.

Each tablet of Torocol presents: Bile Salts, 1 gr.; Extract Cascara Sagrada, 1 gr.; Phenolphthalein, 1 gr.; Oleoresin Capsicum, 1/40 min.; Oil of Peppermint, 1/200 min.

The rationale of this time-tried formula is evidenced by the action of its ingredients. The bile salts in Torocol, sodium taurocholate and sodium glycocholate, are highly purified. Phenolphthalein, cascara and capsicum exert their well-known influence upon intestinal activity. Oil of peppermint contributes to the patient's relief and aids in restoring the appetite.

Available in bottles of 100, 500 and 1,000 through all pharmacies

GREATER AND MORE PROLONGED ACID NEUTRALIZING POWER

Magmasil

An Outstanding Pharmaco-Chemical Achievement

•

Magnesium Trisilicate In a True Magma

•

Contains No Aluminum Hydroxide

•

Not Constipating

Clinical response to Magmasil sets a new high standard in the treatment of peptic ulcer, gastritis, hyperchlorhydria. Since it is free from the drawbacks of many other antacid medications, Magmasil therapy is marked by dependable patient cooperation.

Magmasil cannot lead to alkalosis, to chloride depletion, to constipation. In the dosage employed, it exerts no influence whatsoever on intestinal motility.

Since its profound neutralizing power (86 cc. of N/10 HCl per teaspoonful) is exerted over fully four hours after ingestion, fewer doses are needed, and pain and pyrosis do not recur. The customary eleven o'clock dose usually holds the patient comfortable through the night.

Because of its high protective action Magmasil leads to rapid remission and unimpeded healing.

THOS. LEEMING & CO., INC.
155 E. 44th St. New York, N.Y.

The Flying Capsules

R J Reynolds Tobacco Company Winston-Salem N C.

Now in use on the battle fronts, for speedy evacuation of wounded from nearly inaccessible areas, is this Helicopter with "capsule" stretchers attached to sides

WHEREVER our soldiers are fighting, Army medical men have established a speedy life line for wounded. So fast and so efficient is it that often the wounded are under the care of skilled medical officers *within a matter of mere minutes!*

In this stepped-up tempo of war, however, the Army doctor finds little "time out" for himself. When there is a "break" in his long hours, his relaxation may be limited to a few pleasant moments with a cigarette... very likely a Camel, for Camels are such a big favorite with men in all the services.

Camel—*costlier tobaccos*

Specific Treatment

OF FALL HAY FEVER

RAGWEED COMBINED ALLERGEN

A NEW ADDITION TO THE TUBEX PREPARATIONS, Ragweed Combined Allergen, is made from the pollens of both the giant and short varieties of ragweed.

The importance of the Ragweed group as causative agents of fall hay fever can hardly be exaggerated and the use of a mixture of these two pollens for parenteral therapy is both logical and practical.

Hyposensitization injections provide greater relief than any other form of treatment.

THE FOLLOWING TUBEX POLLEN TREATMENT SETS ARE ALSO AVAILABLE:

Mixed Grasses • Southern Formula • Rocky Mountain Formula
West Coast Formula, Early Summer
West Coast Formula, Late Summer

QUIETING
THE TROUBLED WATERS

. . . THROUGH ADEQUATE THERAPY OF THE MENOPAUSAL SYNDROM

When menopausal disquietude threatens emotional stability, complete control of tl symptomatology—including alleviation of nervous disturbances and restoration of sense of well-being—becomes the primary therapeutic objective. ▪ In combining amp hormonal compensation with safe sedation, Hexital offers the physician a distinct advantageous estrogenic preparation. Hexital contains 3 mg. hexestrol (significant less toxic than stilbestrol) and 20 mg. phenobarbital per tablet. ▪ Clinical evidenc suggests that the combined use of hexestrol and phenobarbital (Hexital) reduces to minimum untoward side effects, so often characteristic of synthetic estrin medicatio SUPPLIED: 100 and 1000 to the bottle, in scored tablets. Pavatrine with Phenobarbital

This new and improved spasmolytic agent—developed by original Searle research—offers a threefold measure of relief in—

Gastrointestinal spasm (the "irritable bowel")
Uterine hypertonicity of dysmenorrhea
Urinary bladder spasticity

Non-narcotic, Pavatrine with Phenobarbital combines the *neurotropic* and *musculotropic* antispasmodic actions of Pavatrine with the central nerve *sedation* of phenobarbital.

Each sugar-coated tablet contains 125 mg. (2 gr.) Pavatrine (Searle) with 15 mg. (¼ gr.) Phenobarbital. Supplied in bottles of 100 and 1000.

G. D. SEARLE & CO., Chicago 80, Illinois

Pavatrine is the registered trademark of G. D. Searle & Co.

Effective Local Therapy in *Hay Fever*

The blurring of vision and lacrimation caused by pollen irritation, as well as the incessant attacks of sneezing, interfere greatly with the working capacity and recreation of the hay fever patient. As shown by cumulative experience, rapid and often complete relief may be obtained during the entire season by the use of

ESTIVIN

One drop in each eye 2 or 3 times daily is generally sufficient to keep the average patient comfortable during the entire hay fever season. In more severe cases, additional applications whenever the symptoms recur will assure relief throughout the day.

NO 8 OF A SERIES • • • "PREMARIN" THERAPY AT THE MENOPAUSE

WILL THIS WOMAN BE *Your Patient?*

No woman escapes the menopause. Some are fortunate enough to experience only mild discomfort, but a large proportion will eventually look to their physicians for help. In "Premarin" the physician will find a medium for estrogenic therapy which extensive clinical work has shown to be highly effective. "Premarin," although derived exclusively from natural sources, is highly potent. It is exceptionally well tolerated, and has the desirable property of imparting a feeling of well-being.

Now available in 2 potencies:
No. 866: Bottles of 20, 100 and 1000 Tablets
No. 867 (Half-Strength): Bottles of 100 and 1000 Tablets

When the pressure is low—
the circulation slackens

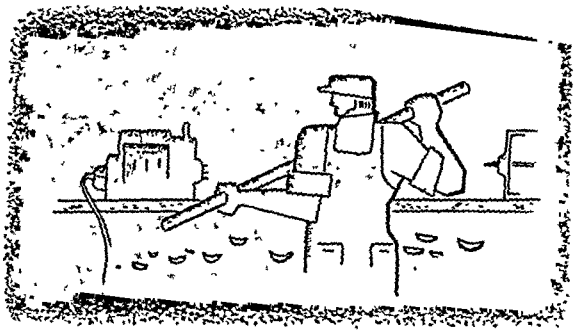
In chronic hypotension or states of circulatory deficiency associated with convalescence, mild collapse, and other asthenic states, Sympatol provides convenient symptomatic therapy. Orally effective, Sympatol improves the peripheral circulation by raising systolic and venous pressure and increasing cardiac output Circulation time is shortened although the pulse rate is frequently slowed

Sympatol

To Improve Peripheral Circulation

THERAPEUTIC APPRAISAL A synthetic pressor drug,—para methylamino ethanolphenol tartrate—for providing safe circulatory stimulation Sympatol on oral administration increases venous and systolic pressures significantly diastolic pressure only slightly with little or no effect on the central nervous system Repeated doses are consistently and uniformly effective

INDICATED for symptomatic treatment of circulatory atony—to improve peripheral circulation to increase cardiac output and shorten circulation time, to increase cardiac efficiency



DOSAGE Adults—1 to 3 tablets three times daily or 1 to 2 cc of solution every four to six hours Children—5 to 10 minims of solution repeated as required

SUPPLIED in 100 mg tablets bottles of 50 10% solution (100 mg per cc) for oral use bottles of 30 cc

ASPIROCAL

by its combined analgesic-antispasmodic action, promotes quick symptomatic relief in headache, neuralgia, dysmenorrhea and general nervousness, as well as in the common cold and influenza. Aspirocal complies with the requirements for an ethical, non-narcotic therapeutic agent as evidenced by its formula—

EACH TABLET ASPIROCAL COMP. CONTAINS:

Acid Acetylsalicylic..... 4 gr.
Calcium Gluconate..... 2 gr.
Butisol (5-ethyl-5-secondary butyl barbituric acid 'McNeil')....⅓ gr.

Being strictly a prescription product, Aspirocal enables the physician to keep symptomatic relief of pain under his constant supervision.

Supplied in bottles of 100, 500 and 1000 tablets.

We will be pleased to send clinical samples of Aspirocal to physicians on their request. Caution: Use only as directed.

Calcium Pantothenate	0.333 mg.
Niacinamide	10 mg.
Mixed Natural Tocopherols	3.4 mg.

The systemic phase of arthritis involves many organs and metabolic processes, with the functions of which vitamins are directly concerned. Darthronol, through the combined pharmacodynamic and nutritional influences of its nine constituents, has proved a valuable aid in antarthritic therapy directed at arrest and correction of both the systemic as well as the articular manifestations of the disease.

No single vitamin, regardless of the amount used, can combat all these local and systemic involvements. Only when adequate amounts of all the essential vita-

TO THE MULTIPHASIC INVOLVEMENTS IN ARTHRITIS

mins were administered has optimal improvement of the arthritic, as a whole, been observed. Comprehensive literature will be sent on request.

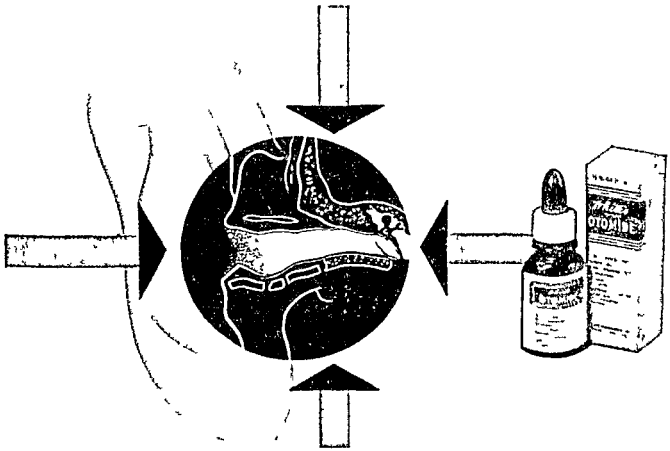
Similar to human milk

★The name is never abbreviated; and the product is not like any other infant food — notwithstanding a confusing similarity of names.

The fat of Similac has a physical and chemical composition that permits a fat retention comparable to that of breast milk fat (Holt, Tidwell & Kirk, Acta Pediatrica, Vol. XVI, 1933) . . . In Similac the proteins are rendered soluble to a point approximating the soluble proteins in human milk . . . Similac, like breast milk, has a consistently ZERO curd tension . . . The salt balance of Similac is strikingly like that of human milk (C. W. Martin, M. D., New York State Journal of Medicine, Sept. 1, 1932). *No other substitute resembles breast milk in all of these respects.*



ACCEPTED AMERICAN MEDICAL ASSN. Council on Foods

A powdered, modified milk product especially prepared for infant feeding, made from tuberculin tested cow's milk (casein modified) from which part of the butter fat is removed and to which has been added lactose, olive oil, cocoanut oil, corn oil and fish liver oil concentrate

for BOTH Acute and Chronic
BACTERIAL EAR INFECTIONS

White's OTOMIDE

More effective topical chemotherapy for both acute and chronic ear infections is now provided in the scientific formula of White's Otomide:

FORMULA:

Carbamide (Urea)	10%
Sulfanilamide	5%
Chlorobutanol	3%
Glycerin	q.s.

ACTION:
Effectively antibacterial and analgesic; hypertonic, non-irritating.

ADVANTAGES:
1. Carbamide in association with sulfanilamide enhances *antibacterial activity*, inhibits sulfonamide-antagonists in purulent exudates.

2. Chlorobutanol (therapeutically compatible with sulfonamides) provides effective *local analgesia.*

3. The foul odor and discharge of purulent otorrhea are promptly overcome.

INDICATIONS:
Local prevention and treatment of acute and chronic bacterial infections of the middle ear and external auditory canal.

● White's Otomide is available in dropper bottles of one-half fluid ounce (15 c.c.)—*on prescription only.*

"YOU'LL FIND THE SPA A FRIEND IN TIME OF NEED, AS I HAVE"

. . . says the harassed practitioner whose wartime load it has helped to lighten.

Saratoga Spa is accommodating an unusually large number of patients suffering from such conditions as cardiac, vascular or rheumatic disorders which may be aggravated by wartime strain.

A large proportion of these men and women are patients of practicing physicians who have found the treatments here very beneficial to former patients.

The facilities which New York State has erected around the famed mineral waters of the Spa are extensive. They will provide amply for the needs of your own patients for whom restorative treatment is indicated, under regimens of care which you yourself have recommended.

For professional publications of The Spa, and physician's sample carton of the bottled waters, with their analyses, please write W. S. McClellan, M.D., Medical Director, Saratoga Spa, 155 Saratoga Springs, N. Y.

Designed *to* ASSIST *the* PATIENT

THE "RAMSES"* Diaphragm Introducer, designed after consultation with gynecologists, engages the rim of the 'RAMSES" Flexible Cushioned Diaphragm at two points, shaping it into an elongated oval, thus enabling it to pass readily into the vagina By providing complete control over the direction of travel, the "RAMSES" Diaphragm Introducer assures proper and accurate placement of the diaphragm

1. The wide, blunt tip of the RAMSES Diaphragm Introducer is designed to prevent even the remote chance of accidental penetration of the uterus during insertion of the diaphragm

2. Made of easily cleansed plastic, the RAMSES Diaphragm Introducer has no minute crevices to harbour bacterial growth—no sharp projections to cause possible vaginal injury

3. The broad, rounded hooked end of the RAMSES Diaphragm Introducer—used for diaphragm removal—guards against possible entry into the urethra

Your patients obtain the "RAMSES Diaphragm Introducer when you specify the "RAMSES Physicians Prescriptions Packet No 501

"RAMSES' Gynecological Products are suggested for use under the guidance of a physician only They are available through recognized pharmacies

Announcing

LUSYN

TABLETS

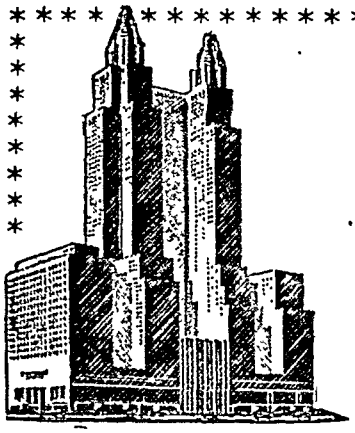
In functional gastro-enteropathies

A rational new application of three distinct components successfully complementing the action of each other, both pharmacologically and therapeutically, has resulted in the formulation of LUSYN in Malthie's research laboratories.

Highly effective, yet *non-toxic* in recommended dosage, LUSYN's clinical efficacy lies in its unique threefold pharmacological action:

1. Its homatropine methylbromide (1/21 gr.) relieves *gastro-intestinal spasm* without unpleasant side effects.
2. Its phenobarbital (1/8 gr.) aids in providing *central sedation*, thus helping to control the psychogenic factor.
3. And its alukalin (5 gr.) is a potent *antacid* and *adsorbent*, which tends to *reduce irritability* and *add bulk*.

Indications include: pylorospasm—cardiospasm—unstable colon—biliary dyskinesia—biliary colic—and as an adjuvant to the dietary and medical management of peptic ulcer, intestinal flatulence and gastro-enteritis.



Suggested dosage: 1 or 2 tablets before meals.

Supplied in bottles of 100 tablets each.

CAMP

Orthopedic Support FOR Chronic Low Back Pain

Patient of intermediate type-of-build (skeleton indrawn)

This lumbosacral support is specifically designed to limit the range of the lumbar spine bending when either the framework or soft tissues of the low back are the seat of injury or disease. Effective support is given the gluteal region, the lumbar spine and the sacro-iliac and lumbo-sacral joints. The adjustment about the pelvic girdle prevents undue pressure of the upper adjustments and yet the presence of the center adjustment gives relief and comfort to the patient. Provision is made for reinforcement with aluminum uprights when indicated.

ANALGESIA IN LABOR

SAFE • Four years of intensive clinical research, with more than 1,400 published cases, have established Demerol analgesia in labor as a safe procedure. Demerol analgesia is harmless to mother and baby. It does not weaken uterine contractions or lengthen labor. There are no post-partum complications due to the drug.

SIMPLE AND EFFECTIVE • Demerol hydrochloride is administered orally or by intramuscular injection. Average dose: 100 mg., when the pains become regular, repeated three or four times at intervals of from 1 to 4 hours. In analgesic power Demerol hydrochloride ranks between morphine and codeine; it also has a spasmolytic effect comparable with that of atropine, as well as a sedative action. It may also be used in conjunction with scopolamine or barbiturates for amnesia.

PLENTY OF ACTION ON THE TOMATO FRONT

● Ever see a tomato planting machine in action? That is one pictured above—in a Kemp's Sun-Rayed field. Many of these tractor-drawn machines are manned by women and children who drop the pedigreed seedlings at mechanically timed intervals into furrows which the machine makes, waters, covers. In north central Indiana, where the world's finest tomatoes are grown, we shall pack millions of cans of Kemp's Sun-Rayed brand Tomato Juice to help meet war-time needs. All of it will be made, of course, by Kemp's patented process which insures high retention of vitamins A, B_1 and C.

tablets. Ethically promoted—not advertised to t
laity. White Laboratories, Inc., Pharmaceutical Man
facturers, Newark 7, N. J.

By combining the specific antibacterial actions of both mandelic acid and methenamine, the resultant compound—Mandelamine—achieves a far wider range of therapeutic activity while eliminating most of the toxic reactions which are frequently encountered when either of these components is used alone.

In addition to its greater effectiveness and lower toxicity, Mandelamine is of value to the busy physician by virtue of the convenient manner in which it may be administered. There is no need for accessory acidification, restriction of fluid intake, dietary control, or other special measures during the course of Mandelamine therapy. And the average daily dose is 3 or 4 tablets 3 times daily.

Literature, and a physician's sample will be mailed to you upon return of coupon.

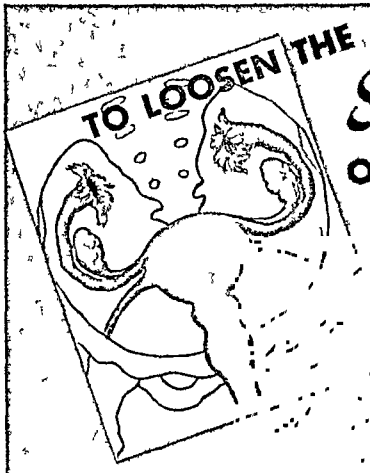
By the light of the moon



Might as well expect the average child to get adequate vitamin D "by the light of the moon" as to depend wholly on the sun. Even in the summertime when the sun is shining many children are not as exposed to it as we might think. Cloud filtration and the uncertainty of adequate exposure even in such sunny areas as California[1] have led leading nutritionists to the conclusion that supplementation with vitamin D is essential. Essential as long as growth persists—through infancy, childhood and adolescence.

Regardless of season or geography, Upjohn makes available convenient, palatable, highly potent natural vitamin preparations to meet the varied clinical requirements of earliest infancy through late childhood.

Upjohn Vitamins

1. Am. J. Dis. Child. 54: 1227, 1937.

Spastic Grip
OF DYSMENORRHEA

Many cases of dysmenorrhea of functional origin, uncomplicated by demonstrable pathology, which fail to respond to other therapeutic measures, are found to yield gratifyingly to Donnatal administration • Donnatal is a combination of the *only belladonna alkaloids possessing therapeutic importance* (hyoscyamine, atropine and scopolamine), for effective relief of spastic uterine contractions by *non toxic* peripheral action It also contains a minimal dosage of phenobarbital (¼ gr per tablet), for safe, *non narcotic* sedation in control of the psychogenic *aspect so frequently present* The *three alkaloids* in pure natural form (and in predetermined dosage) are apparently pharmacodynamically synergetic—imparting to Donnatal a therapeutic effect greater than the sum total of its ingredients • Of interest to many patients, Donnatal is available at *notably less cost* than synthetic preparations

AVAILABLE: In bottles of 100 tablets.
FORMULA: Each tablet contains Phenobarbital — ¼ gr belladonna alkaloids (hyoscyamine atropine and scopolamine) equivalent to .5 m.m. belladonna

MANUFACTURING CHEMISTS TO THE MEDICAL PROFESSION SINCE 1858

For the diabetic, Knowledge is Life

OPTIMAL SUCCESS in the management of diabetes mellitus depends largely on the patient's knowledge of the disease. Physicians carefully educate their diabetic patients. Facts concerning blood and urine sugar, diet, exercise, Insulin, and Protamine Zinc Insulin are valuable steppingstones to successful treatment. Other things being equal, the well-trained patients live the longest.

Iletin (Insulin, Lilly) preparations are products of purity, stability, potency, and uniformity. They are subjects of constant research and are in ever-increasing demand. Eli Lilly and Company, Indianapolis 6, Indiana, U. S. A.

The Record of an Outstanding Institution

In his recently published book, *New York Hospital*, a history of the psychiatric service from 1771 to 1936, Dr. William H. Russell gives an account of the earliest, and for nearly fifty years, the only provision for the hospital treatment of the mentally ill in the State of New York, and its subsequent development.

In 1792, the year in which New York Hospital admitted its first mentally ill patient, Dr. Philippe Pinel created a sensation in Europe when, at a hospital in Paris, he released "a large number of patients from chains and fetters and replaced the severe repressions and drastic medical practices that were then universally employed with a system of 'moral treatment.'" Only one institution, the Pennsylvania Hospital, in Philadelphia, existed in British America prior to the establishment of New York Hospital. There, Dr. Benjamin Rush, "like a voice in the wilderness, was calling for more rational, humane, and effective treatment for the mentally ill." Not until 1769 were three students granted diplomas from Kings College Medical School in New York, at which time Dr. Samuel Bard in an address "accomplished the first steps in the campaign for the establishment of 'the Hospital in the City of New York,'" which, in 1771, began its long and memorable service to the mentally ill.

The long, tedious struggle to implement, practically, the more advanced medical thought of a postrevolutionary period in terms of medical education and better hospital facilities is set forth by Dr. Russell in what amounts to a comprehensive early medical history of New York City. It covers the purchase in 1815 of land for the Bloomingdale Asylum and a proposed new system of "moral treatment" advocated by Mr. Thomas Eddy, one of the Board of Governors of the Hospital, a Quaker, and "a tireless worker for the welfare of humanity." Thirty-eight acres of land, seven miles from Federal Hall on Wall Street, part of the estate of Gerald DePeyster at Bloomingdale, were purchased, and on June 1, 1821, Bloomingdale Asylum was officially opened.

By 1830, Governor Throop,[1] "after de-

[1] Annual message to the New York Legislature.

scribing the neglect and mistreatment of the mentally ill throughout the State, added: 'The contrast of their condition with those in the Lunatic Asylum in New York (Bloomingdale) is very striking. In the latter place everything is spacious, cleanly, and pleasant to the eye; the inmates are suffered to be at liberty and range in the open air in an enclosed yard, they are treated with kindness . . . .; the consequence is, that many who are placed there are restored to reason and discharged after a short period, to enjoy the society of their friends . . . . but one out of sixty or seventy then under care were in close confinement.' " Not until 1896—under the State Care Act of 1890—were all "the insane poor" provided for in state hospitals. By 1840, the fact had been impressively established that a fair proportion of the mentally sick could be cured. The forms of disorder were classified as mania, monomania, dementia, and idiocy. In 1845, an early essay in adult education as a means of group treatment was commenced by Dr. Pliny Earle, who succeeded Dr. Wilson as medical director, and increased recreational facilities were provided.

From 1851 to 1877 the Asylum was subject to many investigations and criticisms, out of which arose some changes for the better. Meanwhile, recognizing the necessity for expansion, property had been acquired at White Plains after many other sites had been investigated, and in May, 1892, work was commenced on "The Society's Farm at White Plains." Bloomingdale, with the "Asylum" omitted, was moved to White Plains in 1894. The school for adult education, established by Dr. Earle but subsequently abandoned, was re-established in 1895; nurse training grew out of the former lecture course for attendants, and in 1897 two women and three men who had completed the course of instruction were given certificates and badges. In 1905 modern clinical and laboratory methods were introduced, building expansion again took place, and a superintendent of nurses was appointed in 1912. Between 1926 and 1936 a complete organization for service, education, and research was established under Dr. Russell and continued successively by Dr. Mortimer Raynor and Dr. Clarence Cheney.

New York Hospital comprises a wealth of historical research and presents a review of the development of the care of the mentally ill in the City of New York which should fascinate all who are interested in truly pioneering movements in the field of psychosomatic medicine. Dr. Russell and his coworkers are indeed to be congratulated on a monumental and fascinating work. At this time, when interest in and support for psychosomatic medicine is widespread, it is well to honor in retrospect those who labored successfully with enlightened inspiration to bring about rational, scientific treatment and hospitalization of the mentally ill.

Infectious Hepatitis

Catarrhal jaundice is no longer so designated in our modern textbooks.[1–3] With increasing knowledge our altered concept has compelled a change of its former name to infectious hepatitis, but the previous term is retained as a pseudonym, a linkage with the past. The present war has heightened the incidence of this form of jaundice and emphasized its epidemic nature. In the Mediterranean military sphere infectious hepatitis has been one of the three most common diseases, sharing this doubtful distinction with malaria and venereal diseases.[4]

The former view of catarrh of duodenum and bile ducts as the causative mechanism is no longer seriously maintained, for the pathology is that of diffuse hepatitis with presumably secondary involvement of the finer bile ducts. Its epidemic nature and similarity to the jaundice caused by homologous serum injections have led to studies which seem to incriminate a virus as the causative agent. The virus has been successfully transferred by inoculation with the blood, bile, stools, and liver tissue obtained during the acute stage of the disease.[5,6]

This work receives clinical support by the rarity of second attacks, indicating a lasting immunity often associated with virus infections. The incubation period averages about one

month, but may be much longer. The incidence peak is from October to November, giving rise to the suspicion that insects may play a prominent role in its dissemination.[4] The virus can be spread by droplet infection as well as by excreta, infected food and water, and flies. These findings call for isolation of the patient in the acute stage, and proper disposal of his discharges.

The clinical picture is too well known to require elaboration, but certain features merit repetition. There is a preicteric stage of from one to eight days, characterized by some fever, respiratory catarrh, malaise, gastrointestinal symptoms, and leukopenia. Usually after a lull, during which time arthritis, rashes, and neurologic features occasionally occur, the icteric stage supervenes. The intensity of the jaundice varies from slight to very marked. The stools are clay-colored in the bare majority of cases; of light color in the others. The fat content of the stool is generally increased, probably because of lack of bile. The icteric stage persists for one to three weeks, during which the liver is usually enlarged. The spleen was palpable in about 30 per cent of the cases of one series.[5] The urine contains bile in all cases, but is free of this element in about ten days.

Such studies shed a different light on the cause, pathology, and epidemiology of a disease which rapidly increases in areas and communities which are suddenly expanded under lax hygienic conditions. Since there is no specific treatment, isolation of the patient, with precautions as in typhoid fever, investigation of the food and water supply, and precautions against the insect vector are valuable prophylactic measures. While the mortality rate is extremely low, the high morbidity rate serves to deprive organizations of sorely needed manpower and work hours. Let us hope that the newer knowledge will reduce the incidence of infectious hepatitis.

Gamma Globulin

Gamma globulin, one of the by-products remaining after extracting the serum albumin from blood plasma, is being made available to the medical profession of the United States through the courtesy of the American Red Cross in collaboration with the Bureau of Medicine and Surgery of the Navy. The Navy has preferred serum albumin to blood plasma for the treatment of shock because it can be stored in smaller bulk and is, therefore, more convenient for use on naval vessels.

Upon the recommendation of a Special Medical Advisory Committee which was recently appointed by Mr. Basil O'Connor, Chairman of the American Red Cross, to assist him in planning future problems of policy, the American National Red Cross has appropriated the sum of $1,500,000 to defray the cost of processing the crude gamma globulin into the refined product, and to package and distribute it to the medical profession through state and local health departments. Sufficient gamma globulin is now available to meet the anticipated civilian needs of the country for several years, provided it is used judiciously.

For the present, civilian use is to be limited to protection of measles contacts. It is particularly indicated in young children up to and including the age of 5, those over the age of 5 who are suffering from some other disease in whom the presence of measles would present a hazard, and for children of all ages exposed to measles on the ward of a hospital. The armed forces will retain some of the material for the prevention of infectious hepatitis. Up to the present time, there is insufficient information to warrant the use of this precious material as protection against scarlet fever, rubella, poliomyelitis, or other communicable diseases except measles and infectious hepatitis. With the approval of the health authorities and the National Research Council, a limited amount of the product may be made available for research.

Gamma globulin is distributed in solution in a concentration twenty-five times that of the pooled plasma from which it is prepared. The dosage to be employed has been worked out through a mass experiment recently conducted by the Department of Health of the City of New York for the American Red Cross. It is recommended that a dose of 2 cc. intramuscularly be used for the protection of children under the age of 5 and for the modification of the dis-

ease in older children. Double this dose, i.e., 4 cc., is recommended for complete protection against the disease in children over 5. If too large a dose is used, complete passive protection is attained and only temporary immunity will then result. Two small a dose may slightly modify the disease but will be followed by permanent immunity after the disease occurs.

Except for serum albumin, gamma globulin, and fibrin film, no important use has thus far been found for the other protein fractions which remain from the processing of blood plasma. However, encouraging investigations are continuing under the direction of Dr. Edwin J. Cohn of the Harvard Medical School, in collaboration with the Subcommittee on Blood Substitutes of the National Research Council.

Current Editorial Comment

Of This and That

Commenting on two decades of progress against illiteracy, the Statistical Bulletin[1] says, in part:

"The large number of Army rejections on the grounds of insufficient education, and the wide publicity given to these, have created the impression that illiteracy is today widespread among the young people of this country. A reasonably careful examination of the facts, as brought out by the census of 1940, gives a very different picture, for it discloses a most favorable trend of vanishing illiteracy.

One way of measuring the progress achieved is to compare the age group 25–29 in 1940 with the same age group in 1920, or what amounts to essentially the same thing (but for the minor effect of immigration), with the age group 45–49 in 1940.

In this way, on the basis of the published data of the 1940 census, it is possible to compare the educational status of young persons of the same general age in 1920 and in 1940. The fact at once becomes apparent that in the white population total illiteracy—that is, the inability to read or write—is nearing the vanishing point in this country. In 1940, only two thirds of 1 per cent of the white population in the ages 25–29 had never attended school. In contrast, of those aged 45–49 in 1940 nearly 4 per cent had never attended school. Even making allowance for the fact that a few of these may have learnt to read and write outside of elementary schools, there can be no question as to the significance of the wide difference in these figures. . . . .

In a large and indeed dominant section of the population, the gains have been even more spectacular. In that part of the country lying outside of the southern states, less than 1 per cent of the white population of ages 25–29 had failed to attend school at all or to complete four years of schooling. In the generation twenty years earlier, the corresponding ratio of illiteracy was about 8 per cent. The decline in this wide area, therefore, was 87 per cent since the first World War. . . . ."

This is indeed hopeful and a vast stride in the right direction, and somewhat indicative of what may be expected in the future. We would not counsel oculists to consign their illiterate charts to the paper salvage campaign yet a while.

• • •

The New York Herald Tribune[2] reports the results of a survey of draft rejection rates by Selective Service. The report says that 40.3 per cent of the men called up at the age of 28 are rejected as physically unfit. The rejection rate is slightly over 50 per cent at the age of 34, and 59.1 per cent for men of 38. The rate at 44 years is 63.2 per cent. Says Selective Service, these rejection rates "are probably the best indication of the general unfitness of men over 29 to take their places in the armed forces." National rejection rates per 100 registrants February through August, 1943, are: whites, 39.2, Negro, 56.9, total U.S., 39.2. Highest rejection rate for the twenty-one months studied was among men employed in domestic service, as cooks, valets, chauffeurs. Of the men in that category examined, 59.6 per cent were turned down.

Here seems to be material calling for research and investigation in the interest of the public health, especially with respect to cooks.

Correction.—In the May 1 issue, page 1018, column 2, line 19, the figure at the end of the line should read $27.75" instead of "$72.75."

FURTHER EXPERIENCES WITH THE SURGICAL TREATMENT OF INTRACTABLE ULCERATIVE COLITIS

JOHN H. GARLOCK, M.D., New York City

(From the Surgical Service of the Mt. Sinai Hospital, New York City)

IN JANUARY, 1941, I reported a series of 25 cases of ulcerative colitis treated by surgical methods and called attention to the fact that, although most authorities agree that ulcerative colitis is essentially a medical problem belonging to the general class of psychosomatic diseases, there still remained a group, estimated at between 10 and 20 per cent, which resists all forms of medical therapy and in whom the pathologic process in the colon progresses to irreparable involvement. Since 1941, our experience with the surgical treatment of this disease has broadened considerably and I would like to present our present viewpoint, based on an analysis of 68 cases.

In order to clarify the indications for surgical therapy, one must have a clear picture of the pathologic sequence in this disease. Briefly stated, nonspecific ulcerative colitis, of unknown cause, is a progressive inflammatory condition of the colon which may be diffusely or segmentally involved. It is characterized by marked hyperemia of the mucosa, ulcerations, infiltration of the colonic wall by the products of inflammation, and the formation of scar tissue. Polypoid degeneration of the mucosa is a not infrequent sequela. There are exacerbations and remissions with gradual progression of the pathologic process until the colon is converted into a greatly thickened, fibrotic, shortened tube, lined by infected granulation tissue constantly exuding pus and blood. The progress of the disease in the colon is reflected in the patient's general condition. Because of frequent rectal discharges with associated loss of fluids, and the general toxemia caused by absorption from the diseased bowel, gradual physical deterioration takes place with weight loss, anemia, avitaminosis, and toxic manifestations such as fever, arthritis, skin infections, etc. Severe psychic disturbances may accompany the physical aspects of the disease. When the colon has reached the stage of such involvement, the disease has become intractable, and it is useless to expect restoration to normal by conservative means.

In the past, the surgical treatment of this disease consisted of appendicostomy, cecostomy, loop ileostomy, and, occasionally, colostomy. The loop ileostomy usually accomplished its purpose of diverting the fecal stream but was invariably followed by marked prolapse of the ileum, a distressing complication as far as the patient was concerned. The purpose of the other procedures was to permit irrigation of the diseased bowel with medicated solutions in the hope of restoring the mucosa to normal. Experience has shown that this therapy was based upon fallacious reasoning and that the important requisite of successful surgical treatment was complete diversion of the fecal stream from the diseased bowel segment.

In the paper published in 1941, it was stated that, after consultation with the members of the Gastroenterologic Department, definite criteria for surgical therapy were established. Since then, a more extended experience has amply corroborated the viewpoint expressed at that time. To repeat, we are agreed that surgical treatment is indicated under the following conditions:

1. Uncontrollable bowel hemorrhage
2. Acute ulcerative colitis with profound toxemia not responding to sulfonamides or other medical therapy
3. Impending perforation of the colon
4. Chronic intractable colitis, with extensive scarring of the bowel, polypoid degeneration, or rectovaginal fistulae, resisting all forms of medical therapy
5. Segmental ulcerative colitis

If the combined medical and surgical staffs are in agreement on these criteria, then the rationale of the various surgical procedures to be described will become quite apparent.

We believe that ileostomy should be employed under certain circumstances in the treatment of this disease and disagree with some surgical authorities who recommend ileostomy as the procedure of choice in the early treatment of all ulcerative colitis patients. It is our conviction that ileostomy is indicated as the initial procedure under the following circumstances:

1. For uncontrollable hemorrhage. Complete diversion of the fecal stream will tend to put the diseased bowel at rest and minimize the likelihood of further bleeding.

2. For acute ulcerative colitis with profound toxemia. The course of the disease is short and fulminating and the patients are desperately ill. Without operation this variety has a high mortality rate. From our experience, we are convinced that the early performance of ileostomy

Read at the Annual Meeting of the Medical Society of the State of New York, New York City, May 10, 1944.

is a life-saving measure. It is important that the operation be performed at the opportune moment and not be deferred until the patient is practically moribund.

3. For impending perforation. Whenever, during the clinical observation of a patient with ulcerative colitis, signs of threatened perforation become evident, ileostomy should be performed as an emergency measure. Only by diminishing intracolonic pressure by diverting the fecal stream can actual perforation be prevented, and it must be remembered that when perforation does take place, the mortality is close to 100 per cent.

4. Intractable colitis involving the entire colon and rectum. Ileostomy is the first step of a graded resection of the colon.

There are a few points concerning the operation of ileostomy which merit emphasis. There are so many objections to the old loop ileostomy that I believe this procedure should be discarded. A properly performed ileostomy should entail complete division of the terminal ileum, the implantation of the proximal and distal stomata in separate incisions, insurance against retraction of either stoma into the abdomen, and also external prolapse of the proximal stoma after it begins to function. In 1938, we developed a new type of ileostomy and have utilized this operation with complete satisfaction since then. The details were reported in 1941 and need not be repeated now. Suffice it to say that we have not encountered one instance of prolapse since the operation was first performed. It is important to emphasize that, during the performance of the operation, especially in cases of acute colitis, the operator should scrupulously avoid any handling of the diseased bowel. The slightest trauma will frequently result in a postoperative perforation at that site. One such experience emphasized to us the importance of this feature.

The marked improvement in the general condition of the patient following ileostomy is one of the remarkable features of the surgical treatment of colitis. The weight gain may be up to fifty pounds, the anemia disappears, the appetite improves, and the various toxic manifestations abate. Skin lesions and joint symptoms may not disappear until the infected colon is removed. At least, such has been our experience. In the acute fulminating cases, ileostomy is followed by a dramatic change in the patient's condition, with a drop in the temperature, often by crisis, and a rapid decrease in the rectal discharges. As time goes on, the discharge from the ileostomy gradually becomes semisolid, which becomes more evident after removal of the diseased colon. It appears that a change takes place in the physiologic activity of the small bowel and that the ileum takes over the water-absorbing function of the diseased colon. In our opinion, ileostomy should in no sense be considered a curative operation. It is the first stage of a graded operation, consisting of subtotal or total colectomy. It seems important to emphasize that we have observed very active disease still present in the colon two years after its exclusion by ileostomy. Therefore, re-establishment of continuity of the ileum is fraught with great danger. The literature contains a number of such instances in which a fatal issue followed the lighting up of a dormant process in the colon.

If the disease is confined to the left colon and rectum and operation is deemed advisable, transverse colostomy instead of ileostomy may be carried out. In such cases, complete transection of the transverse colon and its mesentery and implantation of the colostomy stomata in separate incisions, after the manner of ileostomy, is the method of choice. This is followed at a later date by resection of the left colon and rectum, if the latter is hopelessly diseased.

If the rectum and lower sigmoid are found, on sigmoidoscopic examination, to be free of disease, the initial operation of choice is an ileosigmoidostomy or ileoproctostomy with division of the terminal ileum and transection of the colon proximal to the anastomosis. This is done to prevent progression of the disease to the uninvolved segment of bowel. The rationale of this procedure is clearly proved by the excellent follow-up results in these cases. It is important to exteriorize as a colostomy stoma the proximal end of the transected colon, to permit external discharge of the foul secretions from the excluded diseased colon. This important technical feature has already been emphasized by Berg. At a later date the excluded bowel should be removed in one or two stages.

When ileostomy has been performed as the first stage of a graded procedure, the nature of the subsequent steps will depend upon a number of factors. If the disease is universal and there is hopeless involvement of the rectum as well, as indicated by the presence of polyposis, stricture, or rectovaginal fistulae, further surgery will consist of: first, a subtotal colectomy, and second, an abdominoperineal resection of the rectum. There is some danger in leaving a badly diseased rectum. We have seen three instances of carcinomatous degeneration on the basis of a chronic severe ulcerative proctitis and in each one, the malignancy was of such high grade as to result in early death of the patient. If, however, the rectum is not so severely involved, it is our policy to do a subtotal colectomy and preserve the lower sigmoid and rectum for possible future use in re-establishing intestinal continuity. The rationale of this plan has appealed to us because we

felt that, following colectomy, there would be a greater possibility for a complete abatement of the disease in the rectum itself. In six patients, after a wait of two to three years and repeated examinations indicated apparently complete cessation of the disease and return of the mucosa to normal, we disconnected the ileostomy and re-established intestinal continuity by uniting the ileum and upper rectum. The results have been more than encouraging.

Analysis of Cases

Between September, 1937, and April, 1944, we have operated upon 68 patients. In 38 instances, the primary operation was ileostomy. In this group there were six deaths, a mortality of 15.7 per cent. The cause of death, as determined by postmortem examination in each instance, was generalized peritonitis in three cases, bronchopneumonia in two, and a massive exsanguinating intracolonic hemorrhage in the remaining case. Of the remaining 32 patients, five were subjected to subtotal colectomy in one or two stages followed by abdominoperineal resection of the rectum. There were no deaths in this group and all the patients are well and carrying on their normal activities. Three of them have since married and none has been bothered too much by the ileostomy. In 21 instances of the ileostomy group, subtotal colectomy was performed in one or two stages, but the lower sigmoid and rectum were left in situ. In this group there were four deaths, a mortality rate of 19.9 per cent. The causes of death, verified by autopsy, were as follows:

1. Generalized peritonitis after second-stage colectomy
2. Generalized peritonitis after retraction of colostomy loop following first-stage colectomy
3. Peritonitis and subphrenic abscess after second-stage colectomy
4. Intestinal obstruction caused by band between the first and second stages of colectomy

In the remaining 17 patients, our greatest interest has been directed toward the remaining lower sigmoid and rectum which were left in situ for possible future use in re-establishing intestinal continuity. In six patients, in whom originally there was disease in the rectum, we have taken down the ileostomy and anastomosed it to the upper rectum. Three patients are alive and well after two, three, and five years respectively. They average two to three semisolid movements a day and are continuing with their work. Repeated proctoscopic examinations have shown normal mucosa. Of the remaining three patients, one developed a severe recurrence in the rectum three weeks after the operation and died of peritonitis from a perforation of the upper rectum. The fifth patient died one year later of intestinal obstruction caused by torsion at the site of anastomosis. At postmortem examination, the rectum was free of disease. The sixth patient died three years after operation of intestinal obstruction caused by a band, with gangrene of a portion of ileum. It may be stated, therefore, that in only one of these patients was there any evidence of recurrence of the disease after intestinal continuity was re-established. In six of the remaining eleven patients, improvement in the rectal stump has been so marked that anastomosis will soon be carried out. In four, it is too soon to express any opinion about such a possibility and in the eleventh case, abdominoperineal resection will be necessary because of extensive polypoid degeneration.

In the group of six primary transverse colostomies for left-sided disease, five underwent left colectomy and abdominoperineal resection and one has had only a left colectomy. One patient died after an abdominoperineal resection of an extensive retroperitoneal phlegmon.

In another group of patients, 13 in number, the primary operation was ileoproctostomy or ileosigmoidostomy with exclusion of the diseased colon, followed by subtotal colectomy in one stage. There were no postoperative deaths. One patient died three years later of intestinal obstruction caused by a band. Only one patient subsequently developed disease in the rectum, and it became necessary to perform an ileostomy. Since then he has done well. The remaining patients are well and show no evidence of disease on sigmoidoscopy. The follow-up ranges from seven years to nine months.

There is, finally, a miscellaneous group of ten patients who had segmental colitis. In seven, an ileosigmoidostomy with exclusion of the terminal ileum was done. Two died postoperatively, one of sulfanilamide hepatitis and the other of peritonitis caused by unnecessary and ill-advised handling of the cecum at the time of operation. The five survivors are in good health and doing well. Two patients were subjected to an obstructive resection. In one, the disease was confined sharply to the sigmoid colon. He has remained well since closure of the colostomy. The other patient was submitted to an ill-advised and poorly executed operation and succumbed to generalized peritonitis. The tenth patient presented a segmental colitis of the ascending colon and had an ileocolic resection in one stage. He has been well for six years.

Finally, I would like to call attention to the appreciable incidence of intestinal obstruction

caused by bands, occurring some time after major colonic surgery. In this series of 146 major operations, there were 8 instances of acute intestinal obstruction occurring at varying times following discharge of the patients from the hospital. In spite of the use of the Miller-Abbott tube, laparotomy, and all the modern chemical aids, 5 patients succumbed and only 3 recovered. This experience emphasizes the importance of peritonealizing all raw surfaces at the time of the colonic resections and the need for eliminating all intraperitoneal pockets into which a loop of bowel might herniate and become obstructed. Careful attention to the technical details of these operations should eliminate this highly undesirable and dangerous complication.

Discussion

Dr. Burrill B. Crohn, *New York City*—The very fact that in 1941 Dr. Garlock reported his experience on only 25 cases, while three years later his urgery has included 68 cases, bespeaks the broadening interest in this field of medicine. The massive procedures involved necessarily entail a high risk. It is therefore necessary to review such findings in order to compare risk and results.

Uncontrollable bowel hemorrhage rarely need invoke surgical intervention. Parenteral injections of Vitamin K in abundant dosage usually controls this situation even though the prothrombin test of the blood is within normal limits. The bleeding from the bowel is not arterial, nor is it venous, but is a capillary mucosal exudation and as such is usually controllable by Vitamin K intramuscular injections.

In intractable universal ulcerative colitis the decision when to request an ileostomy is a mos difficult one. If one waits too long, the mortality of the operation may reach 40 to 50 per cent. If one is impatient the next consultant advises delay, and one is likely to be miffed by a sudden and spectacular improvement in the condition of the patient. Dr. Garlock's reduction of the mortality rate of ileostomy to 15.7 per cent is the first encouraging step in this direction. If the surgeon, in addition, could promise that by some feat he could take down the ileostomy at a future day and anastomose the ileum to the sigmoid or rectum (following a colectomy), the objections of the medical man to a permanent disabling ileostomy would be overcome.

Such a successful outcome I saw completed some years ago. A young girl had an ileostomy for six years. In spite of severe rectal involvment, I myself having previously performed the sigmoidoscopies, the rectum had healed; a partial colectomy, followed by an ileoproctostomy, resulted in perfect health.

In this series Dr. Garlock has attempted the same procedure in six cases. Three patients are alive and well, an accomplishment that breeds respect for surgical skill and a real ray of hope for these semi-invalids. Two other patients lived one and three years respectively but lost their lives from later intestinal obstruction. Were it not for these unfortunate and adventitious late complications he would be able to report five out of six such difficult accomplishments successfully carried out.

The very fine results achieved in right-sided or segmental colitis are again most encouraging. Thirteen cases of ileosigmoidostomy with exclusion of the diseased colon, followed by partial colectomy, without an immediate surgical death, is a tribute to modern abdominal technic. A small but identical series was reported in 1938 by Dr. A. A. Berg and myself, and in this series we reported on 5 patients with this complicated type of segmental colitis, all of whom had had an ileosigmoidostomy and subsequent subtotal colectomy. These patients are all apparently well. This procedure is a very satisfactory one, provided always that the rectum had been previously repeatedly examined by sigmoidoscopy and had been proven to be free of disease. I know personally most of the patients in these two series. The postoperative diarrhea may at times be troublesome—three or four stools per day—but the general health and weight is rapidly improved and the individuals are restored to an efficient role in life.

LONGER TREATMENT NEEDED IN TUBERCULOSIS HEALING

Most of the tuberculous patients who seek medical aid today have had many reinoculations with many resultant foci of varying degrees of severity. The best that clinicians can do in a short course of treatment in such a chronic disease is to secure a truce between the patient and his bacilli, a truce which may be broken on either side; by the bacilli if their environment becomes congenial for their growth and multiplication; by the patient if he can increase his resistance sufficiently, maintain it at a high level, and thus prevent the bacilli from further activity. Here we make one of our most abject failures in treating tuberculosis. Both physicians and patients are prone to lose interest, and treatment is often interrupted before healing has been attained. By relaxing measures necessary to complete healing, the patient's defensive powers are allowed to lower, the tissues lose their resistance, and new activity starts. Thus are caused the many relapses which plague us and make us almost lose confidence in therapeutic measures. If we had a little longer treatment and a great deal longer extension of the careful life after treatment has been finished, and a full rehabilitation of the patient before he is discharged from observation, many of the reactivations which we speak of as "breakdowns" would be avoided and many sources of infection would be permanently, instead of temporarily, eliminated.—*F. M. Pottenger, M.D., Am. Rev. Tuberc., Aug. 1944*

HODGKIN'S DISEASE

Salient Clinical Features and Relative Value of Various Methods of Treatment Based Upon Study of 319 Cases

LEONARD B. GOLDMAN, M.D., and ABRAHAM W. VICTOR, M.D., New York City

(From the Division of Cancer, Department of Hospitals, City of New York)

IN 1940, one of us[1] reported a statistical analysis of 212 cases of histologically proven Hodgkin's disease. Since that date our study has continued with an additional 107 cases, a total of 319 patients. In the previous paper the disease with its different manifestations was described in detail; in this communication we wish to emphasize the salient clinical features and stress the relative value of the various methods of treatment.

We have had the unusual opportunity to study this disease in municipal institutions which admit patients in all stages of the disease. Of the total number of patients, 128 were followed at the New York City Cancer Institute (1926–1942), 126 at the Radiation Therapy Department at Bellevue Hospital (1926–1936), and 65 at Queens General Hospital (1936–July, 1944). In this series 193 (60 per cent) were observed until death and 69 of these (32 per cent) have had complete postmortem studies.

History and Physical Findings

The disease may occur at any age. Our youngest patient was 5, and our oldest 76, with the highest incidence in the third and fourth decades. This age distribution is in contrast to that of lymphosarcoma, in which the incidence is greater at the extremes of life.

When seeking medical aid the majority of patients were in relatively good condition, their chief complaint being that of a "swelling," usually in the neck. The duration of this "swelling" varied from one week to seven years. A smaller number were chronically ill with varying symptoms, such as loss of weight, weakness, pyrexia, cough, dyspnea, pain in the chest, and backache, which could be manifestations of a multitude of disease. One leading and outstanding symptom was pruritus. The occurrence of this symptom in the presence of enlargement of lymph nodes was usually suggestive of Hodgkin's disease.

A clinical diagnosis of Hodgkin's disease can frequently be made by deft palpation of the involved lymph nodes. Classically, one is able to count from three to five nodes in each of the involved groups. The nodes may vary in size from 2 to 12 cm. They are irregular, resilient, and differ in consistency depending upon the histologic picture. Matting may or may not be present. As a rule, more than one area is involved and it is rather unusual to find the disease limited to a single lymph node.

Not infrequently the cytology of the involved lymph nodes may be surmised from palpation of these nodes. Attachment to surrounding structures, matting, and marked firmness are indicative of excessive fibroblastic activity. On the other hand, "doughy," elastic, relatively soft nodes bespeak marked parenchymal proliferation. The latter type regresses much more rapidly under the effects of radiotherapy.

Sternal Node Involvement

It is interesting to note that 13 of our patients showed involvement of sternal nodes. In 9 cases the enlargement was to the right, and in 4 to the left of the edge of the sternum along the course of the internal mammary artery and at the level of the second and third intercostal spaces. These nodes measured from 6 to 10 cm. and were fixed to the underlying chest wall. We have found these prominences to be pathognomonic of Hodgkin's disease just as a Virchow's node is indicative of an intra-abdominal malignancy. In our last four patients with sternal nodes we unhesitatingly made the correct clinical diagnosis, mainly on the basis of their presence. These diagnoses were later confirmed by microscopic study.

The only mention in the literature of sternal node involvement was made in 1940 by one of us,[1] stating that 3 patients were made aware of their condition by a swelling on one side of the sternum (see Fig. 1).

Cutaneous Manifestations

One hundred and twenty-four of our patients (39 per cent) showed diverse cutaneous manifestations. Only a few presented a microscopic picture characteristic of this disease. The report of Reimann[2] coincided with our findings. He found that lesions specific for Hodgkin's disease in the skin are as rare as nonspecific ones are common.

The symptoms varied from slight pruritus with no visible lesions to a generalized exfoliative dermatitis with severe pain. The most common finding was that of small, scratched papules, at first appearing most frequently on the extremities

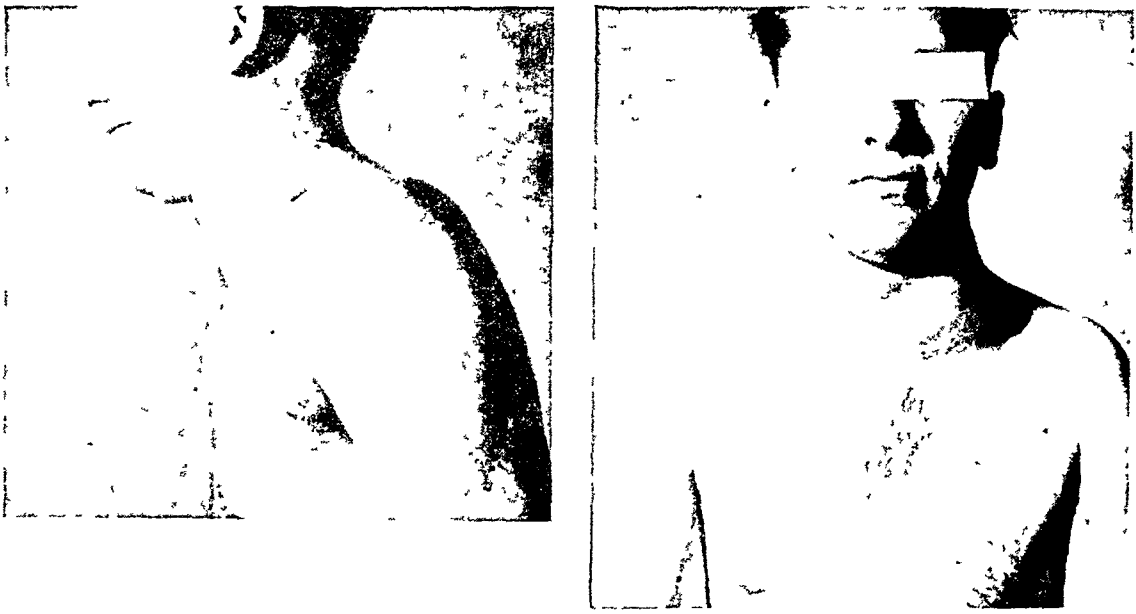

FIG. 1. A man, aged 27, complaining of sternal swelling of two and a half months' duration. Examination revealed an 8-cm., resilient, nontender, fixed prominence just to the right of the sternum at the level of the third intercostal space. Nodes were present in the left cervical, supraclavicular, and axillary regions. A clinical diagnosis of Hodgkin's disease was made. This was later confirmed by microscopic studies

and later not infrequently covering the entire body.

Herpes zoster was present in 24 cases and usually indicated perineural extension. One patient showed this type of lesion, involving the ophthalmic branch of the trigeminal nerve (deep upper cervical nodes were present), and five months later a similar involvement of the sixth right dorsal segment appeared. This is the only case of herpes zoster observed by the authors in which two segments were involved.

It is our observation in Hodgkin's disease that, while the skin frequently shows manifestations, the subcutaneous tissues and mucous membranes remain conspicuously free. We found only two cases in which subcutaneous nodules were present. This finding is in contrast to that seen in lymphosarcoma, in which disease the subcutaneous tissues and mucous membranes are frequently involved while the skin is unduly spared.

Thoracic Involvement

The mediastinum is a frequent site of disease, although it may be silent until late, and seldom is there enlargement of the mediastinal nodes without coexistent adenopathy either in the cervical, supraclavicular, or axillary regions. In the majority of cases we found the first symptom to be a noncharacteristic cough, usually nonproductive. Later, as the disease progressed, dyspnea on exertion appeared. Physical findings were not evident until the disease became advanced, and then signs of pleural effusion or, less frequently, atelectasis were discernible. Hoarseness, cyanosis, marked dyspnea, and dilated veins of the chest and neck, found so frequently in bronchogenic carcinoma, were not present.

Roentgenographically, the changes which take place in the mediastinum are indicated by a gradual transition from a thickening of the hilar areas to a widening of the mediastinum and invasion of the adjacent lung fields. We found no roentgenographic picture pathognomonic of Hodgkin's disease. The hilar shadows were usually bilateral in the superior mediastinum, and rarely was there displacement of the latter except in those cases in which pleural effusion or atelectasis supervened.

The radiographic picture of the mediastinal nodes corresponded closely to the palpatory findings in the peripheral adenopathy; that is, when a desmoplastic reaction was present in the mediastinal nodes, this reaction could be expected throughout the involved lymphoid system.

From the roentgenographic shadows we were often able to postulate the histologic findings. When the hilar involvement was irregular with radiating strands, the microscopic picture showed a predominance of fibrous tissue; when the borders of the nodes were smooth and almost cyst-

like, the microscopic picture revealed a marked pleomorphic parenchymal proliferation

In 25 patients the parenchyma of the lung showed lesions varying in size from 2 to 7 cm Roentgenographically, such a case may not be easily differentiated from a metastatic carcinoma

In 3 cases tissue for diagnosis was obtained from the bronchi On one occasion a node ruptured into the bronchus and the tissue was removed by bronchoscopic examination and in the other two instances the tissue was made available for microscopic study by postmortem examination

In contrast to other malignancies, a bloody pleural fluid, obtained by paracentesis, was rare, and despite numerous examinations for characteristic tumor cells only large, pleural, noncharacteristic mesothelial cells were found

Gastrointestinal Involvement

Hodgkin's disease seldom attacks the gastrointestinal tract, the alimentary canal was involved in only 2 cases, the stomach in one and the sigmoid in another This is in contrast to lymphosarcoma, in which the gastrointestinal tract is not an uncommon site of the disease In this connection Boyd[3] mentions that in so generalized a disease it is rather unusual to find the vast collection of lymphoid tissue in the gastrointestinal tract escaping practically intact As a result of our study of the distribution of the lesions we agree with Steiner[4] that Hodgkin's disease is most likely a disturbance of the reticuloendothelial system, since those sites of the lymphoid tissue which contain the least number of reticuloendothelial cells (nasopharynx, tonsils, thymus, ileum, and colon) were seldom involved Occasionally, extrinsic pressure defects by abdominal nodes on the adjacent stomach wall resembled closely lymphoblastomatous or carcinomatous involvement of that part

In many of the advanced cases epigastric pain, not relieved by irradiation, was a persistent symptom which on further study revealed itself to be due to erosion of the gastric mucosa on the basis of avitaminosis This clinical interpretation was proved to be correct by therapeutic and postmortem studies

Fourteen patients (4 per cent) exhibited obstructive jaundice which was usually indicative of compression of the biliary duct system The jaundice disappeared with irradiation to that area

In early cases it was not usual to find splenomegalia, but as the disease ran its course enlargement of the spleen was encountered Postmortem examination almost invariably showed some degree of enlargement of the spleen Rarely, however, did this organ enlarge below the umbilicus and almost never did it extend down to the iliac crest This is in contrast to myelogenous leukemia, in which the spleen may be high, extending not infrequently to the iliac crest

Abdominal Localization

In 27 patients the disease was confined almost entirely to the abdominal cavity The course of the disease (13 1 months from onset of symptoms) in this group was much more rapid than in the group as a whole Profound weakness, loss of weight, and intermittent bouts of fever characterized the symptomatology Cecil,[5] in describing this abdominal form of the disease, has mentioned that some of the most pronounced types of remittent fever are seen in this variety The clinical diagnosis was difficult to establish since splenic enlargement and peripheral adenopathy, when occurring, appeared only late in the course of the disease In this type of Hodgkin's disease a therapeutic test of irradiation to the abdomen resulted in a temporary amelioration of the patient's symptoms A further clue to the diagnosis was frequently obtained from the material of the sternal aspiration, the findings of which are described elsewhere in this paper In 7 cases the diagnosis was made by postmortem studies

The following case history is instructive

A patient, S G, a 40 year-old Greek man was admitted to the hospital on June 14, 1939, with the following complaints loss of weight anorexia, night sweats, and fever ranging up to 101 F of two months' duration Physical findings were negative except that the patient was emaciated and poorly developed Blood examinations and all other laboratory investigations were essentially negative

The course in the hospital included intermittent diarrhea, epigastric distress, and an irregular rise in temperature up to 102 F with a slow downhill course On September 15, 1939, laparotomy was performed A large spleen (one and a half times its normal size), firm in consistency, was the only pathologic factor disclosed On October 13, 1939 irradiation (1,200 r to anterior and posterior portals) was instituted to the upper abdomen, including the splenic area On October 30, 1939, the patient felt considerably improved, his temperature remained at a normal level The patient remained relatively well for eleven months

On October 22, 1940, asthenia, loss of weight, and elevation of temperature to 100 5 F were present Irradiation was again instituted to the lower abdomen (1 200 r to anterior and posterior portals) The patient felt improved until December 15 1940, when the original symptoms recurred A second course of radiation was given to the anterior and posterior midabdomen In April, 1941, the patient had a relapse Irradiation was directed to the upper abdomen The patient died April 18, 1941

Autopsy findings —There was no peripheral adenopathy Examination of the abdomen disclosed

FIG. 2

many small, mesenteric, periaortic, and retroperitoneal nodes, proved by microscopic study to be Hodgkin's disease The liver was somewhat enlarged, red-brown, and smooth. On section the liver architecture was maintained for the most part. However, there were several scattered areas measuring no more than 1 or 1.5 cm. in diameter, which were made up of grayish-white tissue similar to that seen in the lymph nodes. The spleen was enlarged and firm. On section, the follicles could be readily made out against their firm red pulp. In several areas in the spleen there were similar peripheral areas of grayish-white, firm tissue.

The remarkable feature of this case was the minimal amount of Hodgkin's tissue present despite the severely toxic and hyperthermic course.

Bone Involvement

Roentgenologically, osseous involvement in Hodgkin's disease has been appreciated for many years. In the group of 319 cases under discussion there was radiographic evidence of bone involvement in 20 patients (6.2 per cent), although we found no characteristic roentgenographic picture of these lymphogranulomatous foci. In most instances the lesions were osteolytic and were indistinguishable from metastatic carcinoma. However, autopsy studies proved that we were dealing with Hodgkin's infiltration of bone. The vertebral column was by far the most frequent site of these processes, and in three of the twelve cases of vertebral column involvement, collapse of the involved vertebra was noted. In these patients, however, there was no evidence of spinal cord compression. The next most frequent sites of Hodgkin's disease in bone were, in the order named: pelvis, ribs, upper end of the femora, and sternum. When the long bones were involved, the lesions were most frequently in the proximal and distal thirds.

It is worth while to mention that one patient complained of severe pain in the lower neck. Roentgen examination of the part showed a complete collapse of the seventh cervical vertebra, although there were never any neurologic signs or symptoms. After the administration of 1,800 r to the involved area, the seventh cervical vertebra almost completely disappeared, the small residual portion fusing with the first dorsal vertebra (see Fig. 2).

Two patients showed extensive, irregular, osteoblastic changes of the upper portion of the femur on which a radiographic diagnosis of either Hodgkin's disease of the bone or osteogenic sarcoma was made. Postmortem examination, however, revealed only a chronic productive osteomyelitis.

Blood and Marrow Picture

The changes found in the peripheral blood were neither typical nor constant. In most cases the white blood count was normal. The lowest was 2,950 and the highest 52,000, the latter in a patient in an advanced stage of the disease but with no evidence of infection. It was not unusual to obtain white blood cell counts varying from 20,000 to 30,000. It was noticed, however, that

many of the patients who ran a Pel-Ebstein type of fever tended to have low white blood cell counts (from 3,000 to 5,000 w.b.c.).

When patients with Hodgkin's disease complicated by leukopenia were treated with irradiation, resolution of the lymph glands in the treated area almost invariably brought about a rise in the white blood cell count. We wish to emphasize that leukopenia in Hodgkin's disease is no contraindication to the institution of irradiation, provided heavy roentgen therapy has not been administered previously.

A mild secondary anemia was commonly found and its gradation was comparable to the stage of the disease. It was unusual to encounter a severe anemia (below 2,500,000 r.b.c. count), and in no instance did we find a hemorrhagic tendency on the part of an untreated patient.

In the differential blood picture the more common findings were an increase in the polymorphonuclear cells, eosinophilia, and a slight increase in the monocytes.

Sternal aspirations were performed in 91 cases. The characteristic findings observed either singly or concurrently were:

1. A polymorphonuclear shift to the right with marked toxic granulation;
2. Increase of eosinophilia of young myeloid elements;
3. Increase in the monocytic series.

In no instance were Dorothy-Reed cells found. Other observers of the bone marrow in Hodgkin's disease (Dameshek[6] and Barasciutti[7]) reported no characteristic findings. Varadi[8] had one positive result from sternal puncture, with Sternberg cells appearing in the aspirate. He admitted, however, that this finding was exceptional.

The Effect of Pregnancy

Pregnancy occurred in 11 patients, in three of whom therapeutic abortions were performed, while in one, a miscarriage resulted. In the remaining 7 cases the pregnancies were carried to term with normal deliveries. One patient, 28 years of age, was twice pregnant. She delivered two normal children, the oldest now 10 years of age. In all instances no evidence of Hodgkin's disease could be found in the offspring.

Fortunately in these 11 patients there was no involvement of nodes about the pelvic region either before or during pregnancy. However, 9 of these patients received varying amounts of radiation to other areas of the disease. From these facts it would seem that it is safe to irradiate nodes in the cervical or thoracic regions without any untoward effects upon the pregnancy.

The average duration of life in this group was 47.28 months, as compared to a general average of 23.8 months.

It should not be concluded from the above that pregnancy prolongs the life of the Hodgkin's patient. The longer life may be explained by the patient's better physical condition which in the first instance made pregnancy possible. Moreover, we noticed no difference in the course of the disease in those patients in whom pregnancy was artificially terminated as compared with those in whom the pregnancy ran to term.

In contrast, Klawans[9] has reported a case in which the onset of Hodgkin's disease occurred during the second trimester of pregnancy, and proved rapidly fatal, although the pregnancy and the offspring were normal.

Treatment

It is accepted that even under the most optimal conditions permanent arrest of the disease has not been obtained, although with proper treatment useful life has been prolonged for many years. Fundamentally, the treatment of Hodgkin's disease resolves itself into two principles: (1) The patient should receive the smallest quantity of irradiation that is compatible with his relative well-being, just sufficient to cause gross disappearance of involved lymph nodes; (2) he should receive constant supportive hematinic therapy.

During the period in which these 319 patients were observed various radiation technics were used. Given a proven case of Hodgkin's disease, how shall it be irradiated? In our group the first area treated was the site referable to the patient's chief symptom. When the outstanding complaint was a generalized pruritus, relief of this symptom was obtained with retroperitoneal high-voltage irradiation; less benefit resulted from local, low-voltage irradiation. Several patients with this complaint in an advanced stage and refractory to roentgen therapy were greatly aided by diuretics. When the patient had symptomatic nodal enlargement, treatment was directed to the most prominent site of involvement.

In the usual case we utilized a voltage of 200 kv., a filtration of ½ copper and 1 aluminum, and a portal of 10 by 15 cm. with a skin-target distance of 40 to 50 cm. We found that voltages either higher or lower were inferior in the results obtained.

The patient was treated three times a week with a dosage of 150 r per treatment until a total dosage of 1,200 to 2,000 r (measured in air) had been delivered to the skin area. After this course of irradiation, roentgen therapy was withheld for a period of two to six weeks. The other sites

of involvement were then treated in the same fashion.

Shortly after the institution of therapy, a gradual regression in the size of the involved nodes with a general improvement in the well-being of the patient was noticed. No untoward reactions appeared with this method of irradiation.

Eight patients were irradiated with a modified Heublein method of therapy, that is, half of the body was treated daily with a low intensity of roentgen output. Our results were so discouraging, due to the severe leukopenia that resulted, that this method was soon discontinued. Two of the patients developed pneumonia following a lowering of the white blood cells to 3,100 and 3,000, respectively. Medinger and Craver,[10] however, treated 94 patients with total body irradiation and found that this method of therapy produced great palliation.

Two patients who were in good general condition and presented only one area of gross disease were irradiated in a cancerocidal fashion with the thought in mind of destroying the disease permanently. The results were disastrous. One patient, after receiving 3,200 r to the left cervical region at a daily rate of 200 r, became markedly asthenic, began to vomit, and developed progressive jaundice. She died three and one-half months after the institution of irradiation.

In those patients in whom radiation was used as a prophylactic measure, that is, following disappearance of irradiated nodes treatment was given to areas which were not yet grossly involved, the results were less gratifying. This prophylactic method is contrary to the principle of administering the minimal amount of radiation that is necessary to bring about resolution of the gross disease. It has long been recognized that protracted irradiation interferes with the hemopoietic system, and, we believe, lowers the general resistance of the individual to any disease.

As a trial method we treated three individuals with high-voltage therapy directed at the pituitary gland. However, no definite conclusions could be drawn from the results obtained.

Eighteen patients with elevated temperatures were treated with chemotherapy with no appreciable lowering of the fever.

Summary

1. The salient clinical features and relative value of the different methods of therapy are discussed from an analysis of 319 proved cases of Hodgkin's disease.

2. *The diagnosis of Hodgkin's disease* can frequently be made by deft palpation of the enlarged lymph nodes.

3. Thirteen cases of sternal node involvement are described and their pathognomonic characteristics stressed.

4. In 39 per cent of the patients, the skin was involved. However, only a few presented a characteristic picture upon microscopic study.

5. No roentgenographic findings in the chest that are characteristic only of this disease were found. The pathology was indicated by a gradual transition from a bilateral thickening of the hilar areas to a widening of the mediastinum and invasion of adjacent lung fields.

6. In our series, Hodgkin's disease of the gastrointestinal tract occurred in only two patients.

7. In ambulatory patients it was unusual to palpate the spleen.

8. Abdominal variety of the disease occurred in 27 patients with profound weakness, loss of weight, intermittent bouts of fever, and a more rapid course characterizing the symptomatology.

9. Marked collapse of a vertebra may occur without symptoms of spinal-cord compression.

10. The characteristic sternal marrow findings observed either singly or concurrently were: (*a*) a polymorphonuclear shift to the right with marked toxic granulation; (*b*) increased eosinophilia of young myeloid elements; and (*c*) increase in monocytic series.

11. Pregnancy had no effect on the course of the disease. There was no evidence of Hodgkin's disease in the offspring.

12. Treatment consists of the administration of the smallest quantity of irradiation that will effect resolution of the gross disease together with the continued administration of hematinics.

IT'S ALL GREEK

"Did you hear," asked the sophomore, "about our cross-eyed Greek professor getting fired?"

"No," replied the innocent freshman, "why was he let out?"

"Because he couldn't control his pupils."—*J. Am. Inst. Homeopath., April, 1945*

ANTERIOR POLIOMYELITIS—THE 1944 EPIDEMIC AT MEADOWBROOK HOSPITAL

J W LANDSBERG, M D , Sc D , Hempstead, New York

(From the Meadowbrook Hospital, Nassau County General Public Hospital, Hempstead, New York)

MEADOWBROOK Hospital, the county hospital of Nassau County, has a contagious diseases ward comprising about thirty beds During the anterior poliomyelitis epidemic of the summer and fall of 1944, the majority of patients with this disease occurring in Nassau County were hospitalized in this contagious diseases unit

Since the opening of the above institution in 1935, the poliomyelitis epidemic of 1944 was the largest in the history of the hospital The greatest number of cases, previous to the present epidemic, numbered 81 for any one year (1935) The lowest number of cases observed was 3 in the year 1938 Each year, for the past ten years, cases of poliomyelitis have been seen in this hospital For the nine years preceding 1944 there was a total of 167 cases of anterior poliomyelitis For the year of 1944, which is the basis of the present report, there was a total of 171 cases

The first case was admitted June 26, 1944, the last case was admitted December 7, 1944 The greatest number of cases admitted in any one day was 7 (August 30, 1944) On a monthly basis the number of cases admitted was as follows

June	1 case — 0	5 per cent
July	7 cases— 4	1 per cent
August	74 cases—43	3 per cent
September	56 cases—32	8 per cent
October	22 cases—12	9 per cent
November	10 cases— 5	9 per cent
December	1 case — 0	5 per cent

In general, the cases admitted to Meadowbrook Hospital came from all sections of Nassau County Since it is not the purpose of the present communication, no attempt was made to study the epidemiology of the incidence of these cases in detail A course examination of the distribution reveals no definite localization There were also several cases from an adjoining county

Of the 171 cases, 100, or 58 5 per cent, were males and 71, or 41 5 per cent, were females There were, of the total number of cases, 167 (97 7 per cent) white and 4 (2 3 per cent) colored patients In the colored group there was one male and three females These findings have been summarized in Table 1

When the cases were grouped according to age, using the usual statistical procedure of those under 1 year, and five-year intervals thereafter, it was observed that the greatest number of cases fell in the 5-to-10-year-old group There were 58 cases, or 33 5 per cent, in this group Three patients were under one year of age, while the oldest was 38 years old The next largest group ranged from 10 to 15 years old, in which there were 38 individuals, or 22 2 per cent of the total (Table 2)

It was observed also that 149 cases, or 87 per cent of the total number of cases, were aged 20 or below On this basis the data were regrouped into one-year intervals (Table 3) From this table it may be seen that the scatter was even greater than in the five-year groups (Table 2) The largest group was comprised of 6-year-old patients, in which there were 22 cases, or 14 8 per cent The next largest group was composed of patients 4 years of age, in which there were 17 cases, or 11 3 per cent (Table 3)

It was of interest to consider the number of days from the onset of the symptoms to the time of admission to the hospital Two patients were admitted who had had symptoms less than twenty-four hours The majority of patients were admitted after having had symptoms for three days or less Thirty three patients, or 19 5 per cent, had had symptoms for one day, and the same number had had symptoms for two days before admission (Table 4) Twenty-two patients, or 13 0 per cent of the total, were not admitted until the seventh day of illness (Table 4) Each of the cases in this group began with the common symptoms of upper respiratory infection They did not come into the hospital until other symptoms developed, usually a day prior to admission There was one patient who had had symptoms for seventeen days before the day of admission

Although the sequence of the development of the symptoms of this disease was difficult to ascertain, either from the patient or his family, it seems to fall into a somewhat general pattern In view of the discrepancies in the relating of the symptoms, as well as the fact that histories were recorded by different individuals, they cannot be taken categorically as absolutely final The general pattern usually started with headache, more or less generalized, which disappeared in about twelve hours Following this there were several episodes of nausea or nausea and vomiting, with an associated diarrhea in some instances Then occurred a return of the headache confined

TABLE 1.—The Number of Males and Females, White and Colored, Having Anterior Poliomyelitis

	Male	Female	Total
White	99 (57.9%)	68 (39.8%)	167 (97.7%)
Colored	1 (0.6%)	3 (1.7%)	4 (2.3%)
Total	100 (58.5%)	71 (41.5%)	171 (100.0%)

TABLE 2.—Distribution of Cases of Poliomyelitis, According to Age, When Grouped in Five-Year Intervals

Age in Years	Number of Cases	Percentage
0 to 1.0	3	1.7
1.0 to 4.9	28	16.4
5.0 to 9.9	58	33.5
10.0 to 14.9	38	22.2
15.0 to 19.9	23	13.4
20.0 to 24.9	9	5.6
25.0 to 29.9	8	4.7
30.0 to 34.9	1	0.5
35.0 to 39.9	2	1.5
40.0	1	0.5
Total	171	100.0

primarily to the frontal areas. After these symptoms occurred either (*a*) pain in the cervical region of the spine, (*b*) stiffness of the neck, or (*c*) stiffness of the neck with pain in the cervical and thoracic region on flexion of the neck.

It should be pointed out that on physical examination there is a difference between the neck rigidity of meningitis and the neck stiffness of anterior poliomyelitis. In meningitis the neck is boardlike and the patient may be more or less suspended by holding the head, without any flexion of the neck; in anterior poliomyelitis the neck is not rigid but stiff; it may be partially flexed provided the resistance of the patient, due to the pain involved, is overcome.

In the present series the incidence of the above symptoms was essentially as follows:

(*a*) Headache with subsequent disappearance—92 cases, or 54.5 per cent.

(*b*) Nausea alone—12 cases, or 7.1 per cent.

(*c*) Nausea and vomiting—59 cases, or 34.7 per cent.

(*d*) Diarrhea—8 cases, or 4.8 per cent.

(*e*) Return of headache (after twelve hours)—24 cases, or 14.1 per cent.

(*f*) Pain in cervical region without stiffness—25 cases, or 15.3 per cent.

(*g*) Stiff neck without pain—12 cases, or 7.4 per cent.

(*h*) Stiff neck with pain on flexion—88 cases, or 54.0 per cent.

By far, the commonest symptoms encountered were headache with subsequent disappearance, 54.1 per cent, and stiff neck with pain on flexion, 54.0 per cent. Those patients having beginning symptoms of upper respiratory infection, 27, or 17.0 per cent, were finally admitted with one of the above symptoms.

An attempt was made to evaluate the symptoms occurring in the extremities of these individuals. At the time of admission such evaluation was difficult, i.e., did the patient have a weakness of an extremity, or did he refuse to move it because of the associated pain on motion? In the younger age groups examination was difficult in some instances, particularly because of a lack of cooperation. Since the physical examination was done by different individuals, this factor also influenced the findings. With these facts in mind, in the material presented (symptoms in the extremities), weakness, pain, and paralysis were considered as a group. Since paresis and paralysis were noted at time of discharge and considered later in the present paper, the above grouping may be countenanced here.

There were 17 patients, or 10 per cent, who had symptoms involving the upper extremities; while 73, or 43 per cent, had involvement of the lower extremities. Twelve patients, or 7 per cent, had involvement of both upper and lower extremities. In 68 cases, or 40 per cent, neither the upper nor lower extremities were involved. Eighty-four patients, or 49.1 per cent, complained of either pain, paralysis, or paresis of the back; the majority complained only of pain. Difficulty in swallowing was experienced by 9, or 5 per cent of the patients, and there were 5, or 3.0 per cent, who had facial paralysis.

At the time of admission 41 patients, or 24.3 per cent, had a temperature ranging from 101 to 102 F. Thirty-eight patients, or 22.3 per cent, had a temperature range from 102 to 103 F. Those patients having a temperature above 103 F. composed 17.6 per cent of the total number of cases. About the same percentage, 18.2 per cent, had a temperature of less than 100 F. (Table 5).

A spinal puncture was done in every suspected case of anterior poliomyelitis and the following determinations were made: initial pressure, cell count, differential cell count, protein, sugar, and chlorides.

Pressure.—The normal spinal-fluid pressure, according to Cecil, is usually between 100 and 150 mm., using an aqueous manometer; a pressure above 200 mm. is suspiciously high. In the present series 100 patients, or 75.2 per cent, had a spinal-fluid pressure of 150 mm. of water or less. Twenty patients, or 15.4 per cent, had a pressure of from 150 to 200 mm., while 13, or 9.4 per cent, had a pressure of over 200 mm. It is

TABLE 3.—Distribution of Poliomyelitis Cases under 20 Years of Age When Grouped in One Year Intervals

Age in Years	Number of Cases	Percentage
1 0 to 1.9	3	2 0
2 0 to 2.9	4	2 7
3 0 to 3.9	5	3 3
4 0 to 4.9	17	11 3
5 0 to 5.9	12	8.1

14 to 14 9	2	1 2
17 to 17 9	1	0.5
Total	169	100 0

obvious, therefore, that only a few of the present patients showed an increase in spinal-fluid pressure.

Cell Count.—J. B. Ayer, writing in Cecil,[1] feels that five cells observed in the spinal fluid are pathologic and require an explanation. In the present series, 6 patients, or 3.9 per cent, showed no cells at all. Fifteen patients, or 9.7 per cent, had less than five cells per cmm. One hundred and thirty-three patients, or 86.4 per cent, had over ten cells and less than two hundred cells per cmm.

Twenty-one patients, or 13.5 per cent, had more than two hundred cells per cmm. From these data it is obvious that the majority of patients had a sufficient increase in the cell count to denote pathology.

Differential Count.—In each case in which there was an increase in the cell count, the predominant type of cell was the lymphocyte. In 39 cases the lymphocytes averaged between 90 and 99 per cent of the total cells while in 13 there were 100 per cent lymphocytes.

Protein.—The normal protein range is given as 20 to 40 mg. per 100 cc. (Cecil).[1] Forty-three patients, or 27.9 per cent, had a protein level of 45 0 mg. per 100 cc. or less. Twenty-six patients, or 16.7 per cent, had a protein level of 50 mg. while 85, or 55.4 per cent, had a protein level above 60 mg.

Thus, in over half the total cases reported, the protein level was increased.

Sugar.—normal.

Chlorides.—normal.

Summary of Laboratory Findings

Spinal Fluid

A. Pressure
   1. Pressure of 150 mm. or less, 100 cases, or 75.2 per cent
   2. Pressure of 150 mm. to 200 mm., 20 cases, or 15.4 per cent
   3. Pressure over 200 mm., 13 cases, or 9.4 per cent

B. Cell Count
   1. Six patients, or 3.9 per cent, showed no cells at all
   2. Fifteen patients, or 9.7 per cent, had less than five cells per cmm.
   3. One hundred and thirty-three patients, or 86.4 per cent, had two hundred or less cells per cmm.
   4. Twenty-one patients, or 13.5 per cent, had more than two hundred cells per cmm.

C. Differential Cell Count
   1. Cell type predominantly lymphocytes

D. Protein
   1. Forty-three patients, or 27.9 per cent, had a protein level of 45 mg. per cent or less
   2. Twenty-six patients, or 16.7 per cent, had a protein level of 50 mg. per cent
   3. Eighty-five, or 55.4 per cent of the patients, had a protein level above 60 mg. per cent

E. Sugar—normal

F. Chlorides—normal

At the time of discharge from the hospital each anterior poliomyelitis patient was examined by the orthopedic service and the degree of disability was evaluated. There were 110 cases, or 64.4 per cent of the total number of cases, with some degree of residual paralysis. The disability was classified as paresis, paralysis, or both. Of the upper extremities, 35 patients, or 20.5 per cent, had some residual effects; of the lower extremities, 59 patients, or 34.5 per cent, had residual effects. Involvement of both upper and lower extremities occurred in 16 cases, or 9.4 per cent.

TABLE 5.—Temperature on Admission

Temperature	Number of Cases	Percentage
98– 98.9	13	7.6
99– 99.9	18	10.6
100–100.9	30	17.6
101–101.9	41	24.3
102–102.9	38	22.3
103–103.9	20	11.8
104–104.9	6	3.5
105–105.9	4	2.3
Total	170	100.0

TABLE 6.—Residual Paresis and Paralysis of Extremities Upon Discharge

	Paresis	Paralysis	Paresis and Paralysis	Total
Upper extremities	22 (12.9%)	10 (5.8%)	3 (1.8%)	35 (20.5%)
Lower extremities	29 (17.0%)	18 (10.5%)	12 (7.0%)	59 (34.5%)
Upper and lower extremities	8 (4.8%)	5 (2.9%)	3 (1.7%)	16 (9.4%)
Total	59 (34.7%)	33 (19.2%)	18 (10.5%)	110 (64.4%)

Paresis occurred in 34.7 per cent, paralysis in 19.2 per cent, and both paresis and paralysis occurred in 10.5 per cent of all cases. There was more involvement of the lower extremities than the upper. These data have been summarized in Table 6.

Of the total number of cases there was one case of paralysis of the muscles of deglutition. Paralysis of the facial muscles occurred in 8 cases, and of the abdominal muscles in 3 cases. There were 7 cases which required the use of the respirator. In all there was a total of eight deaths, which may be attributed to either the bulbar or ascending type of paralysis. Of the eight deaths, three occurred in the respirator cases.

Two of the patients with poliomyelitis were also pregnant. One patient had a pregnancy of eight months' duration, while the other was four months' pregnant. Three days after admission the patient with the eight months' pregnancy was placed in a respirator because of respiratory difficulty. Eleven hours later the patient expired, a postmortem Cesarean section was done, and a live premature female child was delivered. The other case (four months' pregnant) had paralysis of both quadriceps and some weakness of the abdominal and spinal muscles. This patient was transferred to another hospital for convalescent care.

Included in this series, also, were five members of the nursing staff of Meadowbrook Hospital—four student nurses and one graduate clinical instructor. Two of the student nurses had no known contact with the contagious diseases service. One student nurse developed poliomyelitis one day after being assigned to the contagious diseases ward. The graduate nurse was present and assisted at the first physical examination and spinal puncture of one of the above students; about twenty days later a diagnosis of poliomyelitis was made in this same person. For two weeks before the diagnosis was made this person had had symptoms of marked upper respiratory infection. The last student nurse to acquire the disease worked on a ward for a period of several weeks in which there were convalescent poliomyelitis cases. No individual who was hospitalized for some other cause acquired poliomyelitis during the entire epidemic, while a patient at the hospital.

In view of the epidemic proportions of this disease, it is of interest to consider the days of hospitalization. The greater proportion of the patients, 89.4 per cent, were hospitalized for a period of twenty-nine days or less. The average stay of this group was 10.1 days; the majority spent less than seventeen days. The remainder, 10.6 per cent, were hospitalized for from thirty-six to ninety-four days inclusive; these patients had an average stay of fifty-five hospital days. This group was composed, by and large, of those individuals awaiting admittance to other institutions for muscle re-education and of the respirator cases.

The treatment of these patients involved the routine procedures of symptomatic care. In addition, each patient received orthopedic evaluation of the amount of disability and the treatment thereof. Fracture boards and foot boards were prescribed in those cases in which they were indicated. All patients except 3 were given Kenny packs,* and a program of muscle exercise (active and passive), in those cases in which it was indicated, was carried out by trained workers.*

It is of interest to compare the findings of the present epidemic (1944) with those reported for the largest previous epidemic at Meadowbrook Hospital (1935). The findings of the 1935 epidemic were reported briefly by Buse and Miele (1935).[2] Although the number of cases in 1935, 82 in all, was just under half the number, 171, reported for 1944, and on such a basis an absolute comparison is not valid, it is of interest to compare the relative percentages. This comparison is summarized in Table 7.

The percentage of white patients for the two years is essentially the same. The number of colored patients was greater in 1935, but this may be explained on sampling variation alone. There was a greater number of adults in the 1944 epidemic. The ratio of males to females is essen-

* These workers were supplied by the Nassau-New York Chapter of the National Foundation for Infantile Paralysis, Inc.

TABLE 7.—A Comparison of Anterior Poliomyelitis Findings at Meadowbrook Hospital for the Years 1935 and 1944

	Total Cases	White	Colored	Adults	Male	Female
1935	82	94 0%	6.1%	3.8%	60.0%	40.0%
1944	171	97 7%	1 7%	12 8%	58.6%	41.4%

	Headache	Stiff Neck	Vomiting	Nausea	Upper Respiratory Infection	Paralysis	Deaths
1935	97.0%	90 3%	64 6%	80 5%	17.8%	40 0%	4.8%
1944	53.8%	51.5%	34 6%	7 0%	16.9%	19.2%	4.7%

tially alike for the two epidemics. The incidence of paralysis was greater for 1935 (40.0 per cent) than for 1944 (19.2 per cent). The percentage of deaths for the same years is strikingly similar. In each epidemic the symptoms of stiff neck and headache were found most frequently. In the 1935 epidemic 22 patients, or 24.8 per cent of the total number, were reported as having abdominal pain, and Buse and Miele point out that on two occasions such patients were admitted with a diagnosis of acute appendicitis. This symptom was not observed at all in any cases of the 1944 epidemic. It may be pointed out also that the incidence of nausea and vomiting was higher in the 1935 epidemic (Table 7). From these figures it appears that the symptoms of gastrointestinal disturbances were more frequent in 1935 than in 1944.

Thirty-six patients were sent into the hospital with a provisional diagnosis of anterior poliomyelitis, which after further study was diagnosed as some other disease. The largest part of this group consisted of 7 patients with upper respiratory infection; tonsillitis, 4 cases; gastroenteritis, 3 cases; meningitis, 2 cases; osteomyelitis, 2 cases; diarrhea, 2 cases; diagnosis undetermined, 3 cases. There was 1 case each of the following diseases sent in as poliomyelitis: subarachnoid hemorrhage; rheumatic heart disease; hypertension; arthritis; spastic diplegia; myositis; brain tumor; pneumonia; pleurisy; croup; phlebitis; otitis media; hysteria.

Summary

1. There were 171 patients with anterior poliomyelitis admitted to Meadowbrook Hospital between June 26 and December 7, 1944. The largest number, 74 cases, or 43.3 per cent, were admitted in the month of August.

2. The patients admitted to this hospital came from all sections of Nassau County.

3. Of the total number of patients, 100, or 58.5 per cent, were males and 71, or 41.5 per cent, were females. There were 167 (97.7 per cent) white and 4 (2.3 per cent) colored patients.

4. There were 149 patients, or 87 per cent, aged 20 or less. The majority of patients in this group was between 4 and 6 years old. The oldest patient observed was 38 years old.

5. The majority of the patients were admitted after having had symptoms for three days or less. Those having beginning symptoms of upper respiratory infection were not admitted, on the average, for seven days.

6. The primary symptoms were generalized headache (disappearing after 12 hours), several episodes of nausea and vomiting, return of headache (usually frontal in character), pain in cervical region of spine, stiffness of the neck, and stiffness of neck with pain on flexion. Commonest symptoms were headache, 54.1 per cent, and stiff neck with pain on flexion, 54.0 per cent.

7. On admission 10 per cent of the patients had pain, weakness, or paralysis in the upper extremities; 43 per cent had the same symptoms in the lower extremities. Difficulty in swallowing was experienced by 9 patients.

8. All patients received a spinal puncture; only in a few instances was the pressure increased; the cell count was increased in 86.4 per cent of the cases; the differential count showed an increase in lymphocytes; the protein was increased in half the cases; sugar and chlorides were normal.

9. At discharge, 64.4 per cent of the patients had some residual paresis or paralysis. Involvement of upper extremities occurred in 20.5 per cent; of the lower, 34.5 per cent; both upper and lower, 9.4 per cent.

10. There were 7 patients who required the use of the respirator. In all there were eight deaths, attributable to either the ascending or bulbar type, of which three were respirator patients. There were two patients who were permanant, one of whom died.

11. Five members of the nursing staff acquired poliomyelitis. Three of these had no exposure to the disease while working in the hospital; one had had exposure to [illegible] the acute stage, while another was [illegible] individuals receiving convalescent [illegible] tient hospitalized for any other [illegible] the disease.

12. The greater portion [illegible] cent) were hospitalized for [illegible] average time [illegible]

13. The present findings are compared with the findings of the 1935 epidemic at the same institution.

14. A list of other conditions admitted as poliomyelitis is presented.

MICHAEL UNDERWOOD AND THE FIRST DESCRIPTION OF INFANTILE PARALYSIS

A recent request directed to the Richmond Academy of Medicine by Dr. Ludwig Hektoen, for a photostat of the first description of anteropoliomyelitis, which is reputed to be found in the first edition of Underwood's "A Treatise on the Diseases of Children," brought to light several interesting facts: first, that the earliest description of this disease is to be found in the second edition, and not in the first edition as is commonly believed; second, that the first edition is an extremely rare book. Evidently it was not available to Garrison when he wrote his "History of Pediatrics," for he erroneously stated (p. 78) that the 1784 edition contains the first description of poliomyelitis. The only copy of the 1784 edition listed in the Union Catalogue of the Library of Congress is that belonging to the Richmond Academy of Medicine. The Army Medical Library and several other libraries have copies of the second (1789) edition. The earliest edition in the collections of the Library of Congress is that which was published in Philadelphia in 1793.

The first edition is a little book of 288 pages, $16^1/_2$ by $9^3/_4$ cm. Its title page reads: A/ Treatise/ on/ The Diseases of Children,/ With Directions/ For the Management of Infants/ From the Birth;/ Especially/ Such as are brought up *by hand.*/ By Michael Underwood, M.D.,/ Licentiate in Midwifery/ of the/ Royal College of Physicians, in London,/ and/ Practitioner at the British Lying-In/ Hospital./ *Ornari Res ipsa negat, contenta doceri.* Hor./ London,/ Printed for J. Mathews, No. 18, Strand./ MDCCLXXXIV. Inscribed on the flyleaf is "Sir John Elliott, Bart. With author's best Respects."

Dr. Hektoen sent us a typescript of the description of the disease from the second edition. There is nothing in the table of contents of the first edition that corresponds to this account and we went over the first edition page by page and found no such description. We are forced therefore to conclude that the description that occurs in the second (1789) edition is the earliest description of the disease. It was a comfort to find that the late Dr. John Rühral (*Am. J. Dis. Child.* 40: 1312 (1930)), came to the same conclusion.

Michael Underwood, 1736–1820, man-midwife, was born in Surrey. He studied at St. George's Hospital under Sir Caesar Hawkins and also saw something of the practice of John Freke. He studied for some time in Paris, and practiced for some years in Great Marlboro Street, London, where eventually he limited his practice to women and children. On April 5, 1784 he was admitted a licentiate in midwifery of the College of Physicians of London, and was the last survivor to bear the title, man-midwife. He was attached to the British Lying-In Hospital and attended the Princess of Wales at the birth of the Princess Charlotte. His treatise on the diseases of children was the best on that subject which had appeared in English. (D.N.B.)

That an obstetrician should write the best book on pediatrics seems strange to us today. However the combining of the two branches was common in England and this country in the eighteenth century. The teaching of obstetrics in our medical schools was always combined with some other branch. Thus the first professor of obstetrics in the United States was also the professor of anatomy. Dewees, the first American to write a System of Midwifery, also wrote a book on the diseases of children. Interestingly enough, Samuel Merriman, the great London obstetrician, edited and revised the eighth edition of Underwood's treatise on diseases of children. It is natural that this combination should have begun in England, where the men-midwives and obstetricians have always been medically minded. In France, on the other hand, and in Germany, the surgical side of obstetrics was developed. It is true that the obstetric forceps was invented in England, but it was done by a Frenchman. Paré reintroduced podalic version, and Sigault devised and performed the operation of symphysiotomy in France. In 1580 Rousset published a book on Cesarean section and reported 15 cases. In the meantime, in England, William Harvey wrote a monumental work on embryology and in 1774 William Hunter published his beautiful atlas on the human gravid uterus, while Charles White, Thomas Denman, John Clarke, and Alexander Gordon were making studies which Oliver Wendell Holmes later used so effectively to prove the contagiousness of puerperal fever.

Not all of Underwood's published work had to do with diseases of children. His "treatise upon ulcers of the legs; in which former methods of treatment are candidly examined and compared with one more rational and safe, proving that a perfect cure may generally be effected more certainly, without rest and confinement, than by the strict regimen in common use; with an introduction on the process of ulceration and the origin of pus laudabile. To which are added hints on a successful method of treating some scrophulous tumors, and the mammary abscess and sore nipples of lying-in women," appeared in 1783. This went through a number of editions and was translated into French and German. Of his treatise on the diseases of children the Catalogue of the Surgeon-General's Library lists some sixteen or seventeen editions: London 1789, London 1797, London 1799, London 1805, London 1819, London 1827, Philadelphia 1793, Boston 1806, Philadelphia 1818, Philadelphia 1841, Paris 1786, Paris and Montpellier 1823, Leipzig 1848, Philadelphia 1802, and London 1835.—*Virginia M. Monthly, March, 1945*

COITUS, IMPOTENTIA, AND ANGINA PECTORIS

M M Melicow, M D , New York City

(From the Department of Urology, College of Physicians and Surgeons, Columbia University)

COITUS, impotentia, and angina pectoris are subjects of interest to every man The urge for a satisfactory sex life, the fear of impotentia, and the dread of angina are experienced by many Our civilization has evolved economic, moral, and religious codes and taboos which have inhibited the free exercise of the sexual instincts as enjoyed by primitive man It has not supplied efficient adjustments to prevent or correct the resultant conflicts Ignorance of the anatomic, physiologic, and psychologic aspects of sexual relationship is widespread

Disturbances have, therefore, increased greatly It is probable that most men experience some degree of sexual inadequacy at some time, even in their youth, and that, with many, understanding is reached only after a series of awkward and at times devastating experiences The struggle between the external curbs by codes and the inward longings of the libido in the obfuscated sometimes lead to major difficulties Some develop a "lack-of-manhood" inferiority complex which they diligently try to disprove the rest of their lives Among these are the Don Juans, the playboys, the "sugar daddies," many of the 'confirmed" bachelors, and the maid- or secretary kissing husbands Depressed chronic masturbators, intraverts, marital failures, and suicides constitute another group Many of the maladjusted short-circuit themselves into compulsion neuroses, and become fanatics, bigots, prohibitionists, cultists, antivivesectionists, and antiracialists

Modern life has multiplied the stresses, strains, worries, and irregularities of existence, it has stepped up the relatively slow, smooth tempo of other eras The pursuit of happiness has become a breathless pursuit with happiness no longer enjoyable—often due to dyspnea—when the goal is reached The repeated surging of psychic or somatic urging against the rock of frustration, the continued drive in spite of body fatigue, the wasting by dissipation and corrosion by irritants, result in a state of agitated tension interminably prolonged. The arterioles become tense and when the coronary arteries fall into that habit then troubles begin An understanding of the limits of cardiac reserve, of dietary essentials and balance, and of the value of physical relaxation and emotional equanimity is generally lacking Knowledge even of the rudiments of the cardiovascular apparatus, its function and reserve, is possessed by only a few Cardiac disturbances are common and on the increase, cardiac insufficiency, due to coronary spasm or occlusion, is an everyday occurrence even in relatively young men Society has made self-preservation more difficult (strain on the cardiovascular apparatus), and multiplied the exigencies of race preservation (sex function) It has not given the individual sufficient enlightenment and understanding to make proper adjustments in either instance For indeed, were modern man given command of some of our accrued knowledge he should be able to engage in the struggle for existence without rapid destruction of his heart muscle, and enjoy sex-life to a degree unknown and unappreciable to primitive man

Proper use of the cardiovascular apparatus requires a harmonious balance between activity and rest Neither the systole nor the diastole of life should be excessive The man who works feverishly, eats irregularly, and "plays" tensely burns the candle at both ends and at the middle Life for many is a jumble of hard work and rapid overeating, an excess of alcohol, caffeine, and nicotine, and a succession of successes or failures imbricated with vexations, worries, and excitations From early youth many diligently proceed to destroy an otherwise inherently excellent cardiovascular system The art of living is something which few learn before damage is done In short, in order to conserve one's cardiovascular apparatus it is necessary to maintain

1 A state of physical, mental, and emotional equanimity

2 Adequate work, judicious play, and beneficial rest

3 Avoidance of the lethal combination of hard work and irritation

4 A simple balanced diet sufficient but not excessive in calories and rich in vitamins and minerals

5 Avoidance of an excess of alcohol, caffeine, and nicotine

6 An avocation—it is selective occupational therapy

7 Aquisition of the ability to "untense

The ideal sex relationship occurs when two ardent, healthy, enlightened individuals of opposite sex, anatomically sufficient and physically, spiritually, and emotionally harmonious, cohabit under mutually satisfactory conditions,

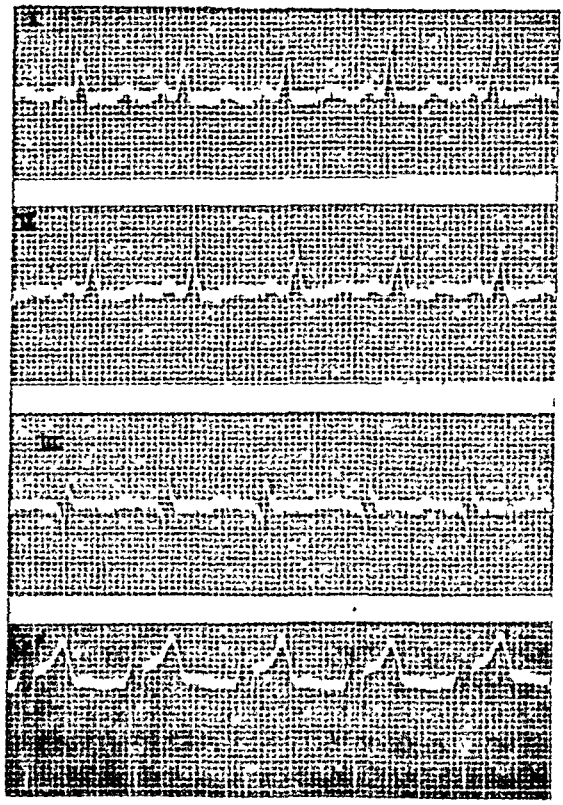

FIG. 1. Electrocardiogram: Case 1. "The Q3, moderately broad QR-S, prominent Q3, depression of RT1 and 2 with small T2 and inverted T3, all together form a borderline abnormal tracing suggesting presence of myocardial changes such as due to coronary artery disease."

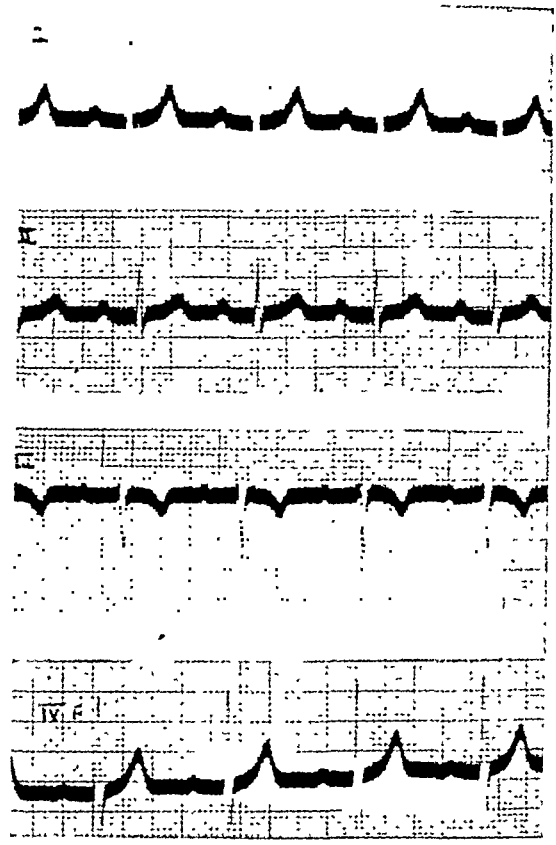

FIG. 2. Electrocardiogram: Case 2. "Left axis deviation and conduction time measuring 0.24 to 0.25 seconds."

the pleasurable experience lasting for a length of time sufficient to allow a simultaneous thrill-bearing orgasm which is followed either by an exaltation of spirit and general somatic well-being, or by a delightful animal fatigue. It follows, then, that ideal coitus is rare and deviations are common. The greater the deviation, the greater the sexual inadequacy. It follows also that the factors affecting potency are numerous, and that any one factor, however trivial, may weaken or suspend it.

The combination of prolonged, tense, and vexatious work, coupled with gnawings of desire and disappointments, rapidly undermine the psychic and somatic well-being of many individuals. It can lead to an interplay of physical complaints with psychotic motivations. The vise-like headache of frustration, the insomnia of worry, the jitteriness of fear and of fretful fatigue are some of its manifestations. In some patients a complex of symptoms is developed whose understanding and interpretation may require a general medical, urologic, and psychologic approach. The patient is usually unaware of the significance of the symbiosis of these factors, and unfortunately his physician often does not seek out the deep personal conflicts that engender them. The urologist is usually interested in only the posterior urethra and gonads, and the psychiatrist commonly digs into the subconscious. Though each may be correct in his diagnosis and attempts at therapy, the patient is receiving incomplete attention and piecemeal treatment. He is not taken as an entity and, disappointed, wanders from one doctor to another. The author presents two such cases. Although aware that the number is small and, from the point of view of statistics, valueless, on the other hand, he is convinced that the thorough and sympathetic understanding of even one case can establish principles of approach and handling which usually are lost in the cold columns of extensive statistics.

Case Reports

Case 1.—A 56-year-old superintendent of a private school was referred for treatment of impotentia. He had been married for thirty years, was the father

of two children, 20 and 24 years old, and until three years ago was relatively potent He first noted premature ejaculations, later erections became unsatisfactory, and for the last six months had ceased altogether His physician treated him with oral doses of strychnine and massages of the prostate gland On examination I found a well-proportioned, overweight (208 pounds) individual looking older than his years The blood pressure was 170/110, the abdomen was negative, and the external genitalia were well-developed The prostate was moderately enlarged, firm but not hard The urine was negative for albumin or sugar, and the microscopic examination revealed a few white and red blood cells per high power field The basal metabolic rate was −20 per cent The cysto urethroscopy was essential negative the prostatic intrusion was moderate, and there was some congestion of the region of the verumontanum Treatment consisted of (1) moderate doses of thyroid (0 09 Gm daily), (2) biweekly intramuscular injections of testosterone propionate (25 mg) (3) instillations of a 1 1,000 solution of silver nitrate into the posterior urethra via Bang's syringe, and (4) prostatic massages He also was advised to reduce

After five weeks of treatment the patient volunteered the information that attempts at coitus often brought on a peculiar pressure in the substernal region He further added that the domestic situation, in view of his impotentia, had become intolerable His wife could not understand his sexual inability and plagued him with the accusation that he 'went out with other women" He dreaded coming home because of the scenes that often ensued He further added that difficulties and discords had arisen at the school, and that between the hard, tense work and the irritations at home he felt he "could not go on" He drank increasing quantities of coffee to counteract the lethargy which resulted from his insomnia, and smoked ten to fourteen cigars a day, contending that that was "the only real pleasure left" Because of the precordial pain, he was referred back to his physician for a further check up The orthodiagram revealed slight left ventricular enlargement and moderate dilatation of the descending aorta of atherosclerotic type The electrocardiographic tracings suggested "the presence of myocardial changes such as due to coronary artery disease" (Fig 1)

The impotentia persisted and the patient, therefore, decided to consult a psychiatrist About three months later he joyfully reported that he had been helped greatly The discussion revealed that the patient had not loved his wife for over a decade She had become obese, unattractive, querulous, and given to acerbity Though other women attracted him, he had remained faithful because of "his work, his position at school, and his sense of honor" For the last year, however, an attractive, highly intellectual young woman had worked in his office A close friendship developed which, however, remained platonic Following the visits to the psychiatrist it became clear to the patient that all his troubles were due to his *affaires du coeur* Because he did not love his wife he became impotent, and when she insisted that he try to cohabit with her he developed chest pain The patient was quite happy with the unveiling of his submerged conflicts He recalled that the manifestations of the libido were normal when he was in the company of his amorata Yet, two weeks later, following a disturbance at school, and a heavy meal at home which culminated in a horrendous quarrel with his wife, he developed an excruciating pain in his chest which radiated to his left shoulder and down the left arm He died within an hour, obviously of acute coronary occlusion

Discussion It is probably true that the patient suffered from profound psychic conflicts, but it is also true that there were other significant organic changes in him which should have received more attention These undoubtedly were aggravated by emotional and physical strains To have treated only one aspect, the psychic, was incomplete therapy

Case 2—A man of 40 married an attractive girl one half his age Three months after marriage he noticed short-lived, ineffectual erections on attempts at coitus About a month later he began to have attacks of tachycardia, precordial oppression, and a sensation of a lump in his throat These symptoms usually occurred at night and were relieved by hypodermics of morphine Physicians told him that he suffered from attacks of angina pectoris, and advised him to stop work and go South The patient was seen by me one year after the onset of his complaints I found a nervous, shaky individual, wearing a heavy sweater and thick underwear in addition to the usual amount of clothing because he was "subject to cold" (the weather was relatively mild) During the interview, from which he omitted any mention of his impotency, I noted that he repeatedly gazed rather beseechingly at his wife She kept showering him with attentions and helped his getting about and disrobing, because, she declared, "He must not strain his heart" The patient had neglected his business, but continued to drink large quantities of coffee and to smoke thirty to fifty cigarettes daily in addition to several cigars and a pipe The examination revealed a man of medium height, flabby build, and protuberant abdomen The skin was dry and the hands felt cold and clammy He had prominent eyes, carious discolored teeth, and a tongue that was tremulous and covered with a gray, brownish fuzz There was a fine tremor in both hands, the muscle movements were jerky, and the knee-jerk reflexes were explosive The blood pressure was 90/60, the pulse was 100, and the heart sounds were forceful The abdomen was negative He resisted examination of his genitalia, stating that they were "very sensitive and hurt him" The rectal sphincter was tight and examination of the prostate was interrupted because the patient cried out with pain However, it was possible to determine that the organ was not enlarged and that it was somewhat boggy When the examination was completed the patient, rather wistfully, asked, "Tell me, Doc, how long?" He resisted probing into his marital relationship

and it was only after a number of office visits that he confessed he was impotent. The difference in age between himself and his wife, her beauty as compared with his unattractive appearance, and the possibility of sexual inadequacy had worried him even before marriage. When the first premature ejaculation occurred the mental hazard caused by that mishap so affected him that satisfactory coitus could not be accomplished thereafter. He then started to worry that his wife might leave him or that she might become untrue to him. Every homecoming was accompanied by an uncontrollable dread of some impending disaster. It was then that the attacks of palpitation and precordial distress started. At first he accepted the diagnosis of angina pectoris with some relief and relished the attention his wife paid him. Later, however, it accentuated the old-age inferiority complex. Certain now that he was "sexually through," he often thought of committing suicide. Further discussion with the patient revealed an ignorance of the anatomy and physiology of sexual relationship. The orthodiagram revealed a left ventricular hypertrophy.

The electrocardiogram showed left-axis deviation and a conduction time measuring 0.24 to 0.25 second (Fig. 2). The pulse rate was 68; one hour later it was 128. The basal metabolic rate was +8 per cent. The urine was negative.

It was pointed out to the patient that the age difference as between himself and his wife was not unusual in many happy marriages, and that being old depends not altogether on one's age, but on one's general condition. He was told that his genitalia, which he considered "delicate, small, and inferior," were normal, and that his "heart trouble" was not organic. Most of his symptoms were the result of a combination of inferiority and fear complexes. He was urged to cut down on tobacco and coffee.

When last seen the patient had had fewer attacks of palpitation and sexually he had swung in the opposite direction to his previous inadequacy, even boasting of his prowess.

Discussion: The summation of phobias, fixations, and feelings of inferiority in a sexually unenlightened individual led to cardiovascular derangements resulting in a profound psychosomatic dyscrasia. The declaration that he suffered from angina pectoris augmented the symptoms. Clarification of the motives and mechanisms underlying the trouble, instruction in sex anatomy and physiology, and general encouragement led to a marked improvement.

WAR OFFICE OF PSYCHIATRIC SOCIAL WORK CONTINUED

Psychiatric social work has proved such a valuable resource to Selective Service and to the mental health services of the armed forces that a projected discontinuance of the War Office of Psychiatric Social Work has been averted by securing additional financing and the work assured for another year, it was learned on February 4.

The War Service Office, stimulated by an officially recognized need for its particular function, will continue in 1945 as a joint project of the National Committee for Mental Hygiene and the American Association of Psychiatric Social Workers. Announcement of continuance was made by Dr. George S. Stevenson, Medical Director of the Committee, and Miss Madeline U. Moore, President of the Association.

It also became known on February 5 that Mrs. Elizabeth H. Ross, Secretary of the War Service Office of the Association, has been appointed a Consultant to the Surgeon General of the Army, bringing a more direct relationship between psychiatric social workers and the Army, through the Division of consultants in neuropsychiatry. Both neuropsychiatry and pyschiatric social work have been utilized as important resources in the Army as they have also been in Selective Service. The Army has established services in conjunction with military psychiatry in station, general, and neuropsychiatric hospitals, in consultation services in rehabilitation centers, in convalescent and reconditioning facilities, and in redistribution centers. The Army is using its own enlisted personnel, both men and Wacs, in conjunction with psychiatry.

As secretary of the War Service Office Mrs. Ross continues her work, not only with military authorities, but with civilian agencies concerned with the problems of war, such as Selective Service, the Veterans Administration, and the American Red Cross.

The War Service Office had been threatened with dissolution for lack of funds at the end of 1944. Widespread and voluntary support by psychiatrists, as well as by civic and socially minded members of the lay public, made possible continuation of the work.

Assured that the military authorities in this war needed the assistance of trained psychiatric social workers to make effective the work of Army psychiatrists by preparing case histories and helping in the treatment of psychiatric casualties, the War Service Office has concentrated on helping find within Army ranks those who had such training and ability in civilian life. Simultaneously, the office has been concerned with promoting the standing of such workers in the armed services, and with recruiting the greatest possible number of new, qualified workers into the field of psychiatric social work to meet future needs.

A REPORT OF 93 CASES OF MENINGOCOCCUS INFECTION ADMITTED TO STATION HOSPITAL, CAMP BUTNER, NORTH CAROLINA (FROM NOVEMBER, 1942, TO SEPTEMBER 1, 1943)

R. W. Houseal, Maj., (MC), AUS, and M. J. Gerbasi,* Capt., (MC), AUS

Ninety-three cases of meningococcic infection have been admitted to Station Hospital, Camp Butner, North Carolina, during the last ten months. In civilian life since late 1942 as in 1929, a great rise of the incidence of this disease has also been noted.[1] The specific effects of therapeutic agents developed within the last decade have provided a thrilling experience to the medical staff. The cures in some cases seemed miraculous. We have come a long way since Viesseux gave the first classic description of this disease (1805, Geneva).[2] Soldiers admitted desperately ill, delirious, and frequently in shock have, after twenty-four hours become rational and comfortable.

Group susceptibility to meningococcic meningitis is low. The number of cases as compared to the total number of troops or to the total number of admissions to the hospital is very small. The influence of meningitis on the total noneffective rate in troops is negligible. It is the influence of meningitis on the morale of troops that is important from a military point of view. The number of cases of meningitis as compared to the number with measles, for example, is very small; yet soldiers pay no attention to the latter disease. Medical officers whose experience goes back to the last war can, however, recall the effect on the morale of both officers and men caused by the appearance of a few cases of meningitis because of its severity, suddenness of attack, coma, and high mortality rate. Fear and apprehension are engendered as soon as the disease appears. During World War I there were 4,831 meningococcic meningitis admissions to U. S. Army Hospitals with 1,836 deaths: a mortality of 38 per cent.[3] At the present time, with a mortality rate of less than 5 per cent, the disease should cease to depress the morale of troops.

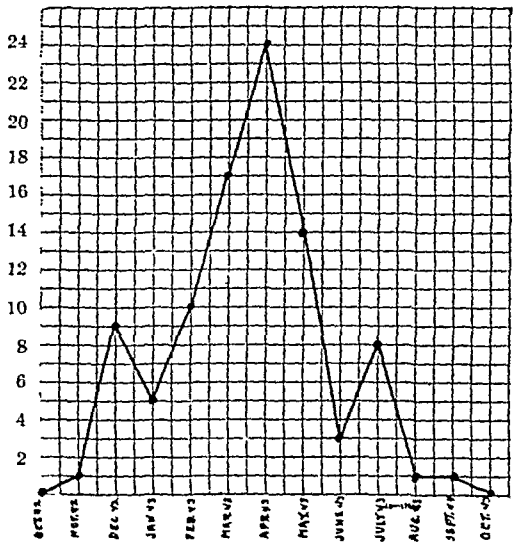
Though spread of this disease is effected by poor ventilation and overcrowding, various writers in Japan, Egypt, England, and the United States have remarked on the relative rarity of family infection. Captain Darlington made an epidemiologic study of our first 16 cases with the following observations: Cases 1, 2, and 16, occurring in November and December, 1942, were in men who had just arrived at camp from other stations and were infected before arrival here. The strength of organizations on the post increased by about 50 per cent during those months by arrival of newly inducted troops. Perhaps many carriers also arrived with these cases. Finally about the middle of December the meningococcus carrier rate reached a point, not necessarily very high, which began to produce cases of disease. No contact among the first 16 cases could be demonstrated (Chart 1).

A great deal has been written on the way in which this infection spreads in the body. It would seem plausible that the meningococcus is harbored in the nasopharynx and when the normal body resistance is broken the blood stream is entered and the meninges secondarily invaded, rather than the germs reaching the meninges by way of the cribiform plate directly. Our early patients frequently showed positive blood cultures with a negative spinal fluid, eight hours later a lumbar tap would frequently reveal a cloudy spinal fluid, positive on culture. The late cases showed a pronounced meningeal reaction but the blood culture was not so constantly positive. These cases will bear out this point.

Case 86 (*D. R. B.*).—The patient's blood culture was positive, the spinal fluid contained no cells, and the culture was negative. Eight hours later the spinal fluid culture was positive for type I meningococcus, 760 cells.

Case 68 (*S. W.*).—Twelve hours after onset of symptoms, the blood culture was positive, the spinal fluid contained eight cells, the culture was positive. Sixty hours after onset of symptoms with no treatment it contained 2,440 cells, and gram-negative diplococci were present.

Case 72 (*J. M.*).—The blood culture was positive, the spinal fluid contained no cells, and the culture was negative. Twenty-four hours later the spinal fluid showed 4,690 cells, and gram-negative diplococci were seen.



Case 76 (*K. F.*).—The patient's blood culture was positive, the spinal fluid contained five cells, all lymphocytes, the culture was positive for meningococcus, type I. Eight hours later the spinal fluid contained 3,610 cells, the culture was again positive, and [illegible] were seen.

[illegible] hours after onset of [illegible] was positive, and petechiae and purpura were present, the spinal fluid contained three cells, no organisms were seen, and the culture was positive for meningococcus, type I.

Our series of cases has been divided into four groups—mild, moderate, severe, and fulminating—on the basis of severity of symptoms. The height and duration of the fever, the state of

* Of Rochester, New York.

Meningococcus Infection Incidence

consciousness, and the condition of the circulation were the principal criteria of the severity of the disease.

The patients with mild cases were mentally alert, the ones with moderate cases were apathetic and stuporous, and those with severe cases were comatose and delirious. The patients with the fulminating type of case showed signs of peripheral circulatory collapse with low blood pressure and gray cyanosis. We feel that all of the cases, especially when the disease is occurring in epidemic form, are potentially severe; a mild case, if untreated, can rapidly become a severe one. Of the cases, 10.7 per cent were mild, 10.7 per cent of the cases were moderate, 63.4 per cent severe, and 15.0 per cent fulminating.

The onset in all the severe and fulminating cases was very sudden. Case 10 (W. C.) drilled with his company in the morning and was found unconscious on the floor of his barrack's latrine at 3 P.M. Case No. 27 (J. M. S.) felt well in the morning and took a three-hour written examination, making an excellent grade. He was admitted to the emergency room at 10 P.M. in stupor. A lumbar puncture revealed a cloudy spinal fluid. On the other hand, the onset in the mild cases was much more gradual. For example: Case 57 (F. H.) had a cold for two weeks and developed a sore throat and fever with an exacerbation of an old sinusitis. On admission his temperature was 99 F., there was nasopharyngitis with bloody nasal discharge, mild headache without rigidity of neck, white blood cells, 11,000; the patient was mentally alert. He rested well all night and a lumbar puncture was not done until eighteen hours after admission. It showed a cloudy fluid, positive on culture.

Most of the milder cases occurred toward the end of the epidemic. Only one case of so-called chronic meningococcus infection without invasion of the meninges was seen. This soldier had five attacks of fever and headache lasting for several hours with intervals of three or four days between. Repeated blood cultures were necessary before a positive result was obtained.

The symptoms and signs most frequently encountered were headache, fever, vomiting, sore throat, stupor, stiff neck, Kernig's sign, and skin manifestations: rose spots, petechiae, and purpura. All patients had herpes labialis, which appeared after the third day. In some instances the whole side of the jaw or face was involved. Table 2 shows the frequency of occurrence of each of these symptoms in 93 cases.

Of these symptoms and signs the most striking on admission were the headache, nausea and vomiting, stupor, rose spots and petechiae, and stiff neck. Headache, vomiting, and fever, while present in a large percentage of cases, are not distinctive, being frequently encountered at the onset of many infections.

Temperature varied from 97.6 F. to 105.6 F., the average being 103.3. The pulse varied from 64 to 126, the average being 97 beats per minute. The respirations varied from 16 to 36, the average being 18 a minute. The blood pressure varied from unobtainable to 150/100, the average being 96/70 and rising to normal levels as soon as the shock condition was relieved. For example, Case 45 (W. H. S.): after administering 1,000 cc. of 10 per cent glucose and 500 cc. of pooled human plasma a pressure of 80/68 rose to 120/80 and remained at that level. Headache is peculiar only in its severity at the onset of meningitis and most frequently is frontal and not occipital even in pronounced cases. Sore throat at the time of this epidemic was also present in large numbers of soldiers entering the hospital with nasopharyngitis. Stiff neck and Kernig's sign were present in 83 per cent of the cases. These latter two signs are evidence of inflammation of the meninges and are not present in the meningococcemia which precedes the localization of the infection. They varied greatly in degree and frequently were equivocal. On the other hand, the mental state of the moderate and severe cases was distinctive. These were drowsy, wanted to be let alone, and answered questions only with continual prodding. Some were in coma, becoming conscious in belligerent, noisy delirium requiring restraint. The skin rashes were also characteristic and were shown by 72 per cent of our series. The first rash to appear is a macular type of eruption, usually over the trunk, resembling the rose spots of typhoid fever. This rash disappears quickly, usually

TABLE 1

Date	Headache	Temperature	White Blood Cells	Polymorphonuclears	Blood Culture	Spinal Fluid
April 28 1943	Severe frontal	103			Negative	
May 2 1943	Severe frontal	103	12 850	75%	Negative	
May 6 1943	Severe frontal rose spots present	101	13 150	83%	Negative	6 cells 4 lymphocytes Globulin 2 plus culture negative
May 7, 1943	Rose spots gone					
May 11 1943	Severe frontal	102	17 150	93%		
May 14 1943	None	98 6	8 800	79%		
May 15 1943	Severe frontal	102 6			Positive	No cells Culture negative
May 18 1943	Treatment begun (sulfadiazine by mouth)					
May 26 1943	No headaches	98 6	6 300	61%		No globulin

TABLE 2

Symptoms	Number Cases	Per Cent
Headache	93	100
Fever on admission	90	96 8
Stiff neck	77	8? 8
Kernig and Brudzinski signs	78	83 8
Vomiting	72	77 4
Sore throat	69	74 2
Rose spots	67	72 0
Chill	60	64 5
Stupor	52	56 0
Petechiae	47	50 5
Conjunctivitis	35	37 6
Purpura	14	15 0

within less than twenty-four hours The most typical skin manifestation was the petechiae These are punctate hemorrhages into the skin varying in size from pinhead to 1 cm in diameter, appearing on conjunctivae, trunk forearms, ankles, and legs They come out in crops with startling rapidity, the patients becoming spotted within an hour Case 8 (R W M), seen in the admission office, had two or three light petechiae His chest, legs, and arms were covered thirty minutes later They fade within twenty-four hours, leaving a rusty fawn-colored stain, which persists for three or four days Some of our patients had larger purpuric spots, chiefly on areas subjected to trauma

The importance of early diagnosis in this infection is paramount In order that medical officers may select the meningitis suspects from among hundreds of cases of acute upper respiratory infection, a thorough knowledge of the symptoms and signs, keen observation, and constant vigilance are necessary The medical staff was instructed particularly in the characteristic skin manifestations and was given a memorandum beginning with this paragraph

"All cases of nasopharyngitis with high white-blood cell count or with petechiae, with or without nuchal rigidity, are to be considered as cases of meningitis until proved otherwise Immediate diagnosis and treatment are imperative Watch all cases of nasopharyngitis with fever, repeated emesis, and those stuporous and not mentally alert, especially in the cases of soldiers who have seen a month or less of service"[4]

Many cases were recognized by the field medical officers or by the hospital admitting officer and sent directly to the ward with a tentative diagnosis Some cases were admitted to other wards and selected by ward officers as cases of meningococcus infection In only one case was the patient in the hospital more than eighteen hours before diagnosis was made (Case 4 (R C A) discussed below as illustrating points in differential diagnosis)

On admission to the meningitis ward the following laboratory procedures were carried out complete blood count and blood culture, lumbar puncture with examination of the spinal fluid including cell count, smear for differential count and bacteria, and spinal fluid culture with inoculation of media as the fluid dropped from the spinal needle

The white-blood cell count made on admission varied from 6 800 to 44 500 cells, average 19,906 The percentage of polymorphonuclears was usually increased, with Schilling shift to the left All cases of nasopharyngitis with white blood counts of over 15,000 and polymorphonuclears above 80 per cent were considered suspects, and correctly so in many cases

The spinal fluid was cloudy on the first lumbar tap in 63 cases These were given intravenous sodium sulfadiazine without waiting for further examination of the fluid During the last ten months we have had 20 patients with virus meningitis, many of whom had an opalescent spinal fluid which proved on examination to be lymphocytic It was thought better, however, for these patients occasionally to receive sulfadiazine than to delay the treatment of cases of meningococcic meningitis while awaiting laboratory proof As soon as the laboratory ruled out meningococcus meningitis sulfadiazine treatment was immediately discontinued in these cases of virus meningitis, all of which recovered promptly The spinal fluid cell counts in our series of cases of meningococcus infection ranged from 0 to 74,200 cells, average 5,544 cells Differential counts on smears showed polymorphonuclear cells pre-

dominant, ranging from 62 to 100 per cent, average 84 per cent. In 64 cases, 73.5 per cent gram-negative diplococci were found in the smear of the spinal fluid. Spinal-fluid cultures were positive in 53 cases, or 61 per cent.

A single diagnostic spinal puncture was done. Often we wished that even this was not necessary, because in a goodly number of cases shock or bellicose delirium followed immediately after puncture. For this reason we did not attempt to follow the spinal-fluid sugar as a criterion of improvement, as was the established practice in the presulfa-drug days.[5,6] A second puncture at times was helpful for diagnostic value or to relieve the increased intracranial pressure with its untoward effect on the blood pressure, pulse, and respiration, as in Case 60 (J. F.)—74,200 cells in the spinal fluid, with depressed respiration.

Blood cultures were positive in 32, or 34 per cent of the cases. Some of these were reported positive in twenty-four hours, the rest showed a growth within five days or less. Blood cultures were thus of no help in making a diagnosis on the day of admission. All our cases were caused by meningococcus type I, except two cases, type IIa, one of meningitis and one of meningococcemia.

Our series showed 87 cases of meningitis and 6 cases of meningococcemia without meningitis. In this latter group laboratory proof was obtained in all except one case. Case 52 (R. S.) had a sudden onset with fever, vomiting, mental apathy, petechiae, and a 23,400 white-blood-cell count, 87 per cent polymorphonuclears, 47 of these being stab cells, which we considered as sufficient evidence for the diagnosis of meningococcemia if occurring in a patient during the course of an epidemic. We include this patient in our series.

In the differential diagnosis meningismus occurring occasionally in such acute infections as pneumonia, typhus fever, typhoid fever, and rheumatic fever may be confused with meningitis. The findings in the spinal fluid differentiate meningococcus meningitis from that due to the tubercle bacillus.

Case 4 (R. C. A.).—This case illustrates difficulties in the differential diagnosis. The onset occurred suddenly on the evening of December 14, one day before admission with severe occipital headache, vomiting, diarrhea, and fever. On admission his temperature was 101 F., pulse 100, respiration 20, neck supple, Kernig negative, pharynx injected, many rose spots on abdomen, white-blood-cell count 10,000 on admission, 7,600 two days later, spinal fluid clear, 9 cells, globulin negative, no organisms seen in the smear, and blood culture negative. Twelve hours after admission the rose spots faded and he developed purpuric spots and petechiae over the face, chest, abdomen, back, and extremities. The temperature rose to 106 F. and the patient was wildly delirious. On December 16 he vomited coffee-ground material which gave a positive test for occult blood. The agglutination test for typhus fever was negative. With these data we felt that the disease was probably typhus fever and did not give sulfadiazine. The day after admission he was given a transfusion of 400 cc. of citrated blood. Improvement occurred and continued for two days. Then his neck became rigid and a second lumbar puncture revealed a cloudy spinal fluid with type I meningococci. He was given intravenous sodium sulfadiazine. The next day he was in coma. A 100-cc. dose of antimeningococci serum was given intravenously and intravenous sodium sulfadiazine was continued. The patient died on his fifth hospital day.

While patients were under the direct management of the Chief of the Communicable Disease Section immediate treatment was essential and all officers of the medical staff were made responsible. The following memoranda was given to the staff:[9]

"1. Call the laboratory corpsman, be it day or night, so that the media can be implanted with suspected spinal fluid directly. Get a blood culture. If the spinal fluid is cloudy start intravenous treatment outlined below without removing this needle from the vein.

2. Five Gm. of sodium sulfadiazine in 100 cc. of distilled water slowly by gravity from salvarsan burette. Repeat in eight hours if the patient does not tolerate oral medication or fluids.

3. One thousand cc. of 5 or 10 per cent glucose in saline intravenously immediately after the sulfadiazine without removing the needle.

4. Pooled human plasma if patient is in shock—comatose, with ashen-gray cyanosis and low blood pressure. Put patient in oxygen tent.

5. Catheterize patient if bladder is distended.

6. If patient is in active delirium administer 12 to 24 cc. paraldehyde in 1 ounce of oil (mineral or olive) by rectum. Always make sure that a special corpsman has been assigned to each new meningitis patient."[7]

An effort was made to avoid focusing the attention on the specific treatment to the neglect of general measures to conserve the strength of the patient. Many details were worked out during the experience of the first month. Various sedatives were tried in the restless and delirious patients. Vomiting in these was almost continuous and medication by mouth was impossible. Intravenous barbital preparations were given in some cases. Paraldehyde seemed to give the best results and has been the only sedative used during the last nine months. An occasional hypodermic dose of codeine was administered for headache and joint pain. During the first month of the experience fluids and sulfadiazine were given into the stomach through a Levine

nasal tube This method, however was discarded in favor of the intravenous route when it was found that the fluid and drug in some patients remained for hours in the stomach and in others they were vomited A Wangensteen stomach suction was used in some cases of persistent vomiting particularly in cases with hematemesis Cases 3, 5, 8, and 39 (R A, N L, R N, and R M)

Fluid intake and urinary output were charted The minimum output considered satisfactory was 1,500 cc One thousand cc of glucose in saline was given to all patients receiving intravenous sodium sulfadiazine on admission To those unable to take fluid by mouth because of coma or delirium, or repeated emesis, two or three thousand cc of 5 or 10 per cent glucose in distilled water were given during the first twenty-four hours in addition to this first infusion of saline One patient had edema (Case 28—T R K.)

Sulfadiazine alone or sulfadiazine and meningococcus antitoxin were the specific therapeutic agents used We followed the dictum "strike hard at the start, subdue the infection quickly" Sodium sulfadiazine was given to all patients in sufficient dosage to produce and maintain a blood level of 7 5 to 10 mg per cent during the first forty-eight hours unless some toxic effect developed, requiring discontinuance of the drug

In the last 70 cases we have treated the results have been as good if not better with a sulfadiazine blood level of 6 to 8 mg per cent Thus last is a most welcomed conclusion, as in this way there is less risk of drug reactions

In all the severe cases 5 Gm of sodium sulfadiazine was given intravenously immediately on the finding of a cloudy spinal fluid This was repeated at eight- to twelve-hour intervals in 3- to 5-Gm doses The intravenous method was discontinued as soon as the patient could retain sulfadiazine and sodium bicarbonate by mouth, which was usually after the first twenty four hours

The average amount of intravenous drug, i e, sodium sulfadiazine was 9 2 Gm, and orally (sulfadiazine, sulfathiazole, and sulfanilamide) 67 7 Gm Treatment was administered on the average for 13 5 days, thus allowing for oral medication for seven or eight days after the patient was afebrile

We learned by daily blood sulfadiazine estimations that the sulfadiazine dosage by mouth necessary to produce a satisfactory blood level was 1 to 2 Gm every four hours This varied somewhat with the individual With all the sulfa compounds excretion is chiefly by way of the kidneys The time of maximum urinary excretion varies with the drug given, the dosage, and the route of administration In comparison with sulfanilamide the rate of excretion of sulfadiazine by the kidneys is relatively slow High blood levels are reached and maintained more readily than with sulfanilamide Our patients were soldiers, mostly young men with normal renal function The only renal impairment to be considered was that resulting from the disease or from the sulfadiazine itself In cases of impaired renal function Alyea[8] standardized the sulfanilamide dosage on the basis of phenolsulphonphthalein excretion By this method he was able to maintain constant blood levels In our cases comparison of the blood sulfadiazine levels with nonprotein nitrogen levels shows that the sulfadiazine levels would rise rapidly in the blood when the nonprotein nitrogen level was higher than normal Likewise, in the presence of impaired renal function, as indicated by nitrogen retention, on discontinuing the drug the blood sulfadiazine would decrease much more slowly than in patients having a normal nonprotein nitrogen At the first indication of a rising blood nonprotein nitrogen the sulfadiazine dosage was therefore reduced It was stopped entirely when the blood nonprotein nitrogen reached 45 mg per cent

Both antimeningococcus serum and meningococcus antitoxin were used Antimeningococcus serum was administered intravenously to only 7 patients No conclusions can be drawn because the number of cases thereby treated is small, however, no dramatic improvement was seen With antitoxin, however, the beneficial effects were very dramatic and obvious in four to six hours It was repeatedly shown to us that it was good insurance to administer the antitoxin intravenously in doses of 30,000 to 60,000 units Recovery is assured even if there should be a pronounced intolerance to all the sulfa drugs[9]

In 35 severe cases antitoxin was given Shock was relieved before patients were tested for serum sensitivity, since a false negative test may be obtained if the capillaries are collapsed Thirty to eighty thousand units of meningococcus antitoxin in 500 cc of saline were given slowly intravenously in one dose Five patients received a second dose of antitoxin eight to twenty four hours later In only one case, 13, was it necessary to discontinue administration of antitoxin because of the reaction Another case, 22, had a severe reaction immediately after injection Both of them recovered In only 12 of the cases receiving antitoxin was any serum sickness seen They had urticaria, easily relieved by the usual measures A few ran a slight fever or had swelling of the joints, usually symmetric Cases 27 and 84 showed elevated white blood counts, 33,200 and 22,300, over a period of days, associated with a more severe form of serum sickness One

of these men showed a predominance of the lymphocytes and the other of granulocytes.

Many therapeutic measures were utilized in the treatment of the fulminating cases to relieve the peripheral circulatory collapse. Immediately after the intravenous sodium sulfadiazine these patients were given 1,000 cc. of 5 per cent glucose in saline. If improvement did not occur as evidenced by relief of cyanosis and rise of blood pressure to normal, they were then given 500 cc. of pooled human plasma and put in an oxygen tent. Some were given adrenal cortical extract. While these measures served to relieve shock in most cases, it is difficult to evaluate the separate effect of any one of them.

The most frequent toxic effects of the sulfonamides noted in our series were related to the kidneys. Each patient had a daily urinalysis. A venipuncture was done each morning and a sulfonamide and nonprotein nitrogen estimation was made on this specimen of blood withdrawn. Over 4,000 specimens of blood were examined in this way and the results were tabulated. Hematuria, kidney colic, suppression of urine, and nitrogen retention all occurred. It is impossible to decide dogmatically how much of this kidney damage was due to the sulfonamides and how much was due to the disease itself. The toxin of the meningococcus injures the cells of the blood capillaries, and the hemorrhagic tendency of the disease, as seen in the petechiae and purpura, might also be a cause of the hematuria. Case 36 (Seib) had gross hematuria before sulfadiazine was given, as did many other cases. In such cases sulfanilamide rather than sulfadiazine was given orally, since we have repeatedly noted that hematuria developing while a patient is taking sulfadiazine cleared when changed to sulfanilamide but not if sulfadiazine was continued, despite an adequate fluid and alkali intake. Then, too, the circulatory collapse in the fulminating cases was conducive to suppression of urine and azotemia.

Our observations tend to confirm the opinion of others that there are two types of renal lesions resulting from sulfadiazine; namely, the mechanical effects of sulfadiazine crystals causing obstruction and hematuria, and the effects on the kidneys similar to that of mercury poisoning resulting in azotemia and suppression of urine.[10]

The hematuria encountered can be regarded as one caused by the infection and aggravated by the sulfadiazine. While it is true that by giving alkali and a high fluid intake with sulfadiazine, the development of hematuria during therapy could be avoided in most cases, with an admission of hematuria it would have been foolhardy to push sulfadiazine, and sulfanilamide was better.

Some of the cases having hematuria did not have nitrogen retention. On the other hand, some of the cases showing a high blood nonprotein nitrogen did not have hematuria. Forty of our patients had hematuria. Of these, 18 had a blood nonprotein nitrogen above 35 mg. per cent and 22 a normal blood nonprotein nitrogen. Twenty-nine patients had a blood nonprotein nitrogen above 35 mg. per cent. Of these cases of increased blood nitrogen 17 had hematuria and 12 did not. We consider an elevation of the blood nonprotein nitrogen as useful a criterion in the administration of sulfadiazine as the presence of red blood cells in the urine. Sulfanilamide is tolerated when hematuria is present. None of the sulfa drugs are tolerated when the nonprotein nitrogen is elevated.

In those patients with a blood nonprotein nitrogen of over 45 mg. per cent the sulfadiazine was stopped; twenty-four hours later sulfanilamide was usually begun. A few red blood cells on a microscopic examination of the urine was not considered a positive indication for discontinuing sulfadiazine. When there was gross hematuria, sulfadiazine was always stopped. No permanent renal damage resulted, as proved by urea clearance tests carried out on eight patients two weeks after having had an elevated nonprotein nitrogen or hematuria; in all cases the standard and maximum clearances were 100 per cent or better.

Other toxic effects of the sulfa drugs were: renal colic (sulfadiazine) in three instances; fever (sulfadiazine, sulfanilamide, sulfathiazole) in eight instances; cyanosis, drop in blood pressure, and air hunger (sulfanilamide) in five instances; gastritis (sulfanilamide) in one instance; anemia, moderate severity, drop of red blood cells to 3,000,000 (recovered with transfusions) in three instances; and rash over body (sulfanilamide) in two instances.

Numerous complications of meningitis are given in every textbook description of this disease. The eye complications, purulent conjunctivitis, corneal ulceration, and panophthalmitis, did not occur in our series. Pericarditis and myocarditis were not recognized. Internal hydrocephalus did not occur. The only complications were five cases of arthritis and one case of unilateral nerve deafness, Case 27 (J. M. S.), proved by audiometric testing.[11] The arthritis was usually monarticular. The joints involved were knee, shoulder, and metacarpophalangeal. There was considerable swelling, no redness, and marked pain on motion. The joint swelling appeared about the fifth day. None were tapped. They were immobilized for about a week. All showed no residual disability, and x-rays were negative on discharge from the hospital. Fever and length of time in the hospital were prolonged in all of these patients with arthritis.[5] In

one case, 30 (N L), a slough of a large purpuric area, 3 cm., over the external malleolus occurred It healed slowly but well

Three deaths occurred in a series of 93 cases, giving a mortality of 3 2 per cent These deaths occurred among the first 10 patients admitted, two of whom had the fulminating type During the last nine months 83 consecutive cases were treated without a death The average duration of hospitalization was 38 8 days in septicemia alone, 28 3 days, meningitis 38 8 days, meningitis and arthritis, 71 0 days All patients have been discharged to duty cured The average duration of fever and nuchal rigidity was 8 3 and 8 days, respectively

Summary and Conclusions

1 A report of 93 cases of meningococcus infection occurring among soldiers in Camp Butner, North Carolina, has been given

2 The concept that meningococcus infection is a generalized disease with meningococcemia preceding meningitis in this series of cases is emphasized The finding of a normal spinal fluid does not rule out the disease

3 The most helpful signs in early diagnosis are increased white blood cells, nausea and vomiting rose spots, petechiae, and mental apathy Medical officers in regimental dispensaries and the staff of the station hospital were able to make earlier diagnoses than is possible in civilian practice

4 Treatment using both sulfonamides and antitoxin was systematized during the first month of our experience and resulted in a zero mortality rate in the last 83 consecutive cases Antitoxin was used in conjunction with sulfadiazine in the severe cases It relieved the toxemia and served as a "sheet anchor" in those patients developing kidney effects requiring the discontinuance of sulfa-drug treatment

5 Constant vigilance is necessary to avoid kidney damage from sulfadiazine which may lead to azotemia and anuria In our cases a daily blood nonprotein nitrogen estimation was made

A nonprotein nitrogen of 45 mg per cent was found to be a satisfactory criterion for discontinuing sulfadiazine

IS THE RACE IMPROVING?

The first million draftees of the last World War (1917–18) measured an average of 67 49 inches in height This was in the age group from 21 to 30 The average height of the 20 to 29 age groups of inductees of this war up to May, 1943 was 68 15 inches about two thirds of an inch higher In the same groups the proportion of men 70 inches tall was 27 5 per cent as against 22 4 per cent in the last war The proportion of men 6 feet tall is now 8 8 per cent as against 6 5 per cent in the last war The general average height as well as the number of tall men is greater

A study of school children in Toronto in 1939 showed the average 6 year-old was actually 2 inches taller than the same aged child in 1892 At 9 years this difference was 3 inches and at 14 years the boys were 3½ inches taller and the girls 2 inches

The stature of the average young person must be accepted as an indication of better physical condition The rejection rates of this war have been used to challenge the medical profession for a job poorly done The standards have been higher, and added causes for rejection have been used In this war 7 per cent were rejected because of illiteracy This one item alone would account for the higher rejection rate

It is of first consideration from a health standpoint, as well as military, that the physical condition of our young people be placed on a high level This is of direct interest to the medical profession, and we accept the challenge, but we cannot be held responsible for some of the factors causing the high rejection rates The medical profession cannot be blamed because 7 per cent of our young men and women cannot read or write

During the twenty five year period between the two wars morbidity and mortality rates have decreased and the life expectancy has increased from 49 to 61 years We feel pride in the manifest improvement of the race as shown statistically But the medical profession is pledged eternally to improvement —*J Michigan State M Soc, Feb, 1945*

sharp nuclear definition are most important, since nuclear changes are especially significant and pathognomonic in malignancy. A differential staining of acidophilic and basophilic cells is desirable, but of secondary importance.

In reaching a definite conclusion and in formulating the reports, a conservative point of view is advisable. A case should not be specified as definitely positive unless the evidence is overwhelming. If the slightest element of doubt exists, the case should be classified as suspicious. Findings should be corroborated as much as possible by curettage or biopsy before a major operation is performed.

Time does not permit entering into a description of the characteristic modifications of the normal structure of cells caused by cancer and of their diagnostic value, nor does it permit presenting detailed statistical data. In fact, it is a little too early to put this method on a statistical basis because of its present transitory status. We are still in the process of learning how to apply the method more successfully and how to use our criteria more securely. A more extensive application is necessary before its relative value can be more accurately appraised. However, it is safe to state that its position is already firmly established and its usefulness as a diagnostic method not only in cancer of the uterus, but also in other gynecologic conditions, has been conclusively demonstrated. In our hospital it has repeatedly been possible to diagnose uterine malignancy before its presence was revealed by other diagnostic methods or when it was not at all suspected, and in some instances, even after an inconclusive or negative curettage.

Summary

In summarizing, I wish to stress the following points:

First, the vaginal and endometrial smear method is based on sound morphologic criteria.

Second, until it is fully explored and mastered by a group of experts, it should be applied with caution and considered not as a substitute but as a supplement to the methods of biopsy and curettage.

Third, its most distinctive advantages are its simplicity and inexpensiveness, the feasibility of repeated examinations, and above all, its usefulness in permitting a recognition of early malignant uterine lesions.

I want to express here my appreciation to the Commonwealth Fund for having generously supported this work, and to Drs. Joseph C. Hinsey and Henricus J. Stander for having extended to us their unqualified support and the facilities of the Departments of Anatomy and Obstetrics and Gynecology of Cornell Medical College and of the New York Hospital.

FREE EYE TESTS ARE STARTED IN DRESS INDUSTRY

Free eye examinations which eventually will be given to eighty thousand workers in New York's dress industry this year were started on January 3. The tests are part of an industry-wide health plan paid for by employers and jointly administered by them with the Dress Joint Board of the International Ladies' Garment Workers' Union, an American Federation of Labor affiliate.

The first group to take the test, a three-minute check to determine whether a more complete examination is necessary, were one hundred and twenty employees of the Apex Dress Company. Two telebinoculars, a stereopticon device for detecting eye weaknesses, were brought to the plant by optometrists under the direction of Dr. Leo Price, director of the Union Health Center.

During the year the eyes of employees in 2,215 shops in the metropolitan area will be examined at their places of work.

Those workers who are found to be suffering defects will be referred to eye specialists at the Union Health Center. There more complete examinations will be given. Glasses and necessary medical treatment will be provided for the workers without cost to them.

Financing of the health program, which was started January 3 in accordance with an agreement made in March, 1944, between employers and the union, will be borne by the employers. So far they have contributed approximately $3,000,000, or 3½ per cent of their total pay rolls.—*N.Y. Herald Tribune, Jan. 4, 1945*

ROENTGEN THERAPY OF ARTHRITIDES

IRA I. KAPLAN, M.D., B.Sc., New York City

(From the Radiation Therapy Department, Bellevue Hospital and the New York University College of Medicine)

OF ALL the ills of man that have baffled medical science for centuries and still fail to respond to any universal therapeutic treatment the most important is arthritis. For thousands of years victims of this crippling disease have filled water-cure places, which seemed to afford the only effective relief available to most of these sufferers. Medicaments of all sorts have been tried for this disease but as yet no drug or chemotherapeutic agent has proved more than temporarily effective.

The widespread incidence of arthritis, the serious social and economic distress associated with it, its chronicity, and the lack of a real remedy emphasize the importance of giving serious consideration to radiation therapy. Radiation effects its therapy by producing analgesia of the involved areas, either through direct action on their nerve endings in the area affected or by relieving the local inflammatory condition. This effect is probably due to a direct effect on lymphocytes and leukocytes, reducing inflammation and thus relieving pressure on the nerve sheaths. Irradiation also induces a better blood supply to the part through its effect on the vegetative nervous system.

Arthritis is not a uniform disease. During the period 1924–1944 we treated 144 cases of arthritis, exclusive of gonorrheal arthritis, and 76 cases of bursitis in the Radiation Therapy Department at Bellevue Hospital. Of the arthritis cases 72 were men and 72 women. Of the bursitis patients there were 32 men and 46 women.

For the purposes of this discussion we group our cases as arthritis proper—wherein the joints are involved per se—and bursitis—wherein the joint is secondarily affected because of involvement of the associated bursa. Arthritic conditions may be acute or chronic, infective or noninfective, and specific or nonspecific. They may be atrophic, rheumatoid infections, proliferating, arthritis deformans associated with the younger age group, or hypertrophic with osteoarthritic degeneration associated with senescence.

Until the advent of chemotherapy, irradiation was the treatment of choice in infective arthritides such as gonorrheal arthritis, and while chemotherapeusis has in a great measure displaced x-ray therapy for this purpose in resistant cases, irradiation is still of therapeutic value.

In Marie-Strumpell disease, which is an atrophic spondylarthritis probably due to rheumatoid arthritic conditions of the apophyseal joints, Oppenheimer[1] states that irradiation in the early stages results in cure, and in definite alleviation in the advanced stages.

As in most diseases, the earlier the diagnosis and the sooner the treatment is instituted the better the response, and the more favorable the results. Weinberg[2] treated a large number of arthritic conditions of all types and noted that the shorter the duration of the symptoms the sooner alleviation was effected by irradiation. Chronic cases required longer therapy for satisfactory results. Goldhamer,[3] too, found irradiation most effective in a large number of cases when therapy was applied early in the course of the disease.

Early in the employment of radiology for diagnostic purposes it was already noted that x-rays had an analgesic action, but it was not until 1906 that Pfahler and his colleagues[4] first made use in this country of this attribute of x-ray to treat diseases of the joints, namely the arthritides. Later, others reported good results in a larger number of cases. Langer[5] in 1931 reported on the treatment of 363 patients. Garland,[6] too, reported very good results, especially in the infectious types of arthritis. However, only in 1941 was a real effort made to investigate under adequate scientific clinical control the effect of x-ray therapy on arthritis in a large series of cases. Smyth *et al.*[7] at the University of Michigan undertook carefully to observe the effect of x-ray therapy under standard conditions in the treatment of rheumatoid arthritis and found the results promising. And later Smyth, Freyberg, and Lampe[8] reported that roentgen therapy is the best method of controlling the symptoms of rheumatoid arthritis of the spine. Rees and Murphy[9] state that spondylitis adolescens is a common disease of infectious origin in which the sedimentation rate is increased and the x-ray picture reveals early involvement of the sacroiliac joints with calcification of the ligaments and soft tissues closely related to the spine. The process begins early on the outer surface of the intervertebral disks. Vertebral changes take place from decalcification to fusion of the bodies. Early irradiation, they say, offers a hopeful and helpful means of relief in what is otherwise a marked disabling disease.

In the treatment of spondylarthritis ankylopoietica, Tenbergen *et al.*[10] report that x-ray

Prepared for presentation at the New York State Medical Society, Buffalo, 1945.

FIG. 1. September 12, 1944—before; and January 26, 1945, after x-ray therapy. C. B., female, 45, pain in shoulder. Treatment: high-voltage x-ray, 900 r to anterior and posterior right shoulder.

therapy was found to be helpful in 16 of 27 cases treated and the activity of the disease decreased, evidenced by decrease of the sedimentation rate in 18 cases. Baker[11] reported on the treatment of 22 cases of rhizomelic spondylosis and observed that x-ray therapy in patients with early involvement showed most satisfactory results. Even in cases with marked deformity, surprisingly good improvement was noted. He states that before introduction of roentgen therapy satisfactory correction of Marie-Strumpell's arthritis required a prolonged hospitalization, while with roentgen therapy plus orthopedic care only a short period of time is required for relief.

Tillis[12] states "The sufferer of Marie-Strumpell disease or ankylosing spondylitis can look more optimistically on life since the advent of massive doses of x-ray therapy." Recently Freyberg[13] demonstrated by moving pictures definite clinical relief following x-ray therapy in cases of Marie-Strumpell's disease, although no definite anatomic alterations were noted in the roentgenographs after treatment of conditions existing before treatment. Yet the marked relief of symptoms and dysfunction was spectacular, and therefore Freyberg strongly advocates this method of therapeusis in all cases wherever possible, although like other experienced clinical radiation therapists he admits that the reason for favorable response in these cases is not yet completely solved.

It is not known whether the effect is merely analgesic through the associated nerve system response to x-ray effect, or due to the response of inflammatory reaction to x-ray as described by Desjardins[14] which chiefly relieves pain because of the indirect resolution of inflammatory deposits which have not yet become organized. As Tillis says, irradiation effects the cellular portion of the blood, and he believes that the antibodies and the ferments liberated by the destruction of leukocytes in and around the inflamed area are the effective agents. The rate of change following irradiation in the different phases of inflammation corresponds to the rate at which lymphocytes, polymorphonuclear leukocytes, and eosiniphils are affected by irradiation. These factors clarify the clinical results previously described and make it evident that roentgen therapy should be used as early as possible. Or it may be through a general effect suggested by Goldhamer. Yet the results are still not clearly understood, for, as Freyberg states, it is still to be determined whether the beneficial results following irradiation are entirely symptomatic or whether the disease is actually favorably affected.

Langer believes the effect is achieved by action on the vegetative nervous system. X-rays induce a better blood supply in the disease area, through their effect on the vegetative nervous system; consequently, a better tissue metabolism

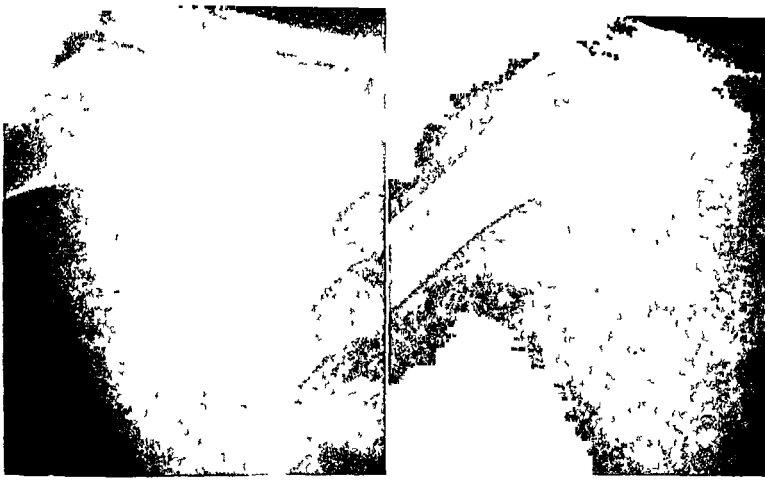

FIG 2 October 21, 1943—before, and February 29, 1944—after x ray therapy J R, male, 46, pain in right shoulder Treatment high-voltage x-ray Right anterior shoulder, 750 r, right lateral shoulder, 650 r, right superior shoulder, 450 r

is established Garland believes that the results, especially in the infectious group, such as the gonorrheal type, are due to the general reaction of inflammatory lesions to x ray But the reason for beneficial results on the chronic, degenerative type is harder to explain Suffice it to say that although we do not know the exact scientific reason for relief achieved, clinically, we have ample demonstrations of the effective subsidence of symptoms with subsequent relief to patients and, in the main, that is what counts For, although we cannot definitely explain the action of x-rays in arthritis, we believe that x-ray therapy is the best method of controlling symptoms and bringing relief to the patient, which is, after all, the aim of all therapeusis

Treatment of arthritic conditions is carried out in two ways, general and specific In many instances the general health of these patients is not good—persistent pain and distress has made them nervous and reduced their stamina, such conditions need relief Diet, too, requires careful supervision, especially regulation of carbohydrate ingestion Hydrotherapy, warm baths, and light massage of the muscles is helpful, Where definite infective sources are present, elimination of these is, of course, indicated, and chemotherapy may be used

Specific therapy consists of x-ray treatment This may either be administered with medium voltage x-ray therapy, for arthritis of small joints of the fingers or the toes, or high voltage x-rays, for the lesions in other parts of the body In the acute stages treatment is administered for two to three weeks and then once per week for five to six or more weeks, as the exigencies of the case may require In chronic cases one or two treatments per week are given for as many weeks as one deems necessary to control the symptoms Treatment is repeated after a latent period of four to eight weeks, if necessary When superficial therapy is used a 2 mm Al filter is employed The dosage given per treatment is the same whether superficial or high voltage is used, 100–200 r per area, two or more areas may be treated at one time, depending on the area involved and the extent of involvement and the general condition of the patient

Results of treatment are manifested in relief of pain and ability to use the limbs previously not functioning Swelling, when present, gradually subsides under treatment

Regarding other methods of treatment, we are in accord with Comroe[15] that gold therapy is inadequate and in many instances harmful. "Gold may be toxic and certainly is not the final answer to the treatment of rheumatoid arthritis." He further states, "Gold salts should not be given in any form of joint disease except rheumatoid arthritis. They are of no value in the treatment of degenerative joint disease, gout, fibrositis, specific infectious forms of arthritis, or rheumatoid fever. One should not continue using gold if the patient shows any untoward reaction, no matter how mild this may be. The unpredictable nature and time of the toxic reactions following gold therapy are the chief hazards in their use."

Radon ointment has been proposed as a remedy. The rationale for this is the supposed effect of mild radium action on the tissues. However, this ointment has little penetrating power, the energy from this form of radon being rapidly dissipated in the air. Practically all the energy is absorbed in the first few mm. of tissue on which it is placed. The assumption that it can influence the underlying joints or bones is entirely erroneous. However, to definitely prove whether such ointment was of any value clinically we treated a group of arthritic patients in the radiation therapy service at Bellevue Hospital in cooperation with the medical service in charge of arthritic diseases. Under careful supervision and scientific procedures this form of therapeusis in our hands proved absolutely ineffective and useless for arthritic conditions.

Bursitis may be either acute or chronic. It was first described by Codman.[16] It is a painful, disabling condition affecting the joints that may be caused by trauma, infection, or as a result of extraordinary use. In the acute stage marked disability occurs with extreme tenderness on pressure over the involved joint area and excruciating pain on joint motion. Where calcium deposits take place they are inside the bursal sac and this usually shows on the roentgen film. It occurs most frequently in men. Irradiation when applied early in the course of the disease rapidly relieves pain and gradually induces resolution of the calcific deposits in the bursa; chronic cases require longer courses of the therapy.

Young[17] states that he has noted resolution of calcified bursitis following but two treatments with x-ray therapy and this method of treatment is a safe, economical procedure. Brewer and Zink[18] state that in acute cases more rapid response is had with irradiation, and since chronic bursitis responds poorly to any other form of therapy, irradiation is a justifiable procedure. Harris[19] also reports that irradiation, although a simple procedure, gives such good results that all patients should have the benefit of treatment by this method. He treated 40 patients, with good results, especially in acute cases.

Klein and Klemes[20] state that roentgen therapy is the optimal method of treating peritendinitis calcarea of the shoulder. Baird[21] states that roentgen therapy is the treatment of choice in all acute and most subacute stages of calcified subacromial bursitis. Chapman[22] also reports striking relief of bursitis following but two radiation treatments. Solomon and Mortar[23] report that in their hands both diathermy and x-ray therapy give equally good results in periarthritis about the shoulder, but this is not the experience in the hands of others or our own experience. X-ray therapy alone appeared to us to be the method of choice in all cases.

Diagnosis is usually readily made because the symptoms are rather specific. Pain and disability are the chief complaints and tenderness over the involved bursa is present.

However, not in all cases will the roentgenogram show a definite shadow, but if symptoms are present which do not resolve in one or two days bursitis must be accepted as the diagnosis. Treatment is given whether or not calcium is visualized in the bursa on the roentgenograms.

In the treatment of bursitis by x-ray therapy, high voltage x-ray therapy with a 0.5 mm. Cu filter is used. Moderate voltage x-ray may be employed, using a 2–4 mm. Al filter, but in our opinion this form of therapy is not as efficient as that employing high voltage x-ray. Treatment is administered to the affected joint through several areas at each sitting. It is our custom to treat subdeltoid bursitis through three areas at each sitting: an anterior, a superior, and a lateral shoulder area, using either a 6 by 8 cm. or an 8 by 12 cm. field. One hundred to 150 r per field is given at each treatment. If the condition is acute two to three treatments per week are administered. In chronic or longstanding cases 1 or 2 treatments per week are given for six to eight weeks. In the acute cases the first one or two treatments may exacerbate the distress, so we always prescribe codeine for the first few nights to relieve pain. Gradually, as the x-ray takes effect, sedation is eliminated. Relief is usually achieved in four or five treatments. Calcium deposits may altogether disappear with a few treatments or require a longer course of treatment for complete resolution. In some cases complete relief and restoration of function occurs even before all the calcium is dissolved. The cases illustrated herewith demonstrate the employment of x-ray therapy in bursitis and the results achieved.

In conclusion, x-ray therapy is a readily available, practical, and efficient method of treatment for arthritis and bursitis. The results are lasting and usually occur shortly after the beginning of treatment. Exercising proper administration, we have never encountered any adverse effects from such treatments. Frequently in bursitis with calcium deposits these deposits disappear following irradiation

DIABETES—A NEGLECTED DISEASE—AND WHAT SHOULD BE DONE ABOUT IT

Diabetes is a neglected disease when compared with tuberculosis or infantile paralysis Diabetic patients equal in number those with tuberculosis and are four times as numerous as those crippled with infantile paralysis Yet, contrast the organizations devoted to the control and eradication of tuberculosis throughout the United States and the huge sums raised to combat the disease, as well as the $ [illegible] the study and care [illegible] with the one small national and the four recently created local organizations devoted to diabetes

The need for an aroused interest in diabetes is growing, because each year the number so afflicted is sure to increase. It is a disease of middle adult life, and the population of the country is steadily advancing to that decade, 45 to 55 years, in which the onset of diabetes is most frequent Diabetic [illegible] ing more cases [illegible] insulin, many coma. This each hospital itself for the encies The time required and the capital involved for equipment would be minimal, and the costs for available services of laboratory personnel at night and on Saturday afternoons, Sundays, and holidays would be insignificant compared with that incurred for maintaining operating rooms during those same periods. Indeed, a hospital that does not exercise such foresight in the not distant future may be held derelict to its local needs

The discovery of alloxan diabetes has opened up opportunities for research never before even dreamed of, and these new pathways of investigation should be exploited. Already, in less than a year and a half following the report of Shaw Dunn's original work, [illegible] have been [illegible] of diabetic patients, to protect them in their emergencies and complications and to foster research, funds are needed, and the most readily available source is from the patients themselves They constitute an intelligent group and are able and ready to contribute if asked They are not content with the present methods of treatment. They know that research gave them insulin, and they want to provide for more research to improve present methods of treatment. They are painfully aware of the short- [illegible] diabetic education or because of inferior medical treatment. They [illegible] and they wish to [illegible] relatives wish to [illegible] tients and their relatives in any community should be asked to furnish the funds for facilities in their local hospital to protect them in emergencies and to promote research in hospitals that are properly qualified. They rightly look on such gifts as personal insurance.

Physicians in the United States should raise $10,000,000 in 1945 for the creation of diabetic funds and for the betterment of hospital facilities. If this is not done, they, too, can be held derelict, because patients and their relatives are more than ready to give the money to improve the care of the diabetic patient —*New England J. M., Feb. 22, 1945*

CLINICOPATHOLOGIC DIAGNOSTIC CONFERENCES

Fourth Medical Division of Bellevue Hospital

Date: March 1, 1945
Conducted by: Dr. Emanuel Appelbaum

Dr. Marilyn T. Schittone: H. S., a 59-year-old Norwegian seaman, was admitted to Bellevue Hospital on October 16, 1944, as a transfer from another hospital, for investigation of gross hematuria which was first noted on November 16, 1943 while the patient was hospitalized there. An abstract of the patient's record there revealed that he had been admitted for a fracture of the neck of the right femur sustained in a fall on October 16, 1943. There was a past history of gonorrhea on four occasions and soft and hard chancres. He was being treated in the outpatient department of the other hospital for tabes. In addition to the findings of a fractured femoral neck, the positive physical findings were: heart enlarged to the left with a systolic murmur at the apex, and blood pressure 200/100. The fracture was pinned. A routine blood count revealed hemoglobin, 52 per cent. The anemia was treated with transfusions and vitamin B complex with no improvement resulting. On the thirty-first hospital day he passed grossly bloody urine, and after cystoscopy the genitourinary consultant felt that this bleeding came from varicosities of the prostate. Treatment with sulfathiazole, retention catheter, and bladder irrigation was given. The urine continued to be intermittently bloody. On the sixty-fifth hospital day he complained of epigastric pain relieved by food and alkalis. Gastric analysis showed no free hydrochloric acid and low total acidity; there was occult blood in the stools. A gastrointestinal series on the seventy-fifth day was negative. The patient became relatively symptom free on alkaline sedative powders and a meat-free diet, and was discharged, improved, on January 3, 1944. Antiluetic and orthopedic treatment was continued in the outpatient department. He was readmitted to the other hospital on September 27, 1944, because of abdominal pain, lumbar pain, and hematuria. Examination at this time revealed the patient to be extremely pale and weak with blood pressure of 162/82, 4 plus blood Kline test, and marked anemia. With that status, the patient was transferred to us for further work-up. Examination on admission revealed an acutely and chronically ill man with lemon-yellow pallor. His temperature was 100.4 F.; pulse, 104; respiration, 24; and blood pressure, 170/76. Marked deformity of the nose was attributed to trauma (possibly syphilis). His eyes revealed blepharoptosis of the left lid and Argyll Robertson pupils. The heart was enlarged to the left and right; it had a regular sinus rhythm. There was a systolic apical blow and an aortic diastolic murmur transmitted toward the apex. His lungs were clear. The left liver lobe was two finger-breadths below the costal margin. The right hip was deformed. Knee and ankle jerks were absent, but biceps and triceps jerks were present. The Babinski sign was negative. His vibration and position sense was intact.

Laboratory Examination and Course.—White blood cells, 9,850; hemoglobin, 7.5 Gm.; red blood cells, 2.8 million; urine, specific gravity of 1.008; albumin, 4 plus; 7–10 red blood cells per high-power field, loaded with white blood cells and clumps. Both the blood Wassermann and Kahn tests were negative on three occasions. The nonprotein nitrogen varied between 118 and 129 mg. per cent; urea, between 69 and 90; creatinine, 2.1 to 3.3; cholesterol and esters, 133/50 to 90/35. The albumin-globulin ratio was 4.85–4.05 to 4.9–2.3. The white blood count rose from 9,850 to 17,400 with normal differential. The red blood count and hemoglobin continued at the same level. Spinal fluid showed two cells; the Pandy test was negative; total protein was 43; the colloidal gold curve was 1,122,210,000. The Wassermann was anticomplimentary on one occasion and ± on another. Stools were 4 plus for blood. Gastric analysis showed no free hydrochloric acid and only two degrees of total acidity. X-rays of the chest and bones were not contributory. X-rays of the stomach and duodenum were negative. An electrocardiogram showed a diphasic T-wave in leads 1 and 4. The patient remained afebrile throughout the course of his disease. The urine showed 4 plus albumin and increasing amounts of blood and pus until a standing specimen would settle into two layers of two-thirds pus and one-third blood. Attempts to culture the urine resulted in overgrowths of Bacillus proteus and of gram-positive diplococci which were not identified. Concentration and dilution tests showed a fixed specific gravity. There was a phenolsulfonphthalein excretion of 45 per cent in two hours. On the twelfth hospital day the patient complained of pain in the abdomen. There was slight right costovertebral angle tenderness and some observers palpated a mass in the right flank which was felt to be the kidney. Several days later the costovertebral angle tenderness was no longer present and the mass was no longer felt. Intravenous pyelogram failed to reveal the presence of the contrast me-

dium in either kidney, but the patient's desperate condition made it impossible to do retrograde pyelography He was given supportive transfusions, vitamins, iron, and liver extract On the thirty-eighth hospital day he began to complain of generalized discomfort, hiccoughed, and had muscle twitches The abdomen was held tensely throughout His blood pressure was 160/76 There was no urea frost and no characteristic breath odor The patient became comatose and died in uremia on the fortieth hospital day

DR EMANUEL APPELBAUM This case will probably provoke a great deal of discussion, since, among other things, it brings up the question of the relationship of hypertension to renal disease During the past few years interest in this subject has been aroused, mainly as a result of the experimental work of Goldblatt As you undoubtedly know, this investigator has produced hypertension in dogs by constriction of one or both main renal arteries This formed the basis of the renal or ischemic theory of essential hypertension For the sake of completeness it also became necessary to add a humoral mechanism to the ischemic concept More recently, considerable doubt has been cast on the renal ischemic theory by several investigations, particularly the renal function studies of Smith, Goldring, and Chasis of this hospital, and the kidney biopsies obtained at operation by Castleman and Smithwick

There are, however, many cases of hypertension secondary to kidney disease These include instances of acute and chronic glomerulonephritis chronic bilateral pyelonephritis, obstructive uropathies periarteritis nodosa, amyloidosis, and polycystic kidneys Hypertension is common in acute glomerulonephritis, but may be absent The association of hypertension with chronic glomerulonephritis is a matter of common knowledge However, it should be noted that renal insufficiency is not the factor responsible for the hypertension Chronic bilateral pyelonephritis is a distinct clinical entity, and is a disease of long duration Symptoms of renal insufficiency may not appear for ten or fifteen years after the infection is first initiated Except for the terminal phase, the symptoms are usually slight and vague Starting with pyelitis or acute pyonephritis, there may be, from time to time, attacks of unexplained fever, pain in the lumbar region, and pyuria and albuminuria The blood pressure is not elevated during the early stages of the disease, but may reach very high figures during the latter months Likewise, there are no retinal changes until the disease is far advanced In addition to the presence of red and white blood cells and albumin in the urine, there is progressive impairment of renal function with fixation of the specific gravity at a low level and mounting azotemia The pyelogram shows characteristic changes—distortion, flattening, and reduction in the size of the pelvis Death is usually in uremia The pathologic changes in the kidneys suggest that the progress of the disease is caused by gradual destruction and scarring of many portions of the kidneys It is to be emphasized that hypertension occurs during the latter stages of the disease, when the kidneys are contracted and atrophic, and is associated with vascular sclerosis

Nephrolithiasis alone is not a cause of hypertension, but renal stone with hydro- or pyonephrosis may lead to hypertension in the advanced phase of the disease when there are extensive atrophic changes in the renal parenchyma This applies also to other forms of obstructive uropathy It is not the hydro- or pyonephrosis that affects the blood pressure, but the parenchymal atrophy and vascular sclerosis In this connection it may be of interest to note that hypertension is uncommon in renal tuberculosis, in spite of extensive parenchymal changes This may be explained by the fact that vascular sclerosis appears to be uncommon in tuberculous kidneys

The status of the relationship of renal tumors to hypertension is still vague and unsettled Hypertension is common in periarteritis nodosa, but as a rule, only if there is extensive renal involvement It is, of course, well known that hypertension can be associated with amyloid contracted kidneys and with polycystic disease of the kidneys

Now, let us see where our case best fits in The outstanding clinical and laboratory features were hypertension, anemia, albuminuria, pyuria, hematuria, fixation of the specific gravity of the urine at a low level, and azotemia Most of us did not feel an abdominal mass Nor did we hear an aortic diastolic murmur The gastrointestinal x-ray was negative and the intravenous pyelogram medium failed to be visualized There was achlorhydria and blood in the stools Death was caused by uremia

The diagnosis appeared to rest mainly between chronic pyelonephritis and pyonephrotic contracted kidneys The presence of hematuria and pyuria, in the absence of an obvious obstructive lesion, led us to favor the diagnosis of chronic bilateral pyelonephritis The presence of cerebrospinal syphilis was suspected and regarded as incidental Dr Mosenthal, what is your impression of this case?

DR HERMAN O MOSENTHAL We will discuss the genitourinary tract first because the probabilities you mentioned are the most certain The fact that pus was present raises the question of tuberculosis, but the mass suggests pyelonephrosis This may have begun with a prostatic infection, as found at another hospital, with a sec-

ondary kidney involvement. That the kidney was involved was proved by the pyelograms. It was not of longstanding duration, however, because the albumin was normal and there was no edema. The blood pressure is as you mentioned in regard to renal disease, but here the hypertension suggests nephrosclerosis. The evidence of marked renal insufficiency is overwhelming and the phenolsulfonphthalein would therefore appear to be incorrect.

DR. APPELBAUM: We also feel that the phenolsulfonphthalein was incorrect. What is your experience regarding bleeding in bilateral pyelonephritis?

DR. MOSENTHAL: It may or may not be present. We cannot rule out tuberculosis without a guinea-pig inoculation when bleeding is present.

DR. APPELBAUM: But then one would not have high blood pressure.

DR. MOSENTHAL: That is true. Homer Smith has shown that unilateral kidney disease can produce hypertension. In this case, the error made is one that is common. The prostatic infection found by the first urologist was not investigated and the genitourinary tract was not further studied. We cannot know where the pus is coming from without retrograde pyelography, but I would favor the diagnosis of right-sided pyonephrosis with bilateral pyelonephritis.

DR. BEECKMAN J. DELATOUR: I think that hypernephroma should be raised as a possibility. We have not ruled it out.

DR. HENRY C. FLEMING: Tuberculosis was not found, but might have coexisted. Anything starting off with primary hematuria should arrest our attention to the possibility of tumor. When present with pus, it suggests the possibility of tuberculosis. If a mass was present and then disappeared, it would strongly suggest an abscess that collapsed after draining. My impression is that this patient had pyelonephritis with a right perirenal abscess. Concerning the blood in the stools, where did it come from? I think he had, in addition, Laennec's cirrhosis with a bleeding esophageal varix.

DR. ARNOLD KOFFLER: There are several inconsistent features in this case. The hematuria was more than could be accounted for in ordinary pyelonephritis. The gastrointestinal bleeding was probably due to chronic uremia with gastrointestinal ulceration.

DR. MAX TRUBEK: There was too much blood and too much pus for pyelonephritis. I think he had hemorrhagic cystitis with ascending pyelonephritis and multiple bilateral kidney abscesses. As Dr. Mosenthal mentioned, the high albumin in the presence of so much albuminuria is evidence against a longstanding and chronic kidney infection.

Presentation of Pathology

DR. HENRY SPITZ:

Anatomic Diagnosis:

Severe chronic cystitis
Chronic ureteritis and periureteritis
Chronic pyelonephritis with abscess formation
Bilateral pyoureter and pyelonephrosis
Bilateral chronic perinephritis
Arteriolosclerosis of kidneys, pancreas, adrenals, and liver
Hypertrophy and dilatation of heart
Edema of lungs
Chronic balanitis

The involvement of the urinary tract was extensive and severe. The urinary bladder was enlarged, thick walled, coarsely trabeculated with formation of small diverticula, and the mucosa showed patchy congestion. The urine was mixed with pus. The prostate was of normal size and consistency and the prostatic portion of the urethra showed no gross abnormalities. The balanitis did not cause any apparent stricture and was probably due to pressure by a retention catheter. Both ureters and renal pelves were markedly dilated and filled with pus. The ureters were elongated, tortuous, and embedded in dense fibrous adhesions. The kidneys were roughly bosselated and felt cystic. The calyces were markedly dilated, the pyramids indented, and in some areas the renal parenchyma was reduced to a mere shell 2 to 3 mm. in thickness. The better preserved portions of the kidney showed loss of the usual architectural markings and yellow and gray streaks radiating toward the capsule and small, soft, yellow areas scattered through the cortex. The fibrous and fatty capsules were indurated and densely adherent to the kidney. When they were stripped a finely granular brownish-red surface was revealed. Histologically the picture was that of severe pyelonephritis associated with abscess formation and rather diffuse arteriolosclerosis. In the areas of scarring and inflammatory infiltration, the larger arteries also showed considerable sclerotic changes.

The aorta and the aortic valve showed no gross or microscopic evidence of syphilis. The spinal cord was not examined and the brain showed too much autolysis to permit adequate histologic study.

The liver was rather small and showed only mild brown atrophy. The stomach showed atrophy of the mucosa, and in the remainder of the gastrointestinal tract no ulcers or other obvious sources of bleeding were found.

This case, therefore, apparently represents the late stage of an ascending infection of the urinary tract with arteriosclerosis of the kidneys and

hypertension Since no stricture or hypertrophy of the prostate was present it might be assumed that stasis and back pressure of urine was partly due to the results of inflammatory changes It is difficult to evaluate what role the tabetic condition played in this connection

MANY SKIN AILMENTS MADE WORSE BY IMPRUDENT USE OF REMEDIES

The all too-common habit of daubing with the nearest thing at hand [illegible] of the skin that be-itch often causes painful work unnecessary expense, and hospitalization even the acquiring of skin sensitization to a substance Dr L Edward Gaul Dubuque, Iowa warns in The *Journal* of the American Medical Association for February 24

"Almost every day," Dr Gaul says skin lesions are observed that have been made worse by imprudent topical therapy Even neoplasms are not spared from the 'put something on it' impulse A similar situation must exist on the West Coast, because at a forum on overtreatment in dermatology H E Miller stated that 'a comparatively large number of patients in routine dermatologic practice are forced to seek treatment because of irritation from remedies applied and not due to their primary complaints' Apparently all that the skin has to do is to complain a little—an evanescent erythema or pruritus—and it is impulsively daubed with the nearest thing at hand "

He believes that not only should the indiscriminate application of various substances to the skin be discouraged but also that a more complete evaluation of drugs used on the skin "might lead to a decline of the incidence of overtreatment dermatitis

'The creation of the Council on Pharmacy and Chemistry of the American Medical Association served to rob of glamour the old oral concoctions and potions it sifted the wheat from the chaff Today oral drugs are fairly well defined Dosage, indica- all toms other of 'tr- the a- prov- this practice that causes overtreatment dermatitis In skilled hands this 'try-stop-try' method is controlled In unskilled hands which treat the major portion of acute dermatoses too much treatment of [illegible] tacks [illegible] the skin m- ortreatm- of the wheat from the chaff and this time to rob of glamour the cutaneous drugs irrespective of the real or fan- ons to apply skin can be used to great advantage by the physician By means of a comparatively simple test it can be found which substance is an irritant or sensitizer in the remedies which have been applied by the patient Such a test also permits the physician to prescribe a preparation avoiding those substances which have caused the patient's difficulties Such tests also often provide a means of determining the original source of the skin condition As an example Dr Gaul cites the case of a man who was found to be strongly sensitive to a tar salve When advised of this the patient recalled that the skin condition appeared after he had tarred a roof A positive test to a substance in a remedy may also make it possible to trace the distribution of the substance in normal trade channels, thus possibly disclosing additional contacts and aiding in deciding the occupational or nonoccupational cause of the skin inflammation of others who have come in contact with the substance

Dr Gaul reports several case histories from a study he conducted to determine some of the causes of overtreatment dermatitis He says that for the most part the patients showed an eager interest in uncovering and comprehending the evils of their own doing and that the manufacturers of proprietary products were most cooperative in furnishing individual ingredients of their products

In a footnote to his report, Dr Gaul advises that "organic mercury compounds have led all the other cutaneous drugs in producing positive patch tests It would seem appropriate that tinctures salves, and lotions containing a mercury compound should bear a warning on the label of the presence of a sensitizer"

Among the cases reported by Dr Gaul was one of a student nurse whose hand was burned from spattering bacon grease and who painted the burn with the tincture of an organic mercurial When the hand became swollen and inflamed, she applied during the ensuing three weeks petrolatum gauze, sulfanilamide and sulfathiazole powders and ointments, boric acid ointment a burn ointment, and calamine lotion A patch test was positive for the organic mercurial Later it developed that the patient had acquired a mercury sensitivity with the result that a change of education was required so as to avoid mercury contact which is relatively frequent in the nursing profession

In another case, scratches on the knee and elbow of a boy were wiped with kerosene and a burn ointment applied, followed by a pink salve, boric acid [illegible] organic mercurial There was a partial disability of five weeks Some of the other cases cited by Dr Gaul involved the application of numerous salves and other substances for such conditions as insect bites, so-called fungous infection of a thumb, and 'athlete's foot" In one instance there was a total disability of eight weeks over two of which were spent in a hospital

Postgraduate Medical Education

Programs arranged by the Council Committee on Public Health and Education of the Medical Society of the State of New York are published in this Section of the JOURNAL. *The members of the committee are Oliver W. H. Mitchell, M.D., Chairman (428 Greenwood Place, Syracuse); George Baehr, M.D., and Charles D. Post, M.D.*

Cancer Teaching Day in Broome County

A CANCER teaching day was presented on June 6 at Phelps Hall, Binghamton, under the auspices of the Medical Society of the County of Broome, the Sixth District Branch of the Medical Society of the State of New York, the Tumor Clinic Association of the State of New York, the Medical Society of the State of New York, and the New York State Department of Health, Division of Cancer Control.

The afternoon meeting was called to order at 4:00 P.M. by Dr. Alfred L. Standfast, attending radiologist at Binghamton City Hospital, as chairman of the meeting. There were opening remarks by Dr. Frank G. Moore, president of the Medical Society of the County of Broome. Two lectures followed.

They were: "Treatment of Cancer of the Cervix," by Dr. Howard C. Taylor, Jr., attending surgeon at Memorial Hospital, New York City, and "Cancer of the Stomach," by Dr. George T. Pack, attending surgeon, Memorial Hospital.

Dr. Victor W. Bergstrom, attending pathologist at Binghamton City Hospital, was chairman of the evening meeting, held at 7:30 P.M. Dr. Ernest M. Watson, chief attending urologist at E. J. Meyer Memorial Hospital, Buffalo, spoke on "Malignancies of the Genitourinary Tract," and Dr. Norman Treves, associate surgeon at Memorial Hospital, New York City, spoke on "Cancer of the Breast."

Dinner was served at 6:15 P.M. at Binghamton City Hospital.

The local committee in charge of the teaching day consisted of Dr. Victor W. Bergstrom, chairman, and Drs. James W. Colella, John J. Cunningham, Harry H. Levy, Alfred L. Standfast, and Florence E. Warner.

MUSCLE DYSTROPHY REMEDY

A remedy for muscular dystrophy may come from a new chemical to be made from two vitamins, it appears from research reported by Dr. Ade T. Milhorat and Dr. W. E. Bartels, of Cornell University Medical College and New York Hospital (*Science*, January 26).

The vitamins are tocopherol, also known as vitamin E and as the fertility vitamin, and inositol, one of the B vitamins. Neither of them alone is expected to be helpful. Large doses of both given together may help patients with a mild form of the disease. For those in whom the disease is more rapidly progressive, the new condensation product of the two vitamins will be needed, the doctors believe.

Whether this product actually will help patients cannot be stated at present because the doctors have not had enough of it for trial. They hope to get and try it soon.

Laboratory tests and studies of animals are the basis for the hope that the condensation product of tocopherol and inositol will be an effective remedy for progressive muscular dystrophy. This disabling disease is characterized by marked weakness associated with degenerative changes in the affected muscles. There is also an abnormal excretion of the chemical, creatine.

Creatine is present in muscles as part of the compound, phosphocreatine. When muscles contract, this compound breaks down into creatine and phosphoric acid. In the recovery of the muscle the two substances are recombined into phosphocreatine.

The Cornell scientists had just enough of the new chemical to try the effect of single doses in a few patients. The abnormal excretion of creatine was reduced for a few days, which encourages them to believe that continued treatment will prove helpful.

Muscular dystrophy very similar to that in patients can be induced in laboratory animals by withholding tocopherol from their diet. Doses of tocopherol by mouth promptly reduce the abnormal creatine excretion and restore muscular function in the animals.

Tocopherol alone has no effect in human patients. The reason, apparently, is that progressive muscular dystrophy results from an inherited defect in the body's handling of tocopherol and inositol in food. Normally the condensation product of these two substances can be made in the body but patients with muscular dystrophy lack the ability to make the product.

Patients with a mild form of the disease apparently can make enough of the product if given large amounts of the two vitamin chemicals. Those with a more severe form of the disease cannot. For them the new chemical, if it comes up to expectations, will be what insulin is to diabetics.—*Science News Letter, Feb. 3, 1945*

County News

Albany County

The regular monthly meeting of the county society was held on May 23 at 8:30 P.M. in the auditorium of the Albany College of Pharmacy. Dr. Joe Vincent Meigs, surgeon-in-chief of the Vincent Memorial Hosp of Massachusetts
sor of gynecol
spoke on "Diat
of the Cervix."
A. Sutton participated in the discussion.

Cayuga County

The Cayuga Health Association offered a free chest x-ray to all school teachers and other school employees and also to all high school seniors through-

of the Christmas seals.*

The annual meeting of the Cayuga Health Association was held at the Woman's Union, Auburn, on April 26 with the president, Dr. M. Leroy Seccomb, presiding. The work of the Association during the past year was reviewed and plans were made for the continuation and expansion of every phase of its effective program.

Dr. N. Stanley Lincoln, superintendent, and Dr. Frederick Beck, of Biggs Memorial Hospital, Ithaca, were guests.

Dr. Seccomb was re-elected president, Joseph F. X. Iacovino, first vice-president, and Mrs. Robert

* Asterisk indicates that item is from a local newspaper.

L. Mosher, secretary. Mrs. Edward S. Platt was elected second vice-president to succeed Mrs. A. B. Chidester, and Ralph A. Inman, treasurer, to succeed Charles Goldman.

The directors re-elected for three years include Mrs. A. B. Chidester, Mrs. W. H. H. Kennedy, Dr. Charles G. Hetherington, Mrs. Carrie D. Gibson, and Mrs. Edward S. Platt, all of Auburn, and Mrs. Charles L. Kilborne, of Moravia.

Miss Adrienne Proskine was elected a director to succeed Edwin R. Metcalf and Dr. L. D. Burlington, of Aurora, was elected a director to serve out the unexpired term of the late Mrs. P. J. Brennan, of Aurora.*

Chemung County

Dr. Anna M. Stuart, of Elmira, was presented with the honorary degree of Doctor of Humane Letters at Elmira College graduation on May 28.

In citing Dr. Stuart for the honor, college officials today praised her not only for service to humanity through the medical profession but also for her keen interest and participation in the cultural aspects of life.

A member of the Arnot-Ogden Hospital staff, she has been pathologist, anesthetist, and a member of the pediatrics staff. When in 1934 she relinquished the position as pathologist which she had held since 1907 when the hospital laboratory was established, she was honored at a dinner at the hospital given by the Board of Managers and members of the medical and surgical staffs.*

Columbia County

The semiannual meeting of the county society was held at the Columbia Country Club on May 9. Dr. L. W. Gorham, professor of medicine, Albany Medical College, spoke on "Penicillin."*

Dutchess County

Several speakers on cancer were assigned to address community groups as part of a joint drive by the county society and the Dutchess County Health Association to acquaint the public with cancer.

On May 1, Dr. Howard Townsend spoke to members of Fallkill Grange. On May 3, Dr. Bertrand E. Roberts addressed the Dover Plains Health Committee at the home of Mrs. James A. Benson. On May 4, Dr. J. Spottiswood Taylor spoke to the Fishkill Health Committee.

Dr. Jane North Baldwin addressed the Red Hook Nursing Association on May 8, and on May 10, Dr. Taylor spoke to the Stanford Health committee at the home of Mrs. John Battistoni, of Bangall.

Other speakers were assigned to address the American Legion Auxiliary on May 5, and the Northern Dutchess Nursing Service, Rhinebeck, on May 21.*

Erie County

In observance of the fiftieth anniversary of his graduation from medical school, Dr. Nelson G. Russell, of Buffalo, was honored on April 26 at a special meeting of the city's advisory health board, of which he is chairman. He also is chairman of the board of managers of Meyer Memorial (City) Hospital.

Dr. Russell, 73, one of the oldest practicing physicians in the city, was graduated from the University of Buffalo School of Medicine in 1895.

Health Commissioner Francis E. Fronczak told Dr. Russell the special meeting was called so board members and the five hundred employees of the health department could express their appreciation of his outstanding services to the city and the medical profession. The board's congratulations were extended by William J. Hoffman and Mrs. Evelyn Johnson.

"I thought we had something important to discuss," Dr. Russell said. "I dislike to be reminded of those fifty years, but I do appreciate your expressions of regard."*

* * *

In observance of Spring Clinical Week, noted physicians and instructors addressed members of the county society at the Hotel Statler on April 24 and 26.

Dr. Isaac Starr, of the University of Pennsylvania School of Medicine, lectured on "Old and New Concepts of Congestive Heart Failure" on May 1 at 8:30 P.M. in the Georgian Room. Later, discussion was led by Dr. James E. Patterson and Dr. Dexter S. Levy.

A cancer teaching day was held on May 3 in the Fillmore Room. Dr. Donald Guthrie, of Pennsylvania, and Dr. Lloyd F. Craver, of Manhattan, spoke at the afternoon meeting and Dr. Hayes Martin and Dr. John H. Garlock, of Manhattan, spoke during the evening. A dinner was held at 6:30 P.M.*

* * *

Twenty-two members of the Buffalo Surgical Society visited Rhoads General Hospital on April 18 and were entertained by Col. A. J. Canning, commanding officer.

The doctors, according to Dr. John C. Brady, president of the society, were interested in seeing what types of surgical care are given wounded veterans. They were escorted about the hospital by Col. Clyde O. Barney, Maj. Robert Perlman, and Capts. Newton McCollough, Gerald Jones, and Louis C. Roettig.

During their tour the doctors were informed of the most recent developments in surgery and post-operative care. Dr. Brady said the Buffalo surgeons were particularly pleased with the opportunity to visit Rhoads because it afforded a chance for them to observe a great many cases of certain types which they would not be able to observe in civilian practice.

Those making the visit, in addition to Dr. Brady, were Drs. W. Ward Plummer, J. Sutton Regan, Patrick H. J. Buckley, Allen Richter, Julius Richter, James E. King, Julius Kohn, Eugene Sullivan, Augustus W. Hengerer, Elmer McGroder, Edward Storck, Harvey P. Hoffman, Alfred H. Noehren, Dennis Hennessey, Descum C. McKenney, Frank Potts, Edmund Reimann, Ralph Upson, John Kohl, Grant Fisher, and Andrew Charters.*

Fulton County

Capt. Howard V. Sprague, (MC), USNR, now stationed at the Naval Hospital at St. Albans, was guest speaker at the regular meeting of the county society, held on April 25 at the Elms. Dinner preceded the program. Dr. Morris Kennedy, president, was in charge.

About forty physicians, including a number from Montgomery County, attended the meeting.

Captain Sprague, a specialist in heart ailments, was formerly chief of medicine on a mobile hospital and the hospital ship U.S. Solace, and was located for a year and a half in the Southern and Central Pacific.

Before entering service, he was associate physician of the Massachusetts General Hospital, and was instructor at the Harvard Medical School For twenty years he was associated with Dr Paul D White, heart specialist *

After the war he remained in France practicing in Chaumont He was permitted to leave the country in October, 1940 *

Onondaga County

A Syracuse doctor, Lt. Col. Henry van Zile Hyde, has been appointed to a high post with the United Nations Relief and Rehabilitation Association. Colonel Hyde will be chief of the Medical Division of U.N.R.R.A.'s Middle East headquarters in Cairo, Egypt.

The U.S. Public Health Service officer, on detached service with U.N.R.R.A., will be assisting in the repatriation of one hundred thousand Greeks, Yugoslavs, and Poles in North Africa and the Levant who fall under U.N.R.R.A. jurisdiction for their return home.

Colonel Hyde has been engaged in this humanitarian work in the Middle East for more than a year, and has controlled supplies of penicillin for civilians there In this work he has been instrumental in forestalling epidemics in North Africa.

An expert in preventive medicine, and former member of the staff of Johns Hopkins Institute, Baltimore, Colonel Hyde resigned his post as director of the Field Casualty Section of the U.S. Office of Civilian Defense to go to the Middle East.

Previously he had been director of the Bureau of Pneumonia of the State Department of Health, an appointment received early in 1941.

He is a graduate of Johns Hopkins University; he interned at Johns Hopkins Hospital and for two years was resident physician in Strong Memorial Hospital and Municipal Hospital, Rochester.

Coming to Syracuse, he became clinical instructor in medicine at Syracuse University. He is a specialist in internal medicine and has contributed articles to medical and other scientific journals.

Colonel Hyde has served as an examining physician of the Tuberculosis Clinic, an associate examiner on the National Board of Medical Examiners, an assistant physician on the staffs of Syracuse Memorial and University Hospitals and of the Syracuse Free Dispensary, chairman of the Publications Committee of the Syracuse Academy of Medicine, delegate to the Fifth District Branch of the American Medical Association from the county society, editor of the *Bulletin*, monthly publication of the county society, and at one time was an instructor in medicine at the University of Rochester.*

Ontario

"Endocarditis Refractory to Penicillin," was the title of a paper by Dr. Francis V. Oderkirk, of Victor, given at the meeting of the Canandaigua Medical Society on April 6 in the Canandaigua Hotel. Dr. Frederick C. McClellan, president, was host at dinner preceding the program.*

• • •

Lt. Comdr. Jacob F. Heinrich, (MC)USNR, physician in charge of the department of tuberculosis at the U.S. Naval Hospital in Sampson, addressed the Ontario County Tuberculosis and Health Association on April 25 at the Clifton Springs Sanitarium.

Lieutenant Commander Heinrich is one of the pioneers in developing technics and determining the practicability of mass chest x-rays. He reported to Sampson in March, shortly after it was announced that the Naval Hospital at Sampson would become the Navy's eastern center for the treatment of all active tuberculosis cases east of the Mississippi.*

• • •

Dr. M. Edgerton Deuel, of Geneva, was re-elected president for another year of the Ontario County Committee on Tuberculosis and Public Health at the annual dinner meeting in Clifton Springs on April 25.

Others elected to serve with Dr. Deuel are John Hamlin, of Holcomb, first vice-president; Dr. John W. Karr, Clifton Springs, second vice-president; Mrs. Ben Whiteman, Geneva, secretary, to succeed Mrs. Croydon Wheat, and W. Horace Rogers, Geneva, re-elected treasurer.

Three new directors chosen and those they succeed are: Mrs. Ben Whiteman for Dr. Stuart Cole, Geneva; John Hamlin for the late Anson Rogers, of Bristol; and Harry Kidder, of Canandaigua, for Dr. A. W. Armstrong, of Canandaigua.*

Otsego County

Dr. LeRoy S. House, of Oneonta, head of the x-ray and electrotherapy department at Fox Hospital, has been elected to fellowship in the American College of Radiology, Chicago, Illinois, it was announced on March 26 by Dr. Eugene P. Pendergrass, chairman of the college board of chancellors.

"The degree of fellowship is conferred, as provided in the Constitution, on the basis of outstanding contributions and service to radiology," Dr. Pendergrass informed Dr. House. "We think you have every reason to be proud of the honor bestowed upon you by the Fellows of the College, and we take this occasion to offer our sincere congratulations. As an active Fellow, you will have further opportunity to participate in the work of the college for the welfare of all radiology."*

Queens County

Benefits of medical social service in the hospital and to the patient were discussed at a forum of the Queens Medical Social Service Committee of the United Hospital Fund on April 17 at the County Medical Society Building, Forest Hills.

Among the speakers were Dr. Claude W. Munger, director of St. Luke's Hospital; Sister Loretto Bernard, R. N., administrator of St. Vincent's Hospital; Mrs. Glee Hastings Dervend, director of social service, Hospital for Special Surgery; and Mrs. Curry Watson, chairman of the Medical Social Service.*

• • •

The stated meeting of the county society was held jointly with the Queens County Dental Society on April 24 at 9:00 P.M. Dr. Theodor Blum, D.D.S., M.D., spoke on "A Conservative Approach to Oral Problems of Medicodental Interest." Andrew J. Sullivan, president of the Association of American Physicians and Surgeons, Inc., discussed the aims of that organization.

• • •

On May 18 the Committee on Graduate Education of the county society presented Dr. Foster Kennedy, chief of the department of neurology, Bellevue Hospital, professor of neurology, Cornell University Medical College, and consulting physician, Neurological Institute, discussing "Nervous Conditions Associated with Warfare." The meeting was held at 4:30 P.M. in the County Society Building.

Rensselaer County

Dr. James J. Evans, of the Lahey Clinic, Boston, was the guest speaker at the April 10 meeting of the county society at the Troy Club.

Dr. Evans, guest at a dinner prior to the business

meeting, spoke on "Postoperative Thrombophlebitis and Pulmonary Embolism." Dr. John F. Connor, president, was in charge of the meeting.*

Saratoga County

The county society held its spring meeting at Newman's Lakehouse on April 26, opening with a business meeting at 4:00 P.M., followed by dinner at 6:00 P.M.

Dr. Kenneth Crounse, of Albany, spoke on allergy.*

Schenectady County

The regular monthly meeting of the county society was held on May 1 in Biggs Memorial Library at Ellis Hospital.

Dr. Eugene Everett O'Neill, professor of surgery at Boston University and consultant in vascular diseases at Faulkner Hospital, in Boston, was the speaker. His subject was "Diagnosis and Treatment of Vascular Diseases of the Extremities."

* * *

The semiannual meeting of the county society was held at the Mohawk Golf Club on May 31. The program was as follows: luncheon at 1:00 P.M., business meeting at 5:00 P.M., and dinner at 7:00 P.M. Dr. Bertrand Shurtleff was the speaker.

Seneca County

The regular semiannual meeting of the county society was held May 10, 1945, at the Armitage Tea Room, Seneca Falls. The scientific program consisted of a lecture by Ellery G. Allen, Syracuse, on "General Résumé of Hematologic Disorders, Including the Anemias," followed by general discussion. This lecture was provided by the Medical Society of the State of New York, through its Council Committee on Public Health and Education.

Steuben County

Penicillin therapy was explained by Dr. Frederick T. Schnatz, assistant professor of medicine, University of Buffalo School of Medicine, at a meeting of the county society held at the Baron Steuben Hotel on April 12.

Dr. Schnatz' postgraduate instruction was presented cooperatively by the Medical Society of the State of New York and the New York State Department of Health.*

Sullivan County

A series of special classes in resort sanitation was offered to operators of hotels, camps, boarding [illegible] thousands of people from the city each summer.

"Because of its promixity to New York City," stated Dr. Calderone, "Sullivan County has become one of the most crowded resort areas in the country. With wartime travel restrictions curbing vacation trips to more distant regions, the Catskill section has attracted ever-increasing numbers of New York City vacationists.

"This tremendously increased patronage comes at a time of serious labor shortage," Dr. Calderone continued. "Many resort operators have been forced to [illegible] have atte [illegible] of guests [illegible] tions, the [illegible] improperly handled food or defective sewage disposal systems is definitely increased. The lectures and motion pictures given by the State Health Department in Monticello should be of great value to resort owners in improving sanitary conditions

and forestalling the possibility of such outbreaks during the summer months ahead."

* * *

Dr. Walter D. Ludlum, Jr., associate in traumatic surgery at the Post-Graduate Medical School, Columbia University, spoke before the county society at the Monticello Hospital on April 18 on the treatment of fractures of the femur and humerus as the sixth in a series of traumatic surgery lectures.*

Necrology

Joseph Grandson Byrne, M.D., died on May 13 in New York City, at the age of 74. Dr. Byrne was born in Ireland but was graduated from Columbia's College of Physicians and Surgeons in 1895. He served in the Spanish-American War and had practiced in New York City since 1898. He had been president of the medical board of Central and Neurological Hospital on Welfare Island, consulting neurologist at Fordham and Neurological hospitals, and a member of the advisory board of the New York City Department of Health. Dr. Byrne was interested in the mechanism of sensation and made many studies of it and contributed many articles on the subject to the literature.

W. Taylor Chamberlin, M.D., died in Hempstead on May 22, at the age of 69. Dr. Chamberlin graduated from Hahnemann Medical College in Philadelphia in 1898 and served his internship at Hahnemann Hospital, Philadelphia, and Brooklyn Homeopathic Hospital. He first practiced in Hutchinson, Kansas, but returned to Brooklyn to practice, later moving to Hempstead. He served as the first mayor of Hempstead. He was on the staffs of Brooklyn Pediatric, Cumberland, and Meadowbrook hospitals and was a member of the State medical society and the American Medical Association.

Charles Goodman, M.D., F.A.C.S., died on May 23 in his home in New York City. He was 73 years old. He was born in Hungary but received his medical education in this country, at Western Reserve University, Cleveland. He interned at Lying-In, City, and Mt. Sinai hospitals, in New York City, and did postgraduate study at the universities of Berlin, Goettingen, and Halle. At the time of his death Dr. Goodman was consulting surgeon at Beth Israel Hospital, and had been on the staffs of Mt. Sinai, Sydenham, Montefiore, Polyclinic, and Park West hospitals. He had served as clinical professor of surgery at New York University and Bellevue Hospital Medical College. He was a pioneer in modern blood transfusion and in 1936 he was a member of the Nobel Prize Nominating Committee in Medicine. He was a member of the State medical society and the American Medical Association, New York Academy of Medicine, American College of Surgeons, Eastern Medical Society, International Surgical Society, and Association of Military Surgeons.

Lawrence G. Hanley, M.D., of Buffalo, died on May 22, at the age of 82. Dr. Hanley graduated from Niagara Medical College in 1887, and subsequently was connected with Sisters Hospital, Buffalo, for sixty years. He was the first surgeon to serve on an ambulance in Buffalo and one of the first to perform an appendectomy there. He was a member of the Erie County society, the State society, and the American Medical Association.

Lee Maidment Hurd, M.D., F.A.C.S., of Rowayton, Connecticut, died on May 15 at the age of 71. He was professor emeritus of laryngology at New York University and Bellevue Hospital Medical College, and was consulting laryngologist at Downtown Hospital and attending laryngologist at Polyclinic Hospital. He graduated from the College of Physicians and Surgeons in 1895. Dr. Hurd was a member of the New York County and the State medical societies and the American Medica Association.

Barnet Joseph, M.D., of New Rochelle, died on May 9 at the age of 63. He graduated from Long Island College of Medicine in 1904 and specialized in internal medicine and conducted considerable research on diabetes. He had been professor of pathology at the University of Vermont and a director of Madison Hospital and at the time of his death was head of the tumor service at Downtown Hospital.

Adrian Z. Leon, Capt.,(MC),AUS, of New York City, was killed in action in Austria on May 3. Captain Leon was a graduate of Montepellier College of Medicine, in France, in 1936, and had done postgraduate work in Vienna, Paris, and New York City. He was assistant physician at City Hospital and assistant physician in the outpatient department of the Hospital for Joint Diseases. He joined the Army three years ago and was serving as battalion surgeon with the Seventh Army. He was a member of the county and State medical societies and the American Medical Association.

Gurdon Edgar Padget, M.D., of Cuyler, died on May 4 at the age of 79. He graduated from Syracuse University College of Medicine in 1904.

Benjamin Ritter, Maj.,(MC),AUS, formerly of New York City, was killed in action in Normandy on March 9. He graduated from New York University and Bellevue Hospital Medical College in 1931 and was clinical assistant surgeon in the outpatient department of Mt. Sinai Hospital. Major Ritter entered the Army in January, 1943, and had been overseas for twenty months. He was a member of the New York County and State medical societies and the American Medical Association.

Beryl W. Scully, M.D., of Rome, died on April 28 as the result of injuries suffered in an automobile accident. He graduated from Cornell University Medical College in 1933 and took postgraduate work in anthropology at Columbia. He interned at Bellevue Hospital. Dr. Scully was associate physician at Rome and Murphy Memorial Hospital and was a member of the Oneida County and State medical societies and the American Medical Association.

Toyohiko Takami, M.D., of Brooklyn, died at the age of 70 on May 16. He was born in Japan but received his education in this country and was graduated from Cornell University Medical College in 1906. He was consultant in dermatology at Cumberland Hospital and was an instructor in dermatology at Cornell University Medical College and Bellevue Hospital. He was a member of the New York County society, the State medical society, and the American Medical Association.

Hospital News

Improvements

The official opening of the new pediatrics wing of Long Island College Hospital was hailed as a notable achievement for the institution and an auspicious day for the community by speakers at the dedication.

At the ceremonies on April 18, Dr. Grover F. Powers, child specialist and professor of pediatrics of the Yale University School of Medicine, stressed that, with the expansion, Long Island College Hospital was "increasingly becoming a medical center and assuring a more abundant life for the borough's children."

Borough President John Cashmore, speaking both as a grateful former patient and city official, praised the men and women of the hospital for having "done a great job."

George Whitlock, executive vice-president of the hospital's board of regents, who presided, hailed the new department as a medical advance "accomplished under great difficulty."

Expressing his staff's appreciation, Dr. Charles A. Weymuller, chief pediatrician, praised Superintendent Bernard McDermott for having accomplished [illegible] wartime conditio[illegible] Dr. Weymuller ter[illegible] he institution's best friends who had long helped both the college and the hospital on important problems with his expert advice. Dr. Powers, remarking that he was proud to consider himself an honorary member of the staff, said that his interest was inspired by Dr. Frank L. Babbott. Dr. Babbott, former president of the medical school and now chairman of the board of regents, was guest of honor at the ceremonies.

After refreshments served by the dietary staff, the visitors and their guests were escorted through the new children's wing by physicians and nurses of the pediatric staff. Composed of small units, the department has twenty-two beds. When further expansion permits, Superintendent McDermott said, six more beds will be added.

Future plans, Mr. McDermott, Superintendent, declared, include having the children's surgical ward of thirty beds located on the same floor level. The proposed new ward would be located in a five-story addition to be erected when funds and building materials are available.

Besides wards, the new wing has classrooms and diagnostic and research laboratories. The hospital plans to amplify these facilities for the postgraduate training of physicians returning from war service.*

At the Helm

Dr. and Mrs. Fred Badt, who were residents of Germany and left the country a step ahead of the Nazi rise to power, have taken up their residence at Binghamton State Hospital, where the physician is entering upon his new duties as a member of the medical staff, according to announcement on April 19 by Dr. Hugh S. Gregory, director of the Hospital.

* * *

Rockaway Beach Hospital has a new advisory board, functioning as an adjunct to the hospital's board of directors.

The advisory board will sit with the board of directors and lend assistance in the conduct of the hospital's business affairs. It was believed that the board would prove particularly valuable at the present time, when the hospital has its campaign [illegible]

the advisory board. They are: William R. Brennan, William H. Gallagher, Nathan Cohen, Sol E. Slatin, Philip M. Basser, Louis Reichert, Philip J. [illegible] Wilham J. Morris, Julius C. Siegelman, Ralph S. Lazarus, Joel A. Abrahams, Benjamin Lord, and Max Gold.*

* * *

Other new officers named at the session are George F. Wertime, vice-president; Stanley H. Calkins, treasurer; and James B. Wright, secretary.

The following eight persons were re-elected as directors of the association for terms of three years each: E. A. Foster, Thomas E. Maycock, Ernest C. Game, Wilfred Sarrault, A. Raymond Van Santvoord, Rev. Valentine Gierlacki, J. Harry Lear, and James P. Dooley.*

* * *

Dr. B. C. Tillotson was re-elected president of the Glens Falls Hospital medical staff at the annual meeting in the hospital on May 1. Other officers re-elected were Dr. Edward J. Fitzgerald, vice-president, and Dr. W. W. Bowen, secretary-treasurer.*

Newsy Notes

Citizens of the Ossining area have contributed more th[illegible] Hospita[illegible] first rep[illegible]

by Walter L. Johnson, president of the hospital. The $300,000 fund is being sought to expand the hospital facilities to one hundred patient beds and fifteen bassinets by construction of an additional three-story wing, remodeling of portions of the

* Asterisk indicates that item is from a local newspaper.

present building, and purchase of needed new equipment.

The doctors of the hospital staff made a joint memorial gift of $34,000 and plan later to designate one or more units of the hospital approximating this amount as a memorial from the doctors.*

• • •

The will of Mrs. Charles E. Townsend, who died in Newburgh on February 26, probated before Surrogate Charles E. Taylor on April 17, left her residuary estate to St. Luke's Hospital, Newburgh, with the direction that the bequest be known as the "Dr. Charles E. Townsend Fund."

Persons familiar with the affairs of the late Mrs. Townsend estimated that the bequest to St. Luke's Hospital would amount to about $500,000.*

• • •

A card party for the benefit of the wounded, disabled, and sick veterans of both World Wars, who are patients at Sunmount Hospital, Tupper Lake, was held by the Wyszomirski Post, 701, American Legion, Newburgh, on April 22.

The project for which money is needed is for providing equipment that bed patients may see moving pictures on the ceilings of wards.*

• • •

Construction of the new U.S. Veterans Administration hospital at Crugers Park, on the Hudson near Peekskill, will start in August, according to word received from Washington by county officials. Gen. Frank T. Hines, head of the Veterans Administration, notified County Executive Herbert C. Gerlach that the government will purchase the county-owned park for the hospital site, on the county option of $125,000.*

• • •

Assemblyman Eugene F. Bannigan, Democratic leader of the Eleventh Assembly District, said on April 24 that he will introduce in the next session of the State Legislature, a resolution memorializing Congress to name the proposed Brooklyn Veterans' Hospital after the late President Roosevelt.*

• • •

State Attorney General Nathaniel Goldstein and former Mayor James J. Walker were the principal speakers at the annual dinner-dance of the Jewish Sanitarium and Hospital for Chronic Diseases on May 6, in the Waldorf-Astoria, Manhattan. The event marked the twentieth anniversary of the institution and also featured the first display of plans and sketches for the construction of a new $1,000,000 building.*

• • •

Looking toward a postwar future in which the demands on the modern hospital, because of trends in social service, will be no less than under present wartime conditions, Buffalo General Hospital on April 25 launched a $4,000,000 campaign to keep its facilities abreast of the times. The program contemplates accommodations for eight hundred and fifty patients, construction of a twelve-story main building, and renovations to present structures.*

• • •

A fund-raising campaign to finance the enlargement of Jamaica Hospital will be launched in the Fall, two hundred and fifty business and professional men of the community were told on April 25 at a dinner at the Pomonok Country Club, Flushing, which marked the twenty-fifth anniversary of the Jamaica Chamber of Commerce.

The announcement was made by Thomas D. Austin, Jamaica attorney and a director of the chamber, who was toastmaster at the dinner.

Mr. Austin also is a trustee of the hospital. He said that no decision had been reached on the size of the addition or a tentative date for starting construction of the wing to the present institution, which has two hundred beds. The financial campaign for the addition probably will start in August.*

• • •

The ninetieth anniversary of Woman's Hospital, New York City, was observed on May 4. When *Woman's Hospital opened in 1855 at 29th Street and* Madison Avenue it was the first hospital in the world for the treatment of diseases peculiar to women.*

• • •

Action on plans for construction of new buildings for Orange County's tuberculosis sanatarium, located in Newburgh, has been taken. A joint meeting of the public welfare and tuberculosis committee, the county treasurer and finance committee, and the building and grounds committee was called for May 11, in the County Building in Goshen, when recommendations of the board of the sanitarium for construction, improvement, and betterments were considered. The initiative for the meeting was taken by Supervisor T. Albert Farrington of the Fourth Ward, Newburgh, chairman of the building committee.*

• • •

The 15,000-ton United States Navy hospital ship *Consolation*, a converted cargo vessel, was commissioned on May 22 at the Bethlehem Steel Company shipyard in Hoboken with ceremonies at which the Purple Heart was presented to three survivors of a torpedoed Navy oiler.

The *Consolation* will be sent to the Pacific to provide hospital facilities for the Navy in forward combat areas and will not be used as a hospital transport ship.*

• • •

There is a 40 per cent membership increase in the New York women's division of the National Jewish Hospital at Denver, bringing its total to three hundred members, Mrs. Hal Horne, who heads the division, told two hundred and twenty-five members of its New York and Westchester women's divisions at its annual donor luncheon on May 21 at the Waldorf-Astoria.

Alfred Triefus, president of the hospital, Samuel Schaefer, executive director, and Col. Melvin H. Schlesinger, finance chairman, came from Denver for the occasion. Mr. Schaefer said the tuberculosis facilities at the hospital, which cares for one thousand patients on a nonsectarian basis, should be expanded "because of the anticipated rise in tuberculosis figures."*

In the Protean Manifestations of Thiamine Deficiency

BETHIAMIN, available in a wide range of dosage forms for both oral and parenteral administration, provides appropriate medication for every degree and type of thiamine deficiency encountered.

For oral administration, palatable Bethiamin Elixir provides 6 mg. of thiamine hydrochloride per ounce; Bethiamin capsules are available in various potencies ranging from 1 mg. to 15 mg. For parenteral administration, Bethiamin ampuls and vials are available in potencies up to 100 mg. per cc.

B E T H I A M I N

For oral administration, Bethiamin, crystalline thiamine hydrochloride, is available in capsules containing 1 mg., 3½ mg., 10 mg., and 15 mg.; for parenteral administration, in 1 cc. ampuls containing 1 mg., 10 mg., 50 mg., and 100 mg., and in 10, 30 or 60 cc. rubber-capped vials. In liquid form Bethiamin Elixir contains 6 mg. of thiamine hydrochloride per fluidounce.

SOPRONOL *Inhibits* FUNGOUS INFECTIONS

MONILIA albicans

EPIDERMOPHYTON inguinale

MICROSPORUM audouini

TRICHOPHYTON purpureum

. . . As demonstrated by clinical investigation in a leading United States hospital

In tests on a large number of hospital patients, Sopronol was found to exert an *inhibitory* rather than a destructive action on the fungus. The advantages of this method are obvious. Sopronol, taken readily into the fungous organism, prevents its development and spread. Hence the infection is quickly brought to an end, but without the customary skin irritation caused by poisonous by-products resulting from strong fungicides in contact with the mold. The chemical basis of Sopronol is sodium propionate.

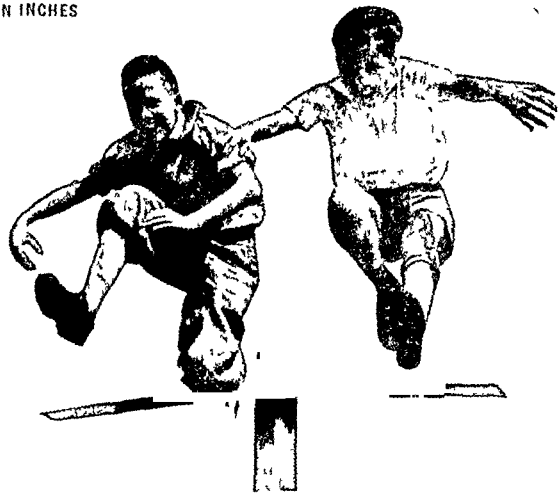
ALL SUPERFICIAL MYCOSES (RINGWORM)

Prescribe Sopronol for: Tinea Pedis, Tinea Cruris, Tinea Capitis, Tinea Glabrosa, due to "the dermatophytes"—Trichophyton, Epidermophyton, Microsporum, Monilia (Candida) and pathogenic aspergillae infections. Sopronol is non-irritating, non-keratolytic, non-toxic.

Available in alcoholic solution, powder and water soluble ointment bases

SEND FOR FULL SIZE SAMPLES OF SOPRONOL SOLUTION, OINTMENT, POWDER

MYCOLOID LABORATORIES, INC., Little Falls, New Jersey N 2



Please send me large samples of Sopronol in the three forms; also descriptive booklet.

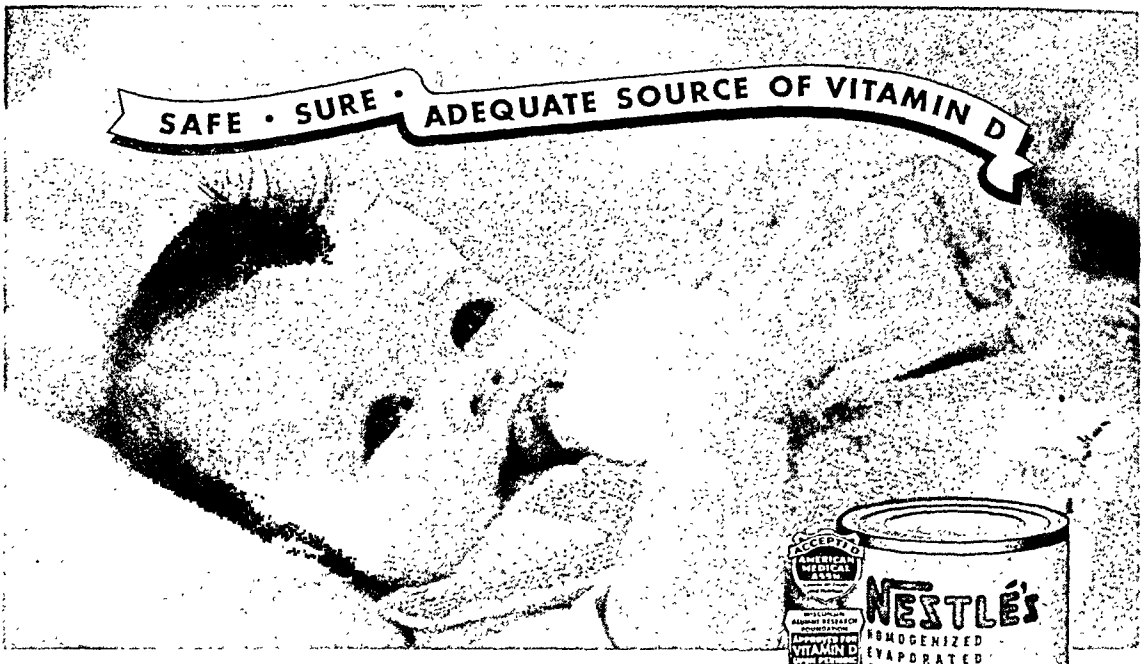
AN INCH A YEAR

Boys and girls grow more than an inch a year from their sixth to their twentieth birthdays But too often children lack the vitamins needed to chalk up this gain since even essential vitamins A and D are often omitted after infancy



'AVIMAL' a polyvitamin mixture, furnishes many vitamins required daily for optimal growth In only three teaspoonfuls, there are sufficient quantities of vitamins A, D, B_1, B_2 and nicotinamide to meet the minimum daily requirements of the average child May be mixed with water, milk, or fruit juices Both children and grownups like 'AVIMAL'S' pleasant flavor even after long use

AVIMAL' Registered Trademark

'AVIMAL' A pleasantly flavored polyvitamin preparation

Daily dose (3 teaspoonfuls) contains Vitamin A, 5000 U S P Units Vitamin D 500 U S P Units, Vitamin B_1, 2 Milligrams, Vitamin B_2, 2 Milligrams Nicotinamide, 15 Milligrams Bottles of 8 oz, 1 pt. and ½ gal

BURROUGHS WELLCOME & CO (U S A) INC
9 & 11 East Forty-First Street • New York 17, New York

NOW 400 UNITS OF VITAMIN D_3 PER PINT

The new NESTLÉS Evaporated Milk, fed in customary amounts, protects normal infants from rickets *and promotes optimal growth.* 25 USP units of vitamin D_3 are added to each fluid ounce of this milk. So—when you prescribe a NESTLÉS Milk formula—you assure a safe, sure and adequate supply of vitamin D.

NESTLE'S MILK PRODUCTS, INC., N. Y.

Appreciation . . .

The Physicians' Home received a colorful and heartwarming letter from the wife of a physician who recently lost his vision. Her husband, a beneficiary of the Physicians' Home, receives a check each month for maintenance in his own community, among his friends and former patients. Help us continue this friendly and constructive service to our colleagues. Please make your check payable to

THE PHYSICIANS' HOME, Inc.

52 EAST 66th STREET, NEW YORK 21

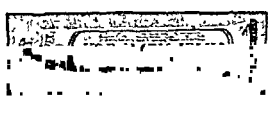
recent extensive investigation confirms contraceptive effectiveness of the active ingredient in Koromex Jelly

A most illuminating report based on extensive clinical and experimental data has recently been published by Eastman and Scott (Human Fertility, 9:33, (June) 1944.) These authors studied the safety and efficacy of phenylmercuric acetate which is the active constituent of Koromex Jelly.

1 Clinical evidence showed that in actual use, phenylmercuric acetate jelly had a remarkable record for contraceptive efficiency.

2 The earlier work of Baker, Ranson and Tynen (Lancet, 2:882, (October 15), 1938), showing a very high spermicidal potency, was confirmed.

3 Toxicity was found low.



4 No evidence of irritability on the part of either the husband or wife.

In addition to the above qualities, Koromex Jelly, which also contains oxyquinoline benzoate and boric acid in a well buffered glycerine gum base, has the properties of adhering firmly to the vaginal lining and mixing readily with the vaginal secretions. It has optimum spreading qualities. Its pH of 4.6 is constantly maintained even in the presence of the buffering action of the protein seminal fluid.

Koromex Jelly does not stain. It is not excessively lubricating, and is well tolerated. Because of these qualities you can assuredly — prescribe Koromex *with confidence.*

Write for Literature.

Books

Books for review should be sent to the Book Review Department at 1313 Bedford Avenue, Brooklyn, N. Y. Acknowledgment of receipt will be made in these columns and deemed sufficient notification. Selection for review will be based on merit and interest to our readers.

RECEIVED

Duodenal and Jejunal Peptic Ulcer. Technic of Resection. By Rudolf Nissen, M.D. Octavo of 143 pages, illustrated. New York, Grune & Stratton, 1945. Cloth, $4.75.

Anatomy. As a Basis for Medical and Dental Practice. By Donald Mainland, M.B., D.Sc. Octavo of 863 pages, illustrated. New York, Paul B. Hoeber, 1945. Cloth, $7.50. (Med. Students' Series.)

REVIEWED

Practical Malaria Control. A Handbook for Field Workers. By Carl E. M. Gunther, M.D. Duodecimo of 91 pages. New York, Philosophical Library, Inc., 1944. Cloth, $2.50.

A concise and practical manual on malaria control, this little handbook will prove invaluable to workers in the field. Shorn of embellishment, its 91 pages are jammed with facts based on years of practical application. No theoretic treatise this, but a manual of what to do and how to do it.

To the physician faced with the problem of malaria, as are so many today, it will undoubtedly be a welcome volume.

H. M. FEINBLATT

Hypertension and Hypertensive Disease. By William Goldring, M.D., and Herbert Chasis, M.D. Octavo of 253 pages, illustrated. New York, Commonwealth Fund, 1944. Cloth, $3.50.

This volume is in the main a summary of the experience of the authors in dealing with a large number of cases of hypertension at Bellevue Hospital. The more refined methods which have been introduced by the New York University group in the study of kidney function are explained in detail and the results in hypertension are given. They show that the kidney is affected easily in essential hypertension although in only a small percentage of cases is renal failure the cause of death. The book is mainly devoted to essential hypertension and a critical review is presented of the whole subject. Despite the hope of an early solution of this problem as a result of Goldblatt's work, the authors conclude that the renal lesions are secondary to the hypertension and that the kidney is not primarily at fault. This is the consensus of opinion of a majority of students of the subject at present. They also feel that more of the present forms of therapy are based on a sound foundation, as they do not attack the fundamental cause of essential hypertension. The book is well written and the data clearly presented. It is a valuable addition to the literature on this perplexing subject.

J. HAMILTON CRAWFORD

Handbook for the Medical Secretary. By Miriam Bredow. Duodecimo of 253 pages, illustrated. New York, McGraw-Hill Book Co., 1943. Cloth, $2.25.

A secretary who would fulfill all the qualifications discussed within the pages of this book would be perfect indeed. This little volume belongs in the hands of any doctor's secretary as a guide in her daily work.

B. M. BERNSTEIN

The Analysis and Interpretation of Symptoms. Edited by Cyril M. MacBryde, M.D. Octavo of 301 pages, illustrated. Philadelphia, J. B. Lippincott Co., 1944.

In this cloth-bound reprint of the April, 1944, issue of *Clinics*, Dr. Cyril MacBryde and nine collaborators discuss in detail nine sets of symptoms which present problems in differential diagnosis. Nervousness and fatigue, fever, headache, thoracic pain, cough and hemoptysis, abdominal pain, gastro-intestinal bleeding, jaundice, joint pain, and obesity are the topics covered.

All the papers are good. Of outstanding excellence are those by Schiff on hematemesis and melena and a brief but eminently sensible discussion of obesity by the editor, MacBryde. In the latter, there is a section on the neglected psychologic aspects of obesity.

The book is cheap, well printed and bound, contains a good index, and might well form part of the working library of the intern and busy practitioner.

M. PLOTZ

Bailey's Text-book of Histology. Revised by Philip E. Smith, Ph.D., and Wilfred M. Copenhaver, Ph.D. Eleventh edition. Octavo of 786 pages, illustrated. Baltimore, Williams & Wilkins Co., 1944. Cloth, $6.00.

The authors have revised the tenth edition to bring to date a text primarily for first-year medical and dental students. They have added many new plates and figures.

The chapter on the female reproductive system has been made more complete by the addition of many recent articles. The authors should be commended for bringing to the overburdened student such a comprehensive histology text.

NATHAN REIBSTEIN

Sexual Anomalies and Perversions. Physical and Psychological Development and Treatment. A summary of the works of the late Professor Magnus Hirschfeld, M.D. Octavo of 630 pages. New York, Emerson Books, Inc., 1944. Cloth, $4.95.

This volume is the translation of a summary of the works of the late Dr. Hirschfeld, who devoted a good deal of his time to sex anomalies. It is a large book covering the different aspects of the subject and contains many case histories. The book as a whole does not measure up to those published by different psychoanalytically trained authors. However, it does contain some valuable information and numerous case histories. Works on sex have a universal appeal and this is enhanced during wartime. Therefore, many people will find considerable interest in this particular volume.

IRVING J. SANDS

Take Advantage of VITAMIN "B" SOLUBLE (WALKER) IN ALCOHOLISM THERAPY

Vitamin B holds a well-recognized place in the treatment of alcoholism. Alcoholic polyneuropathy is said by Jolliffe[1] to be unquestionably due to vitamin B_1 deficiency. Romano[2] states that both vitamins B_1 and B_2 have definite value in this condition. It is also believed that the addition of nicotinamide hastens recovery of the patient. (Spies, Sydenstricker, Jolliffe).

Vitamin "B" Soluble (Walker) supplies all the factors of the B complex, plus additional fortification of various constituents. Each capsule contains 3 grains brewers yeast concentrate, 1 mgm. Thiamin HCL, 1 mgm. Riboflavin, 5 mgm. Nicotinamide, 30 mgm. Ascorbic Acid. The dosage potency is regulated by the physician according to severity of the symptoms.

The generous use of Vitamin "B" Soluble (Walker) preceding and following indulgence in alcohol, does much to prevent symptoms of depression and nervous irritability that so commonly occur. In bottles of 30 and 100 capsules.

Rx Pediforme FOOTWEAR

for FLAT-FEET

The family physician, in health examinations, will not over-look examining the feet of babies and growing children for evidence of flat-feet through heredity tendencies or other causes—and will naturally prescribe measures for correction.

Proper shoes are essential to supplement the doctor's own treatments—but a proper source of supply *is essential, too,* and the patient of any age-group should be directed to competent and trustworthy fitters of correctly designed shoes of scientific construction. Pediforme footwear have the qualities desired by the doctor and the attractiveness so vital to the sensitive patient.

CENTRAL VALLEY, Orange County, N. Y.

SUBJECT FOR RESEARCH

Very little has been learned in the field ventive medicine that can be of much use individual person who acquires rheumatic fev in this respect, we must continue to do the l know, which is little more than what was kn and practiced by the earlier physicians. But field of public health, great advances hav made and much can be accomplished, pr certain measures can be carried out for the community which result in real protection individual. This same situation is equally t several other important diseases; for ex tuberculosis and infantile paralysis, in wh each case, the cause of the disease and the which it is spread is now well known, but wl specific form of treatment exists with which dividual patient may be relieved.—*Hugh McC M.D., Minn.
